WASHINGTON, May 6—The Commercial Economy Board, of which A. W. Shaw is chairman, has endorsed the work of the War Service Committee of the National Automobile Dealers' Association. President F. W. A. Vesper to-day reported to Chairman Shaw the recommendations of the committee, which were printed in Motor World April 24, whereupon the job of developing the recommendations was turned over entirely to the N. A. D. A.'s committee.

A meeting of the war service committee and the board of directors of the association will be called for some date in May as soon as President Vesper reaches his home in St. Louis. He left to-day.

Two-Ton Traffic Truck To List at $1095

New Company Will Market Vehicle with Standard Components

The Traffic truck equipped with low-side delivery body

The frame is strongly braced though thoroughly flexible

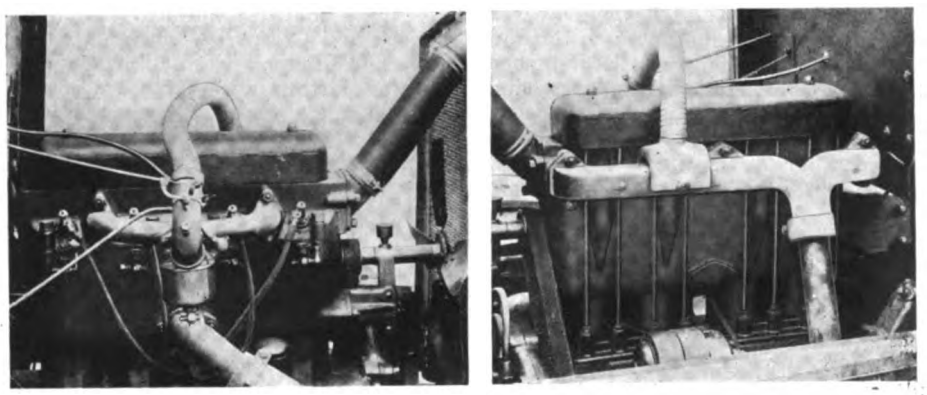
THE Traffic Motor Truck Corp., St. Louis, which was organized during the past year with a capital of $500,000, is going to put out a 4000 lb. truck to sell for $1095. A gray 35 hp. four-cylinder valve-in-head engine is used, the valve mechanism enclosed by a casting which is held in place on the head by two acorn nuts. The engine is 3½ x 5 in., and uses a Carter carbureter fed by gravity from a tank located on the dash. A hot-air attachment is fitted, the flexible metal hose leading across the top of the cylinder block to the exhaust manifold. A flexible control rod from the choker leads to the dash. Priming cups are provided on each cylinder, immediately beneath the spark plugs. An impulse starter is installed on the Kingston high-tension magneto. Lubrication of the engine is by a gear pump and splash system.

The cooling system operates on the thermo-syphon principle, having a cellular radiator with a 16 in. steel fan. The radiator is considerably narrower than the frame, and is well back from the front so that it is protected from injury.

The transmission members are assembled from well-known units embracing a Borg & Beck disk clutch, a Covert three-speed gearset, and a Russel internal gear drive rear axle. The propeller shaft is a two-piece member with three universal joints and the alignment of the front shaft is maintained by a self-aligning ball bearing. The wheels are heavy, have 2 in. spokes and steel rims and are fitted with Fisk pressed-on-type tires, 34 x 3 in. in front and 34 x 4 in. in the rear. Semi-elliptic springs of silica manganese steel are provided all round and these are lubricated by oil cups instead of grease. Both sets of springs are lined directly beneath the frame side rails. Two sets of brakes operate on the rear wheels, of the internal expanding and external contracting type. The front axle is I-beam with Timken bearings in the wheels.

Structural steel is used in the frame, which is 156 in. over all length, with bound and gusseted cross members. The center cross frame member is in the form of an X. The front cross member acts as a bumper, being rounded for this purpose. The length of the frame back of the driver's seat is 122 in. Wheelbase is 133 in., tread 56 in., turning radius 26 ft. and road clearance 12 in.

Steering is on the left side with control levers at the center and a foot throttle is in addition to the regular hand throttle. The regular equipment includes two side oil lamps, tail lamp, horn, jack and complete set of tools. The weight is 3300 lbs.



H. P. Mammen is president of the company, being formerly sales manager of the Westcott Motor Car Co. The vice-president and general manager is T. C. Brandle, also president of the Brandle Motors Co., St. Louis, distributer for Westcott and Chevrolet cars. The secretary and treasurer is Guy Wilson. The engineer in charge of construction is E. R. Martin, formerly associated with the Marmon and Westcott factories.

New 1-Ton Commerce Truck

DETROIT, May 6—Commerce Motor Car Co. is entering the market with a 1-ton truck; the chassis will sell for $1340. It is equipped with Bijur starting and lighting and Dixie magneto ignition; the generator and magneto are driven in tandem. There is a choice of three types of bodies; Model EA, open express, to sell at $1375; Model EH, open express with top, at $1450, and Model ES, stake body, which will sell at $1490. Shipments on this new model have started this week.

To Sell Ross Assets

DETROIT, May 2—The entire stock and equipment of the Ross Motor Car Co. will be sold May 14 by B. F. Everitt, receiver in bankruptcy. The inventory value is given as $150,000.

A Drive-Away Accomplishment

Driving Trucks Overland 100 Miles a Day

Two 2-Ton Indianas Driven From Marion, Ind., to Greensboro, N. C., in 8½ Days

EDITOR Motor World: We are enclosing you an account of the splendid performance of our Mr. Moser in driving two 2-ton Indiana trucks from the factory at Marion, Ind., to Greensboro, N. C.—a distance of 873.1 miles—in 8½ days, or an average of more than a hundred miles a day.

According to the reprint which you sent us, it seems that the record of 67 miles a day by the Army trucks was quite a feat, but it is badly outclassed by this performance of the Indianas.—Carolina Motor Co., Statesville, N. C.

On Wednesday, April 10, about 11.30 a.m., Earl Moser and E. L. Beatty, of the Carolina Motor Co., Statesville, N. C., distributers of Indiana trucks in North Carolina, left the factory at Marion, Ind., with one 2-ton dump truck and one 2-ton truck with long chassis.

The necessity for speed was apparent from the fact that the Carolina Motor Co. had guaranteed delivery of the 2-ton dump job at Durham, N. C., on the 19th of April.

The 2-ton long-chassis truck carried about 1500 lb. of miscellaneous accessories, while the dump truck carried no weight except the dump body and hoist.

The first stop was made at Muncie, Ind., a distance of 32 miles. Leaving the main highway at Muncie, the trucks were driven via Blountsville, Losantville, Hagerstown, Richmond to Eaton, where the night was spent. *The first day's drive was 97.4 miles.*

The drivers adopted the precautionary habit of oiling and greasing the trucks and filling up with gas at the end of each day's journey, so that no time would be lost in making early morning starts.

Leaving Eaton at about 7 o'clock in the morning, April 11, they passed Dayton and stopped at Springfield for dinner—a distance of 48.3 miles. Snow was about 6 in. deep from Eaton to Springfield. Leaving Springfield they stopped at Hebron, Ohio, for the night, passing South Charleston, London, Briggsdale and Columbus, driving 72.2 miles in the afternoon, or a total *mileage for the second day of 120.5 miles.*

Starting from Hebron about 7 o'clock on the morning of April 12, the next stop was New Concord, a distance of 55 miles. From this point the consumption of gasoline increased very materially because of bad roads. Between Zanesville and New Concord the highway is plowed up and under construction. Here our trucks passed six Government trucks which had been hung up in the snow and mud for two whole days and were waiting orders from Washington to move as quickly as the roads were passable.

From Zanesville to New Concord the trucks had heavy going. At Cambridge they rested for the night, *with 62.3 miles to their credit for the day.*

At a point about three miles east of Zanesville, in 18 in. of slush and mud, the dump truck skidded, sliding sideways down the hill, and its radiator striking the push pole extending from the rear of the front truck, cutting a hole in the radiator of the dump truck and perforating 21 tubes. The radiator was taken down and each tube plugged with wooden pegs whittled out of white pine, then put back on the truck and finished the entire journey without leaking a drop and without heating as much as it did before. This speaks highly for the accessibility of the Indiana construction and of the ease with which repairs can be made. These repairs consumed four hours. No tools were required other than those furnished with the truck.

Leaving Cambridge, Ohio, on the morning of April 13, they passed through Wheeling, W. Va., on to Washington, Pa., for the night—*making 80.8 miles for the day.*

The gasoline consumption still continued high on account of very bad roads, which were under construction and covered with snow. Between Washington and Morristown, Ohio, the road conditions were very bad—the worst encountered so far on the trip as a whole.

From Washington, Pa., at 6 o'clock, Sunday morning, April 14, the drivers made Uniontown, Pa., for breakfast; dinner was eaten at a roadside farm house, and they drove into Grantville, Md., about 8 o'clock p. m., a distance of 73.2 miles for the day, having been delayed four hours in snowdrifts between Addison and Grantville, where 52 automobiles of different sizes and makes were being towed through by teams.

The snow at this point averaged from 36 in. to 22 ft. where it had drifted, and there was no way around. Here our trucks passed three 3½-ton trucks, which had been stalled for 2 days, their drivers having drained the radiators and left them standing in the middle of the road. Four cars had also been left deserted by their drivers in a neighboring field. After getting through this drift the trucks made the six miles to Grantville in an average of 24 in. of snow. At Grantville 160 cars of different makes had been tied up from Friday until Sunday waiting for passable roads.

Leaving Grantville, Monday, April 15, through Cumberland, Hancock and Williamsport, the trucks made Martinsburg, W. Va., for the night, a distance of 109.5 miles for the day.

The first toll road was reached coming into Williamsport. The State of Virginia has 30 of these supporting institutions.

On Tuesday, April 16, the drivers left Martinsburg at 6 o'clock, breakfasted at Winchester, took dinner at Harrisonburg, Va., and spent the night at Lexington, Va., which they reached at 7.30 p. m., their mileage for the day being 149.7.

From Staunton to Lexington there is a stretch of very bad roads.

Leaving Lexington at 6 o'clock, April 17, Natural Bridge was made before breakfast, over 7 miles of good roads and 7 miles of bad roads. From Natural Bridge over the mountains to Lynchburg heavy grades and very dangerous, narrow roads were encountered. At no point was there more than 2 ft. side clearance on the roads; the curves were very sharp, many bad, weak little bridges, and in some places it was necessary to back in order to turn the curves.

For 18 miles this road was so narrow that it would have been impossible to get by a car if one was met. Lynchburg was reached about 3 o'clock p. m. for dinner, then Alta Vista and Gretna for the night about 9.30, the day's run being 101.1 miles. The road from Lynchburg to Gretna was red gumbo mud, said to be the worst road in the State of Virginia, but now under construction.

Leaving Gretna in the rain the next morning, then to Danville for dinner, the road being in an awful condition, raining hard, and no teams to be seen. From Danville to Reidsville, N. C., and 9 miles south of Reidsville, the roads were still in bad condition. Then on to Greensboro, N. C., over sand clay hard roads, in fair condition, arriving there at 7.30 on the night of April 18, a distance of 78.6 miles for the day.

Total mileage on trip—873.1 miles.
Total running time—8½ days.
Total gallons gasoline long chassis truck—145 gals.
Total gallons gasoline dump truck, 119½ gals.
Average miles per gallon gasoline:
Dump truck—7.3 miles.
Long chassis—6.0 miles.
Oil consumed by dump truck—5 qts.
Oil consumed by long chassis—6 qts.

OVER THE TOP

What Dealers Did for the Third Liberty Loan

City.	Amount
Albany, N. Y.	$150,000
Austin, Tex.	100,000
Bloomington, Ill.	85,000
Boston	500,000
Buffalo	276,350
Chicago	1,852,600
Columbus, Ohio	110,000
Davenport	100,000
Des Moines	300,000
Galesburg	20,000
Greenwood, R. I.	110,500
Hartford, Conn.	40,000
Memphis, Tenn.	90,000
New York	12,050,000
Pittsburgh, Pa.	250,000
Philadelphia	2,813,350
Phoenix, Ariz.	27,000
Raleigh	12,400
Salt Lake City, Utah	65,000
San Antonio, Tex.	255,000
San Francisco	501,000
Springfield, Ill.	25,000

NEW YORK, May 6—It is still impossible to give any definite figure for the amount of Liberty Bonds of the Third Loan, subscribed for by the motor-car industry. With only a very small percentage of the returns in, the total runs nearly to $20,000,000, but every one knows that the grand total will be far in excess of this. New York City alone subscribed for more than $12,000,000.

The energy and enthusiasm with which the dealer and garage industry plunged into the Third Liberty Loan has been indicative of the spirit which animates this essential industry, which on more than one occasion has been asked to make sacrifices to help win the war.

Almost without exception, dealers placed the resources of their whole organizations at the disposal of the Liberty Loan Committee. In addition to subscribing heavily themselves, many dealers turned over to local committees their places of business and their salesmen. Salesmen were sent out on straight canvass to sell bonds, not cars—and they sold them.

Following are reports from a few of the cities that have compiled their returns to date:

LOUISVILLE

Louisville, May 4.—While the automobile dealers of Louisville did not subscribe collectively to the Third Liberty Loan, the Louisville Automobile Dealers' Association invested $5,000, all of its surplus funds, in previous issues of Liberty Bonds. In Louisville, 60,000 subscribers purchased approximately $13,000,000 worth of Third Liberty Loan Bonds. This city's quota was $7,941,850.

TACOMA

Tacoma, May 6—Twenty-one thousand Tacomans subscribed $3,670,000 to the Third Liberty Loan, this being 39 per cent over quota.

SAN FRANCISCO

San Francisco, May 6—San Francisco oversubscribed its $53,970,000 Liberty Loan by $4,030,000. Of total sum, automobile industry, under leadership of William L. Hughson, president of San Francisco Automobile Trade Association, and Phil T. Prather, president of Automobile Dealers' Association of San Francisco, subscribed $501,000. This was the largest collective subscription from any one line of trade in San Francisco.

SAN ANTONIO

San Antonio, May 6—Members of the San Antonio Automobile Dealers' Trade Association purchased $255,000 worth of Liberty Bonds. Many of the members also did service as bond salesmen among outsiders, with the result that they disposed of more than $25,000 of bonds in this manner.

SALT LAKE CITY

Salt Lake City, May 4—The Allied Automobile Trades of Salt Lake City have subscribed slightly over $65,000 to the Third Liberty Loan. This amount was raised by a committee of local automobile dealers headed by T. W. Naylot, manager of the Studebaker branch. The automobile trade's subscriptions ranked high in comparison with other business interests in the city.

QUINCY

Quincy, Ill., May 5—Motor trades in this city and territory went over the top by 50 per cent over their quota. Over 50,000 subscribed by trade. Big dinner last night to all committees, city and county, to celebrate event. Over $3,000,000 raised here.

PORTLAND

Portland, Ore., May 4—Portland motor car dealers did not work as an organization in Liberty Loan campaign, but their work as individuals was a big factor in putting the city over the top with full quota on April 9, the fourth day after the opening of the campaign. Portland is tied with Toledo as first large city to oversubscribe its quota. During these four days dealers practically called off all other business and turned organizations over to Liberty Loan canvassing.

Special dealers' committee obtained cars from dealers whereby speakers were taken over the city in whirlwind speaking campaign. All dealers subscribed liberally as individuals, and Dealers' Motor Car Association subscribed $1,000. Not content with subscribing its quota so quickly, dealers helped in the wind-up of campaign to oversubscribe it. Result: Portland to-night is 51 per cent oversubscribed, total subscription being $15,296,000, and state 35 per cent oversubscribed.

PHOENIX

Phoenix, Ariz., May 6—The automobile trade of Phoenix is 100 per cent subscribed. Every one of the 490 men engaged bought a bond. Total, $27,000.

Digitized by Google

ALBANY

Albany, N. Y., May 6—The Albany motor-car industry helped to put the city a million dollars over the top in the Liberty Bond drive. The trade did not operate in any organized manner, the dealers doing their full share of the work as individuals with business men in other lines. Chauncey P. Hakes, president of the Albany Garage Company, was chairman of one of the merchants' committees, and reported $150,000 in bonds sold.

AUSTIN

Austin, Tex., May 5—Subscriptions of the automobile trade of Austin to the Third Liberty Loan were not separated from others, but it is estimated that the amount of bonds bought by dealers was approximately $100,000.

BOSTON

Boston, May 4—According to George B. Kimball, chairman of the Boston Automobile Dealers' Association Liberty Loan Committee, it is expected that when all the figures are compiled next week it will be found that the trade went over the $500,000 mark this time. This is merely from the dealers in cars, trucks and accessories. The tire pledges were counted in with the rubber trade, and this took a big bunch out of the automobile list. Also, this time, the dealers were limited strictly to their own trade, and had to keep in the city instead of soliciting anywhere and everywhere.

BLOOMINGTON

Bloomington, Ill., May 6—While the Bloomington Automobile Trade Association did not act as an organization in respect to subscriptions for Liberty Bonds, yet all of the twenty members, without exception, subscribed liberally. Joseph E. Lockwood, president of the association, was one of the active members of the Liberty Bond committee for Bloomington. The total subscriptions of the Bloomington motor car and accessory dealers aggregated $8,500. The dealers also subscribed liberally during the previous campaigns.

CHICAGO

Chicago, May 6—The Chicago Automobile Trade Association went over the top with a total subscription of $1,852,600, the quota being $1,800,000. These figures are not complete, as a careful count has not been made. Saturday morning saw the association over $100,000 behind its quota, but by night $149,000 worth of bonds had been sold. Stewart Warner Speedometer Corp. was the largest purchaser, with Nelson & Lemoon second. In all there were 15,242 subscriptions scattered among manufacturers, dealers, employees, etc.

COLUMBUS

Columbus, May 6—Columbus automobile dealers, accessory men, garage men and tire agencies came forward with a zest in their subscriptions toward the Third Liberty Loan. The trade in the Buckeye capital was worked by a team of motor-car men and accessory dealers headed by O. C. Belt of the Belt-Franklin Co. The total of subscriptions reported was slightly in excess of $110,000. Columbus and Franklin County went over their quota with a rush, and honor flags were given to both communities. The quota for Columbus was $6,569,100, and subscriptions late May 4 totaled $7,178,450. Others are to come in to swell the total.

HARTFORD

Hartford, May 6—Hartford has gone over the top in the Third Liberty Loan drive, and so has the state. The city of Hartford this afternoon was reported to have subscribed in excess of $20,000,000. The aggregate subscribed by the dealers, who number thirty-four, is $40,000. The individual scores were high. One representative house subscribed over $5,000, another $3,400, and still another $2,000.

At a meeting of the Hartford Automobile Dealers' Association, held Friday evening, Fred W. Dart moved that the returns from the recent automobile show at the Broad Street Armory, which represented 50 per cent of the cost of the attraction, be used for the purchase of Third Loan Bonds. The show cost the association about $10,000, and $4,800 was put into the bonds. This makes the total automobile showing nearly $45,000.

MEMPHIS

Memphis, May 4—The automobile interests of Memphis subscribed between $85,000 and $90,000 on this Liberty Loan.

PHILADELPHIA

Philadelphia, May 6—This afternoon's revision of the Trade Association loan figures brings the total up to $2,813,500. Team No. 2 gets high honors, oversubscribing its quota five times.

BALTIMORE

Baltimore, May 4—This campaign in Maryland was conducted differently from the previous ones. The automobile dealers of Baltimore were members of the Retail Merchants' Committee of the M. & M. Association, and their work is merged into the other associations. Practically every one of the automobile dealers had their salesforce working at different times during the campaign. William F. Kneip, president of the Dealers' Association, appointed a committee headed by John K. Harper, manager of the Eastwick Motor Co., and Arthur Stanley Zell, president of the Zell Motor Car Co., and these two men worked out a schedule which permitted every dealer to have some of his salesforce at work during the days, and especially in the evenings. The M. & M. has a committee at work now trying to figure out what each of the various trades accomplished in pushing the loan. Baltimore and Maryland overscribed their allotment of $38,000,000, the city going $4,000,000 and the state $3,272,000, over the top, with some places still to be heard from at midnight.

DES MOINES

Des Moines, May 4—$300,000 worth of Liberty Bonds was the record made by the Des Moines motor trades. With the exception of two purchases of $20,000 each by the Standard Oil Co. and the Studebaker Corp., the Des Moines campaign was ended in 5 days. The Motor Trades team worked as one of thirty teams representing all classes of trades and professions under the leadership of the Chamber of Commerce. R. J. Clemens of the Clemens Auto Co., and chairman of the Motor Trades Bureau of the chamber, captained the team. Des Moines' total sales were just under $9,000,000.

DAVENPORT

Davenport, Iowa, May 4—The automobile dealers of the Tri-Cities—Rock Island, Moline and Davenport—went over the top with a wide margin to spare for the Third Liberty Loan. Under the leadership of Commr. V. G. Kropf of the Associated Dealers of the three cities, almost every garage, sales agency and accessory dealer in the territory covered by the association took their full share of the bonds, and their employees followed suit. While no separate record was kept of the motor trades subscriptions, a rough compilation shows the total exceeded $100,000. All the dealers and their employees aided the loan in every way possible, and did their part in helping the district to almost double its quota.

PEORIA

Peoria, May 6—The city and county exceeded Liberty Loan quota by a wide margin, and the motor trades helped greatly to put this result over. No separate canvass was made in the trade, but practically every shop and agency was 100 per cent, and the dealers, under the leadership of President Pinkerton of the Peoria Automobile Trades Association, worked hard to fill their allotment.

GALESBURG

Galesburg, Ill., May 4—This city and county almost doubled their Liberty Loan allotment. The automobile dealers helped a lot toward this happy result, and devoted their time and the use of their cars to various committees to assist in the canvass of the city and the county. Over $20,000 was subscribed by the trade in this territory.

SPRINGFIELD

Springfield, Ill., May 4—With their Liberty Loan quota exceeded by at least 50 per cent, the various committees closed the canvass to-night well satisfied with their efforts in putting the city and county over the top and in line for the honor flags. No separate committee was appointed for the motor trades, but practically every shop and agency bought bonds until it hurt. At least $25,000 was raised among the automobile dealers and their employees.

JACKSONVILLE

Jacksonville, Ill., May 6—No separate canvass was made of the automobile dealers in this territory, but they all worked to help put the loan over in the city and county, and as a result the quota was exceeded by over 50 per cent. Several of the dealers devoted practically all of their time to the loan during the canvass, and results proved their work was appreciated. The motor trades are 100 per cent in this district. At least $15,000 were subscribed through the trade.

OMAHA

Omaha, May 6—The city of Omaha has nearly doubled its Third Loan quota. The last county in the state passed the goal on last day of drive. State total in quota of $31,000,000 is well over $40,000,000. Nebraska claims banner city and county in Union in loan. Hayes County trebled quota. City of Antioch, in potash district, oversubscribed quota nine times. State leads all others in district.

RALEIGH

Raleigh, N. C., May 6—Motor car dealers subscribed to $12,400 Liberty Bonds during campaign, the amount representing 92 subscriptions. The campaign was carried on by the motor division of the city campaign organization. Not only dealers took an active part, but employees of every garage bought at least one bond. Dealers also furnished motor cars during the campaign and boosted bonds with placards and stickers on their cars.

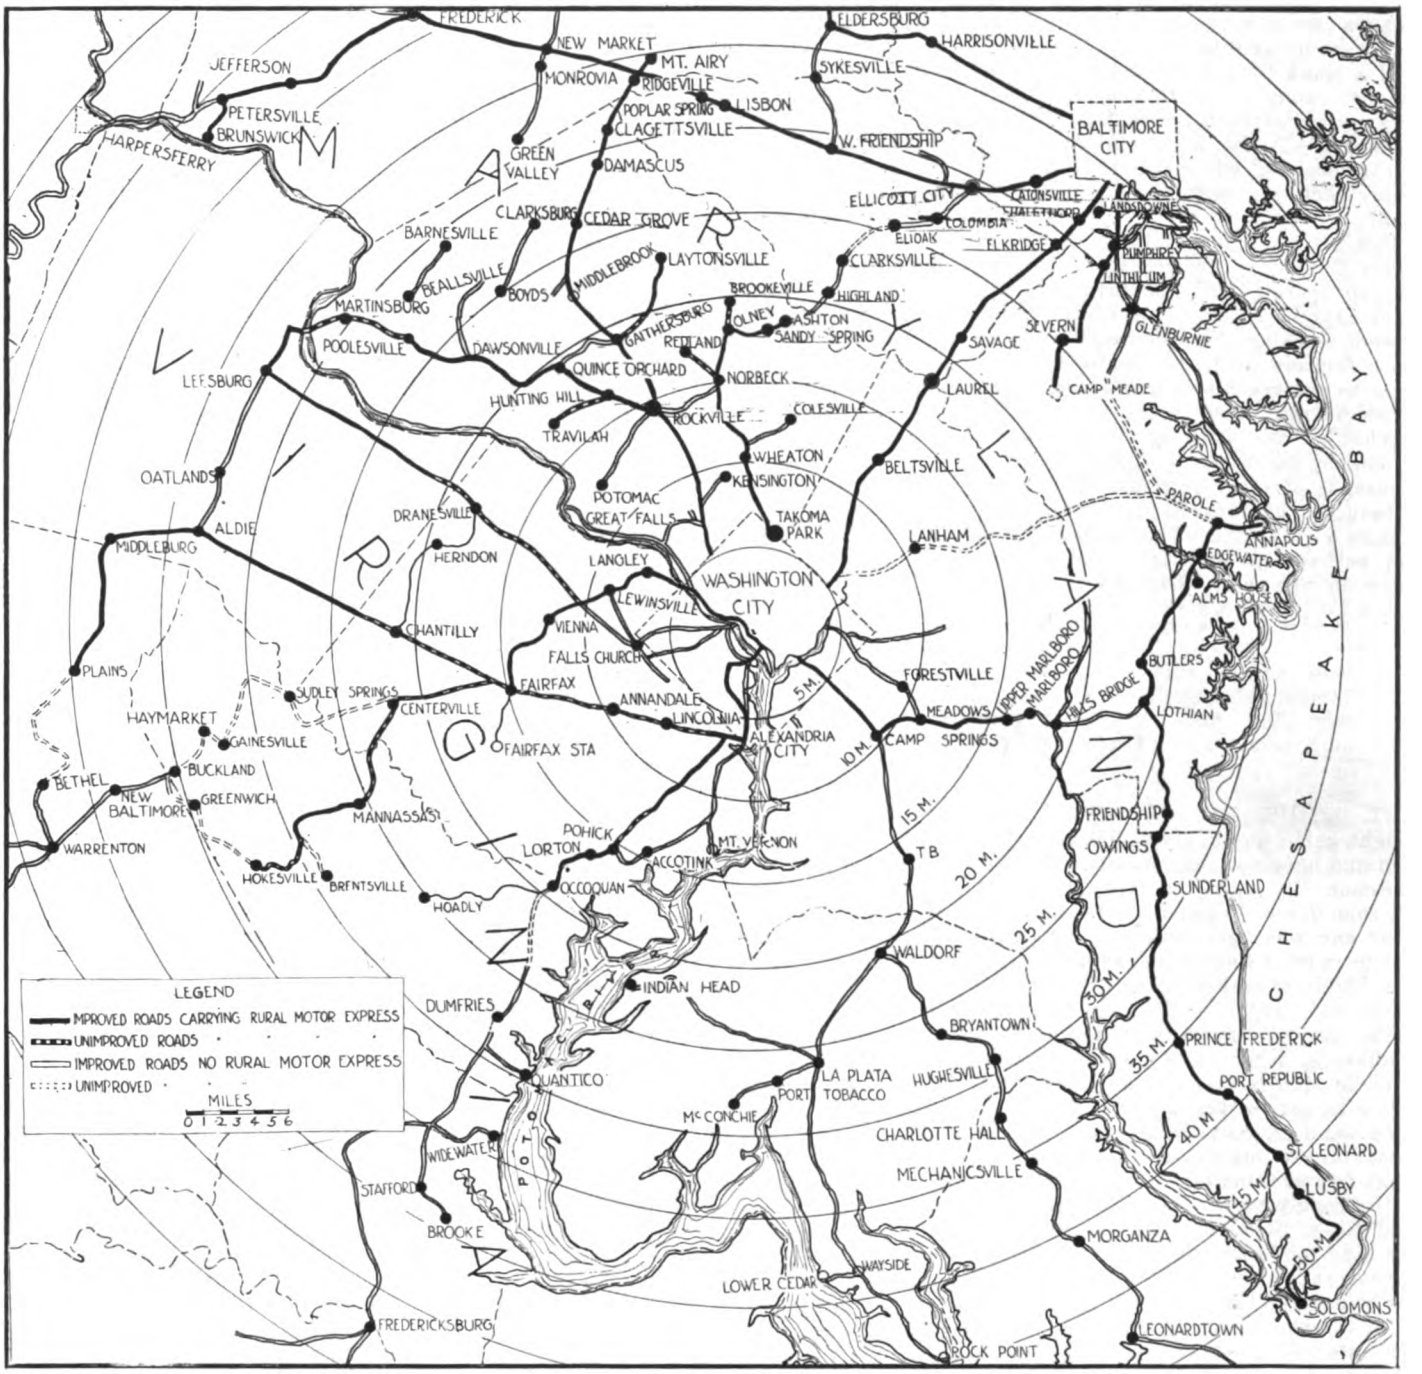
GREENWOOD, R. I.

Greenwood, R. I., May 6—The Rhode Island automobile trade went over the top with the state in the Liberty loan, subscribing to $110,500. Official figures incomplete. H. L. Rice, trade chairman, praises tradesmen's loyalty.

BUFFALO

Buffalo, May 6—The Buffalo automobile trade subscribed $276,350 to the Third Liberty Loan. The quota was $250,000. Charles B. Kane was chairman of the automobile committee.

OKLAHOMA CITY



Oklahoma City, May 7.—The automobile men did not work in the Third Liberty Loan campaign as a trade, although every prominent dealer took an active part. W. H. Vesper of the Vesper Auto Co. was one of the four Generals in the Oklahoma City drive and he had under him one-fourth of all the workers.

Rural Express Routes

Will Help the Dealer

Sell More Trucks

WASHINGTON, May 4—Increased transportation facilities will go far toward assuring a more adequate supply of food. The possibility of obtaining increased transportation is inseparably linked up with the sale of more motor trucks.

These are two facts which assume prominence in the good work that is being done by the Highways Transport Committee of the Council of National Defense, of which Roy Chapin is chairman. At present, and for a long time, the committee has been urgently and persistently advocating the establishment and development of Rural Express Routes and has so far advanced in its plan that a fair network of routes has been laid down in the territory immediately surrounding Washington with the result that a greatly increased quantity of food is coming daily into the National Capital.

The work that has been done by the committee in and around Washington is a fair indication of what can be accomplished in every other section where industrial and commercial interests are centered and surrounded at comparatively short distances by agricultural areas. Such Rural Express Routes put

Digitized by Google

the farmer directly in touch with his market, secure an adequate supply of food for cities, and undoubtedly will mean the sale of more motor trucks to farmers.

Take one concrete case as an example. One farmer near Washington discovered 4 years ago that the railroads could not be depended upon to get his milk to town quickly enough; rates were high; cans were lost and injured.

So he bought a truck. He found he could get his milk to town in a fraction of the time required by the railroad; that his cans always came back; and that they were never injured.

In a short time he discovered that he had not enough milk to keep his truck busy. He started to truck milk for his neighbors. To-day he is operating four trucks, each of which makes two trips a day, and his venture shows a good profit.

This man is still a farmer. But he is also a Rural Express operator. He and his son operate both the farm and the rural express route. This farmer is at present trucking the produce of some 14 other farmers along his route. He expects to enlarge his sphere of activities, to add several more trucks.

What has been done by this farmer can be done by thousands of other farmers in thousands of other sections. The wider introduction of Rural Express Routes will require a great deal of educational work, and perhaps no man is better able to carry on this work than the motor car and motor truck dealer.

The dealer is the one to carry to the farmer the gospel of motor trucking. He is the one to spread the facts and figures which will lay before the farmer the undoubted advantage, in these times particularly, when railroads are hard put to it to take care of long hauls let alone short hauls of completely divorcing himself from the railroads—of becoming his own railroad and the railroad for a dozen or more farmers along his route.

The establishment of Rural Express Routes does not require any act of the legislature; it does not require special permits or licenses except in a few cases and these are not difficult to obtain; it requires only the investment of limited capital. It is a business that can be rapidly extended and which properly managed, will return a good profit to anyone who enters it.

The Highways Transport Committee is now actively engaged in spreading Rural Express Routes propaganda. It urges upon others the desirability of spreading such propaganda.

Following is an outline of how the committee investigates the need for the establishment of such routes close by Washington and carries their establishment to conclusion.

In the first place a map is prepared showing all the improved and unimproved roads leading into the city from a radius of about 50 miles around it. This gives the towns and cities and also shows present rural express routes.

One section may have no such route despite the fact that it is in a rich agricultural territory. In this case a letter is sent to every farmer along the proposed route, calling attention to the necessity for the route and giving its advantages. With the letter goes a questionnaire which the farmer is to fill out and return.

The questionnaire asks if a Rural Express Route would help the farmer who is requested to suggest the most suitable route. The farmer is asked the nature of the produce he ships to market and how much. He is asked if he will help put the roads in good condition and maintain them. And last, he is asked to suggest some farmer who would be the logical one to operate such a Rural Express Route.

The replies which the Highways Transport Committee have received have been gratifying. Already, plans are being laid for a great increase in the number of Rural Express Routes and it is confidently expected that a number of additional routes will be in operation very soon.

The time is particularly opportune for dealers to get behind this work. Railroads are unable to handle the great volume of goods that must be transported. Motor trucks are the only solution to the problem.

And the dealer is the best teacher the farmer can have in learning of the advantages of motor truck transportation, or rather of its absolute necessity in these war days.

Be Positive When Selling Cars

ST. LOUIS, MO., May 7—"I have bought half a dozen automobiles for this firm and have not yet met an automobile salesman. I bought the cars; they were not sold to me. When I wanted to know what car was best suited to the job I had in mind, I found out," says the head of a highly organized piano sales organization in St. Louis.

The above remark was repeated to William A. King, sales manager for the Brandle Motors Co., and he was asked: "As a recent recruit from the life insurance business, regarded by many as the most highly organized sales business, what do you think of it?"

"I strongly suspect that he was right," said King. "I have been connected with the automobile business in St. Louis for a year and I have not met many motor car salesmen. They are very scarce.

"It is my opinion that the sales force of the automobile business are not recruited properly. There are three kinds of salesmen:

"*First*, the former mechanic who is made a salesman because he can talk entertainingly and, perhaps, convincingly about the machinery of the car:

"*Second*, chauffeurs who have sold a car or two to persons who have been impressed by their knowledge of the working of the cars and who are ambitious to raise their position in society.

"*Third*, the rich man's son who has seen in the automobile a chance for a nice, easy way to become a business man.

"None of these ways is the proper method to recruit a sales force. If you are going to make a salesman you will have to pick the man you believe can sell an automobile and then teach him about the car he is to sell, and the competitive cars.

"The chief difference between the sales manager's problem in the life insurance business and the automobile business is that in the former he has no class to pick from. In the automobile business, he has pick of the land. In one it is a case of recruiting, in the other a case of weeding out.

"As to selling," continued Mr. King. "I find that the automobile men tell their prospects: 'I think.' Now in the life insurance business, no one '*thinks*' about a fact or what should be a fact. Everyone *knows*. The entire argument is based on completed and proven tables of guaranteed accuracy.

"Here we sell the Chevrolet car. It has one especial competitor. I wanted to know the difference between our car and that particular car. No one could tell me. It was assumed that the other car was run at less per mile than any other car on the market. Many other things were assumed, both about our car and its competitor.

"I don't like things that are assumed. So I started a bit of bookkeeping on my own part and had some of our users keep books too. We availed ourselves of the best records made public about our competitive car. We asked firms that use both cars for their figures.

"As a result I have tables comparing these cars in every sort of use for long and short periods. We now know that our competitor has nothing on us, but we have in fact a serious percentage on him. We have *facts* and we can *show* where we got these facts and they can be quoted to the person who plans to use the car all the time or occasionally.

"*These things are what the motor car business must come to.* The successful salesman of tomorrow is the man who knows, who is a salesman first.

"In the life insurance business, we kept our salesmen on edge by inspiration, but I am inclined to believe that in the motor car business, the salesman must be driven somewhat. The inspiration does not seem to inspire the class of men who place the car before salesmanship.

"What I have said is in all kindness. I am not critical, it is merely facts. It is a new business and the real selling is only beginning. The cars have sold themselves largely."

Whole Trade Awaits Word From Washington

Production Committee Meeting Discusses Further Restriction in Production of Motor Cars

WASHINGTON, May 7 (Special to Motor World)—The matter of further curtailment of passenger car production was discussed to-day and left in the hands of a committee of eight men to be taken up again to-morrow. This committee includes, representing the War Industries Board, C. A. Replogle, Hugh Frayne, Geo. N. Peek and Mr. Legg; representing the automobile industry, W. C. Durant, John N. Willys, Walter E. Flanders and John Dodge.

F. W. A. Vesper of St. Louis, representing the National Automobile Dealers' Association, is at the meeting and is optimistic of results. He does not believe that matters are as bad as some believe. He urges that dealers not be unduly apprehensive, and adds, in case of a severe cut: "Diagnose your business; if you can't do it, get some one who can; eliminate all waste and reduce overhead; take on truck and tractor lines and make up in some other way for the loss of passenger car business."

WASHINGTON, May 7—The Automobile Production Committee of the National Automobile Chamber of Commerce which early in March met with the War Industries Board, at which time a curtailment in motor car production by 30 per cent was mutually agreed upon, is meeting again to-day. The meeting has been called to discuss a further proposed curtailment, to take effect after July 31, which is the date when the old agreement expires.

At the present moment it is not known what the War Industries Board will suggest in the way of a further cut. Nothing concerning the probable result of the deliberations has been permitted to become public though rumors are flying thick and fast.

One of these rumors has it that a cut of 50 per cent will be made; that is, an addition of 20 per cent to the present existing schedule. Another, that a reduction of 66 2/3 per cent will be made, and that the basis for calculating the reduction will be an average of the three years' production commencing July, 1915, and ending July, 1918.

It is practically certain that a further cut will be ordered. Increasing quantities of raw materials are required for war work, and among these steel takes an important place.

Last week the leading steel makers of the country met in New York and unequivocally pledged themselves to give their entire outputs to government and war needs for the next 60 days. Not a pound of steel not intended for actual war needs is to be delivered. The meeting was history-making in its importance. Here were representatives of 45 of the greatest steel concerns in the world voting without restraint to devote their entire energies to a program that will help win the war. Here is the pledge they signed:

"For myself, my corporation or any firm, I pledge the prompt production and delivery of the largest possible quantity of material in our departments that is, or shall be, required for the United States Government for the necessities of itself and its allies, and agree that all other lines of our business shall be subordinated to this pledge, and all this in accordance with the request of the War Industries Board."

In offering the pledge to the steel makers, Leonard Replogle, director of steel supply of the War Industries Board, stated frankly that he came from the President clothed with power "to go practically to the English system of an absolute prohibition on the consumption of any iron or the manufacture of any steel except for absolute war necessity."

Serious Cut Would Be Disastrous

NEW YORK, May 6—If serious cuts are made in the production of motor cars it will have a disastrous effect on the businesses of a great many of the dealers in this section, and this section, state those familiar with national conditions, is not unlike the rest of the country.

Factory branches, if the factories so desire, can be continued even at a loss, because most of the factories are operating at a profit through war contract work—but branches are comparatively few. These branches can also cut down their own retail sales and pass along a larger percentage of their quotas to the dealers, but even this will leave the dealers short.

Production is now from 30 to 50 per cent off along the row. This means that some dealers have made no money for weeks. Some are just about breaking even. Others are showing small margin of profit through parts and service.

One dealer is planning to open a used-car business and hang on indefinitely if possible. Several state that, while they haven't thought that far yet, they would undoubtedly have to go out of business if there is a further cut. One such dealer says his rent is $30,000 a year and his overhead $100,000, and he has the latter figure down as low as it can be cut. He says if there is any further curtailment he will have to go out of business.

It is agreed that thousands of dealers throughout the country sections would be wiped out if there is any further great curtailment. A few could continue on their parts and service work, with accessories, tractors, etc., but the mental change that would be necessary would be too great for some, and they would lose nerve and fall out.

One distributer says he advises all dealers to hang on as long as they can in order that they may not lose the good-will that attaches to a going business, for, he states, starting anew at a later date will be hard and possibly more costly than keeping going in the face of a cut on production.

One branch manager of a big production car states that he could continue the branch with a cut of 50 per cent, but that his 100 dealers could not exist below a cut of 33 1/3 per cent. At that margin he says they would be on the profit-and-loss line and would be forced out of business if the cut were greater.

Dealers generally recognize that the possibility of being forced out of business is something that is to-day more than mere talk. It has been talked of for a long time, but the bare facts are to-day at hand, and thousands realize that much more shaving of the industry will cut off the roots upon which it must subsist after the war, and also part of the roots that are sustaining thousands of cities, villages and hamlets all over the country.

Omaha, May 4—Considerable skepticism prevails among Omaha men as to probability of cut in automobile production going into effect as forecast.

J. T. Stewart Motor Co.—Pierce-Arrow and Mitchell—Propose to protect our dealers to limit. Had plenty hard luck already getting

Digitized by Google

cars for demand; can't imagine much worse. Shall proceed along customary lines until forced to other measures, then may consider cutting some wholesale connections and taking over retail end in state trade, but this only as last resort.

W. L. Huffman Auto Co.—Premier Columbia, Nelson—All serene. Have bought and paid for enough cars already manufactured to last us through entire year. Will make even more money if competition is eliminated this way. Will not cut any connections. Have good lines of trucks, tractors and accessories to help if needed, but see no danger. Will do bigger business than ever.

Murphy-O'Brien Auto Co.—Dodge and Paige—Do not believe it. Factory advises nothing. Thirty per cent cut already in effect has been sad blow. Had to cut similar proportion of wholesale connections and assume retail trade in territory. Further reduction would mean further similar cut, with more territory to cover. This means fifty-fifty basis, or more profit to us, so we protect ourselves. Ample finances. Can stick. Have trucks, tractors and accessories to help. Cut in production would mean freeze out for lots of little fellows.

Nebraska Buick Co.—Buick—Can't be much worse than it is. Lots of trouble; long time to get even small percentage of cars for demand. Plenty of capital. Can stick. Don't like to consider dropping dealers and taking their trade, but may have to.

H. Pelton—Marmon and Franklin—Do not believe it. No great trouble to get cars to date for delivery. Sold 30 days ahead. This is just fair situation. Have cut no connections, and not thinking of it. Will cross that bridge when we come to it. Don't see any bridge. Not worrying.

Studebaker-Wilson Co., Inc.—Studebaker—Await outcome of meeting of automobile men and government representative now on in Washington. Some doubt as to what 75 per cent means, whether this proportion of what factory might put out at capacity in normal times, or of present rate, or what was done last year. If 75 per cent of all possible in normal times, remainder would be yearly total last year's factory output. Factory advises it can make 35,000 cars and fill all government requirements. Made 53,000 last year. Can get along if 35,000 are put out and we get our share. In any case, we propose to protect our exclusive dealers to the limit. Plenty of capital.

Kansas City, May 6.—Many dealers are depending heavily on truck and attachment business to make up deficiencies in passenger-car supply; 20 per cent of dealers without truck accounts will probably close if cut is 50 per cent. Those having used cars separate with exclusive lines will keep such open. Large city dealers with several lines expect advantage over small country dealers. Dealers await Washington action.

Minneapolis, May 6.—Dealers are handling the situation optimistically, and day by day in instances reductions have been made in selling forces, readjustment of allotments, and addition of truck and tractor lines to help out.

Willys-Overland has made big reduction in space used, called off all wholesale traveling men, and readjusted allotment of cheap cars. Hence this automobile company will do anything to help win the war, and has made no cuts in overhead or dealers, but considers one-third cut already is in effect.

Midland Motors Co. says that to continue in business, making money, it will have to have at least 50 per cent of factory production for this year's schedule. With fewer cars than that will have to cut organization and let out many men to curtail expenses.

Bohn Fawkes, Oldsmobile, can do business at 50 per cent cut. Already has cut representation one-third and will have to cut more.

Northwestern Automobile Co. reports up to May 1 running 60 per cent of last year, and at end of fiscal year, July 30, will not be over 50 per cent of last year. Has curtailed advertising and road expenses for salesmen, taking only tractor and truck lines. Does not expect further curtailment.

Murphy Automobile Co. believes if any more curtailment is necessary than already has been made it will have to go out of business.

Baltimore, May 6—While a strong, optimistic spirit pervades the large motor dealers, there is a feeling among many of the smaller and less substantial dealers that a reduction of passenger-car output from 50 to 75 per cent is going to work havoc with the trade. All of the dealers expect to see higher prices for motor cars with a reduction of the output, while most of them rely on the truck business and other accessory business to carry them along. Practically all of the larger dealers have been getting their stock in away ahead of their orders, and will not be materially affected by this year's reduction; but there are many who have not been able to get the stock ahead. Even those who have stocked up for this year's trading are more or less anxious over what effect the curtailment order is going to have on their business next year.

F. S. Bliven, manager of the Standard Motor Co., Cadillac, Knox Traction Unit, Lally Light, and a truck distributer, says it is almost impossible at this time to forecast what effect the order is going to have on business. "We have never been busier," said Bliven, "than we are at this time. If this order of curtailment means the motor industry as a whole, it will have quite a different effect than if it is going to be applied to each individual company. Many of the small companies have already closed down, and some are on the brink of doing so. If the order is going to take the industry as a whole, then the closing down of the small companies will permit the larger ones to make the most of their output and make it possible for the dealers with the high-class representation to continue in business.

Earle Williams, general manager of the Packard Motor Co., Baltimore, says: "The price of cars will naturally take a big jump, but we are prepared to place our reliance in trucks. Used cars and accessories, for we have large departments for both, will also help to carry along our overhead unless production becomes normal."

W. D. Howell of the Howell Motor Co., Reo, Day-Elder truck and Duplex Four-Wheel Drive distributer, says: "The reduction of the output is going to bring about a healthy buying public with cars at higher prices. There is no doubt in my mind but that the manufacturers have anticipated such a possible situation, and have been manufacturing parts to such an extent that they will be able to get out most of their production. I will have 75 per cent of my allotment here by June 1. Another point—I am prepared to handle the mechanical end of the business very well, because we have large machine shops, and about 10 per cent of the Baltimore dealers will also be able to come through by this means. Trucks are going to help us along, and our accessory department is also going to help us to take care of the overhead."

Harry A. Mayer, general manager of the United Auto Sales Co., Studebaker and Garford distributer, says: "Business was never better with us than it is at the present time. We have not been able to get in our passenger cars fast enough, and have sold ahead all we will be able to drive in and obtain by railroad within the next 30 days.

"The truck business is going to help out, but we need both to make business pay as it ought to. It is costing a great deal more to do business to-day than ever before. I feel safe in saying that many of the Baltimore dealers who have not a truck account will be forced to close down."

James J. Flynn, manager of the Baltimore branch of the Chevrolet Motor Co., Inc., of New York, says: "I'm optimistic, and feel that the Chevrolet company is going to see that we get either passenger cars or some side line to keep this business going. We have too many cars on the streets of Baltimore and in the state for us to close down. I would like to be sure that we will be able to continue to get sufficient cars to keep running at a profit, so as to give service to our owners."

Most of the dealers declined to express any opinion on the subject, in view of the matter not having reached a definite end as yet, but should the cut be made to 75 per cent there is going to be a doubling up of many passenger-car agencies under one head, for it will be impossible, from the information gleaned for dealers, to continue as at present and make a profit.

Boston, May 6—The Boston automobile dealers are still at sea over the proposed curtailment of motor cars, and they have not yet made any effort either as individuals or as a body to plan just how to meet the shortage of cars for next year, other than to decide that now is a good time to take on trucks.

Since the Boston show there has been a great rush to add commercial vehicles to the various lines, not only in Boston but all through New England. Companies that have never given a thought to commercial lines before, and were not expected to bother with them, now sell trucks.

In some instances, where sales forces have been depleted by war drafts, the dealers, realizing the unsettled conditions, have not made any attempt to secure additional men, and are going along on a war basis. But there has been no attempt to seek smaller quarters or to cut overhead expenses yet, although that may come later.

St. Louis, May 5—The motor trade here was not inclined to be enthusiastic when the plan of organizing business as a whole, instead of by trades, was announced for the selling of the Third Liberty Loan. But when St. Louis, on Thursday, was the first of the cities rated at more than 500,000 to go "over the top," any criticism was disarmed. The St. Louis district had previously been the first district to go "over the top" as a whole. So impersonal has this organization been that even motor-car men who have been giving most of their time to Third Liberty Loan work are unable to see a basis for estimating the amount the trade here has taken.

Milwaukee, May 7—While definite expressions are withheld pending further information, leading dealers believe proposed radical curtailment of passenger-car production means ruination of the dealer industry, already hard hit by previous cut. Overhead generally is too large to stand up under radical curtailment. Dealers handling trucks are not so much worried, unless truck output also is cut. Some dealers have extensive outside interests to keep them afloat; others consider the future situation precarious.

First Report of Fordson Tractors in Operation

Has Ample Power, Is Easy to Operate and Is Giving Little Trouble

LANSING, MICH., May 6—Good reports are coming from many quarters of Michigan on the work of the 554 Fordson tractors distributed through the War Preparedness Board, as the majority of these tractors are in operation. The tractor is doing good work and has ample power. It is easy to operate and is giving little if any trouble. Its speed is a factor that is being appreciated.

None of these tractors has been running long enough to show wear or breakage. No conclusion can be reached as to the life of the machine. The consumption of kerosene is running a little over 2 gal. to the acre in parts of the state visited. Many farmers are not keeping sufficiently accurate records to give more than general statements.

On one farm a Fordson was plowing on rather heavy clay soil. The land is rolling, some of the grades being quite steep. With the plows set so that they were cutting nearer 16 in. than 14 in. of furrows width and with the ground plentifully sprinkled with tough alfalfa roots, the tractor moved at its regular speed except on the steeper grades. The furrows were 7 to 8 in. deep and the work good enough to satisfy anybody.

Pro-German Emery in Bearings

In some parts of the state troubles pointing to pro-German activities have been encountered. A number of the tractors did not work properly and an examination showed that oil tubes had been stopped with drops of solder. It is said that these tubes are not made in the Ford factory and no one knows where the solder could have been put in them. A member of the War Preparedness Board has declared that some of this has been traced to spies working in factories.

A further indication of pro-German activities is that emery has been found in some of the bearings. A Motor World representative in his investigation of the work of these tractors saw examples of this emery a few days ago.

Tractor To Cost $800

There is much discussion as to what methods Henry Ford will use in merchandising this tractor. It is reported he expects to fill the quota of 1000 through the regular agencies. These agents pay him $750 f.o.b. Detroit for the tractors, which is the same price that the farmers have paid the War Preparedness Board. These dealers are instructed to sell the tractors at $800, which price includes service on the tractors, which have already been sold.

The merchandising of the plows to go with the tractor is not so definite. They will sell for $180. It is believed the agency for the Oliver plow, which is being used, will be given to Ford agents, although this has not been definitely announced.

One matter in connection with tractors has been well demonstrated, and that is the necessity for accessibility. Where a bearing has to be taken up, such as on the crankshaft, the work has to be done on the field, and the greater the accessibility the shorter the time required for the job.

Accessibility Is Important

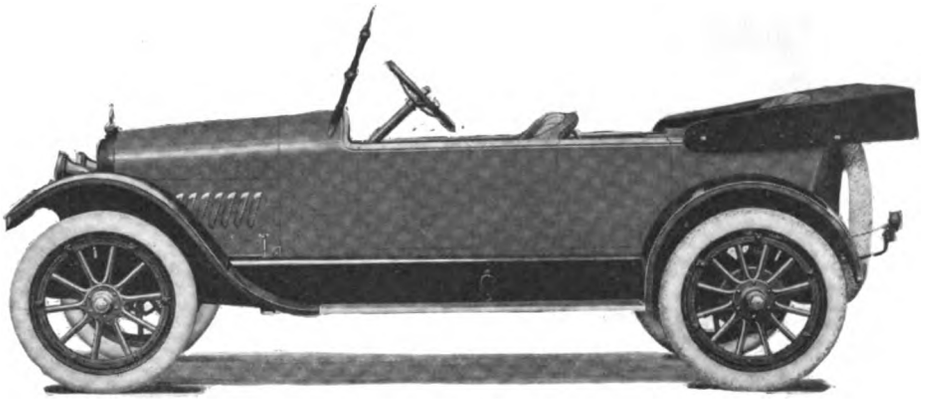
In taking up one of the bearings which had been damaged by emery the status of the Fordson in this matter came in for attention. To remove the bottom of the crankcase it is necessary first to drain the crankcase of oil and also the cooling system of water. The triangular brace connecting the crankcase with the front axle has to be removed. It is necessary to disconnect one end of the steering rod before the loosened crankcase can be removed. This bottom is held by thirty bolts, all of which must be taken out. As all of this work must be done in the field, the job becomes naturally more difficult than if it could be done in a garage or factory.

One or two dealers in Michigan have already decided upon a service policy, which includes preparation for speedy repairs on any tractor within a distance of 30 miles of the agency. Such service would apparently include bearing trouble such as the case above cited, which was due to the emery. Where service must be given, it is important to do the work as speedily as possible. The job of repairing a bearing is one that cannot be done by many farmers, and dealers must be prepared to give adequate service until such time as the farmers are better prepared to handle these difficult jobs.

Start Fordson Distribution

DEARBORN, MICH., May 6—The placing of the Fordson tractor on the general market was started this week. Local agencies must keep a supply of parts and accessories for the tractor, and the service system is a duplicate of the Ford service system. In order to educate prospective dealers and others who will handle the tractor, the agents are sending young men to the Fordson plant, where they are being taught assembling from start to finish, so that they will be thoroughly familiar with the construction of the Fordson tractor.

States Order 800 More Fordson Tractors



DEARBORN, MICH., May 3—Three more states have ordered tractors from Henry Ford & Son. Wisconsin placed an order for 500; Virginia for 200, and Tennessee for 100. The two latter states will handle distribution through a recognized distributing agency. The order to Wisconsin will go to only a few counties and will be distributed through T. W. Meiklejohn, a distributer, who will co-operate with the County Council of Defense.

Harroun Producing 20-30 a Day

WAYNE, MICH., May 6—Business of the Harroun Motors Corp. is steadily increasing and amounts to a production of from twenty to thirty cars daily. The May schedule calls for 500 cars and indications are that this figure will be exceeded. The company plans to produce 600 cars in June. Approximately 500 men are now employed and it is expected that this figure will be doubled within the next 30 days to take care of the 155 m.m. shell contract received from the government.

2000 Chandlers in 3 Months

CLEVELAND, May 6—The Chandler Motor Car Co. produced 2000 passenger cars the first 3 months of 1918, as compared to 4400 during the corresponding period last year.

The Elgin Motor Car Corp., Chicago, is building a new 4-passenger model which will be known as Military Scout. While it is a 4-passenger car, it will comfortably carry five people. The body of this Military Scout model is of distinctive design of straight-line type, beveled edge and full size rear fenders. The price is $1,195

Wage Competition Is Causing Shortage of Skilled Mechanics

Big Money Paid by War Industries Lures Men from Garages and Service Stations

NEW YORK, May 4—An investigation of the shortage of labor in service stations discloses the fact that this shortage is occasioned not alone by men taken for military service by draft or enlistment, but to a still greater extent by the wage competition of munition plants, shipyards and airplane factories. As most of these are turning out work for the Government on a cost plus basis, the item of labor cost does not bother them much, and they can afford to pay almost any price as long as they get the men. The service station stands in no such position as regards its ability and willingness to pay excessive prices for skilled labor, and unless the station can meet the price the men seek more lucrative positions.

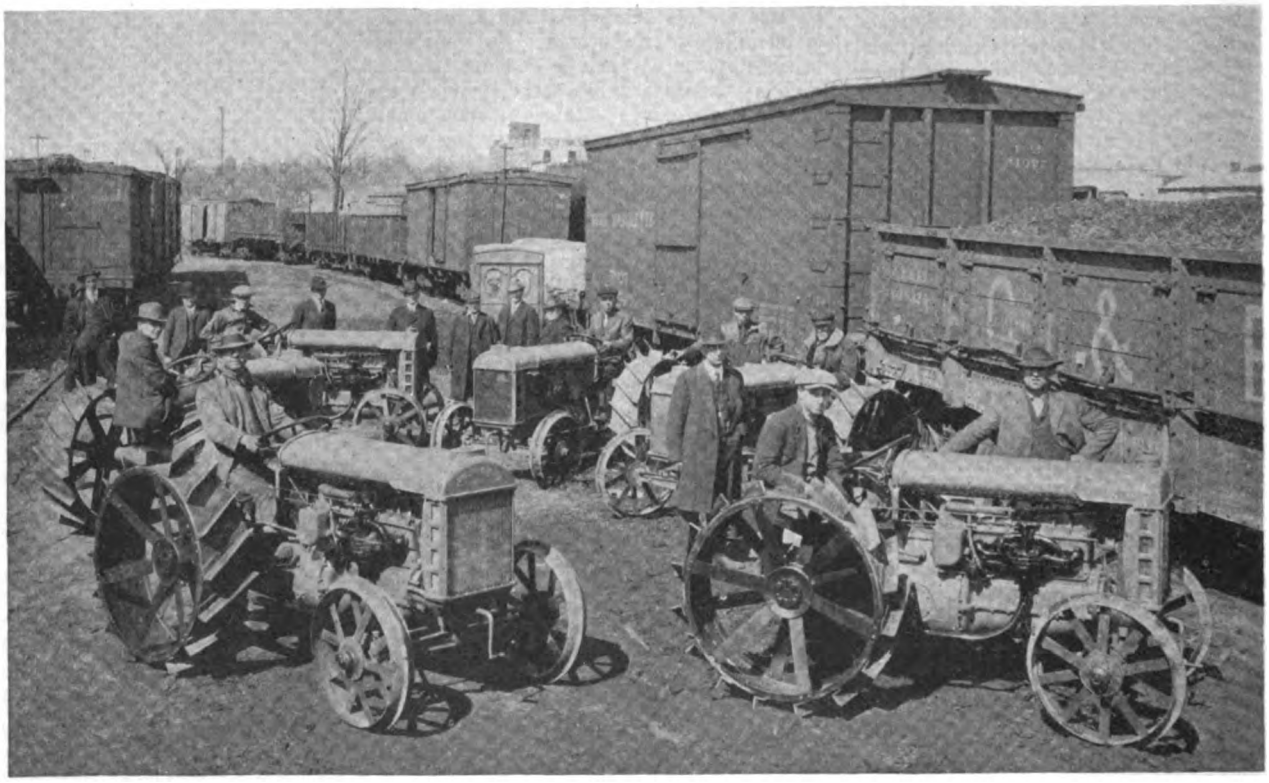
The service stations have adopted various means of combating this loss of their employees. The market for skilled labor of the particular type demanded is not very large, and some stations have been training green men or taking mechanics of not more than medium ability and teaching them the fine points.

This, however, only stays the trouble for a short time, for as soon as the men learn something they follow in the footsteps of their predecessors.

A more satisfactory answer to the question is to increase the efficiency of the men that remain. The Packard company, which lost 31 men in the first draft, and more in other ways, co-operating with Packard stations all over the country, found that its efficiency was about 94 per cent. This figure was arrived at by a scheme of averaging up the other stations. Some of them were quite low.

By installing additional machinery and adopting a bonus system, the efficiency of the New York station was raised in a short time to 167 per cent. The bonus system consisted in adding $10 per month to each man's wages, with a certain amount deducted for every complaint that came in from a customer on the particular work done by that man. Inducements were offered for devices to shorten time on jobs, and the men showed considerable ingenuity in this sort of work.

So far, the use of girls in service stations has not been advocated. F. R. Bump, manager of the Studebaker branch, however, thinks that the time is not far off when he will have to use girls in the stock room and for various positions in the office hitherto held by men. He is of the opinion that it is no harder to teach girls the work than it is men.



Girls are being largely used in England and France in shops, but it hardly seems possible that they can do the class of work done by the service station men in this country. They may be all right on automatic machine work, and on lathe jobs, but service station work requires an inherent mechanical skill which is possessed by but few of the weaker sex.

In spite of the fact that the cost of labor to the station has soared to unheard of heights, in most cases the cost to the customer remains the same. Some few of the stations that previously had made a very small charge on the labor items were forced to come up to the general level of $1 per hour.

It is quite generally agreed that the price will soon have to be raised, but to what figure is a point not yet decided on. J. B. Hulett, president and treasurer of the Brady-Murray Motor Corp., handling the Chandler, is of the opinion that a charge of $1.25 for ordinary mechanical work and $1.50 for highly specialized work would be a fair figure and one on which the station would not show a loss.

There are no exact figures available as to the cost of labor to the station. Hulett says that two years ago, when the price to the customer was the same as it is now, the cost to the station was 82 cents. At the present time he estimates that the cost is fully equal to the price he gets if not more.

While the shortage and high cost of labor and other things have been a thorn in the side of the service station, it has created a spirit of efficiency that has resulted in getting out more work with a smaller force. Devices and machines have been bought or made to make possible certain jobs being done by one man instead of two or three. Where formerly the lifting of a truck body took several men a couple of hours in the Packard station, a winch is now used which enables one man to do the job in a half hour.

ARRIVAL of the first carload of Fordson tractors ordered by the State of Michigan and delivered April 5. The price of the tractor has been definitely set at $800 and the plow will probably be $140. Nebraska, South Dakota and Indiana have each placed orders for 500 tractors this week

Cut Rubber Imports; Set 9 Sizes for Tires

War Trade Board Curtails Imports 37½%—Eliminates 200 Pneumatic Sizes

NEW YORK, May 6—The establishment of nine standard sizes of pneumatic tires and the restriction of rubber imports from overseas points by 37½ per cent are two measures which have been taken by the Government as a means to help in winning the war.

The War Service Committee of the Rubber Industry of the U. S. A. has sent a letter to automobile manufacturers urging that they use nine standard sizes of pneumatic tires for passenger cars and commercial vehicles up to 2 tons, commencing July 1, 1918. It is believed that this schedule will be adopted by both tire manufacturers and automobile manufacturers, resulting in the ultimate elimination of some 191 different sizes and types of tires which the manufacturers must now produce and the dealer carry in stock.

The sizes which the War Service Committee includes in its schedule are as follows:

Size	Rim	Size	Rim
30x3½, clincher	30x3½	34x4½, S.S.	34x4½
31x4, clincher	30x3½	35x5, S.S.	35x5
32x3½, S.S.	32x3½	36x6, S.S.	36x6
33x4, S.S.	33x4	38x7, S.S.	38x7
		40x8, S.S.	40x8

All these sizes, with the exception of the 36 x 6, 58 x 7 and 40 x 8, conform to the Society of Automotive Engineers' Standards, which were adopted in July, 1915. One entirely new size, 33 x 4, has been adopted as a regular standard size, and is intended as a compromise between the 32 x 4 and the 34 x 4. It is pointed out by the War Service Committee that the adoption of this schedule of sizes by the automobile industry will greatly reduce the amount of stock a dealer must carry and correspondingly increase the service which he can give car owners. At present there are approximately 200 sizes in types of tires made in inch sizes as against the nine sizes in the new schedule.

The War Service Committee also urges the earnest support of automobile manufacturers in the program looking to the standardization of American inch sizes on all export shipments of cars, which will eliminate the necessity for manufacturing and carrying in stock, both in this country and in foreign branches, 43 sizes and types of millimeter clincher tires.

The committee urges that, except in the two smaller sizes, only straight-side shoes be manufactured, thus eliminating clincher, which is used now only in a very small number of cases, Q.D. and straight side Q.D., in which the beads are reversible.

Both this measure and the decision to restrict rubber imports by 37½ per cent have been adopted as a means to release ship tonnage for other purposes more intimately connected with winning the war. Commencing about May 1 the War Trade Board will refuse to issue licenses for the importation of rubber from overseas points for a total amount in excess of 25,000 tons. Based on receipts during the past three months, this represents a restriction of about 37½ per cent.

The immediate effect on the tire industry will not be great. In fact, it is understood that tire manufacturers have sufficient rubber on hand at the present time to permit them to manufacture at practically normal capacity during this three-month period, allowing, of course, for a certain reduction in production to correspond to the reduced production of cars and trucks.

Following the decision to restrict imports, the War Trade Board has let it be known in a manner unmistakable that the Government will not permit hoarding of rubber or profiteering in it. It has issued regulations requiring everyone receiving rubber to sign an agreement giving the Government an option on the entire shipment at 62 cents per pound for standard quality smoked sheets, 63 cents for latex crepe and 68 cents for fine Para. Under the terms of the agreement the person receiving the rubber is not permitted to sell or transfer any of it at a price higher than is set by the Government.

More Money for Farmers

WASHINGTON, May 6—A possible 650,000,000 bushels, the greatest winter wheat crop since the record breaking yield of 1915, together with a probable increase of 15 per cent in the acreage of spring wheat—that is the forecast made in a report on the condition of winter wheat issued to-day by the Chamber of Commerce of the United States through its Committee on Statistics and Standards.

"The present acreage now standing in winter wheat," says the report, "is 20 per cent greater than the acreage at the same time in 1917. But the greatest promise of a high yield of winter wheat is found in the general high condition of the wheat, a condition which has improved steadily since the first of April.

"Estimates of coming yields are always uncertain because of the possible vicissitudes of weather and depredations of insect enemies. But the crop has come through the trying month of March with a higher condition than it entered it, and with moderately favorable weather from now on there is promised a production of at least 600,000,000 bushels. It may go as high as 650,000,000 bushels if all goes well."

St. Louis Association To Help Win the War

Members Individually and Collectively Will Assist in Knifing the Kaiser

ST. LOUIS, May 6—Joseph A. Schlecht, re-elected president of the Automobile Manufacturers' and Dealers' Association, is planning that his administration this year shall do all in its power to aid the government plans, whatever they may be.

"I am not expecting to do anything radical in the way of extending business," said Schlecht, "but I am hoping that we shall bring about many conservations of our material, labor and time. We hope to keep the trade in St. Louis in such shape that it will be in conformity with any orders the Government may at any time issue. We are on a platform of 'Win the war, never mind the cost to us.'

"Our first step will be to conserve labor in repairs. We are making plans for one general repair firm to take over all of the night work. We want this firm to have a downtown, west end, south side and north side station for night and Sunday work, then all members of the association will close their repair shops at night and on Sundays. This will mean a considerable conservation.

"The Junior Officers bureau will be a conservation plan. This will include accountants, service managers, etc. We think that when these men get together then can work out standardizations that will help us all. One of the first questions is that of insurance. At present, hardly any two motor car dealers are insured on exactly the same terms.

"These are a few of the things that we are working on. In the appointment of the committees, I have kept the chairmen within the Board of Directors, so that one meeting will serve. I have put each man on the question which appeals most to him and will permit each chairman to name his committee. We hope in this way to get better service from them."

Smith Signal To Weiss & Sinclair

NEW YORK, May 4—Beginning May 1, 1918, the firm of Weiss & Sinclair took over the United States distribution of the Smith auto signal. The company is at 42 West 39th Street, but expects in the near future to move to the plant of the Smith Signal Corp., 53-55 West 66th Street. On and after May 15 price of the Smith auto signal will be $20.

One Harley Motorcycle Van

MILWAUKEE, WIS., May 4—The Harley-Davidson Motor Co., which in the past has made several commercial motorcycle models, including a 600-lb. side van and a 400-lb. three-tracker truck, has decided to concentrate in the future on a 400-lb. side van. The motorcycle part will be identical with the Harley-Davidson solo motorcycle except that the engine compression will be a little lower.

Prominent Tradesmen Assume New Duties

Resignations and Promotions Place Workers in New Places

V. M. Brady, for 6 years manager of the St. Louis branch for the Pest-O-Lite Co., has taken over that business as distributer for Prest-O-Lite products. The warerooms are at 2700 Locust Street.

C. N. Tucker, formerly service manager for the De Luxe Automobile Co., St. Louis, now a sergeant in the 222nd Aero Squadron, U. S. A., cables his safe arrival in France.

H. Jay, manager of the Philadelphia branch of the Bearings Service Co., since last November, has left for Camp Sherman, Chillicothe, O. His successor is **L. H. Ward.**

M. J. Wise, former district sales manager of the Federal Motor Truck Co., Detroit, in the middle west, has been appointed district sales manager for the Acason Motor Truck Co. for the same territory.

J. V. Thomas has been promoted from assistant sales manager to general sales manager o fthe B. F. Stearns Co., Cleveland. He was associated with the Moon Motor Co., of which he had charge of general sales prior to joining the Stearns company.

R. B. Campbell, branch manager of the Bearings Service Co., Detroit, formerly located at Atlanta, Ga., has been transferred to the Detroit Branch.

C. M. Garrett, purchasing agent of the Midland Motor Car & Truck Co., Oklahoma City, has opened an office in Detroit.

Frederick B. Bartnitz has joined the truck sales department of the Foss-Hughes Co., Philadelphia distributer of Pierce-Arrow cars and trucks. For the past 15 years, he was division passenger agent of the Pennsylvania Railroad.

C. O. Olson, for two years auditor for Warner M. Bateman, Cleveland Maxwell distributer, has been made manager of the Youngstown branch.

F. Winsor Eveland, a pioneer in the Philadelphia automobile trade, having started in 1906 as the Stevens-Duryea agent, has been appointed sales manager of the Girard Automobile Co., which distributes Peerless cars and trucks.

F. E. Hurst, for the last year and a half assistant factory manager for the Chevrolet Motor Co., Flint, has resigned to become associated with H. L. Innes, former factory manager for the Chevrolet, and now vice-president and general manager of the Doble-Detroit Steam Motors Co., Detroit. Prior to coming to Flint, Hurst was with the Dodge Brothers for 2 years, and also with the Hupp Motor and Grabowsky Power Wagon companies.

J. Walter Drake, president of the Hupp Motor Car Co., has been elected vice-president of the Wayne County War Preparedness Board. A permanent office will be established at the Board of Commerce, with a secretary in charge.

Charles G. Frowart, for several years connected with the Pennsylvania Railroad, has been appointed manager of the McNaull Tire Sales Co. of Pennsylvania, with Philadelphia distributing offices at 809 North Broad Street.

H. W. Badenhousen, who for the past year was general manager of the Warnola Mfg. Co., New York, has joined the New Era Spring & Specialty Co., Grand Rapids, in a similar capacity and as treasurer of the company.

R. W. Leach, Cleveland, O., has been appointed sales manager of the Curtis Auto Co., Milwaukee, distributer of the Reo in Wisconsin. Leach succeeds Alton J. March, who resigned April 1.

Robert H. Thieman, secretary-Treasurer of the Raab-Thieman Co., Ford dealer, and manager of the Sheboygan Auto & Supply Co., Sheboygan, Wis., has enlisted in the ordnance corps of the national army and left May 1 for Jefferson Barracks. Ultimately he will be assigned to the ordnance supply school at Camp Hancock, Augusta, Ga. He retains his interest in the Sheboygan concern, which will be continued by Arthur F. Raab.

C. A. Miller, assistant general sales manager of the Republic Motor Truck Co., Alma, Mich., has succeeded M. E. Holmes as general sales manager.

J. D. Wilson has been appointed chief engineer of the carriage division of the Packard Motor Car Co., succeeding G. H. Bridie, recently transferred to the aircraft engineering staff. He was formerly assistant carriage chassis engineer.

L. W. Coppock has resigned as chief engineer of the Higrade Motors Co., Harbor Springs, Mich.

Marwin Truck Gets Plant

KENOSHA, May 6—The Marwin Motor Truck Co., Chicago, which recently was organized under the laws of Delaware with a capital stock of $1,000,000 to manufacture motor trucks and tractors, has purchased the former plant of the Skidd Mfg. Co. at Kenosha, Wis., and will make that city its manufacturing headquarters.

Weld Coast Overland Companies

TOLEDO, May 2—Two subsidiary companies of the Willys-Overland Co. on the Pacific coast have been consolidated—the Willys-Overland Co. of California and Overland Pacific, Inc.—under the name Willys-Overland Pacific Co. Frank Riggs is vice-president and general manager. He was manager of the Packard truck department in Detroit prior to becoming Packard dealer at Portland, Ore., from which position he left to become associated with the Overland company. The new company will serve California, Oregon and Washington and parts of Montana, Idaho, Nevada and Arizona.

Wisconsin Car Dealer Gets Fordson Tractor

T. W. Meiklejohn, of Service Motor Co., Fond du Lac, Named Distributer

FOND DU LAC, WIS., May 6—T. W. Meiklejohn, general manager of the Service Motor Co., Fond du Lac, Wis., and one of the best known distributers and dealers in the Northwest, has been selected as Wisconsin distributer of the Fordson tractor under the plan now in effect in Michigan and several other states. Meiklejohn volunteered his services and is donating his time to the tractor distribution by way of "doing his bit" during the present crisis. The first supply of tractors already has arrived and they are being displayed at the Service Garage, 41 East First Street, Fond du Lac. The Service company has been a district distributer of the Ford car for several years.

Chevrolet Service Managers Convene

FLINT, MICH., May 3—Zone service managers of the Chevrolet Motor Co. closed a 3 days' session here to-day. Over twenty were present and there were thirty-six present at the dinner given Thursday evening. F. A. Bonham, manager of the parts and service division, presided at the business sessions. M. E. Coyle, comptroller, was present from New York, as was also J. H. Newmark, manager of the advertising division. Both were speakers at the dinner.

Take Philadelphia Ford Plant

PHILADELPHIA, May 4—The plant of the Ford Motor Co., North Broad Street and Lehigh Avenue, has been commandeered by the United States government for storage purposes. The incumbents are given until May 16 in which to vacate the premises. The building is valued at $1,000,000, is ten stories high and contains more than ten acres of floor space.

Truck Train in Chicago on a Regular Schedule

Part of Goodyear Akron-Boston Fleet Is First Motor Convoy to Arrive in Windy City

CHICAGO, May 4—The first fully equipped motor truck train to reach Chicago running on a regular schedule arrived here May 1 at almost exactly the hour set when it left Akron, Ohio, Monday night. This means a 440-mile trip in 25½ hr., a time that surpasses prevailing railway freight schedules.

The trucks are part of a fleet which the Goodyear Tire & Rubber Co. is operating between Boston and Akron. The detachment consists of five trucks—1½-ton Packard, 3-ton Packard, 5-ton Packard, 3-ton White and 3½-ton Mack. The truck drivers worked in shifts, sleeping and eating en route, and the only stops were for bad roads or an occasional repair.

The trucks brought tires, tubes and other accessories to the Chicago Goodyear branch. They were met by delegations from the Chicago Association of Commerce, the Chicago Automobile Trade Association and the Traffic Club with a band, and the procession moved down Michigan and over Jackson Boulevard to the Board of Trade Building.

The trucks were loaded with 16 tons of Red Cross hospital supplies and started on a trip to Baltimore by way of Washington. The supplies are for immediate shipment to the army in France, and are those which have been delayed for several weeks because railroad transportation could not take care of them. A complete field kitchen, capable of serving 400 men at the front, is included. A detail of jackies and representatives is to give the train its send-off.

A feature of the train which is attracting much attention here is the use of the huge Goodyear pneumatic cord tires, the largest of which are 44 x 10 in. These tires are credited with the record of the trucks, which is 20 m.p.h. average speed for actual running time between Akron and Chicago.

Newman Retires From His Company

DETROIT, May 3—Harry Newman, Chicago, distributer of the Maxwell and Chalmers, has retired from his company, which will hereafter be a branch of the Maxwell company, in charge of Jack Banta, who has been assistant production manager of the Chalmers-Maxwell plant in Detroit. Newman, with the Maxwell distribution under his charge, took on the Chalmers again sometime ago, after having had it once and lost it to James Levy, the Chalmers distributer who relinquished it, regained it and returned it to Newman again.

Receiver for Pull-More Truck

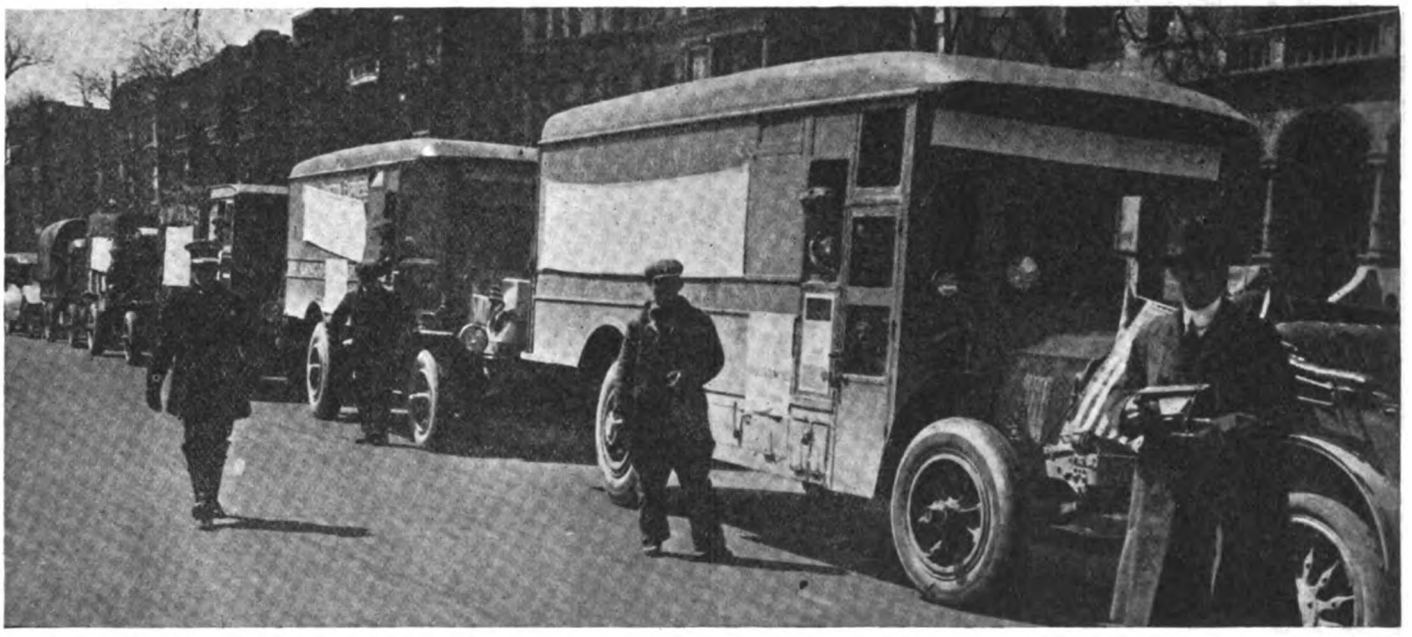
NEW CASTLE, PA., May 7—A receiver has been appointed for the Pull More Motor Truck Co. W. S. Craig, assistant secretary, admitted the insolvency of the company, and joined in the request for a receiver.

Puts Campaign in Booklet Form

PHILADELPHIA, May 7—The Philadelphia *North American* is distributing a folder showing a series of advertisements it ran during the latter part of the winter to combat the then prevalent idea that the motor car was a "non-essential." The advertisements are put together in attractive form and are followed by reprints of letters from Philadelphia dealers expressing their approval of the stand taken by the *North American*.

Urge N. A. D. A. Help for Federal Licenses

Dealer Body Asked to Back Bill Making Licenses Usable in All States



ST. LOUIS, MO., May 6—The National Automobile Dealers' Association has been asked to indorse U. S. Senate Bill 31, introduced by Senator Pittman, which provides that motor car licenses obtained from any state shall be recognized by any other state. The bill came up while President Vesper was in Washington and Secretaries Ruddle and Holke suggested to the sponsor of the bill that it be changed to expressly provide for driveaway cars. The question is taken up in this bill under the head of interstate motor car traffic.

Pence Enters Banking Field

MINNEAPOLIS, May 7—Automobile men are well represented on the board of the Lincoln National Bank, which opened to-day. Harry E. Pence, president of Pence Automobile Co., is chairman of the board. J. A. Graham, Northwestern manager for the Studebaker corporation, is a director as well as Don B. Mullen, president of Brehm-McMullen Co., distributer for Acme trucks.

Assemble Fordson Tractor in Columbus

COLUMBUS, OHIO, May 4—An assembling plant for the Fordson tractor will soon be erected in Columbus by Henry Ford & Son. The plant will be nearby the assembling plant of the Ford Motor Co., which is on Cleveland Avenue.

This detachment of the Goodyear Fleet consists of 5 trucks—a 1½-ton Packard, a 3-ton Packard, a 5-ton Packard, a 3-ton White and a 3½-ton Mack. A feature of the train which is attracting much attention is huge Goodyear pneumatic cord tires, the largest of which are 44 x 10

Studebaker Advances Many Men

DETROIT, May 3—A number of promotions in the sales organization of the Studebaker Corp., South Bend, have been made. One of the most important is that of R. H. Williams, former manager of the Detroit branch, to the position of assistant director of sales under L. J. Ollier, vice-president. J. E. Grady, for 3 years sales manager of the Studebaker Corp. of Canada, Ltd., Walkerville, will assume the added duties of manager of the Detroit branch, succeeding Williams. S. A. McGonigan, former manager of the automobile division at South Bend, will become his assistant. L. A. Keller, who has been at various times manager of the branches at Omaha and Portland, Ore., and more recently head of the Los Angeles branch, will hereafter be at the offices as manager of branches. George L. Willman, advertising manager, has been advanced to manager of the Chicago wholesale branch and will have direct control of the wholesale distribution of the Studebaker cars throughout much of the middle west. A. J. Brechtel, for 2 years assistant to the sales manager of the commercial car division, has been promoted to the management of the Des Moines wholesale branch. Perry E. Newell, assistant office manager of the automobile division, has been appointed assistant manager of the Cleveland district sales organization.

Rickenbacker Gets His German

DETROIT, May 2—Lieutenant Edwin Victor Rickenbacker, a former Detroiter, and one of the most prominent racing drivers in the United States, has brought down his first German airplane. Rickenbacker went to France as personal chauffeur for General Pershing. After 9½ years of racing on America's automobile speedways he left Detroit last May for Cincinnati to drive the Detroit special in the speedway race there. He was then offered the opportunity to go to France with General Pershing. He enlisted and was made a sergeant. He accompanied General Pershing as his personal chauffeur in his tour of all sectors on the western front. Later he obtained a transfer to the signal corps, 5 weeks after which he completed the usual 3 months course of instructions. He was commissioned first lieutenant and assigned to the mechanical division, later being transferred to the flying division.

Two Men

(*Continued from page* 17)

have all said each man must be two men where last year he was only one, but I'm afraid it has been just words with some of us and that we haven't stopped to think how it applies to ourselves. We have pictured in our minds this great American nation becoming more efficient and producing more and more and more with the same number of men—or less—and we haven't tried to find out what part we ourselves play in that plan.

"This is, to my mind, one of the places where we fit in. We must change our habits of thought. If we have thought a salesman could sell only one thing we must take another think. Instead of hiring extra men we must find ways for the old men to do additional things—and earn more. We must all do more. We must throw away our old minds and ways and get new ones and do things we never thought of doing.

"When a salesman walks into a prospect's office the salesman must say he represents C. J. Reilly, Incorporated, and not the Sennett car or the Sayanna truck. Then the prospect, knowing what we handle, will wonder 'what's he going to sell me?' and before the salesman gets through he may sell the man the whole line, whereas, if the salesman announces that he represents the Sennett car, the prospect knows that is what the salesman has to sell, and the prospect is rather surprised when the salesman tries to bring the truck into the argument.

"Last year, Tommy, with our nice little car agency we were pretty much a one-horse, one-legged business. This year we're going to make the old business do things it never did before, and I believe our salesmen can do the same thing. What say?"

"I'm for it!" Tommy displayed considerable enthusiasm. "Anyway, they say it can't be done—so let's do it."

Buick Has 4000 in Service

FLINT, May 2—More than 4000 Buick employees are now in government service, according to latest reports, and employees of the company are still leaving for training centers daily.

Hupp Advances Prices $100

DETROIT, May 6—The new prices of both the Hupp touring car and roadster are $1,350 instead of $1,250. This advance was effective May 1.

Reorganize Bosch Personnel

NEW YORK, May 4—Arthur T. Murray, of the Bethlehem Motor Co., Allentown, Pa., will have charge of the operation of the Bosch Magneto Co., recently taken over by the United States Government through A. Mitchell Palmer, custodian of alien property. The company under Government management has been reorganized and Christian Girl, quartermaster corps, U. S. A., and William G. Fitzpatrick, assistant director of the bureau of investigation, have been designated additional directors. The officers of the company under the reorganization now are as follows: Joseph A. Bower, Liberty National Bank, New York, president; Christian Girl, vice-president; William G. Fitzpatrick, secretary; George A. MacDonald, Springfield National Bank, treasurer, and Arthur H. D. Altree, New York, formerly sales and credit manager of the Bosch company, assistant treasurer. The production capacity of the plant will be materially increased.

Scrap Metal and Rubber Prices

NEW YORK, May 4—Following are scrap metal prices paid by New York dealers for scrap metals during the past week. They are from *Iron Age:*

	Cents per lb.
Copper, heavy and crucible	23.50
Copper, heavy and wire	23.50
Copper, light and bottoms	21.00 to 21.50
Brass, heavy	16.25 to 16.50
Brass, light	12.00 to 12.25
Heavy machine composition	23.75 to 24.00
No. 1 yellow rod brass turnings	13.00 to 13.50
No. 1 red brass or composition turnings	19.00 to 20.00
Lead, heavy	6.50
Lead, tea	5.50
Zinc	5.50

Prices paid for scrap rubber by reclaimers follow:

	Cents per lb.
Tires	5-5¼
Inner tubes, No. 1	21-22
Inner tubes, No. 2	10¾-11

Schlecht St. Louis President

ST. LOUIS, May 4—The St. Louis Automobile Manufacturers' and Dealers' Association has re-elected as president Joseph A. Schlecht of the Mound City Buggy & Auto Co. The other officers follow: Vice-president, P. H. Brockman, DeLuxe Automobile Co.; treasurer, H. I. Schnure, Velie Automobile Co. Directors, F. W. A. Vesper, Vesper-Buick Automobile Co.; F. R. Tate, Tate-Gillham Motor Car Co.; I. G. McNiece, Cadillac Automobile Co.; W. L. Johnson, Johnson Automobile Co.; W. S. Roberts, J. I. Case T. M. Co.; C. R. Frampton, Hudson-Phillips Motor Car Co.

Germans Have New Fighting Plane

NEW YORK, May 4—An American airman in France has brought down a new type of German airplane known as the Pfalz D3. This is a single-seater chasing machine. It is extremely small, the entire spread being less than 32.8 ft. It is a good deal like the Albatros, but does not seem to have much ascension speed. Another plane of the same type has been brought down by a French aviator.

The Finger Points—

THE most valuable thing in business is good will.

And good will is just a reputation for quality.

It attracts steady customers—therein lies its great value.

Nothing sold by garagemen, auto supply dealers and hardware dealers is so representative of distinctively superior quality as Champion Dependable Spark Plugs.

So the finger points to the mark of spark-plug quality—that one word "Champion" on the porcelain of the plug.

Sell Champions—their quality attracts steady customers—establishes that most valuable asset in business—good will.

2 SECONDS AGO → AND NOW

The

NEW UTILITY DISAPPEARING TRUCK

Has Proved a Huge Success

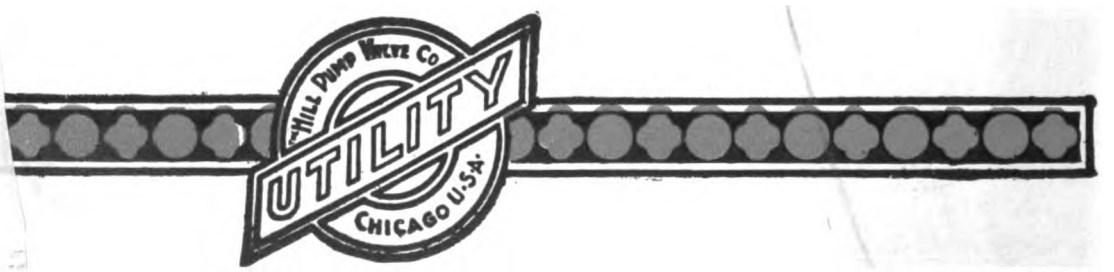
As we expected, dealers are quick to see the possibilities in the agency for this proposition. They see that the field is practically unlimited because every person who owns a Ford roadster is a prospect whether he is in business or not. And merchants can be induced to buy a Ford roadster because it will be a half-ton truck as well as a passenger car.

In two seconds a Ford roadster is converted into a half-ton truck and back again. The truck is completely out of sight under the ORIGINAL turtle back of the Ford. When not in use the **Utility Disappearing Truck** cannot be seen by the most careful examination.

Can be completely installed by **anyone** with a hammer and wrench in **one hour.** Only four bolts used in attaching it. No rattle, no vibration—a firm, secure truck body made of heavy gauge steel.

The turtle back cannot be injured or marred when Ford is being used as a truck. It lifts up automatically and protects back of seat from scratches. Even when the UTILITY DISAPPEARING TRUCK is in use the Ford does not lose any of its original appearance. It is still a trim, neat little runabout. There is no doubt about the tremendous sale that awaits this wonderful invention.

MAKES A FORD THE MOST USEFUL CAR ON THE MARKET



No matter what the nature of the load to be carried, if it does not exceed a half ton it can be carried quicker and cheaper with the UTILITY DISAPPEARING TRUCK. No extra attachments or parts—just lift the turtle back, slide out the UTILITY DISAPPEARING TRUCK and have a half ton truck in 2 SECONDS.

Made of heavy gauge steel, beautifully finished in black baked enamel, and can be pulled out to the desired length. Practically indestructible because no bolts or rivets are used in the acetylene welded body.

DEALERS Order your sample now and write for complete details and the agency for your community.

Why the Corbin-Brown Centrifugal Principle Is Best

MOST motorists know that the Corbin-Brown speedometer operates on the centrifugal principle, but not all of them stop to consider the great importance of that principle in giving perfect accuracy.

Science has proven that a mechanism built on the centrifugal principle is not affected by changes in temperature or by electrical influence. That is why you have a sure guarantee of lasting reliability in the

CORBIN-BROWN SPEEDOMETER

No matter how high or how low the temperature may be, your Corbin-Brown gives you the usual flawless record. Although your Automobile will probably be equipped with an electric lighting system and electric self-starter, your Corbin-Brown will not feel the increased electrical influence.

This assurance of perfect accuracy which is given by the instrument itself is carried through all other features of the mechanism. Every part is made by experts from the highest grade materials, carefully inspected and tested and finally covered by the Corbin guarantee of quality.

Investigate the Corbin-Brown Maximum Speed Hand. This extra feature indicates your highest speed and remains at that point until reset to zero, which can be done in an instant at any time. It is a great convenience to know that the record of speed will remain until you are ready to inspect it at leisure.

Be Prepared

In these days of change no one can tell just what conditions will be a few weeks or months ahead. No one can say how many cars will be built during the next year. No one can prophesy anything. But, regardless of what happens, every dealer should get his business in a most healthy and ready condition. Then, no matter whether the wind be favorable or adverse, he will be fit to meet it. *Read the story on page* 10

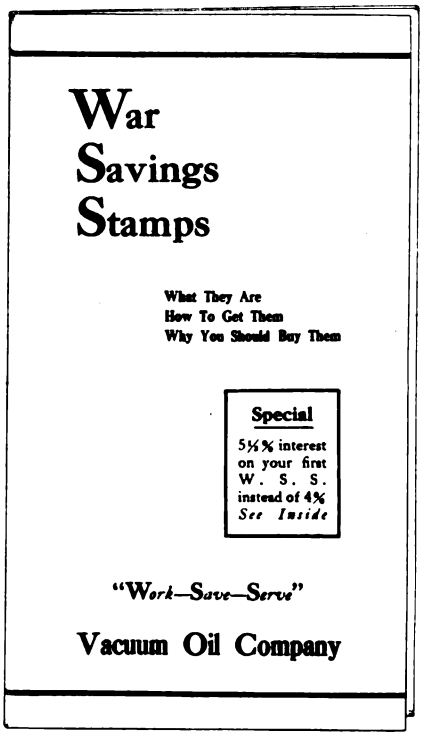
Selling Thrift to the Employee

How One Company Has Made Its Workers Better Workers and Netted Large Funds for the Government's War Work

WE all bought Liberty Bonds —and we all have a few extra quarters left.

A quarter is a small item—but it buys a war savings stamp, which has been made familiar to millions through "W. S. S."



Thrift and the absence of wastefulness are admirable qualities in employees. They are so valuable in making employees better workers that the Vacuum Oil Co. is investing its own money in stamps, provided the employees will "get the habit."

It is a worth while idea.

Read the story and see if there isn't an opportunity for YOUR organization to get behind this year-around government financing plan.

In order to stimulate and increase the sales of war savings stamps among employees, the Vacuum Oil Co., New York, instituted a sales competition among departments, refineries and branches of the company.

Previous to this time the company had been urging the sale of war savings stamps in about the same manner as is probably used by many other business concerns throughout the country. That is, war savings stamp posters were put up in various conspicuous places, "stamp agents" were appointed and employees were urged to lend their money to the government.

This is the folder issued to employees, setting forth the advantages of investing in war savings stamps

But with the starting of the competition conditions changed and tremendous increases of purchases by employees throughout the entire organization resulted.

Gave Last Stamp Free

To further the competition and to encourage each employee to start a thrift card the company offered each employee the sixteenth stamp free on his or her first filled thrift card, and this offer of the free thrift stamp likewise had a great stimulating effect.

A general idea of the contest follows:

For practical purposes the branch organization is the unit of operation. All the departments at a branch compete among themselves and are ranked at the end of each week on a basis of "average investment per employee."

The average investment per employee is determined by adding the total cash value of the stamps purchased by the department during a past period of the contest and dividing this total cash value by the number of employees in the department. For example:

How Workers Are Rated

If there are 15 employees in a department and the total cash value of the stamps purchased is $27.45 the average investment per employee is $1.83—$27.45 divided by 15.

The department having the highest average investment per employee leads for the ensuing week in that branch. Once a month the sales for all departments at a branch are totalled and this result entered in competition with results at the other branches. The branch showing the highest average investment per employee leads for the ensuing month.

In the weekly contest among departments and in the monthly contest among branches the figures used are accumulative; that is, the total (accumulative) sales for the entire past period are used in determining the average investment per employee.

How Company Organizes

The stamp sales organization for this company is as follows:

1—Department Stamp Agent

One employee in each department is the department stamp agent. He receives and accounts for the thrift stamps sold in his department and reports weekly to the branch stamp manager on the proper forms.

Except in unusual circumstances he does not sell $5 war savings stamps, exchange thrift cards for $5 war savings stamps or deliver the free thrift stamp offered by the company.

2—Branch Stamp Manager

This post is held by a responsible employee at each branch. He purchases, distributes and accounts for all thrift stamps and $5 war savings stamps sold at the branch.

From him the department stamp agents obtain thrift stamps as needed, and to him they make their weekly reports.

Only the branch stamp manager may sell the $5 war savings stamps outright, exchange them for thrift cards or deliver the free thrift stamp offered by the company.

Each branch stamp manager reports monthly to a department in the head office in New York, where the branches are ranked in the contest.

WAR SAVINGS STAMP CAMPAIGN
DEPARTMENTAL EMPLOYES STAMP RECORD

For Four Week Period Ending March 30th, 1918

Pos.	Employes	Number Stamps Bought
1.	A. W. Jones	78
2.	C. B. Smith	52
3.	C. O. White	48
4.	F. W. Greene	26
5.	P. F. Rose	22
6.	I. Burns	18
	L. H. Brown	18
7.	W. H. Edwards	17

A reproduction of an actual cash book page showing transactions for a week in a department at New York City. A little study will show the simplicity and accuracy of this method of keeping accounts. By referring to it you will see that stamps delivered to this department by the branch stamp manager are entered in the left-hand column. The actual cash received by the branch stamp manager is entered in the right-hand column.

The first six items show that on March 4 the stamp agent of this department procured 120 thrift stamps for sale. As a department stamp agent turns over to the branch stamp manager the cash received from sales it is entered in the right-hand column. The last March 4 order for 20 thrift stamps shows that the cost was charged against the stamp agent but that the cash was not returned that day. This is accounted for later.

The next item, "March 4, 4 War Savings Stamps—$16.56," shows that four war savings stamps were sold to members of that department at the March rate of $4.14 each. The cash was immediately forthcoming as shown on the next line.

Under March 5 we see that 75 thrift stamps for a value of $18.75 were given to the department stamp agent; next, that one war savings stamp was sold for $4.14.

The word "Exchange" on the third line, March 5, means that a thrift card filled with thrift stamps was turned in to be exchanged for a $5 war savings stamp.

The thrift stamps on this card had all been accounted for above so that the only cash income from this sale was the 14 cents premium required by the government to exchange the thrift card.

On the following line "Cash $28.03" we find that the money was received for the above three items and in addition, the $5 to be paid for the 20 thrift stamps given the stamp agent the evening before. Thus the two columns balance each other.

March 9, being Saturday, closed the week's transactions.

3—Group Managers

These men form the executive stamp campaign committee at any branch, but do not take part in actual stamp sales. Each group manager has several departments under his supervision, and it is his business to stimulate and promote stamp sales in these departments.

The position of group manager is a very important one in the success of the campaign. It is vital that the group managers be live wires, for in contests of this sort and, for that matter, in any sort of contest extending over a considerable period of time, the interest in the contest must be maintained at white hot heat throughout if it is to accomplish maximum results. This depends in no small measure on the work of the group managers.

How It Operates

Briefly stated, the mechanics of the competition are:

The stamp agent in each department turns in weekly to the branch stamp manager the following data:

1—Number of employees in the department.

2—Total cash value of purchases made by all employees since the beginning of the competition.

3—Average investment per employee derived from the above figures.

4—The number of employees in the department who bought stamps during the current week.

5—The percentage of employees who bought stamps during the current week.

This information shows not only the amount invested by employees but whether or not they are regular purchasers, this latter being one of the chief aims of the competition.

When he has received the above data from all departments the branch stamp manager ranks the departments in the order of their average investment per employee, typewrites them in their correct order and sends a bulletin to each department for posting.

The monthly contest among branches is operated similarly, except that the data include all employees in the branch and cover total sales at the branch for the month.

The branch stamp managers send this data to the New York office, where they are tabulated and the branches ranked in order of their average investment per employee.

Sidelights on the Contest

In order to keep interest in the competition constantly fresh large blackboards are placed in the main halls showing each week the standings of all departments. At the same time a smaller blackboard in each department shows the weekly standing of that department in comparison with other departments in its group.

In addition, bulletins are sent to each department from time to time touching on the progress of the contest and describing interesting features.

War Stamp Sales Folder

The company also publishes a war savings stamp folder, which points out the attractiveness of war savings stamps as an investment, and this booklet has been widely circulated throughout the entire organization.

Branch managers, group managers and department managers take great pride in getting as large a percentage of employees in their department as pos-

Digitized by Google

sible to purchase stamps regularly each week, and are continually sending out letters, bulletins, etc., calculated to maintain interest in the contest.

As a means of keeping track of the free thrift stamps given by the company, all first thrift cards issued to employees are numbered by the branch stamp manager.

As each is given out the name of the employee receiving it is entered on a sheet opposite the number. As these thrift cards filled with fifteen stamps are returned, it is a simple matter for the branch stamp manager to check the free stamps given.

Results of the Plan

During the first month that war savings stamps were sold at the New York office, that is, the four weeks previous to the opening of the contest, $800 worth of stamps had been purchased by the employees.

In the *first week* of the contest $970 worth of stamps were bought at the New York office.

Results of the Fifth Week

For the fifth week the results of the contest in the New York office alone were as follows:

Number of employees.....	404
Total value stamps purchased...	$6,870
Average investment per employee	17
Percentage of employees buying stamps regularly each week...	92%

The total amount of war savings stamps purchased by the employees of the company during the period from March 4 to March 30, *less than one month*, was $13,751.79.

In the four refineries of the company at Bayonne and Paulsboro, N. J., Rochester and Olean, N. Y., the employees purchased considerably over $9,000 worth of stamps.

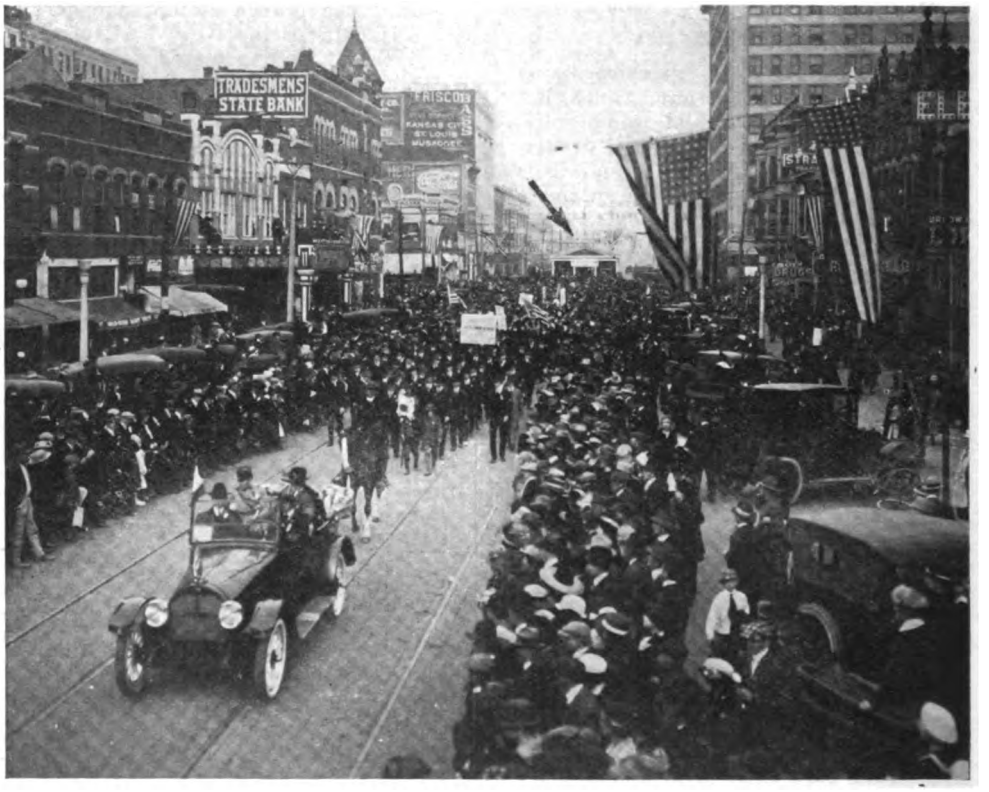
These are figures that talk.

How many employees have you?

What is the average investment in war savings stamps per employee in your organization?

Do you know?

Why not?



How about starting a contest like this yourself?

And, by the way, how many war savings stamps did YOU buy last week?

Motor Car Dealer Leads in Patriotic Work

"Dick" Carhart selling the first stamps sold in the W. S. S. Bank

The W. S. S. Bank, indicated in the background by the arrow, stands in the middle of the street at Broadway and Main Street, the busiest corner in Oklahoma City. Folks simply can't help know the W. S. S. goods are on sale

OKLAHOMA CITY, May 14—To an automobile man, E. Richard Carhart, president of the Carhart Motor Co., Oklahoma distributer for the Willys-Knight, belongs the credit for establishing the first war savings stamp bank building in the United States. The new bank building was dedicated in Oklahoma City on Monday, March 11, following the greatest parade Oklahoma City ever had, in which 12,000 persons took part. The bank building, located in the middle of Main Street, was Carhart's own idea, and through his committee $10,000 was raised in a few days to carry on the stamp campaign in this county. Everything that went into the bank was given free. A bell is on top of the building, and when a stamp is purchased it is rung. The building is at the intersection of Main Street and Broadway, the busiest corner in the city.

Carhart also was head of a committee a few weeks ago that raised $11,000 for the war camp recreation service fund, of which John N. Willys, president of Willys-Overland, Inc., was national chairman. Carhart's committee by hard and untiring work raised the money five days before the national campaign was started on its way, and for showing such speed was commended by the national organization.

They Need $100,000,000

WE have all bought our Liberty Bonds and War Savings Stamps. This money has helped buy guns and ammunition and the machinery of war. But now the Red Cross, which takes care of our friends, brothers, and dear ones, is asking for money to take care of the soldier when he can't help himself. This money helps in many, many ways, and because of the way the Red Cross is managed, and the interest that is secured on funds deposited, $1.02 is spent for every dollar that you give. It is a time now not to invest or buy, but to GIVE. Can we afford not to be generous? Let's all give a handful. We KNOW it will bring joy and comfort—and maybe life—to some one, somewhere. The Red Cross campaign for $100,000,000 is on the week of May 20-27. Let's ALL give!

A Wartime Business Creed

BE PREPARED!

EVERYBODY is wondering what is going to happen. There is talk of diminishing car production. There is speculation as to how many motor cars will be manufactured in the next six months. Everyone wonders what he should do. This page will give you a thought.

I—The General Situation

AUTOMOBILE production should continue until Aug. 1 or Oct. 1 about as it has been running. Manufacturers of cars long ago put in their stocks of steel for their fiscal years, most of which end about those dates. Parts stocks are also in fair shape for the rest of the 1917-18 year. In a few cases there is a shortage of a few parts, but it is not serious.

The railroad situation does not stand in the way so far as deliveries of cars are concerned, because dealers have accepted the drive-away idea and, when shipping is impossible, can drive the cars home. Shipping has, however, held up materials to some extent. Coal is not to-day a great problem.

The future is less definite. The government needs steel—and a lot of it. It may have to take all the steel there is and shut down the industry entirely. It also needs a surplus stock for shipbuilding next winter when the snow handicaps the railroads. It must get it now. Of course, the logical step would be to speed up the steel mills, the coal mines, the railroads and all the other "necks of the bottle," but since that seems to be a job that is going to require time and since the immediate need is for transportation and certain raw materials, such as steel, the important step is to supply materials—and that *may* mean reducing car production. Therefore, there is a *possibility* that car production after the middle of the summer may suffer a shrinkage.

So far as the prosperity of the country is concerned it is such as to make the demand for cars greater than the supply for months to come. Dealers need have no worry about selling all the cars they can get.

II—What May Happen

Production may be trimmed down to the point where all dealers may get few cars, or it may be pared only to where nearly all dealers will get considerable. It is difficult right now to predict the extent of the shift in production. Truck and tractor production is likely to be increased rather than decreased, as is that of accessories. The use of cars seems likely to continue as heretofore.

III—The Effects

In the case of the dealer who has depended on car sales alone his source of business is going to be taken away.

The dealer who carries cars merely as one of several departments is going to see that department shrink.

The dealer who hesitates to change his business simply because he is in the habit of doing business a certain old way is in a bad hole right now.

Every man must be figuring on the changes he can make that will tide his business over with as much profit as he can make, or, at least, without suffering a loss, until the present unsettled situation is terminated.

IV—Things to Do

The present situation may change for the worse so far as car selling is concerned—or it may not. There are certain things dealers can do that will help the situation if an adverse turn comes, and these same things will make the dealer stronger if nothing happens. Wherefore, change or no change, the dealer should BE PREPARED. Millions of our men are being hardened and tuned up by war training. Whether they meet the enemy or not they will be better men. Business requires this same war training.

1—Overhaul your business, no matter how big a dealer or distributor you may be. Learn all about your business. If you haven't been accounting as well as you should hire a bank clerk to come in evenings and get you the figures you need. Find out these things:

a. What departments are paying a profit?

b. What unprofitable or shaky departments can you build up?

c. If you can't build them up can you do without them?

d. How much volume must you do in each department to break even?

e. What expenses can you cut?

f. What volumes can you increase?

g. What overhead can you eliminate?

h. What waste can you detect and stop?

i. What departments have employees working at part capacity?

j. What departments can handle work or business in addition to what they are now handling?

k. How many men must you employ in different departments to make the output meet the overhead?

2—When you know how many cars you must have to effect an even break notify your factory and ask if you can't be given that many cars. But unless you KNOW your costs you can't intelligently ask the question.

3—Cut out waste.

4—Cut down your free service.

5—Trim your overhead.

6—Systematize your shop, stock and other departments.

7—Make money on used cars.

8—Get a truck agency.

9—Investigate the tractor question. Secure an agency.

10—Take a farm lighting system agency. These can be sold to farmers, cottage owners, home owners where electric light is inaccessible, small shop owners and many others. The farmer is not the only prospect.

11—Investigate the possibility of taking on additional kindred products which can be sold by you without any great alteration in your organization.

12—Get on a cash basis—a most important step.

13—If you are a small dealer in a small town or a garageman in any size of town get after repair work. If you have a good service station in which you have been doing mostly service work on your own cars get in some straight repair work on any line of cars.

14—Investigate the sale of accessories. Put in displays. Push these goods. Buy wisely. Don't over-stock. Keep the goods moving—at a profit.

15—Analyze your sales possibilities. See if there isn't somebody you can sell something to, a field or product you haven't touched yet.

16—Tune up your sales and promotion work. Make it better than ever. Work harder and see how high you can keep your business curve.

17—Don't relax! Don't lie down! Don't admit you are licked! Determine to push on just as fast and as far as you can go. Aim at a higher mark than your competitors expect to hit, and, above all,

STAY IN BUSINESS

Make Two Cars Out of One

If the factory sends you 10 cars you can still have from 12 to 18 to sell. You can do it if you will make money on used cars

WITH car production trending down instead of up the dealer's problem is to get cars to sell. He can at this time make his former "used car problem" a profit yielder *if he will only take hold of it in the right way.*

Furthermore, he must take hold of it in this way or he is skating on thin ice. The type of dealer who can't make money on used cars this year is the type that is liable not to be here when the war ends, if—as now seems likely—it lasts for a couple of years more.

How good a dealer is can be determined by his ability at this time in meeting this used car situation.

Therefore, go ahead and trade—*sensibly.* If you get a chance to trade on eight sales out of 10 it means that you are handling 18 cars instead of 10. And if you make a profit on your used cars it means that you have had 18 cars to sell instead of 10.

Also, if you have been losing money on used cars and will now start to make money—a real 10 per cent net profit—on used cars you are practically tripling your profits. And that will be a *mighty big help these days,* won't it?

There are many of the biggest and supposedly best dealers in the United States who have for years maintained that the used car department could not be expected to show a profit. They have been content to break even or lose as little as possible—*all of which isn't very hot business tactics.* Can you imagine a pork packer selling the pig's hair at cost?

Here's What You Must Do to

Make Money on Used Cars

1—Secure a man who KNOWS used cars and let him have charge of your appraisal work. After you give him charge don't let the new car sales department over-ride his decisions. That has been one of the flaws in the business heretofore.

2—Trade whenever possible. The more used cars you can get the better, but don't let your supply get too far ahead of your demand.

3—When a car is presented for trading have the used car man check it over carefully. Find out exactly what it will cost to overhaul it and put it in shape.

4—Determine what the car will sell for. If there is a question as to this figure, cut it down. Play SAFE. Circumstances to-day are making it hard enough for you without your cheating yourself.

5—From this SALE PRICE deduct the overhaul cost.

6—Then deduct the salesman's commission.

7—Deduct 10 per cent profit.

8—Deduct the overhead. The overhead is determined by taking the fixed charges for the used-car department, such as rent, light, heat, manager's salary, etc., and dividing it by the average number of cars sold for a given period, such as one month.

9—Find in this way the allowance that will let you come through clean and STICK TO IT.

10—If you want to sell "as is" cars do so only in case the car is in very good condition. Or, sell them "as is" for the owner on commission, making the commission one that will show you a profit.

11—Remember this: Every time you take a car in the door it costs you money. The overhead at least is something you can't dodge.

12—Keep an accurate record of your trades and resales and KNOW how much you are making on each deal.

13—In case you run short of cars you can even buy used cars outright, fix them up and sell them. You can become a used-car dealer and make money at it *provided you operate along real business lines.*

14—Bear in mind: Your business is the sale of merchandise at a profit, so what difference does it make khere or how you get it? Trade, buy, sell on commission; do anything legitimate that will let your organization make money.

15—*And don't neglect to advertise.* The classified columns are fine for moving used cars.

By 1922 He Hopes to Have

An Automobile Department Store

A. A. Peterson, of Los Angeles, Has Been at the Job Since 1915 and It Looks as Though He Would Make Good at It

Here is where Peterson is now. His front indicates a clean and honest business, and he makes the inside harmonize with the atmosphere of the outside

Accessories can be sold if they are displayed near the front of the building. This is the way Peterson does it. Note the neatness of the floor and the fixtures

By 1922 He Wants a 10-Story Building

First Floor—New cars, 3 or 4 makes. Offices.

Second Floor—Trucks and tractors.

Third Floor—Used cars.

Fourth Floor—Accessories. Tires. Vulcanizing.

Fifth Floor—Machine and repairshop. Welding, brazing, blacksmithing. Battery and ignition.

Sixth Floor—Body building, top making, upholstery, fender work.

Seventh Floor—Painting and enameling.

Eighth Floor—Automobile wrecking. Used accessories and parts.

Ninth Floor—Light manufacturing. Our own polishes, inventions, appliances. Mail order and catalog department.

Tenth Floor—Employees' floor. Cost-price restaurant, library, lecture and study rooms, hall for dancing and entertainments. House physician, dentist, physical development instructor.

Roof—Demonstrating course and athletic track. Center to be covered with awning and to include handball courts, wrestling mats, gymnasium and boxing apparatus.

First Basement—Lockers, lavatories, engine room, bowling alleys, billiard rooms. To be well ventilated.

Second Basement—Storage.

Third Basement—Swimming pool, shower baths, storage.

LOS ANGELES, May 12—In the summer of 1915 the real estate business in this city went to smash. From the most aggressive and best advertised line of endeavor in the city and one that had made dozens of men wealthy and hundreds comfortably well fixed, it rapidly became one in which there was said to be no money at all.

Development work and exploitation were abandoned and the for rent sign went up in many windows as each succeeding month brought the rent collector on his rounds and there was nobody to sign checks, because there was no bank balance.

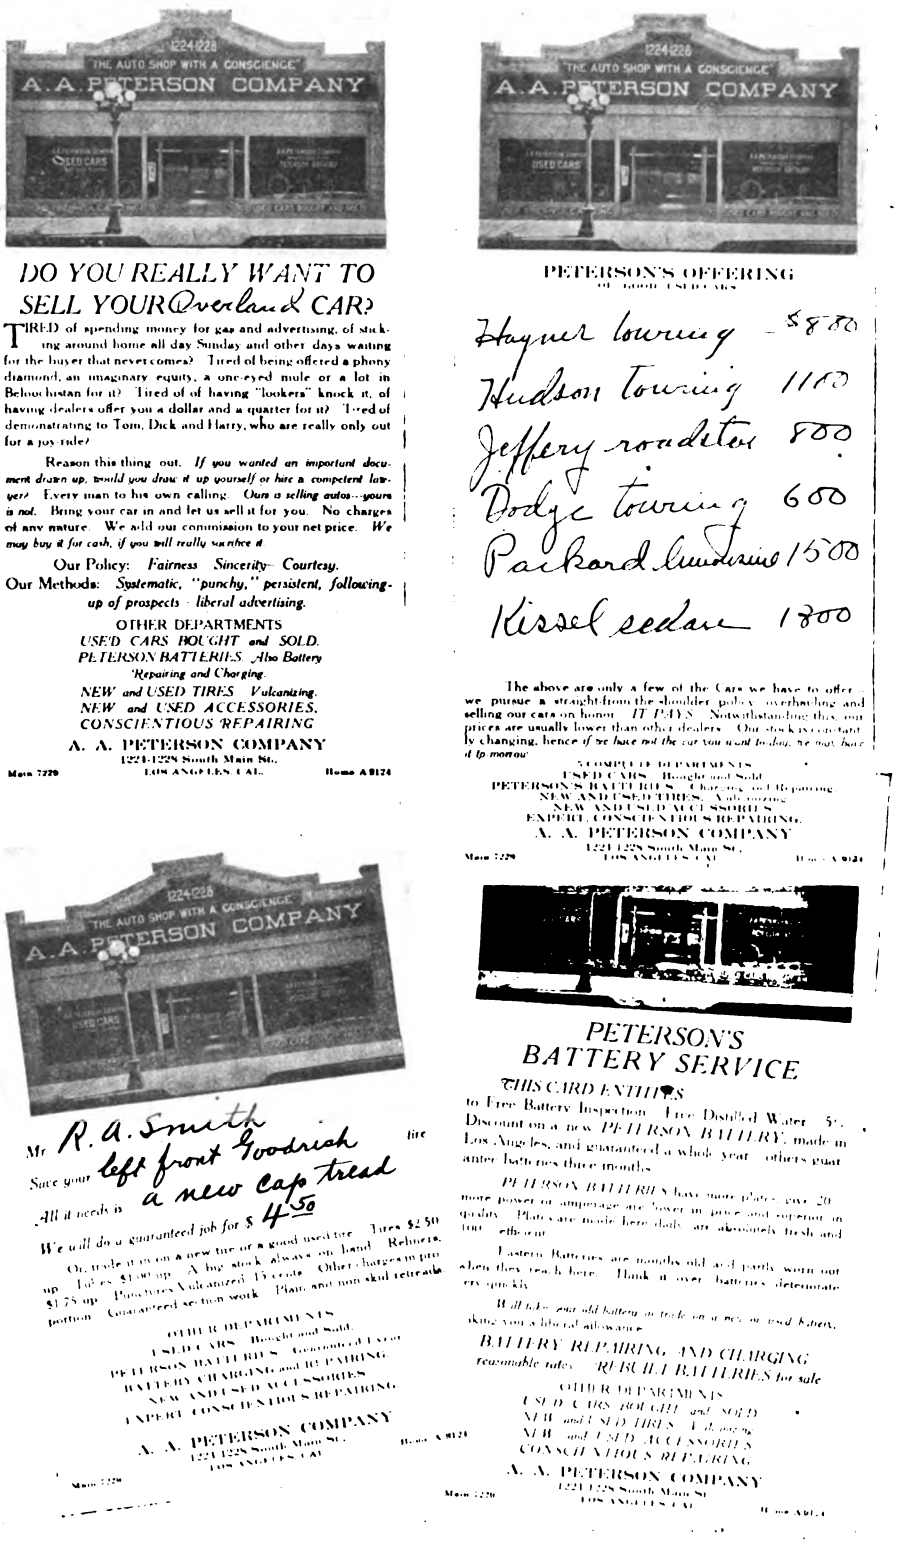
A small army of realty salesmen were literally dumped out into the southern California sunshine that they had talked about so much in the hope of loosening

Digitized by Google

some Easterner from the bank roll hid under his astrakan overcoat. There is nothing more sustaining about the sunshine of California than that of Iowa, and A. A. Peterson was one of the salesmen who soon found that fact out.

Peterson "looked around" for something to do. He had had experience in the advertising department of a railroad, and this had taught him that display advertising is a business barometer. The heavier the business the more advertising. For years he had been so accustomed to seeing columns and columns of real estate advertising and whole sections of newspapers devoted to this department that he thought the realty market the biggest thing in the country. But when it slumped his attention was attracted to the regularity with which automobile dealers were using printer's ink. A 10-in. double-column space was about the smallest "ad" to be seen, and from this up to full page and double-truck ran the scale.

"There must be something alive in the automobile business, so I guess I'll try for a job there," he concluded. "On the row" he found nearly all his realty acquaintances also seeking jobs as salesmen, and learned that few were obtaining berths. Then it was he made his big decision—he would go in the automobile business for himself, but select the used-car end of it. He had less than $400 in cash and realized he couldn't buy many cars with that, so chose a different plan.



He paid $12.50 monthly rental for desk space in an office building. He clipped from newspapers the lists of used cars advertised for sale and also the ads of people seeking "second-hand" cars, and it became his mission to bring the two parties together. He went around and looked over listed cars, selected the best appearing and then scouted for someone he might interest as a purchaser.

The start was made in September, 1915. A few months later Peterson obtained free office room and the use of telephones in a garage by paying 10 cents per day for each car he stored there. He was now taking cars upon consignment from owners in the effort to sell them. Observation convinced him that the best location for a used-car salesroom was on South Main Street. He spent hours counting the number of street cars and motor vehicles which traversed that thoroughfare to estimate the number of people passing.

He rented the rear of a garage on that street and kept on hustling. Next he removed to a storeroom 20 ft. wide a few doors away. The room was so narrow it was necessary to run the cars out onto the street each morning so that they might be looked over and pack them away each night in a way that saved every inch of space. But he kept his stock of cars moving and saved his profits.

It was Peterson's determination that some day he should own a used-car department store. Now he does. He recently occupied a one-story brick structure in his favored location that has a lease value of $10,000 annually. There are 11,000 sq. ft. of floor and he cannot complain against the arrangement, because he drew the plans himself. He says it already has proved too small, though, and predicts that by 1922 it will require a ten-story structure to house his enterprises.

Peterson does not put all his eggs in one basket. He does not confine his work to selling used cars only. He buys and sells used parts and supplies. He does not crowd his showcases over against the wall out of the way of cars, but puts them on both sides of the main entrance so that he impresses every person who enters the place both coming and going. Of course, he would not try to sell used oils and greases, but he makes a point of buying his stock at a figure that will return a neat profit

These are a few of the postal card advertising pieces that Peterson uses to create business. The upper left card is sent to the owner of some car that is seen standing at the curb. The lower left card goes to some man whose tire is seen to need fixing. They all bring business

Digitized by Google

The one big room is sub-divided by portable partitions and the repair, battery and vulcanizing departments all have their own quarters. Every car that this merchant takes in is overhauled and put in good shape before being offered for sale. He does not guarantee any car as being other than it appears, but assures the buyer that it is in good mechanical condition and ready for service.

Assembles Batteries

Peterson saw a chance to make money in the battery business, so he assembles batteries and sells them under his own name in competition with those of standard makes.

When the Motor World correspondent visited Peterson he saw on hand about $1,250 worth of used tires and tubes. Some had been rebuilt and all were repaired. Employees make a note of the license number of every car they see that needs better tires. The registration book gives the name of the car owner and Peterson sends him a card telling him that the tire needs a new cap tread and he will do a guaranteed job for $4.50.

The sale of a used car means the car only with standard equipment. Extras are not "thrown in," but Peterson has them aplenty. They have been used before, but their worth is not exhausted and the price is reasonable. An electric or mechanical horn, bumper, tire rack, spare tire or something else that motorists need nearly always goes with the car.

Profits For Employees

Including the proprietor and business inspiration, the Peterson force consists of eleven. Young men are employed, and there is only one connected with the place over 25 years of age. They are trained in the ways of the boss and their wages increase as the business grows and the length of time they have been with him. Only one man has been discharged. It is the intention of Peterson eventually to make his establishment cooperative and every employee share in the profits.

Thousands of Cars Driven Away Weekly from This Garage

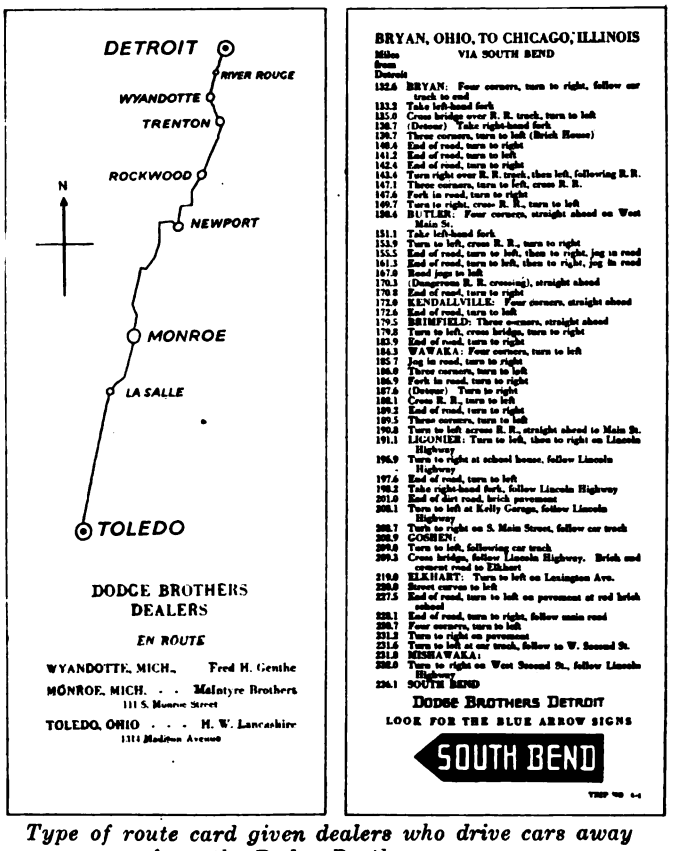
Dodge Brothers Maintains a Garage Solely as Starting Point for Dealer Drive-aways

DODGE Brothers has established a large garage solely as a starting point for drive-aways. It is in the western part of the city; thus the dealers avoid the congested part of the city, which they would necessarily be compelled to pass through were the garage situated at the plant. Being on the west side, it is an easy outlet to the main highways, all of which go west and south, where nearly all of Michigan's output must go.

The dealer coming for cars first first stops at the main plant, where he makes arrangements for the number of cars he wishes to take away and there pays for them. He is given a shipper's report and passes equal to the number of cars desired, which he takes to the drive-away garage to claim his cars.

Upon his arrival at the garage he hands in his report and passes and the cars are assigned to him. The number of the car is written on each pass and the latter is left with the car until it leaves the garage.

As the cars move out the passes are taken up and the numbers on them are compared with those on the cars. If they tally the dealer and his crew of drivers leave the building and proceed to a gas filling station just around the corner when the train is ready for its homeward journey.



About everything that is necessary to equip a car for a drive-away is carried in stock at the garage—tires, chains, blow-out patches, spark plugs and anything the dealer may need on his trip. During the winter, cold weather supplies were sold to dealers at cost.

There are six men in charge of the garage, and they are kept busy practically all day taking care of the wants of dealers. There is a swarm of them there every day. Thousands of cars are driven away from this garage each week.

The building is one block long and 75 ft. wide, and will store approximately 100 cars. A continuous stream of cars pours into the garage all day and part of the night. The buliding is never filled during the day, however, as the cars are taken out by dealers nearly as fast as they come in. An opportunity to stock up the garage is given in the evening, when fewer cars leave. In the morning when the garage men arrive there is an ample stock to start the day with.

A space of about 50 x 70 ft. in the front part of the building is partitioned off and devoted to the office and waiting room. Two-thirds of this space serves for the latter. In the center of this room is a large furnace-like stove. On the walls are hung route maps. More than a dozen chairs are furnished to give comfort to the waiting drivers.

At one side is a show case displaying accessories to cars which the dealer may buy. To the left is a long shelf, on which can be found the necessary large rubber stamps and IN TRANSIT cards to make license tags if the dealer hasn't taken with him a sufficient number of official plates.

Type of route card given dealers who drive cars away from the Dodge Brothers garage

Making the Tractor Prospect Believe Your Story

By W. A. Kirby

THE farmer is rooted in prejudice and habit. He by nature prefers the old to the new. To get the tractor story across this prejudice must be beaten down. And the salesman must exercise unusual care to see that the sales seed is rightly sown in that most delicate of fields—the farmer's mind. A slight misstep may mean the loss of many sales.

IS there a distinct difference between automobile or truck selling and tractor selling?

Only in a superficial way. Selling is inherently similar no matter along what line the efforts are directed.

And yet, everyone knows that selling is not always, if ever, accompanied by the identical probleems and methods among different commercial and industrial organizations.

It is as though selling were a priceless but extremely fragile material, always the same, but which requires a container suited to the places to which it is carried and conditioned by the other considerations which obtain in transporting a fragile or easily-destroyed material from one place to another; or to bring the simile down to reality, in carrying sales efforts to various divisions of our industrial life.

So it is then, that selling is always the same, but it must be contained in a carrier suitable to the region in which it is placed. The thing to consider in tractor selling, therefore, is the variety of container to use. And the greatest factor entering into the determination of that variety is, of course, the farmer.

In the East where the more conservative class of farmers are entrenched—the old-line men of the soil—the problems are multiplied. This is due to the great skepticism of the average farmer in connection with anything new.

When the gasoline tractor first appeared in the West it was necessary to demonstrate its practicability to the farmer. He was like the man from Missouri—had to be shown.

The First Thing to Do

This is still true of the Eastern farmer, to whom the tractor is coming as practically a new proposition. He must be shown just as his big brother of the West. *This is the first thing to do in preparing a sales campaign. Have a number of demonstrations at points in the territory which are easily accessible to the greatest numbers of farmers. And hold them in a period of the season when the farmer has time to attend.*

During the demonstration the farmer has an opportunity to see and observe the tractor working as it was claimed to work and to be convinced that it is practical. There can be given no more conclusive proof than this. But the demonstrator must be careful to *get the right slant on the attitude the farmer takes even during the demonstration.*

Attending a small local demonstration in the East was a typical small farmer. The land being plowed was sandy and when the plowshares were turning over 7 in. of earth the lower layer was found to be unseasoned and decidedly sandy.

"Daut is no good," commented the farmer with characteristic finality. "I would never plow daut deep. That earth is no good (picking up a handful and rubbing it). It should not plow so deep," and he shook his head dubiously without thinking that the tractor and plow could be adjusted to plow to any depth from nothing to the full power of the tractor's pull.

Make First Impression Right

That farmer became prejudiced against that tractor immediately, and it is no idle assertion to say that before he became finally convinced of the tractor's value much arguing and expostulation was necessary. This may seem like an extreme case, but it is not. There is a tendency on the part of many farmers, especially in the East, to be dogmatic in *sticking to first impressions.*

Distribute Literature

The distribution of some literature during the demonstration is valuable practice because it gives all the spectators an opportunity to learn the different points in the tractor's construction as they occur to them.

The farmer does not, as a rule, go through a catalog systematically to become acquainted with the details of a tractor. Like a sudden spark shooting upward comes to him the thought, *"I wonder what kind of engine that tractor has."* If he has a circular with the specifications in his hands he will consult it, learn the make of the engine, remember it and feel satisfied. *His interest will also be quickened.*

Use Follow-Up Letters

Following the demonstration, in a few days, it would be advisable to send out a live, convincing form letter with some testimonials enclosed, preferably from men well known in the locality who own tractors. Farmers view life to a great extent on a community basis. The best recommendation, therefore, that a machine can have is that Sam Jones has one or that Hank Smith just ordered one.

An important phase of tractor selling, at least until the tractor becomes numerically well established, is to *keep tractor, tractor, tractor, constantly before the farmer.*

Never let him lose thought of it. Form letters are perhaps the best medium through which to keep in contact with prospects and to keep them in constant thought of the tractor.

One type of letter upon which others may be modeled follows:

Dear Sir:

You are facing serious labor problems; you need something that will do more work with less help. The Model tractor is ready to serve you.

It is guaranteed to pull 3 plows 7 in. deep under ordinary conditions, and has a belt pulley that will drive all your power equipment, including a dynamo

Digitized by Google

for lighting and heating, a separator, butter churn, saw mill, etc.

You cannot be fair to yourself and to your interests if you ignore the advantages of tractor farming. And the price of this tractor is only $700.

Another thing, we have plenty of spare parts so that there will be no delay in making repairs.

Your horses are the most expensive power plants you could use. The tractor gives more and cheaper power and is more reliable. It can be depended upon at all times and in all weathers. You need it—and every live farmer needs it and should have it.

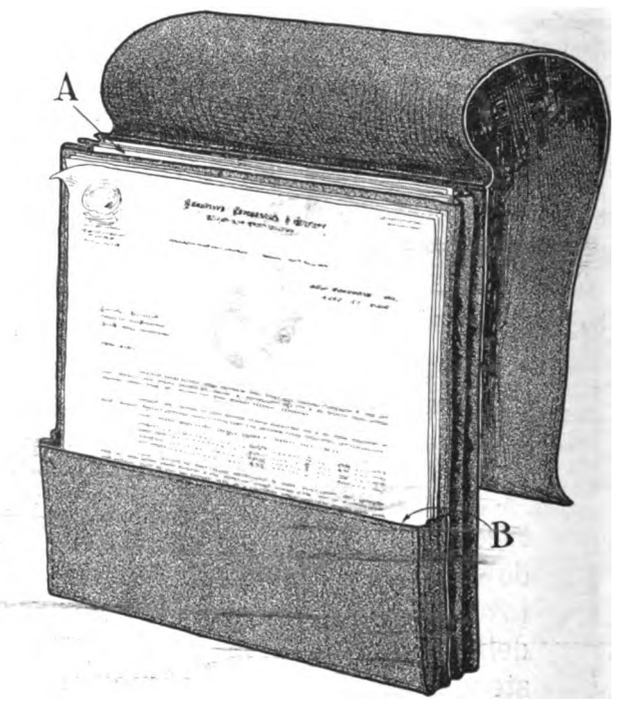
We are here to assist you in your work, so do not hesitate to call on us. Why not drop in and discuss the proposition with us? We will then be able to go more into detail and clear up any doubtful points.

In the interests of the farmer, we are,

Very truly yours.

P. S.—We are inclosing several letters of testimony from men you know who are using our tractor. They may interest you.

The above letter is only a sample and should be varied in a number of ways especially to suit the type of farmer to which it is to be sent. It does not do to make a letter of this kind too long. *Short, spicy messages are best*—ones that set the farmer to thinking and arouse a feeling of dissatisfaction with existing conditions. *Create a desire for something better by convincing him that what he has is no longer up-to-date.*



A pertinent warning might here be sounded concerning the claims that are made by tractor salesmen in regard to the ability of the tractor in question and the range of work it is capable of doing. Everyone knows that the tractor is not a perfect machine in its present state of development, and that it is just as prone to the effects of wear and tear and to the destructive effects of overloading and insufficient care as is any other mechanical agent. *No salesman should claim more for the tractor than it has been proved to be able to do under tests.*

Make Truthful Claims

There is nothing that will so quickly kill a possible market as to make air-castle claims which time and experience quickly refute. The farmer must be shown at the time he acquires a tractor that some troubles are to be expected, and he should also know just what can be expected of his tractor and no more.

Now, if the farmer responds to the first form letter sent out it is then up to the dealer to carry his interest along in the proper way until he buys. There are innumerable arguments that can be used at this time. These, however, should not be advanced without prudence. *They must be seasoned with human-interest stories of what other farmers have accomplished with tractors.*

Should the first letter produce no fruit it must be followed by others. In these care must be taken to make the reading as new as possible. Avoid reiteration. In these follow-up letters some of the points for which there was not sufficient space in the initial letter can be put in. Maintain a friendly, confidential tone in the letters, for this appeals more to the farmer than to the cold, calculating industrial man. For instance, the second letter, which can be sent about 10 days after the first, might be worded in this way:

EVIDENCE FOLDER FOR TRUCK AND TRACTOR SALESMEN—Made of imitation leather or some other flexible material. There are two envelopes, A and B. A is a deep envelope. B is an envelope with a half or third face, as shown. Testimonial letters, blueprints, advertising matter and anything to be used in selling is carried in compartment A. In case the prospect to be called on next is a coal dealer, compartment B is filled with only such material as will be used on the coal man. If the next call after the coal man is on a farmer B is filled with only farm material and all the rest of the data are kept out of sight in compartment A, where the prospect can't see it. This provides a specialized folder for each call and still enables the salesman to have complete data with him at all times

Second Follow-Up Letter

Dear Sir:

We presume that the work on your farm prevented you from giving our recent letter the attention it might otherwise have received. We want, however, to keep before you the opportunities which the tractor offers.

These may not be apparent to you at first thought, but we are sure that after a little investigation you will become an enthusiastic tractor owner and advocate.

We are inclosing several leaflets in which some important questions are discussed. These questions are of vital importance at present and are well worth careful perusal. The data were gathered by an expert implement and tractor man who canvassed a large number of our country's farmers.

Perhaps you would like to have one of our men call and go over your requirements with you. If so, just 'phone Main 293 or drop us a postal. We shall be pleased to serve you in whatever capacity lies in our power. We again suggest that you give the inclosed leaflets careful consideration.

Yours very truly.

It will be observed that this form of letter is distinctly a follow-up type. It is Act II in a two-act play, as it were. The inclosures mentioned can be prepared from figures which may be obtained from any large tractor manufacturer.

Comparisons between horse and tractor efficiency and reliability are interesting and instructive. Figures on the work the tractor has done with some cost data are very valuable as arguments. Any records of unique or extraordinary work bear out the tractors' versatility. The data should be in harmony with the character of the crops raised in the district, however. It would obviously be useless to go into detail concerning the success of the tractor in the great wheat fields if the immediate district in which the dealer is distributing is in the corn belt.

Much of the literature prepared by the manufacturers is suitable for this use without much change. Other data can be rearranged for proper presentation.

Another method by which the farmer may be converted to tractorism but which means a greater outlay in time and money is to take the tractor around to the farm of each prospect and run it through a number of operations with the farmer; *a sort of individual demonstration.*

This will make a much more convincing argument in the eyes of the farmer and impress him as no systematic public affair would. It also creates a closer contact between the dealer and the farmer so that further dealings are facilitated. It is not necessary to do any considerable amount of work; in fact, that is inadvisable. Do just enough to demonstrate the utility of the tractor and no more. *If the farmer is anxious to have more work done by the tractor he admits that it works satisfactorily and is worth acquiring.*

Personal contact with the prospect is a very valuable asset.

Making Mechanics By Magic

By Ray W. Sherman

"REILLY," announced Williams the service manager, "we're short of men."

"The idea!" declared the Sennett dealer. "How can that be? I thought there was a line of men out there every morning begging for work."

"There was—once. But quit your kidding. I haven't seen an unemployed mechanic in so long that I wouldn't recognize one if I saw him. We have been more or less short of men for a long time, but now it's getting serious. Two of the men left last night for the shipyards and two more go in the draft next week. If they keep on the kid and myself will be working with both hands and both feet and running all the machinery with our eyebrows."

"Well—why not!" Reilly seemed to have a thought.

"Why not what?"

"Let the kid run some of the machinery."

"That kid!" Williams evidently didn't admire his shop boy very much.

"Got two hands, hasn't he? Got two eyes, hasn't he? Not crippled, is he? Sure! Why not let him do some real work?" Reilly meant it.

"He couldn't do real mechanic's work," scoffed the service manager. "He isn't skilled enough. He—"

"I know all about that, Williams, but let's look this situation in the face. We've got to get the work done or shut up shop. We have been down to the danger line for some time. My figures tell me that unless we have eight men at work in the shop the shop is likely to lose money. With four men going that leaves us only six. We've got to have more production. I'll take care of filling the shop if you'll get the men and keep the work coming through.

"Now—what have you got out there in the way of men? How many old men who are outside the draft age? How many really good men who you think will stick?"

"I have three birds and two helpers and the kid. That's all," counted Williams.

"Well," figured Reilly, "if we can't get skilled men we can't. There's no use speculating as to where we can hire top-notch men because they are not to be had. Let's forget that part of it.

"Anyway, what we want is skill and the ability to turn out work, not men. If we could hire Newfoundland pups who had the skill and could turn out the work we could hire the pups, so let's see if we can't find the skill without the men. We've GOT to do something—and do it darned sudden.

"A big percentage of the shop work is NOT skilled. Only a small percentage requires a skilled man, but because part of a job is skilled we put a skilled man on to do the whole job from start to finish, whereas much of the job could be done by a helper or man of minor skill.

"Take, for instance, such a job as taking up the connecting rod bearings. We probably have called that a skilled job—and it is. But the skilled part comes mostly in the taking up part. As a starter the under-pan has to be taken off. An unskilled man can do that. Then you take off the caps and remove the shims. An unskilled man can do that, provided he gets a little instruction from the skilled man.

"He must be taught to remove the caps and shims and place the caps, shims and bolts in rows so that the skilled man can tell just where every part came from. Then comes the skilled man's part. He does the fitting. This may take 40 or 50 per cent of the time of the whole job. After the fitting is done the unskilled man can put the pan back and clean up the job.

"And we have been making some of our parts because we considered the factory prices high. We have been turning up some of the rear axle shafts. If we buy these from the factory the price is a little higher than we can turn them out for, but it will save a lot of labor to buy them. Or, we might be able to let an unskilled or semi-skilled man do much of this work provided the skilled man kept an eye on him and took care of the finishing.

"Furthermore, Williams, you must remember that we must be all the time teaching these unskilled men to do skilled work. We must MAKE mechanics. There is no other way to get them. Whenever you get a chance let the skilled man—or yourself—teach the unskilled man how to do certain things. Shove him along fast, just the same as some teachers shove kids along in school. Of course, the unskilled man won't become an A-1 mechanic, but he will get so he can do 90 per cent of the skilled jobs we have in the shop.

"For instance, if you have a lot of lathe work teach an unskilled man to run the lathe, and let him do as much of the lathe work as he can. So far as the lathe is concerned this man will be equal to the skilled man, but, of course, he won't be an all-around skilled man. But what we want is some way to get our work turned out. We are not so much interested in having ten or fifteen skilled men as we are in having ten or fifteen men who can keep our shop going.

"And, again, take our cleaning and janitor work. We have had this done by men. We can use able-bodied women on this work just as well as not, and they probably will be glad to get the work. It won't be hard for them. They can clean the building and the shop, wash and polish cars, paint tires, clean motors perhaps, and with a few labor-saving appliances to reduce the muscular exertion and strain, and with the supervision of a skilled man, you might even teach a bright woman to do all our vulcanizing.

"The tire shops are having trouble getting vulcanizers, so if we can turn this work over to women we can bring to our shop a lot of the tire work that has been going to the regular tire shops. It will help increase our volume."

"I don't know about hiring these women—" began Williams.

"Why not?"

"Nobody's doing it," asserted Williams.

"Never mind what 'nobody's doing,'" Reilly declared. "Our problem is to keep from doing what the rest are doing, and that is running with a half-equipped and money-losing shop. We've got to do something, so let's give it a try. If you, the boss of the job, can sell yourself on the idea I KNOW we can make it work."

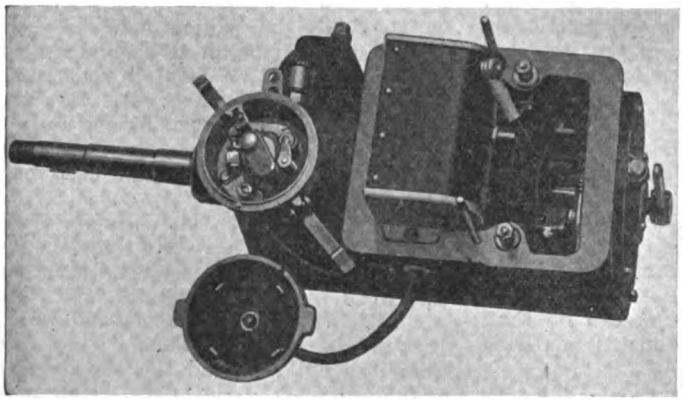
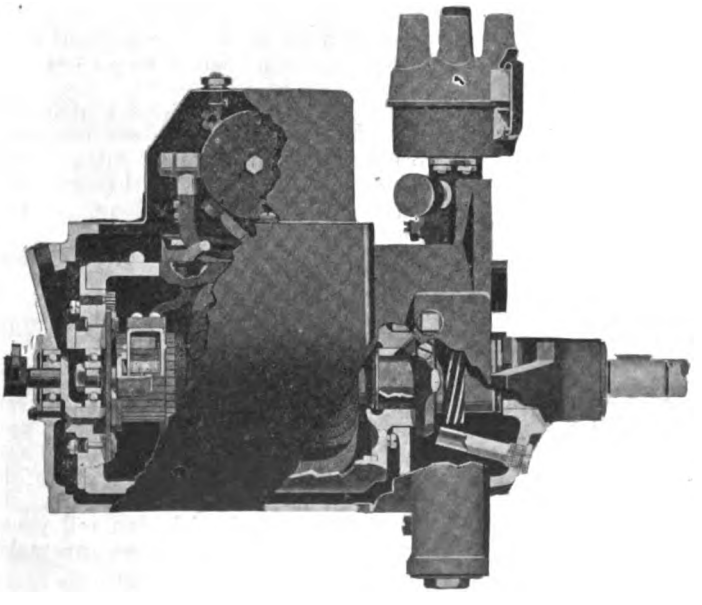
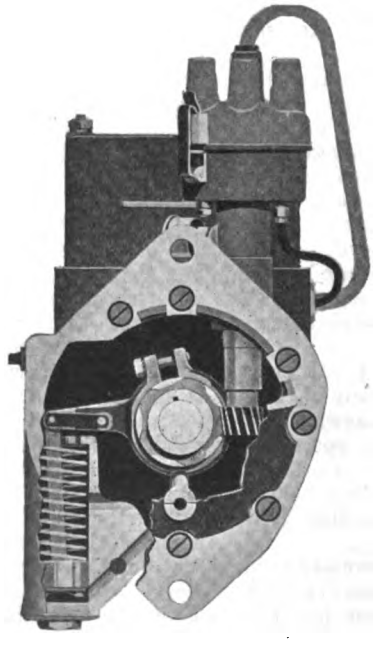
Remy Governor Generator for Tractors



New Lighting and Starting Equipment Combined with Controller for Engine



THE Remy Electric Co. of Anderson, Ind., has brought out a starting and lighting system for the Moline Plow Co.'s tractors, in which the generator acts also as an engine governor. In view of the necessity of getting work done quickly at certain seasons of the year, night work is necessary. The starting and lighting system is intended to permit night operation of the tractor, as well as to provide for the likely contingency of tractors being operated by women and youths who would not be physically able to perform the arduous labor of cranking the engine.

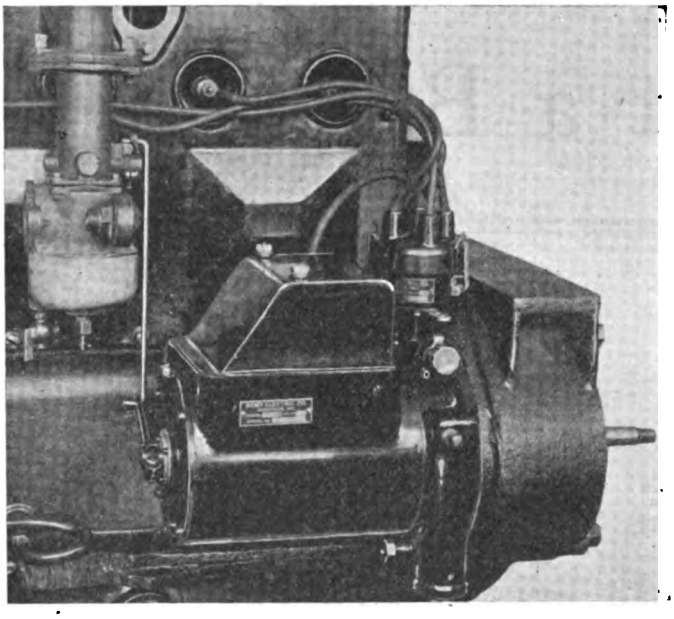


The Remy company believes that, since it is necessary to employ a generator, this generator may well be used for governing the engine speed, especially because it can be so arranged as to provide settings for the various kinds of work and the various loads found in farm practice. The principle on which the governor acts may be explained as follows:

Any rotating apparatus which absorbs power must have at least two members, one rotating, the other stationary, and the absorption of power is due to reaction between these two. In order that the apparatus may absorb power, it is necessary by some means to resist a turning action on the stationary member. This resistance to turning action may be provided either by rigidly supporting the stationary member, or by opposing its rotative tendency by some flexible means such as a spring.

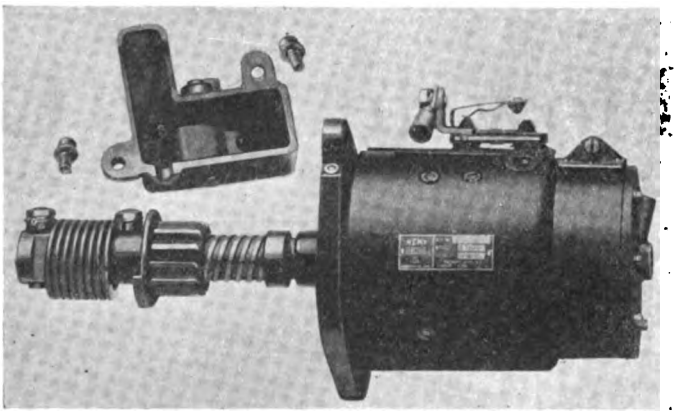
An electric generator is an apparatus which absorbs mechanical energy and changes a large proportion of it into electrical energy. The two essential members of an electric generator are the rotating part—the armature—and the stationary part—the field. The reaction between the rotating armature and the stationary field is due to the magnetism of the field and the current in the armature coils. At a given armature speed the tendency to turn on the part of the stationary field depends entirely upon the amount of mechanical energy absorbed, which in turn depends upon the amount of electrical energy produced. Therefore, by varying the amount of electrical energy produced we can vary either the resistance to turning or the speed at which this resistance will be realized.

The upper picture shows the Remy generator and ignition unit design for tractor use. The lower one is a cutaway view showing the construction of the Remy unit



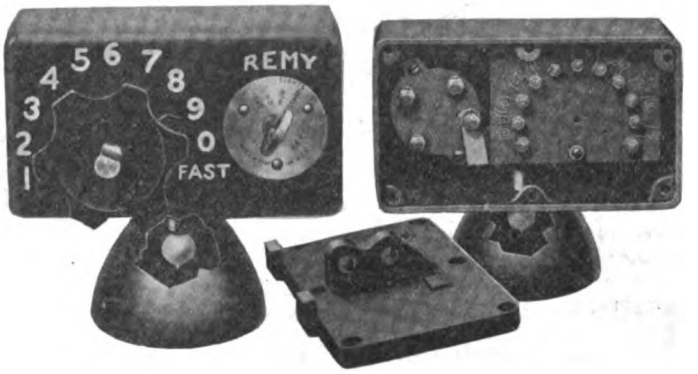
Governor Principle

In the Moline plow equipment this principle is utilized by having the stationary or field magnet member rotatably supported, and the tendency to rotation resisted by a spring of predetermined pressure. The field magnet remains in its normal position until the speed of rotation has become such that the amount of magnetism in that field, interacting with the armature ampere-turns, creates a rotative tendency sufficient to overcome the pressure of the spring, and then the field magnet starts to rotate in the same direction as the armature. This frame is so connected to the carbureter throttle that any angular motion in the same direction as the armature closes the throttle and thereby decreases the amount of power which the engine can produce.



If a different engine speed is desired, it is necessary to change the magnetic strength of the field, and this is done by inserting resistance in the field circuit or cutting it out. With increased resistance in the field circuit the magnetic strength of the field at a given armature speed is less, so that the spring will cause a retrograde movement of the field magnet, thereby admitting more fuel to the engine and increasing its speed. On the other hand, with reduced resistance in the field circuit the field will be stronger at a given armature speed and close the throttle against the force of the spring.

This increase or decrease in resistance in the field circuit is accomplished by an adjustable rheostat. Rheostat and generator are of such di-



Digitized by Google

Above—Remy ignition switch and control unit mounted on a tractor in accessible position

mensions that with the rheostat resistance entirely eliminated from the field circuit the spring pressure will be balanced by the field rotative tendency at about 500 r.p.m. of the engine, and with all of the resistance of the adjustable rheostat included in the field circuit the pressure of the spring will balance the rotative tendency of the field magnet at about 1500 r.p.m.

Generator Shunt-Wound

The generator is a simple shunt-wound type. A ⅜-in. extension is brought out through the generator case or housing, to which a lever is attached. This lever, in turn, is connected by a simple link to the carbureter lever.

The spring shown in the dashpot cylinder is so arranged that the generator body is forced around by it in the direction opposite to that of armature rotation, which is clockwise (when looking at the drive end), and the connection of the lever to the throttle is so made that the throttle is open when at rest, and the spring has rotated to the generator body on its trunnion bearing to this position.

When the engine is started and the generator commences to generate current, there is a magnetic drag on the field, and at a generator speed of 600 r.p.m. this is sufficient to overcome the spring, causing the generator body to rotate in the same direction as the armature, i. e , in a clockwise direction, and to throw the throttle sufficiently to maintain this predetermined speed. There is a minimum speed regulation of 600 generator r.p.m., for it is supposed that the generator will be driven at one and one-half times engine speed; therefore, the low governing speed is 400 engine r.p.m. Any higher speed can be secured by merely inserting resistance in the field circuit by means of the adjustable rheostat.

Voltage Varies With Speed

If, on account of an increased load, the engine slows down slightly, the voltage and magnetic drag decrease, and the spring opens the throttle, maintaining the desired governed speed. If the load is reduced and the engine speeds up a few revolutions per minute there is an increase in the voltage and current output, and a resultant increase in magnetic drag; therefore, the spring is overcome by the magnetic drag and the throttle is closed. The current output is automatically controlled and therefore is approximately 6 amp. at all operating speeds. One and one-half amperes are utilized for ignition, while 4½ amp. are continually going into the battery.

The starting switch is mounted on top of the motor and is provided with tunnels to take the end of ½-in. steel conduit through which the starter cable is run. The starting switch is of the lever and shaft type.

The generator is inclosed in a cast iron case, leaving a large inspection hole or hatch open at the top, which is provided with a pressed steel cover with extremely wide flanges and drawn down by two bolts centrally located, thus assuring a dust and water tight joint with the generator case. In the ignition distributor the principles of the Remy battery ignition design have been closely followed out.

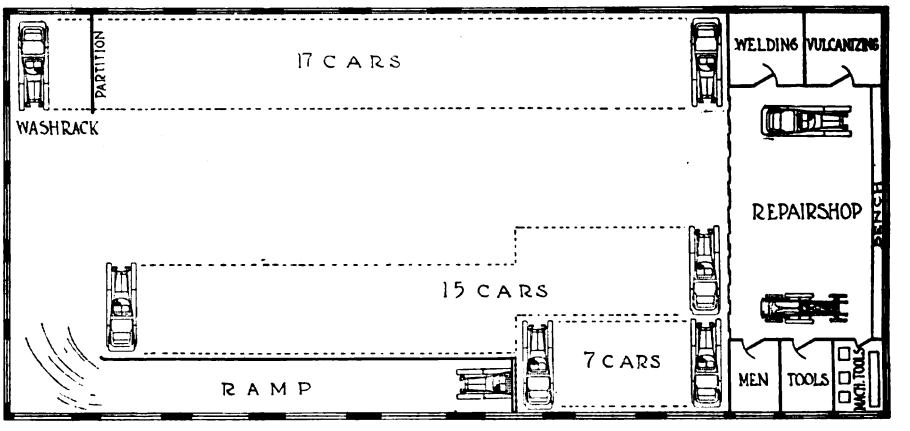
How to Lay Out a Building—5

An ideal arrangement for a two-story elevator-less garage with a symmetrical front

THIS is the fifth of a series of articles which take up in detail the layout and arrangement of buildings for the dealer, garage and repairshop.—Editor.

By Harold F. Blanchard

Plan No. 4



SPECIFICATIONS: Plot, 70 x 150 ft.; two story building with ramp; showroom for four cars; store; rest room; private office; garage for 70 cars; shop for five cars; two specialty rooms and machine tool room.

A PLOT 60 or 70 ft. wide and 100 ft. or more long is an ideal one for a two-story building with a ramp, and perhaps for this reason it is very common to use a ramp in such a case, Figs. 16 and 17.

It is wrong, however, to draw the conclusion from this that a ramp is not suited to most plots. The contrary is the case. A ramp may be used on most plots more than 55 ft. wide, but, as pointed out at the outset, in order to conserve space it is necessary to fit the ramp to the plan, therefore this is the only standard plan shown with a ramp.

In general the showroom and accessory store are similar to those already shown and are interchangeable with them.

Fig. 18 shows the ground floor plan for the same building when the plot is on a corner. The rooms in the show-

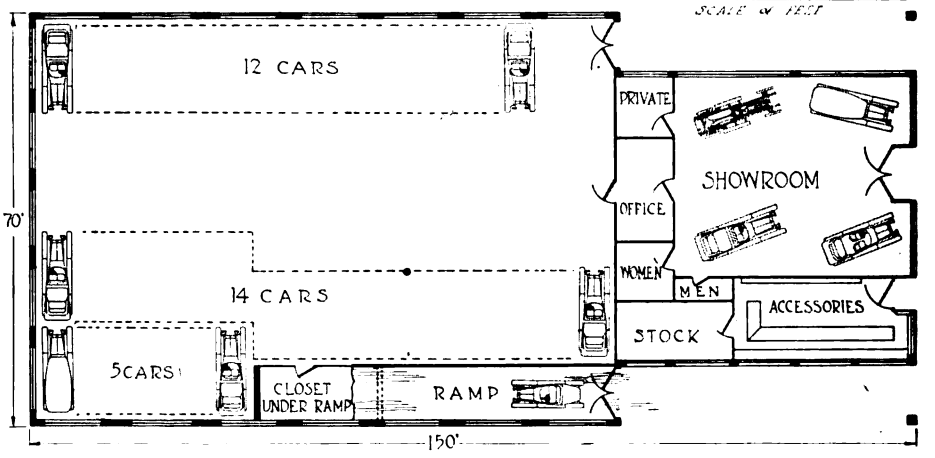


Fig. 16, upper, and Fig. 17—For a plot 60 or 70 ft. wide and 100 ft. or more deep, a ramp may be used to good advantage. In fact, a ramp generally may be used if the plot measures more than 55 ft., but the ramp must be fitted to the plan

Digitized by Google

room unit are only slightly larger than in Fig. 16 because the unit is somewhat shallower. The second floor plan is the same as Fig. 17.

Plan No. 5

SPECIFICATIONS: Plot, 100 x 125; showroom for four cars; accessory store; large shop with three specialty rooms; garage for forty-nine cars.

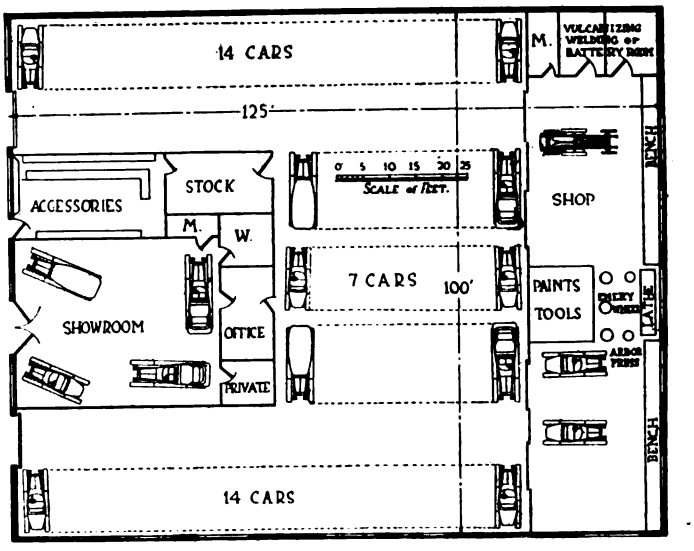
THE showroom unit in this plan, Fig. 19, is the same as in Fig. 16.

Mainly for the sake of a symmetrical layout the showroom unit is placed in the center, thus making it necessary to use up the space at either side with a row of small cars and a rather narrow aisle.

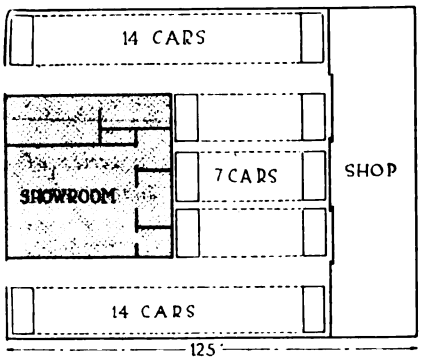
The minimum width for the strip at each side is about 25 ft., and since the total frontage is 100 ft. the difference, or 50 ft., is the amount available for the showroom unit.

The shop is much larger than any shown so far, holding eight to ten cars. The tool and parts room has been placed in the center so that the distance a workman has to travel from any car on the shop floor to it is a minimum.

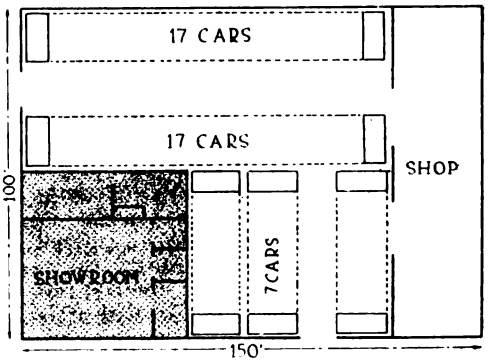
Shop Centrally Located



For the same reason and also because it makes a neat layout, the machine tool room has also been centrally placed. This position is most convenient for machinists inasmuch as it is only a step to the tool room. The tool equipment consists of lathe, drill press, emery wheel and arbor press. The lathe is located along the window, where the light is best.



There are two specialty rooms and a lavatory included in the design.



An alternative method of arranging the cars in the garage is shown in Fig. 20.

The same plan revised for a corner plot is shown in Fig. 21. Showroom and shop unit are unchanged, but naturally the arrangement of cars in the garage is different. This plan permits both a side and a front entrance, although when all the car spaces are filled it is not possible to drive from one door to the other. This is of practically no importance, however.

Fig. 19, Right, and Figs. 20 and 21, Below — These are three alternative arrangements for a plot 100 x 125, the upper plan showing the salesroom in the center with garage space at the sides. Fig. 20 shows a slightly different method of arranging the cars in the garage, and Fig. 21 shows the plan adapted for a corner location

Ohio's Distribution of Fordsons

DEARBORN, MICH., May 8—The plan of the Bryant Tractor Co., Columbus, in distributing Fordson tractors in the State of Ohio is to enlist the services of patriotic citizens and automobile dealers, of whom the latter are mostly Ford agents, and ask them to finance a carload each in their respective communities. Tractors cannot be shipped in less than car lots of seven, and the dealer taking and financing this quantity speeds up the delivery quite considerably. The orders being sent direct to the distributor from farmers usually average one, two or three to a community. The dealers also take a few Fordson service parts besides the selected stock, amounting to $200, which is included with the tractor, so they may give the proper kind of service to the farmers of their community. The responsibility and expense of unloading is assumed by the Ford dealers, but is charged back to the user, on delivery. This amounts to $15 per tractor, including freight. Since the recent demonstration the Bryant Company gave in Columbus it has received cash and certified checks covering better than fifty carloads of tractors. Along with this the company has a record of checks in the mail, or soon to be in the mail, for fifteen more carloads. This makes a total of about $400,000 worth of business covering tractors, plows, parts, etc., in little over 2 weeks. One remarkable feature about this is that practically all this business has been secured without the buyer ever having seen the tractor.

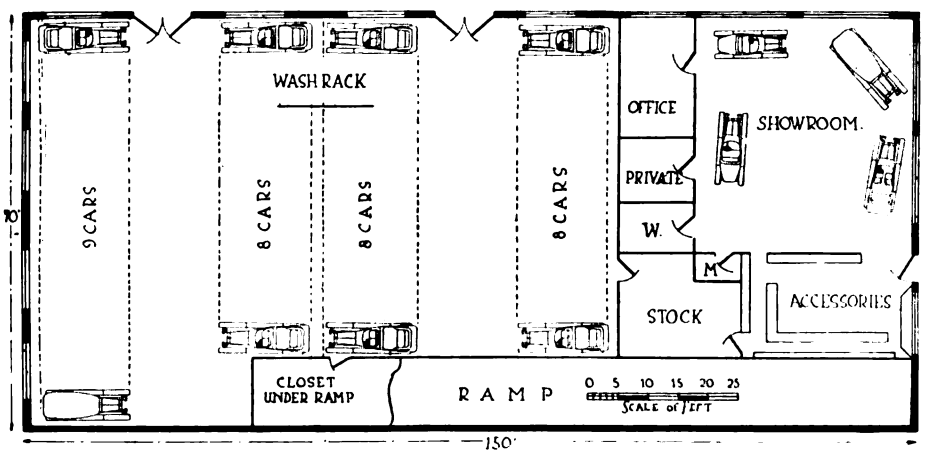


Fig. 18—This shows one method of arranging the cars in a garage which has a ramp running along the side of the building

Dort Has New Model

FLINT, May 8—A new model Dort Fleur-de-Lys roadster will make its appearance on May 15. It will sell for $865, with $60 extra for wire wheels. It is a three-passenger car of the Clover leaf type, with divided front seats and a divan in the rear. Lines of the new model vary considerably from the preceding model. A change is noted in the sill curve at the rear. The divan is wider, and there is more leg room. The standard paint is gray body, hood and wheels, with a white stripe just below the sill. Fenders and radiator are black. Car will carry a mohair top. Body will be mounted on Model 11 chassis, with the new 3½ x 5 motor, and the same other refinements brought out in the touring-car chassis introduced last January.

Simple Electrical Testing—3

Testing Bench for Starting and Lighting Systems

IT is possible to make a rough test on a starting motor or a generator by belting it up in an ordinary engine lathe and roughly determining its operation. However, when any amount of electrical testing is required, a special testing stand fitted with accurate instruments should be installed; for by this alone can an instrument be tested after repair, and installed with the certainty that it will function properly.

The testing stand is divided into two parts, that for testing the generator and that for testing the starting motor. Roughly the generator test consists simply of driving the generator at varying speeds by a small motor and determining its operation under these conditions. The system used in the automobile is duplicated, and by comparing the performance with the performance of a generator known to be in good condition, the condition of the generator being tested is determined.

Likewise the conditions in the car are duplicated in the starting motor test. The starting motor is connected with a storage battery and a variable load applied, its effect upon the speed and power being compared likewise with a starting motor in good condition. Its condition is thus determined.

The layout of the testing stand is shown in Fig. 2. The instruments are mounted on a heavy wooden table that is about 30 in. high, 30 in. wide and 5 ft. long. This table is securely bolted together and to the floor so that the parts will not be subject to vibration or motion. The generator testing equipment is mounted at the left end of this bench and the starting motor equipment at the right end.

Taking first the generator testing equipment, it will be noted that the generator is clamped to a hinged table and driven by a one-half horsepower variable speed motor.

The purpose of the hinged table is to permit the belt to be adjusted as required by various starting motors and special pulleys for belting to the armature shaft. These are essential in those cases where the usual gear cannot be used as a pulley.

THIS is the last of a series of three articles on simple electrical testing. The articles have been written with a view to assisting the garageman and repairman to a better understanding of the electrical equipment of the modern car so that he can be of greater service to his customers. Save all the articles for future reference.—EDITOR.

As stated, the one-half horsepower motor should be of the variable speed type, this being effected by a rheostat mounted at the front of the bench. By this the speed of the starting motor may be controlled between 600 to 1800 r.p.m.

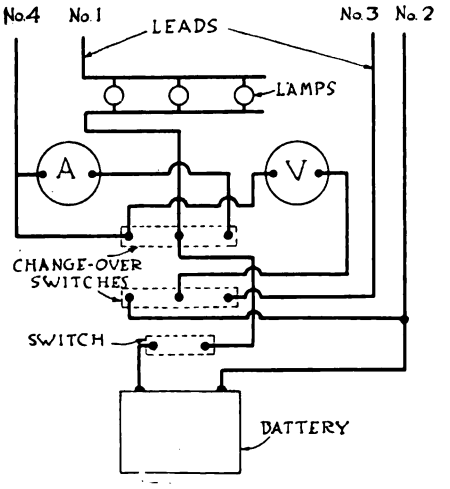

Fig. 1—Diagram of the wiring for the test board shown on the opposite page

The various instruments used in the generator test are mounted on an instrument board on the rear of the bench. The material used in the instrument board may be wood if desired, though hard asbestos board is much better; inasmuch as the voltages low perfect insulation is not absolutely essential.

Mounted on this board are three 15 cp. lamps connected in line with the battery circuit and the generator. The two instruments required are a 15-volt scale voltmeter and a 25-ampere scale ammeter reading both to the right and left of the zero mark. The additional equipment required comprises two 15-ampere double-throw switches and one 15-ampere single-throw switch together with a revolution counter, permitting the speed of the generator to be ascertained.

The connection of the various instruments and equipment is shown in Fig. 1. It will be noted that a 6-volt storage battery is connected into the circuit and that the four leads are brought to a point at the rear of the bench in much the manner of telephone switchboard extension plugs. The detail of each of these wire extensions is shown in Fig. 2, and it will be noted that whenever a wire is removed from its binding post it is automatically drawn back into position. This prevents the possibility of accidental short circuits and keeps the wire leads where they can be found in an instant. The wiring should be either No. 8 or No. 10 flexible cable.

Turning now to the starting motor test equipment, it will be noted that this is simpler than that used in testing generators. A steel plate or base is bolted to the bench forming the ground connection of the motor similar to the engine frame when the equipment is in place in the car.

To this the starting motor is clamped through the medium of two upright studs and a cross bar.

The connections are made to the motor from the storage battery in exactly the same manner as they were on the car.

Digitized by Google

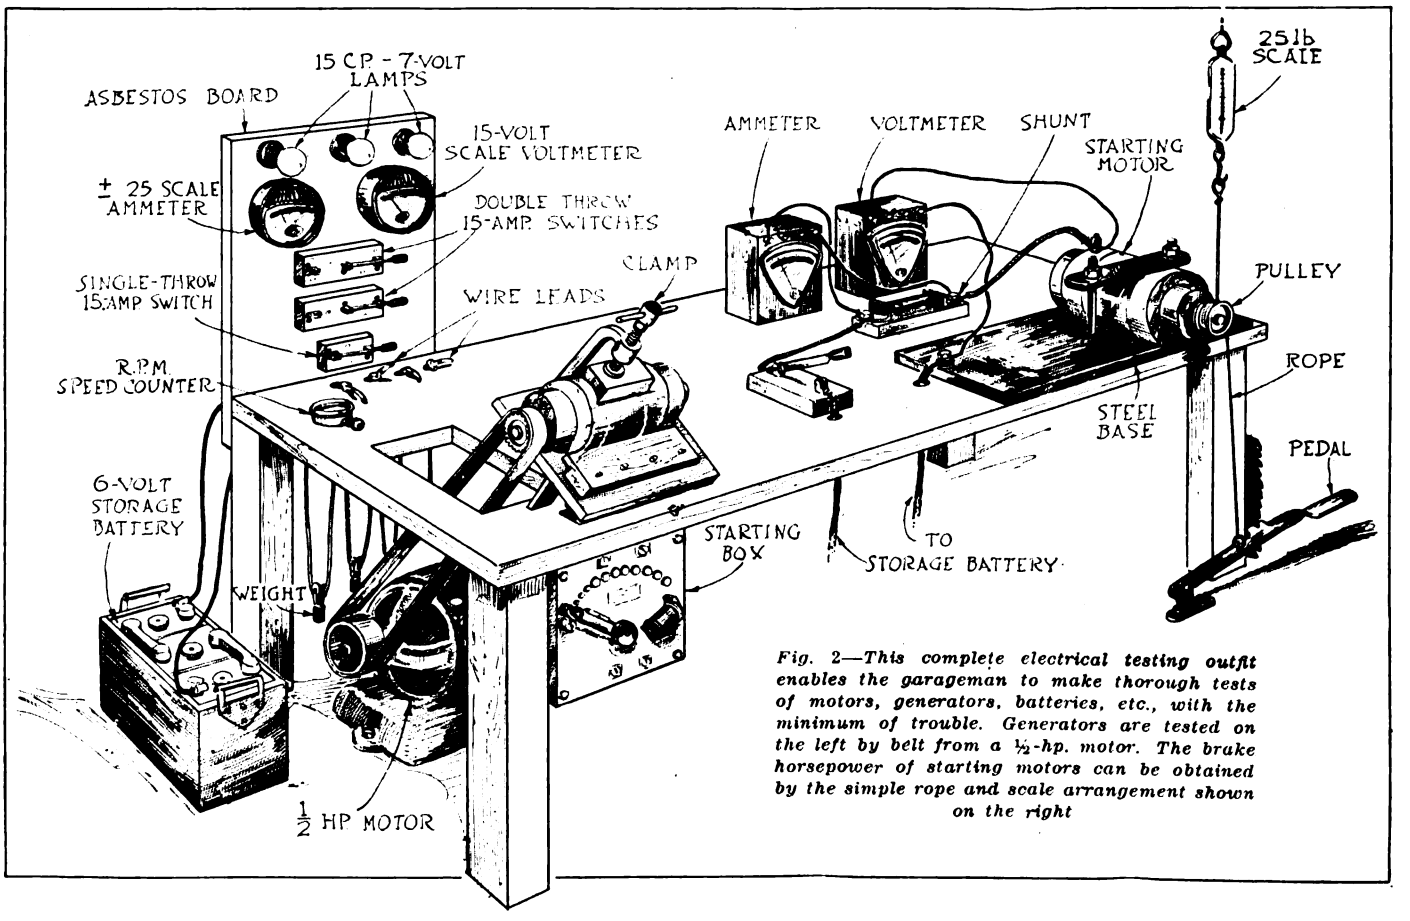

Fig. 2—This complete electrical testing outfit enables the garageman to make thorough tests of motors, generators, batteries, etc., with the minimum of trouble. Generators are tested on the left by belt from a ½-hp. motor. The brake horsepower of starting motors can be obtained by the simple rope and scale arrangement shown on the right

However, as the current flow is high, the ammeter will have to be connected to a shunt, as described in previous articles, and an ammeter and shunt combination permitting the measure of current flow up to 300 amperes is necessary.

The power for turning the starting motor is supplied by a storage battery, a 6 or 12-volt being used, as the case may be.

The load is applied to the starting motor through a prony brake regulated by a pedal and measuring the torque on a 25-lb. spring scale.

All of the wiring on starting motor test equipment, with the exception of the ammeter and voltmeter leads, should be No. 1 flexible cable.

Testing a Generator

THE first test of a generator is to run it as a motor from the storage battery. By knowing the amount of current required to run a generator in good condition and the number of revolutions per minute at which it should run, a comparison may be made with the similar operation of the generator being tested. If an excessive amount of current is required and the speed is somewhat low, a short circuited armature is indicated, while, if the speed is high, a defective field is indicated, or the bearings may be too tight.

Then, by driving the generator connected through the lamps to the storage battery until from 8 to 10 amperes current is generated, the speed of the generator is taken. This is likewise compared with the speed of a normal generator under the same conditions. If it is found necessary to drive the generator much faster than normal, providing the brushes and commutators are in good condition, defective fields or armature are indicated. This condition should be checked up with that of the first test.

Not only do the above tests show exactly what is happening with the generator as compared with a generator known to be in good condition, but also current cut-outs and control can be regulated within the required limits. Any equipment manufacturer can supply the data required in making these tests, or it may be obtained from a generator known to be in good condition.

Starting Motor Test

The first step in testing a starting motor is to run it without any load. A high amperage reading and slow speed will indicate that the bearings are either tight or the armature or field circuits are shorted. This test may be made with one, two or three cells of a storage battery supplying the current. If the current is not excessive but the speed low, the connections and conditions of the brushes and commutator should be examined. Likewise the brushes should be adjusted.

The next test is made under load to show whether the starting motor will deliver its full power at required speed and with the required amount of current. For example, a certain instrument having a current of 135 amperes passing through it at approximately 6 volts should turn 2000 r.p.m. and exert a torque of 1½ ft. lb. This amount, if the pulley were 2 ft. in diameter, would register 1½ lb. on the spring scale. However, it is not advisable to use so large a pulley, and by using a 6-in. pulley the spring scale reading is multiplied by four, giving the reading required.

In making the test the motor is started and sufficient pressure applied to the pedal to bring the spring scale to the required reading. The ampere, voltage and speed readings are taken and compared with the similar readings of a starting motor known to be in good condition. A low reading indicates defective armature or field.

Swedish Crucible Adds 2-Ton Unit

DETROIT, May 8—The Swedish Crucible Steel Co., Detroit, manufacturers of Olson units, has added a 2-ton unit to the line. With the wheel equipment is furnished the Olson 36-in. driveshaft and frame extension, increasing the wheelbase to 136 in. This makes possible the mounting of commercial bodies of large size, their standard stake body having loading space 5 ft. x 10 ft. Internal gear drive is used, gear reduction giving a final ratio of 10 to 1. The load is entirely removed from the Ford axle and borne by the set of large ball bearings mounted outside the internal gear. The bearings have a capacity of 7 tons per wheel. The wheels are steel, of special design, made for the mounting of dual solid-rubber tires, either 28 in. or 32 in. x 3½ in. Heavy auxiliary semi-elliptic side springs 52 in. long and 2¼ in. wide, of thirteen leaves, insure maximum strength, and complete the equipment, which sells for $550 f.o.b. detroit.

Protecting Finish During Drive-aways

Cars Can Be Given a Coating of an Oily or Greasy Material Such as Paraffin, or Can Be Protected by a Suit of Overalls

By C. J. Shower

THERE is no reason why cars should arrive at their destination, after a drive-away, with their finish in poor condition. Since the advent of drive-aways, dealers as well as manufacturers have burned the midnight oil to devise schemes for protecting the finish of cars that are driven some distance before getting into the hands of the user, and their efforts have not been in vain.

F. S. Bliven, Cadillac distributor in Baltimore, as told in Motor World March 6, invented a very pretentious suit of overalls to put over his cars. The outfit consists of a padded hardwood stick that extends across the radiator, from which straps run up over the windshield. Other straps made of webbing run around the entire car. To this webbing the curtains are fastened. The right door is left free, and the driver is able to get in and out of his car because a piece of thin steel, which fits into the socket of the rain-curtain holder, is turned over.

Overalls Cost $100 for 3 Cars

These covers were made in Bliven's own shop, and the original set of three covers for three cars cost him approximately $100, figuring material and time at cost. When folded up, ready to be carried by the men on the train, they weigh 39 lb. each, and make a package the size of a suit case. It takes only 20 min. to adjust them and only about 3 min. to take from the cars.

On both sides of the car, fastened to the running board, are hardwood boards which hold down the lower end of the cover. Two straps lead from these boards to the straps around the car, and keep the cover from sagging. Over the front springs and radiator, and separate from the covering that goes around the body of the car, is a covering that is fastened to the splash pan. These coverings are made of rubberized top material.

This "overall" has proved so satisfactory that many other Cadillac distributors have adopted its use. A similar outfit could be made for other cars.

The Paige-Detroit Motor Car Co. applies a coating of paraffin to all the cars leaving the factory overland. The cars are driven up alongside the curb, and one by one they are sprayed. A can that holds a quart of the liquid is connected with an air line. By depressing a small lever with the thumb an invisible spray is started.

As soon as the paraffin settles on the body of the car it immediately becomes hard and forms a coating which prevents any dust and mud from reaching the finish. After this has been removed in the manner explained later, the car looks as good as new.

Some Use Vaseline

A number of dealers and manufacturers have adopted the use of certain oils and greases, the most popular of which is vaseline. This, being put on the body with a rag, requires no special equipment and offers very little trouble. It is a very satisfactory protection for the surface of cars. Some dealers use olive oil in the same manner and find it just as good or better.

The difficulty lies not with the application but with the task of removing the coating. Vaseline or any oil or grease can very easily be removed with hot water. Water hot enough to remove it is not hot enough to mar the finish on the car, but care must be used in this to keep the water just above lukewarm.

The water is flowed on from a hose by the same method as is ordinarily used in washing a car. The car is gone over afterward in the usual way with cold water and then polished. After the cleaning process is over nothing remains to tell that a preparation was used.

Vaseline or any oil preparation is different from paraffin in that it remains soft enough the entire trip. Unlike paraffin, it collects dust. In doing so, however, it prevents the dust from reaching the finish.

The disadvantage of using paraffin lies in the fact that it is difficult to remove. Being a hard coating over the entire car, it is necessary to apply much hotter water than necessary for vaseline. This, the dealers complain, has a tendency to leave a residue on the finish which makes it almost impossible to restore the luster. Vaseline, on the other hand, being already in a partially melted state, flows off with the water very easily.

Another preparation successfully used by the Cadillac Motor Car Co. is an oil that can be applied with a rag. In spite of its recommended use, complaints have reached the factory that cars coated with the preparation had ruined the finish. It was stated that after being washed the cars were badly streaked and would have to be revarnished. The factory sent the man who made the preparation to the dealer. It was found that most of the trouble was due to the fact that the men in the shop were afraid to rub. Through this experience the company was led to offer the following directions:

Rules for Best Results

1—Drivers should stop about every 200 miles during the course of the trip and rinse the cars off if they are muddy, but not wash them.
2—Proceed to clean the cars as soon as possible after their arrival, because if they are left the preparations will harden.
3—Rinse off all dirt with hose.
4—Wash the car with lukewarm water and sponge and rinse it off again.
5—Dry with a clean chamois skin, which has first been soaked in water and wrung out.
6—When thoroughly dry, apply polish with waste and rub off. It is important to use an up-and-down or side-to-side movement rather than to "just rub" and move the hand in a circle. Do not be afraid to rub hard; in fact, it is necessary.
7—If the polish does not take all of the preparation off (as it may not on the hood and cowl), use a little rotten-stone with the polish, or apply rotten-stone and water, using a piece of felt. Then rinse off, dry with chamois and apply polish.

THE LAW

By George F. Kaiser

As It Applies to
Dealers
Repairmen
Garagemen

What About Insurance?

When a motorist is puzzled about insurance it is most natural for him to look to his dealer or garageman for information. A little knowledge of insurance on the dealer's part is therefore very often a pleasant thing to have. As most dealers know, automobile insurance is divided into several forms.

Liability insurance covers the person insured against claims for personal injuries to any member of the general public caused by the operation or maintenance of the automobile specified in the policy.

Liability Damage

Liability damage covers the liability of the insured for damages to the property of other persons caused by the motor car specified in the policy.

Collision insurance covers damage to the insured's car by reason of a collision with some object either moving or stationary.

Fire, theft and transportation insurance covers damage to the car itself by fire from any cause. It also covers loss or damage from theft or through the stranding, sinking, colliding, burning or derailing of any conveyance while the motor car which is specified in the policy is being transported by land or water.

Liability for Bodily Injury

As has been often pointed out on these pages, the various courts have held in numerous cases that liability for bodily injury of property damage does not always attach to the person owning the car, and persons who are not owners may be held responsible for accidents caused by use of borrowed motor cars. In cases like the above, the liability of the insurance company is limited to the persons named in the policy. If persons other than the owner are permitted to take a car out for their own use they are liable for accidents while they are using it. Of course, they may be covered and included in the policy by the payment of a small additional premium.

Collision Insurance

As to collision insurance, it is common for an insurance company to write two kinds, *i.e.*, full collision and deductible collision. Under a full collision policy, all damage to an insured person's motor car is covered. Under the deductible collision form, a person insured must pay the first $100 of all losses himself before the company is required to pay anything.

It is well when a car is insured to see just what extra equipment is attached to it. The ordinary policies read that the companies insure "the body, machinery and equipment of the automobile described herein." This provision has been held not to include extra equipment. If, therefore, tools and accessories are added to a car other than those regularly furnished by the manufacturer as part of the regular equipment, additional insurance should be taken out on the extra equipment. This additional premium usually amounts to but a few dollars, and if the additional equipment is not insured there can be no recovery for it.

It is well to remember when taking out automobile insurance that it is only a proper precaution to make all checks payable to the insurance company and not to your broker. If checks are made payable to the broker and the broker appropriates the money for his own use and does not pay the premium, you will have to pay it all over again or have your policies cancelled, because the broker is your agent and not the company's.

Every insurance policy should, of course, be read over very carefully. In connection with this, when reading policies I might advise that dealers look over the policies of the so-called "mutual companies" very carefully. Oftentimes these "mutual companies" cut rates—that is, charge a lower premium than the stock companies.

Obligations of Insured

In most cases when reading over their policies the insured will find, if he reads carefully, that he not only obligates himself to pay a premium of say $50 but also obligates himself to pay twice that amount in addition if the affairs of the company do not prosper. These policies also usually provide that the constitution and by-laws or whatever other name the rules and regulations promulgated by the companies are called, are binding on the insured.

In case of any accident when automobile insurance is carried, the policy should immediately be carefully examined and notice should be given to the company when and where the policy provides. It is a good practical idea to make a short memorandum of what automobile policies provide as regards giving notice and either keep the memorandum in your car or on your person.

The "100 Per Cent" Clause

Editor MOTOR WORLD: In my policies I find what is called a 100 per cent co-insurance clause which reads as follows: "This company shall not be liable for a greater proportion of any loss or damage to the property described herein when the sum hereby insured bears to one hundred (100) per centum of the actual value of said property at the time such loss shall happen." An insurance broker who is trying to get the business tells me that if I had an 80 per cent clause it would be better in case of a fire. Will you please explain what the difference is, as I do not understand.—J. T. Miller, Erie, Pa.

Answer—The clause that you find in your policy covers the amount that you can recover from the insurance company in case of loss. If there is no co-insurance clause then you can recover up to the full amount of the policy. If there is an 80 per cent or 100 per cent clause you cannot recover that much.

Under the 80 per cent clause, if the property was worth $10,000 and was insured for $6,000 and a fire occurred which caused the loss of $6,000, only $4,500 could be recovered from the company. Only $3,600 could be recovered from the company if there was a 100 per cent clause.

When there is an 80 per cent clause in a case like the above, $6,000 can be recovered when the loss is $6,000 or over. When the loss is less than that only a proportion can be recovered. As for example, $\frac{6000 = \text{(the insurance)}}{8000 = \text{(80\% of value)}}$ or $\frac{6}{8}$ which is $4,500 of the loss falls on the company, and $\frac{2000 = \text{(the deficit)}}{8000 = \text{(80\% of value)}}$ or $\frac{2}{8}$ which is $1,500 you must pay yourself.

When the 100 per cent clause is found in the policy only 6/10 of the loss need be paid by the insurance company and the owner must stand 4/10 himself, so you see that the 80 per cent clause is much the better clause for a property owner.

Repairshop Shortcuts

From Motor World Mechanics

No. 1664—TO REMOVE STUBBORN WHEELS

To remove wheels from shafts when they are rusted or stuck on, place a jack between the rims of the wheels, blocking out with a piece of wood. Set the jack up fairly tight, then pound the end of the shaft, using a piece of brass or wood to protect the threads.—J. Puvogel, Superintendent, United Line Service Corp., New York City.

No. 1665—WORK SUPPORT

A support for the end of long work held in a vise is made by cutting the big end of a connecting-rod off flush with a hacksaw, drilling it and riveting it to a piece of shafting which is the same length as the height of the vise from the floor. The lower end of the shaft is fastened in the hole of a shaft pulley about 8 in. in diameter.—R. B. Laffay, New York City.

No. 1666—SANITARY HEAD REST FOR MECHANIC

A head rest for a mechanic working under a car is made from wood, so that it is about 6 in. high, 14 in. long and 10 in. wide. It is upholstered with some kind of soft padding and 10 to 20 thicknesses of newspaper tacked on top. Sheets of paper that have become soiled can be torn off to leave a clean place for the mechanic's head.—R. B. Laffay, New York City.

No. 1667—MOVABLE GARAGE STALL

A movable garage stall made by notching a cross-piece into the two side pieces, and bracing the rear with diagonal pieces. It is made from 4 x 6 in. lumber and prevents backing the car into the wall or into adjacent cars.—F. R. Crocker, Wheat Growers' Garage, Kimball, Neb.

No. 1668—REMOVING AND CARRYING TRUCK WHEELS

A hand truck provides at once a means of lifting a heavy truck wheel off the axle through the leverage obtained and the means of moving the wheel to the hydraulic press or any other place desired. The axle is jacked up till the iron end of the hand truck can be pushed under the wheel. A pull on the truck will take the weight off the wheel bearings and the truck can be rolled out.—George E. Wilhelm, B. F. Goodrich Rubber Co., New York City.

No. 1669—TOWING BAR

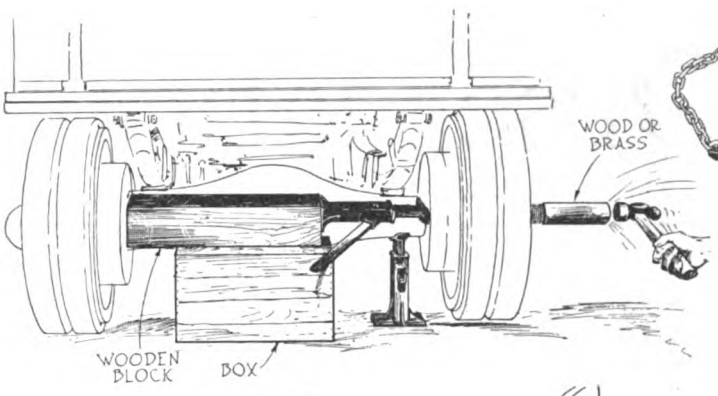
A towing bar having a chain and hook to fasten around the axle of the towing car, a universal joint, and a pivot arrangement to operate the tie-rod of the towed car so that it will follow its leader. The swivel is placed about 10 in. back of the chain and may be formed out of an old Ford universal. The rear end of the rod has two holes, one to go over a stud clamped on the front axle and the other to go over a stud clamped on the tie-rod. —Robert P. Ewer, Bangor Motor Co., Bangor, Me.

No. 1670—METAL HORSE

A horse for placing under the axles while working on cars is made from standard L-sections of steel or iron, 1¼ or 1½ in. Each joint is made with a rivet. The base measures 10 in. wide by 12 in. long, the height of the horse being 12 in. The height can be varied to suit the cars usually handled.—R. B. Laffay, New York City.

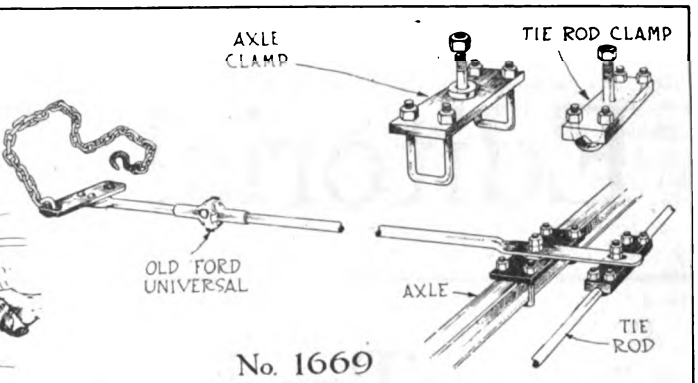
No. 1671—TO REMOVE DISK CLUTCH

A disk clutch that has a beveled back plate so that the usual arms of a crane puller will not take hold can be removed by using two short log chains, one on each side of the shaft, back of the clutch. These are bolted together as close to the shaft as possible, bringing the free ends on each side of the clutch and over the puller arms, where they are again bolted together. Pins can be inserted in the arms to prevent the chains from sliding off.—L. R. Bleitz, Fountain Avenue Auto Shop, Los Angeles, Cal.



No. 1672—FOLDING SMOKE SHIELD FOR COKE OVEN

Extended pieces of sheet metal are hinged to the ordinary hood of a coke oven so that when heating oily castings the doors can be dropped down, insuring all the smoke going into the hood. When the doors are not in use, they can be hinged up and hooked to the ceiling.—William R. Smith, William R. Smith & Co., New York City.



$1 a Helpful Kink

HOW often have you been compelled to rack your brain to overcome some difficulty? But when you did find a solution—what a satisfaction it was! Well, here's a chance for you to dig some of those life-savers out of their hiding places and put them to work for your fellow-craftsmen. Send them to Motor World. We will pay you a dollar for every one accepted for publication. The only requirements are these: 1—*Describe the short-cut briefly but clearly, in few words.* 2—*Send a sketch, in pencil or pen, no matter how rough; our artists will finish the job.* 3—*Write on ONE side of the paper only.* 4—*Sign your name and initials, the name of the company you are with, and the town. Write plainly. If your name is unusual, print it in capital letters.*

Editorial Observation

Trade Privateering

ON the opposite page is a letter from H. S. Collinson, a dealer in Arkansas City, in which he sets forth conditions that seem to amount to what is commonly known to-day as "privateering." And the worst of it is that he charges one automobile man with trying to rob another.

For one thing, Collinson asks for a route between Flint and Kansas City. This is taken up elsewhere in this issue of Motor World, but the other things are discussed here.

He charges that his drivers, because they seemed to be of draft age, were unreasonably held up by officials in Flint and made to stand in line all night until Collinson could wire their registration numbers. It would seem that if anything like this is being pulled off by unduly zealous officials the factory people in Flint should take a hand in it and see that officialdom is tempered with a little common sense.

Furthermore, let this serve as a warning to dealers: If you are sending to the factories or to out-of-town points men who seem to be within the draft age see to it before they start that they are equipped with proper credentials, testifying to their patriotic standings in their home towns. Hundreds of men of draft age are faithfully working at their jobs and waiting for their country's call. They should not be molested but should, however, be properly certified.

Hotels Unfair to Drivers

Collinson charges that the drive-aways were unsuccessful because the drivers were robbed en route by hotels and garages. A dealer or garageman who would extort high prices—such as 50 cents for gasoline—from brother tradesmen in this present trade dilemma is not only a profiteer but very foolish.

The whole trade is working to the top notch of energy and initiative right now to save itself from rapidly changing and adverse conditions, and if the effort is at all successful it will benefit every dealer and garageman. How then can any tradesman afford to throw obstacles in the path of such efforts as the drive-away? He is extorting a few cents at the risk of ruining the whole trade, and with it himself.

There is no excuse whatever for this extortion. It is an offense that has been charged against the trade in the past by motorists, and the man who would do it to either motorist or drive-away crew should be shown up. He is no good to the trade and the sooner he is out the better. Show him up!

Collinson asks Motor World for a list of the "fair" garages and hotels on the route from Flint to Kansas City. We are sorry we can't give it to him. But we make this suggestion. Let such organizations as the Chicago Automobile Trade Association and the Kansas City Motor Car Dealers' Association get to the bottom of this thing and establish a Drive-away Bureau. Let some association official or other competent person accompany a drive-away, investigate the garage and hotel situation, have a frank talk with the hotels and garages and get an agreement as to some fair rates.

Keep Information on File

Then let this information be on file for the benefit of dealers who want to conduct drive-aways. Require every man who gets information to deposit $5 or $10 when the information is given, which money will be returned to him provided he will report to the association bureau his experiences when he returns from the trip. This will assure the bureau's information being kept up to date and will centralize complaints. Furthermore, it will put behind this movement the names of some influential associations, which have far more weight than the names of individuals.

The same thing can be done by every other good city association in every territory. It is a chance to show the country dealers what the big city association is worth to them and also to bind the distributors and dealers closer together.

As to how to cover cars that are to be driven a story is printed elsewhere in Motor World this week.

Also, Motor World will be glad to conduct a Drive-away Department with information about conditions, roads, hotel and garage rates and experiences, with the object of letting dealers know what conditions are all along the route. Send us this information NOW. Give us the towns you pass through—large and small—between the big cities, tell what hotels and garages you stopped at, what rates were charged for different items, and give just exactly the information you would want to know yourself.

What Are Your Drive-Away Experiences?

We request our readers to forward their favorable and unfavorable drive-away experiences. Let the rest of the dealers know if you have something you think would interest them. Every time you return from a drive-away write Motor World a letter about it.

Let's have this information. It is best, however, if this information be sent on the stationery of the dealer himself and signed by some responsible member of the organization and not be written by the driver on his own stationery. We request this in order that we may be sure the information is right and coming from an authentic source.

Letters from Readers

THIS page is for the use of MOTOR WORLD readers with something to say. Letters on subjects of interest to dealers, garagemen, repairmen and jobbers are always welcome.—EDITOR.

Trade Privateering

Editor Motor World: Inasmuch as you people do more for the dealers than all publications put together I am going to offer a few suggestions which might permit you to do more.

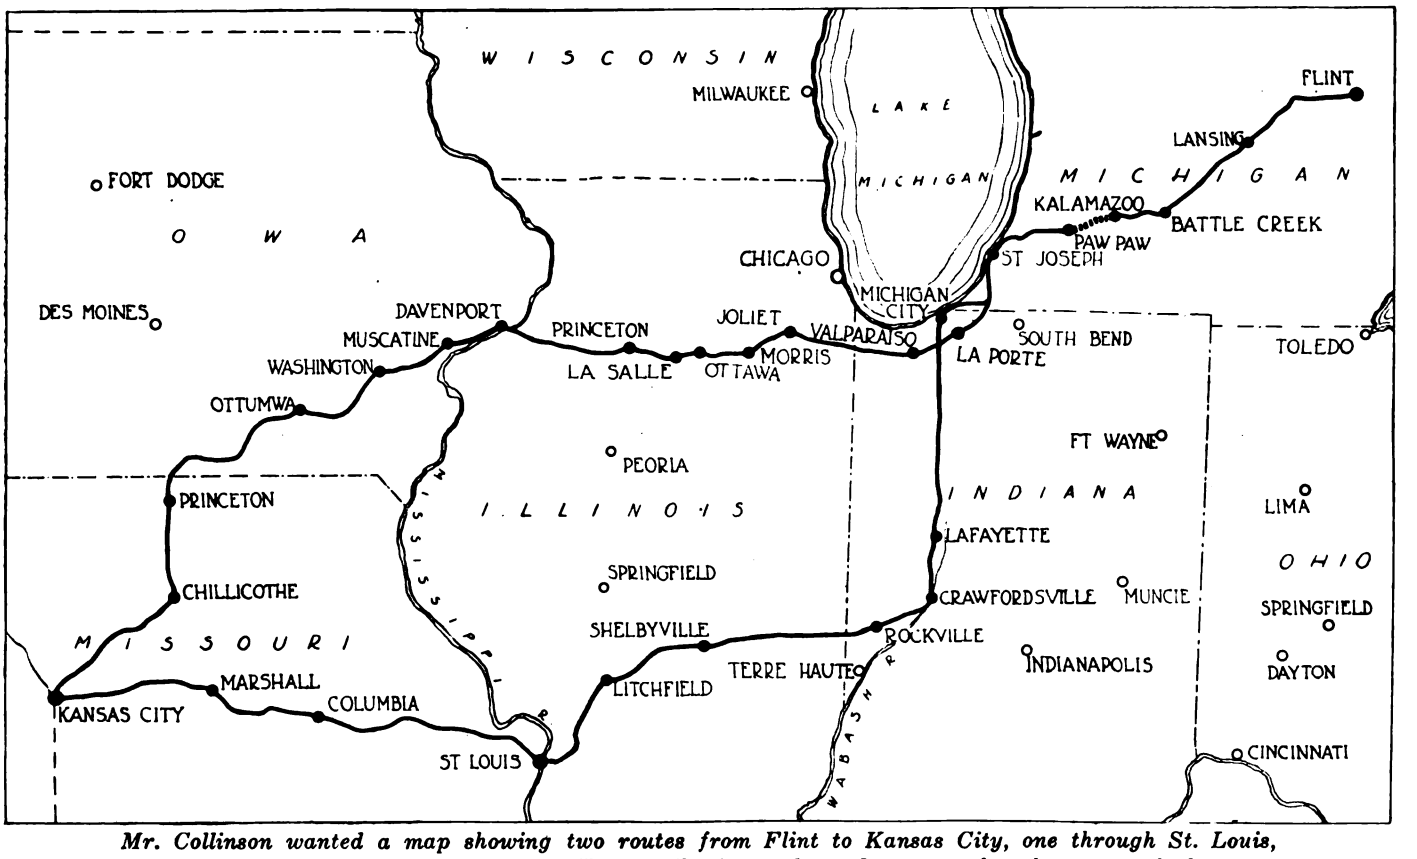
The writer has just completed the third drive-out trip from Flint, Mich. Two bunches consisted of five machines and one of three machines and several individual drive-outs.

And almost without an exception the drive-outs have been what we term unsuccessful. The drivers, of course, were ignorant on drive-outs, and each person they asked gave them different information.

Most of the towns they went through absolutely robbed them on storage, washing and gasoline. One place they report paying $5 for 10 gal. of gasoline. In Kansas City one shop tried to hold them up for $10 for oiling the car all over and adjusting the carbureter. There should be arrangements as to which is the best route from Flint, Mich., to Kansas City.

Now, if the Motor World would get up a map showing the exact route from Flint, Mich., to Kansas City, naming the towns they would go through and the best service stations making arrangements with the garages to wash tourist cars and oil them up at a reasonable price. Name the hotels, and it might be wise to make several routes, for instance, one by St. Louis and another the Northern route, also instructions what to do with cars before leaving the factory. For instance, some people say go all over the cars with vaseline if you must go through the mud, and the factory men will say not to put vaseline on the car. If you would issue instructions along these lines it would help us out.

Now, in our last trip at Flint we sent five boys, all of whom were of draft age and married and had their exemptions, however, very carelessly failed to have their cards with them. The officers at Flint held these boys under guard, made one of them stand up in the room (with 40 other men for cars) from 7 o'clock in the evening until 4 o'clock next morning waiting for a wire from home giving his registration number. Now, these men had credentials on them showing they were in my employ driving cars out for me.



We believe that Motor World should take steps toward such absurd treatment as this.—Collinson Auto Co., by H. S. Collinson, Arkansas City, Kan.

Wants Rental Letter

Editor Motor World: Will you please give me an idea for the best way of advertising or getting up a nice letter telling my friends and others that I am in the automobile renting business, that I have a machine to hire out by the hour, trip, day, week or month. It is a seven-seater Packard. Likewise if you know the rates I should charge by the mile? —H. Ascher, 1403 Webster Avenue, Bronx, N. Y.

Answer—We are pleased to submit a letter which perhaps will assist you in getting business for your renting car.

As to the rates you should charge, you, of course, know that some cars are rented at $2 an hour and some charge $3 or $4. Taxicab rates vary. You probably could not charge the 25 and 30-cent rates that are charged by some cars be-

Mr. Collinson wanted a map showing two routes from Flint to Kansas City, one through St. Louis, and another further north. Here it is. Every mile is good road except the short stretch between Kalamazoo and Paw Paw. The map was prepared from special telegraphic information by the Automobile Blue Book Publishing Co.

Digitized by Google

cause you have a big car that is going to cost money to run. From the nature of your letter, we imagine most of your work will be special party work, and will be more or less on the hour basis. For runs to outlying towns you probably will have to make a special charge.

It is hard to tell you how much you ought to charge for this work. If you are exclusively in the rental business and have only the one car, you should figure how long the car will run and plan to set in reserve from your earnings a certain amount each month so that when the car is worn out you will have money enough to buy another one at the same price. You should also take into account gasoline, oil, tires and other expenses and figure in the salary of the driver.

In addition to that, you should add a certain per cent for profit. Take all of these factors into consideration, find what the cost of operation is, and make your rates accordingly. If your rates are higher than those of the people with whom you are competing, you will have to fix the car up in very good condition, give a high grade of service and charge accordingly. There is no use running the car on a rental basis unless you are going to make money out of it. You might better sell the car and get your money out and get a job where you would have nothing to worry about.

Shall I Buy?

Editor Motor World: Please note that I have been running a Willard station with a side line of starter repairing.

Several of the garages in this city are planning to install battery stations this summer, which will affect somewhat my business. I have recently added a few accessories to help out. My gross business has been running about $1,800 per month on batteries and starter repairs only. We have your bookkeeping system.

The above is not an introduction to my life's history, but is intended as data bearing on a question which I am going to ask you.

I have recently made tentative arrangements for the purchase of a garage which is just across the street from my present location.

This garage has about $1,500 tire stock and $1,000 in miscellaneous accessories, mostly good salable stuff. Also have about $100 in garage tools, such as wrenches, grease guns, etc. The lathe, drill, emery wheel and gas and oil pumps belong to the building. The rent is $125 per month. The present proprietor wants $3,500 for the business, including all accessories and good will.

Please give me your advice on the change. At present the garage has 12 steady storage customers at $7.50 per month. I would plan to conduct only my battery business and storage with accessories and gas and oil and repairs on starters and generators only.

At present am paying $40 per month rent, but do not have much of a building.

Will attach a sketch showing the layout, together with other garage locations.

Your advice will be very much appreciated. Shall I make the change? Yours very truly.—Reader.

Answer—The proposition that you are considering looks good to us at this distance. You are paying $3,500 for the business, and about $2,500 of that is represented by salable material. This means that you are paying $1,000 or less for the good-will; as for rental, you have $90 coming in from storage, whereas your rent will be increased only $85. You also have a fine opportunity to expand the business. From the plan you have drawn we imagine that the property on which you will be located backs up on the main street. Our suggestion would be that, as time goes on, open this up on both streets and get the benefit of a double front, unless there is some obstacle in the way.

In this new building you will have an opportunity to use the aggressive methods that have made you successful in the past, and we suggest that you advertise as far as your resources will permit, send out form letters and continue your past activities so that your garage will stand out in the minds of the public in the group of garages in which it is located. We believe if you will do this, you will not suffer greatly by having so many near competitors. Judging from the map you sent, the location is very good, being near the main street and also on the street that leads from the main street to the railroad station.

If you will continue to operate the Motor World System of Accounting as you have in the past and let it tell you as it already has done where you are gaining and where you are losing, we believe you can take this new business over and put the thing over in a way that will be highly profitable to yourself.

The Letter
For Ascher

When you want to ride there is nothing like a Packard.

Maybe you haven't bought a Packard—and maybe you don't intend to—but that is no reason why you can't ride in MY Packard.

My Packard is a seven-seater, looks the part, is easy riding, and is everything you could desire in a car.

Instead of your having to take care of this car I take care of it and bring it to you whenever you want to use it.

The rates for using this Packard are reasonable. I drive it myself and give things my personal attention.

Picnics, outings, the theater, Sundays, evenings, any time. A Packard is always a pleasure. It's yours to use when you want it.

Phone 876 and ask me about it.

Don't Cut

Editor Motor World: While we and every other automobile dealer are certainly more than willing to do all we can for the successful termination of the war, it seems to me that cutting down on passenger car production isn't going to help very much.

In the first place, passenger cars are becoming more and more essential for business men in order that their time may be doubled and tripled to make up for the help they have lost due to enlistments or the draft.

Everybody needs to be as efficient as possible in order that they may have at their command every possible dollar with which to buy Liberty Bonds, pay income taxes, subscribe to the Red Cross and to various other war work demands of a similar nature.

Automobile dealers are certainly doing their bit along with other business men, and I believe they are doing a good deal that doesn't show on the surface, as there is a constant demand on the automobile dealer for the use of automobiles, which certainly cost him money but for which he gets very little credit except possibly from the one who calls him up and gets the service.

I am not mentioning the automobile manufacturers very much because even a considerable curtailment would not hurt them as much as it would the dealer, because they can at least keep going by taking on the manufacture of something in the line of munitions or army supplies for the Government.

I mention the dealer particularly because if you take away from him cars to sell there isn't a great deal he can do to keep going.

I certainly hope the men who are handling this particular problem will take a very broad gauge view of it in order that the various people who would be affected by curtailment of passenger automobile production will not be hampered in conducting their business in such a manner that they can be of the greatest possible assistance to the Government in carrying on the war.—The White Motors Company, W. A. Rutz, General Manager, New Haven.

One Hundred Per Cent. on the Loan

Editor Motor World: We take pleasure in enclosing herewith a copy of letter which we have to-day sent to the Liberty Loan Committee, New York City, and which the writer knows you will take pleasure in reading.—E. A. Laboratories, Inc., W. Von Elm, Brooklyn, N. Y.

The Letter

April 29, 1918.

Liberty Loan Committee: We beg to advise that on Friday we had two speakers address our employees in the factory and it affords us pleasure to advise you of the result of same.

We have one hundred and ten employees. After this meeting was over one hundred and eight employees subscribed in the factory for bonds to the amount of $7,000. The two employees that did not subscribe at the meeting had previously purchased bonds on application blanks submitted by their children from school.

This gives us a record of 100 per cent for men and women connected with our institution who have bought bonds of the Third Liberty Loan issue. We believe this entitles us to an honor flag. If you will kindly forward same we will take great pleasure in displaying same in our office.

Yours very truly,
E. A. LABORATORIES, INC.

The RETAIL NEWS

PACIFIC COAST

E. N. Shryock, Bakersfield, Cal., has sold his interest in the Auto Electric & Battery Co. to A. M. Robertson. The firm is now styled Harris & Robertson.

Hayes & Murray, operating a general merchandise store at Bakersfield, Cal., have added a stock of Mason tires.

John Reed has bought the Page Garage at Fillmore, Cal.

B. R. Muidoon has opened the Fillmore Vulcanizing Works at Fillmore, Cal.

C. C. Elkins, Fillmore, Cal., has sold his garage and opened a general accessory store and battery service station.

William W. Wurzburger has remodeled the Ford Garage, Lancaster, Cal.

M. C. Livermore has opened a tire shop and vulcanizing plant at Lancaster, Cal.

The Buckeye Auto Supply Station & Garage has opened quarters at Mojave, Cal.

The H. A. Jones Motor Truck Co. has moved its main office from Riverside to San Bernardino, Cal., and will operate the Arrowhead Garage in the latter city.

N. A. Pallow and **M. G. Robinson** have opened the San Bernardino Cut-Rate Tire Store, San Bernardino, Cal.

The San Bernardino Rubber Works has opened salesrooms at 595 Third Street, San Bernardino, Cal., and will handle the Hupmobile and Chalmers.

Joe H. Eddy has purchased an interest in the San Bernardino Rubber Works, San Bernardino, Cal., and the firm will be styled Naschke & Eddy.

H. I. Bradley has bought the garage and Maxwell agency at 446 D Street, San Bernardino, Cal.

Henck & Reed have moved the Triangle Tire Shop to 420 Fourth Street, San Bernardino, Cal.

F. G. Stickney and **N. I. Bogart** have opened an accessory store at 839 Third Street, San Bernardino, Cal., under the style Stickney & Bogart.

William Nisle has opened salesrooms at 538 Court Street, San Bernardino, Cal., and will handle Saxon cars.

The Pacific Auto Wrecking House has opened a branch in San Bernardino, Cal., with A. Wilenchik, J. Camers and S. Goodman as proprietors. The company's main office is Pomona.

Dexter & Martin have opened the Bear Filling Station at 398 Third Street, San Bernardino, Cal., and will carry a complete line of accessories.

Montgomery & Dickenson, Santa Paula, Cal., have added a battery department.

Roy A. Saviers has bought the People's Garage, Santa Paula, Cal.

W. B. Naugle, Santa Paula, Cal., has obtained the selling agency for Oakland and Maxwell cars and Case tractors.

Edward J. Bush, Oregon City, Ore., has opened a Ford agency at 1103 Main Street.

David Hodes Co., Portland, have opened a parts depot at North Broadway and Flanders Street.

The Northwest Auto Co., Portland, has leased a 4-story building at Ninth and Alder Streets for showrooms and salesrooms. The company handles Reo, Cole, Marmon, Dort, Stearns and Roamer cars, and Duplex, Reo, Indiana and Bethlehem trucks.

B. E. Gregory, Okanogan, Wash., has taken the agency for Ford cars and Federal trucks.

Hoyt & Elcks, Inc., Seattle, automobile body builder, has opened new quarters at 1515 Broadway.

The Martin-Stuart Co., Tacoma, has opened a tire salesroom and service station at 750 Broradway. Diamond tires will be handled.

Hand & Sullivan, Tacoma, have formed a partnership and opened a tire salesroom and service station at Tenth Street and Tacoma Avenue. A vulcanizing department has been installed.

The Sander-Westfall Co., Tacoma, Wash., has opened a repairshop at Fifty-eighth and Hood Streets.

MOUNTAIN

I. M. Sink has opened a repairshop at Julesburg, Col.

Jess Grant has opened a tire repairshop and salesroom at Julesburg, Col.

EAST

Cahill & Co., distributors of Dodge Brothers and National cars in Wilmington, Del., will move soon to new quarters at Second and French Streets.

The Delaware Cycle Co., Wilmington, has moved from 407 Delaware Avenue to new quarters at 1105 Orange Street.

The Concord Boulevard Garage, Wilmington, formerly conducted by Howard Williams, has been bought by Charles T. Hartmann, who will operate a service station.

New Garages

P. F. Martin	Philadelphia
F. E. Hall	Philadelphia
Marco Marks	Philadelphia
Robert Burns	Philadelphia
Charles Atherton	Philadelphia
August Schaubacher	Philadelphia
Conrey & Co., Inc	Philadelphia
Anthony Mignione	Philadelphia
M. Biermesiter	Philadelphia

SOUTHWEST

F. L. Mattocks, Eureka Springs, Ark., has bought the McKinley Hussey Garage.

East & DeLamar, Malvern, Ark., have opened a branch of the Arkadelphia Motor Co.

The A. Hood & Sons Co., Baxter Springs, Kan., has bought the building at Military and Twelfth Streets, and is remodeling it for a repair and accessory shop.

C. A. Taylor, Boisington, Kan., has bought the automobile and garage business of Peugh & Kelley.

Nichols & Hawk, Enterprise, Kan., have bought the Swanger automobile repair business.

Clyde Gozad, Goff, Kan., has bought the Goff White Way Garage from Thoren & Pinick.

J. H. Drake, Hazelton, Kan., has sold the Hazelton Garage to Fred Allison and Fred Handley.

Evans & Anderson, Herington, Kan., have bought the repairshop of Liggett Brothers.

Alex Abel, Holton, Kan., has bought out his former partner in the firm of Baskett & Abel.

Magee Brothers, Independence, Kan., have leased the Vincil Garage.

R. B. Lignoski, Laredo, Kan., has sold the Rio Grande Tire & Rubber Co. to Lin Kirkindell.

Case & Miller, Leavenworth Kan., have leased the J. C. Davis Garage.

The Bussinger Garage, Lebanon, Kan., has succeeded Bussinger & Hart.

The Hodgson Tire & Supply Co., Little River, Kan., has opened salesrooms.

The Nickerson Garage, Nickerson, Kan., is remodeling its building.

Guy Spillman, Nortonville, Kan., has bought a half interest in Carl Robinson's garage and repairshop.

The Osage Motor Co., Osage City, Kan., has opened additional salesrooms.

The Auto Tire Supply Co., Pittsburg, Kan., has opened a supply and accessories store.

V. E. York, Pittsburg, Kan., has bought the Boyles & York Garage.

J. A. Farmer, Pratt, Kan., is making extensive improvements at his garage.

Davies & Marsh, Buffalo, Mo., dealers in accessories, are erecting a new building.

F. C. Blackbur, Malta Bend, Mo., has enlarged his quarters and added the Mitchell.

Ray Schooling, Sturgeon, Mo., has bought the E. M. Little & Son Garage.

W. T. Foster, Windsor, Mo., has purchased the repairshop of Perry & McClelland.

W. J. Crites, Bartlesville, Okla., has bought the Capitol Hill Repairshop.

Wantland & Brown, Edmond, Okla., have bought the Edmond Garage.

The Sleeper Motor Co., Tulsa, Okla., will erect a new building.

Floyd Sullivan, Waurika, Okla., has bought the City Garage from Ford L. Marks.

The Rankin Auto Supply Co. has opened quarters in Beaumont, Tex.

L. L. Luckett, Coleman, Tex., has sold his interest in the Luckett Brothers Garage to Chas. Paddleford.

Kelly Willis, Crockett, Tex., has opened a vulcanizing plant.

The F. L. Shaw Auto Co., Dallas, Tex., has increased its capital from $10,000 to $125,000.

H. Hansen, San Antonio, Tex., has bought the vulcanizing, tire and accessory business of Lowry & Doolin.

The McCauley-Ward Motor Supply Co., Waco, Tex., has increased its capital from $25,000 to $50,000.

NORTHWEST

The Parks Motor Co., Afton, Iowa, has purchased the vulcanizing business conducted by the Afton Harness and Saddlery Co.

E. H. Streepy & Son, Cincinnati, Iowa, have bought the Beall Auto Co., Albia, Iowa.

The Youngstrom Auto Co., Des Moines, has changed its style to the Holtberg-Hanselman Auto Co.

The Marsh-Kinney Oakland Co. has opened a salesroom at Glenwood, Iowa.

Bartholomew Brothers, Ford agents in Keokuk, Iowa, have moved to new quarters, three times as large as their former showrooms.

E. G. Singleton has opened a service station in Keokuk, Iowa.

The Smith Motor Co., Newton, Iowa, has bought the C. F. Mackerman Taxi Co.

The Owens Service Co. has taken over the Prest-O-Lite business at Red Oak, Iowa.

J. J. Tauzer has bought the garage of Benzler & Nelson at Kearney, Neb.

The Midway Motor Co. of Kearney, Neb., has opened a branch at North Platte, Neb.

10 Ideas From Successful Salesmen

My Sales Attitude

My most successful sales plan is to show the prospect that I am trying to help him in the selection of a car that will give him satisfaction rather than merely seeking to sell him one. I make him realize I believe in it myself; that I had to be sold on it first as my bread and butter depend upon my ability to make others realize how good it is, and that is more important to me than is the one deal with him.—Maurice Hessel, Albertson Motor Co., Los Angeles.

Ask an Owner

After making the usual demonstration and having my statements about economy of operation doubted, I find the thing that seldom fails is to give the prospect a list of names of twenty-five or more owners and tell him to select any of them he pleases and find out what tire mileage they get, how many cars they have owned, etc.—W. A. Hoblit, Franklin agency, Los Angeles.

Called on All Owners

One of the best plans I ever saw tried out was to have a tactful man employed to do nothing but interview owners. He asked how the car was, if there had been any trouble of any kind or similar question. He insisted that the car be brought in for attention the following day or that he be permitted to take it immediately. He kept a card upon which to make a report and at the bottom of every card was "Do you know anybody interested in the purchase of a car?" The owner would appreciate what we were trying to do for him and reciprocate by giving us prospects.—M. H. Green, Ralph Hamlin, Los Angeles.

Stay Till You Sell It

A way of getting business that proved especially good for us in disposing of used cars was putting the car in the hands of a salesman, giving him a certain territory and telling him to take the car out and stay out until he had sold it.—E. W. Johnson, Apperson Branch, Los Angeles.

A Swinging Display Chart

To emphasize the personnel of the factory and the dealer's own organization, especially if the proprietor is not always in the salesroom, the pictures of these men may be made about 2 ft. square and placed on the leaves of one of these upright affairs consisting of leaves swinging about a central standard. Casually turning these large faces before the prospect will impress him with the heroic size of the institution and its leaders. Buildings may also be shown.

Analyze the Prospect

The successful motor car salesman must be shrewd and able correctly to analyze his prospect. If a man has the reputation of being generous and liberal, I argue along the lines of the enjoyment that a car will bring to his family. If he is tight-fisted and hesitates about letting go of a dollar, I argue about the wonderful value he is receiving. Every man has his strong and weak points. It is up to the salesman to locate these.—C. W. Frey, Bloomington, Ill.

Change the Tune

When a prospect does not follow the channel I am working on, I study up some different word picture to get his attention.—W. J. Haughey, MacFarland Auto Co., Denver.

Find Who Is Boss

To gain interest without loss of time and effort, I always find out as soon as possible who is boss, whether husband, wife or children. —W. W. Barnett, Denver.

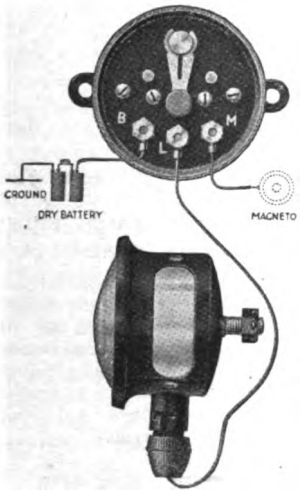
Check the Accessories

About the hardest problem is to show the average prospect, already an owner, that his old car isn't worth more than the new one he wants to buy. An accurate appraisal basis, with figures right before his eyes, is the only sure solution I know of for this. If he waits for another visit, I have my appraisal record on hand and check over to see whether he has been stripping his old car to get ahead of me.—W. W. Barnett, Denver.

Sales Team Work

My best sales move has been to establish team work in my sales force.—W. W. Barnett, Denver, Oldsmobile.

Make Him Think Investment



If a prospect says price too high, I show him where my own 8-cylinder car will cost only about $40 more per 5000 miles than my 6-cylinder of the same make—including gasoline, tires and interest on the additional sum invested. Then he begins to think investment rather than bargain.—W. W. Barnett, Denver.

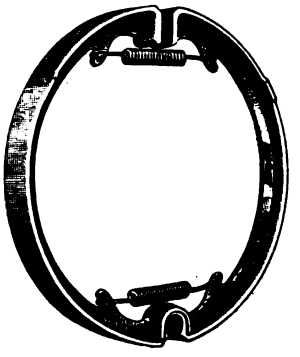
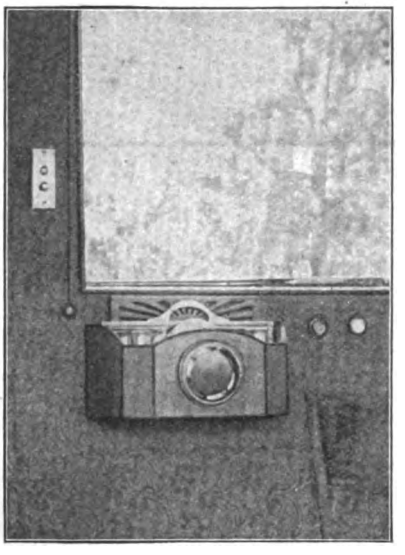
Accessories



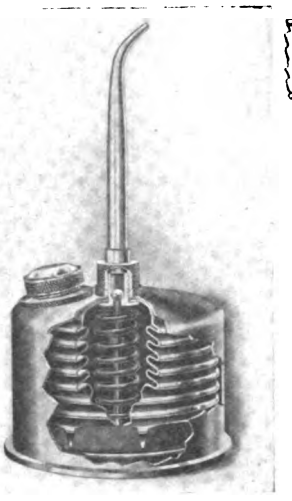
CORCORAN - VICTOR TAIL LAMP

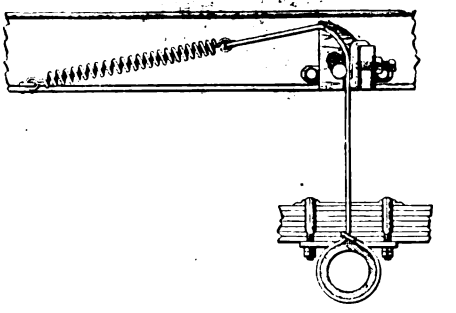


Model 49-H and L single bulb electric tail lamps for Fords operating either from the magneto or dry cells. Model 49-L is of the indicating type, with a small switch bulb to indicate to the driver whether or not the tail lamp is burning. Illustration shows the wiring connections.—Corcoran-Victor Co., Cincinnati, Ohio.

ADAMSON BRAKE SHOES FOR FORDS

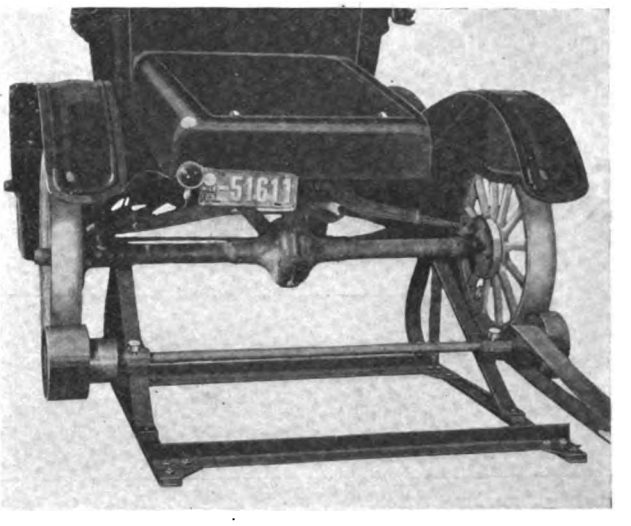
Brake shoes for Fords either unlined or lined with wire insertion asbestos riveted to shoe The faces are hardened where they come in contact with the cam. Adamson Mfg. Co., East Palestine, Ohio.





THE MOTOR DICTOGRAPH

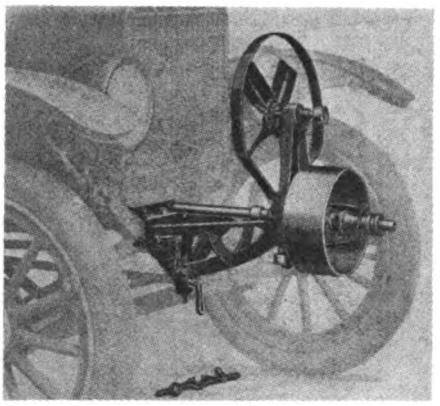
A sensitive microphone or telephone transmitter installed in closed cars so that the occupant can convey instructions to the driver by pressing a button which rings a buzzer, and then pressing another button and talking in an ordinary tone of voice toward the transmitter. Releasing the button cuts the connection and nothing further can be heard by the driver. Type A is intended for installation during body construction. It sets flush in wall and is covered with ornamental silver plate. Type B is for installation in finished cars and transmitter. Buzzer and push buttons are contained in a mahogany case 3¼x5¾x1 in. The Vanity Case Type has the transmitter installed in the opening designed for the clock. The device uses two dry cells. Horn and loud speaker are adjustable to any position.—General Acoustic Co., 220 W. Forty-second Street, New York.



SYLPHON OILER

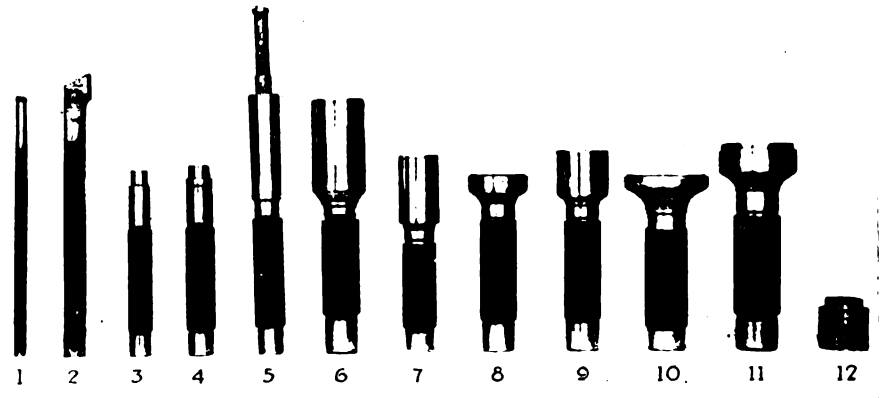
An oiler with exterior casing of heavy gage steel which houses the internal container which is a Sylphon. The contraction of the Sylphon forces the oil out, or when it is allowed to expand, the oil is drawn in. Ordinary filling is through a screw plug. A ball catch valve is lifted from its seat by a stem on compressing the Sylphon back to its original position. No spring bottom, piston or valves. Price $1.50.—Fulton Co., Knoxville, Tenn.

COMMON-SENSE SHOCK ABSORBER



A shock absorber consisting of a strap, one end of which is fastened around the car axle, a spring attached to the other end of the strap and a friction device whereby the strap is taken in rapidly by the spring on the up-bound of the axle, but allowed to return slowly. The friction device and spring are attached to the inside of the frame. Price $12.50 per pair for light and medium weight cars, $15 per pair for heavy cars. —Common-Sense Mfg. Co., Runyon Street & Sherman Avenue, Newark, N. J.

VERSAL MOBILPOWER CONVERTER.



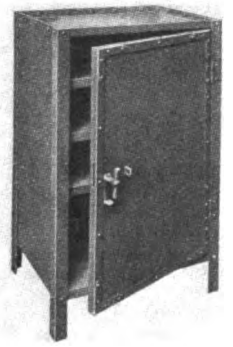
An inclined frame with cross shaft and pulleys against which the rear wheels of the car press, revolving the pulleys, convey the power to any machine desired. Frame is channel and angle iron structural steel, weight 90 lbs. Cross shaft runs in two 5 in. babbitt bearings lubricated by grease cups. Frame is slid in under rear axle and pushed down on rear end, this having the action of a jack, raising the car and allowing axle to slide down the incline till wheels are in contact with pulleys. Weight of car keeps them in contact. Belt pulleys 4 in. diameter, 5 in. face, speed 600 r. p. m. Price $28.50.—Versal Products Mfg. Co., Detroit.

Digitized by Google

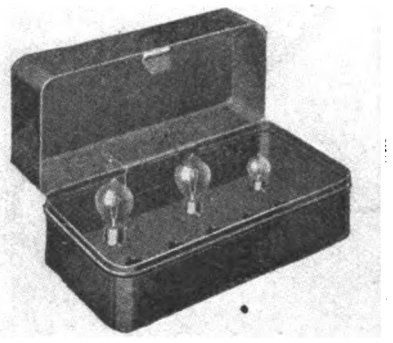
McGILL AUTOPOWER ATTACHMENT

An attachment for Ford cars whereby the power is taken from the front of the engine through an extension shaft and pulley so that it can be belted to grinders, saws, shellers, etc. Is attached to the car in about 2 hours by fastening a plate to the front cross frame member. An auxiliary fan supplements the Ford fan to assist in cooling the circulating water. A special clutch pulley enables the engine to be started and the load then applied. Pulley size 10 in. diameter x 4 in. face. Price $60.—Hyslop Bros., Toronto, Canada.

ARBOR PRESS BUSHING DRIVERS



A set of arbor press bushing drivers and ball race tools for Fords consisting of twelve tools. 1. Spindle body bushing driver. 2. Tool for removing inner or outer ball races. 3. Spindle arm bushing driver. 4. Triple gear and piston pin bushing driver. 5. Transmission brake drum bushing driver. 6. Slow speed bushing driver. 7. Tool for driving roller bearing sleeve on propeller shaft. 8. Driving timing gear on crankshaft. 9. Front wheel outer ball race driver. 10. Front wheel inner ball race driver. 11. Reverse drum bushing driver. 12. Transmission driven gear puller block. The price of the complete outfit is $30.—Service Station Equipment Co., 233 W. Schiller Street, Chicago.



SPLENDOLA BODY CLEANER AND FINISH

A body cleaner in powder form to remove oxidation and a liquid finish to be applied after the cleaner has been used to prevent further oxidation. Cleaner 25 cents per package, finish $1.25 per quart can.—C. F. Roberts Co., Inc., Detroit.

INDIVIDUAL WORKMAN'S CABINET

Individual locker with shelves and door with padlock. Door can be either sheet steel or wire. Width 21½ in., height 30 in., depth 15½ in., leg 6 in. Finished in brown enamel baked on. Frame is angle iron.—Manufacturing Equipment & Engineering Co., Boston.

HAYES ELECTRIC LIGHT BULB CASE

A black enameled metal box with spaces for eight bulbs, two for headlights and six for small lights. Bulbs are held rigidly in place without touching each other. Price $1 packed in carton.—Onguard Auto Necessities Co., Detroit.

FORD RADIATOR TEST PLUG

A test plug for Ford radiators constructed of hardened steel and high grade soft rubber. Price $3.—Service Station Equipment Co., 233 W. Schiller Street, Chicago.

RELIABLE RATCHET JACK

A ratchet-lifting jack designed for heavy loads. Detachable steel handle is 17½ in. long with a telescopic steel extention to 33 in. Can be put in place from standing position. An auxiliary foot catches the lowest axles. Motion of jack can be reversed by turning handle. Weighs 9 lb.; capacity 1 ton; lift from 11 to 18 in.; price $5.—Elite Mfg. Co., Ashland, Ohio.

STOLL AUTO BED AND TENT

A combination shelter and sleeping equipment which folds into package 4½x8x47 in. long. When in use, one end of the bed rests on the runningboard and tent roof fastens to top of car. An extra shelter tent fastens on other side of car. Bed clamps to runningboard without boring holes or marring. It has a steel frame with mattress fabric and twenty-two rows of flexible steel cables attached to tempered springs at head and foot. Weight 65 lbs. crated. Price $48.50.—Stoll Mfg. Co., Thirty-third & Walnut Streets, Denver, Col.

Doing Business *on the* CASH BASIS

DOING business on a strictly cash basis offers just as many advantages from the customer's standpoint as it does from the proprietor's standpoint. In fact, of those who have tried it, most of them believe that selling for cash benefits the buyer more than it does the seller.

There is an ingrown idea that the average man will object to paying cash because it is more trouble. But is it?

If he buys on credit he must wait for a slip to be made out and then sign it. Then he must save the duplicate of the slip, make a record in a notebook, or trust to the honesty and infallibility of the proprietor and his helpers. Finally at the end of the month he must check the items on the statement with the slips, confer with the proprietor on disputed items and then pay the bill.

Obviously, from this survey of the matter, it is easier for him to pay cash, and the proof of this statement is that car owners who have been educated to the advantages of the cash system are enthusiastic about it, believing it far ahead of the old, antiquated credit system.

Old Fashioned Credit Buying

Buying on credit, in most lines of trade, has no place in a wide-awake, up-to-date country where money is plentiful. Looking the world over, it will be found that the volume of cash business done is an index of the country's prosperity and degree of progress. Where progress is slow and money is scarce credit is the rule and payments long delayed. The advantage is as much with cash over credit as the one price policy of the more civilized countries is ahead of the haggle-and-get-as-much-as-you-can methods of less advanced countries.

Selling on credit represents a principle which no good business man would tolerate if applied to any other part of his business. Forget for the moment that we are talking about money inasmuch as it merely clouds the issue, and think of a purchase as a transaction. If the purchase is for cash the transaction is begun and completed on the spot. It is good business to complete the transaction as soon as possible after it was commenced. It is following out the most modern ideas. On the other hand a purchase on credit represents a transaction which is inexcusably drawn out for a long period with its satisfactory completion more difficult as each day goes by.

The cash system eliminates the dead beat—but he requires no consideration anyhow.

Of prime importance is the fact that paying as you go prevents disputes and misunderstandings which cause loss of trade and sometimes loss of reputation as well, inasmuch as the disgruntled ones may develop into knockers. This holds true regarding all phases of the automobile business but particularly the repair end.

When To Check Repair Bills

When a car has been repaired, the time for the owner to go over the various items on the statement is when he receives the car. It is then an easy matter to determine whether all the work has been satisfactorily done. On the other hand if he does not pay on the spot the chances are that he will not thoroughly satisfy himself that the work has been correctly done but will wait until something develops. The something may be an entirely new trouble but, in his ignorance, he may claim that it is due to some defect in the work.

In that case he will insist upon an adjustment of the statement when it is received. If the repairman does not make it, the customer may not only refuse to pay but may go elsewhere in the future. So the repairman is a double, yes, a triple loser. He loses on the work done, loses the customer's trade, and also the trade of others which the customer, if satisfied, might have brought to him.

Cash Avoids Disputes

It seems hardly necessary to explain in detail that similar disputes might occur regarding the purchase of supplies and accessories.

Having decided that it is advisable to adopt the cash system, the question of how best to do it must be solved.

In the first place the change should be scheduled for a day far enough in advance so that the customers may all be sold on the idea. The advantages of the change should be explained to each one.

After the new policy is in full swing, firmness is necessary in dealing with customers. There must be no exceptions to the rule *or the proprietor will soon be forced to make many exceptions and finally he will be back on the old basis.*

There will always be some customers, mainly those employing chauffeurs, whether business houses or private owners who will not find it feasible to pay actual cash for daily purchases. These may be taken care of, however, by using coupon books. The customer pays cash for the book which may be of any denomination and as purchases are made coupons are torn out.

Using Coupon Books

Books of $5, $10 and $25 will be found satisfactory. A little difficulty is offered because it is not convenient to use coupons of less than 5 cents but it is not serious. Suppose, for example, that the purchase came to $1.79, it would be necessary to take $1.75 or $1.80 worth of coupons.

There are two solutions. One is to tear out $1.80 and return 1 cent in cash, or else omit returning the cent. In this case, if the purchase was $1.77 only $1.75 would be taken out. In other words coupons to the nearest 5 cents are removed. This averages up very well so that in the long run neither proprietor nor customer loses.

Storage should be paid in advance. It should be due on the first of the month, and privileges of the garage should be withdrawn after a reasonable number of days, usually a week.

Perhaps the only exception that must be made is in the case of a concern whose driver may fail to notify it in time for a check to be mailed before the old book is exhausted. To minimize this difficulty it is good practice to notify users of coupon books in advance that it is time to buy a new one. This may be done by a printed postal card.

Benefits to Customer

1—*Elimination of error in paying for his purchases.*

2—*The necessity of recording his purchases so that he can check the statement at the end of the month.*

3—*The trouble of checking the statement, conferring with the proprietor regarding disputed items, and adjustments.*

4—*The danger of living beyond his means is automatically done away with.*

5—*Somewhat reduced prices because of the fact that the proprietor can use his capital for buying advantageously instead of for carrying his customers' accounts.*

6—*The customer holds the garage in higher esteem because down in his heart he knows that selling for cash is a more business-like way of doing business.*

Benefits to Dealer

1—*Prevention of misunderstandings, with consequent loss of money, trade or both.*

2—*Elimination of bad debts.*

3—*Reduction of capital required.*

4—*Simplification of accounting.*

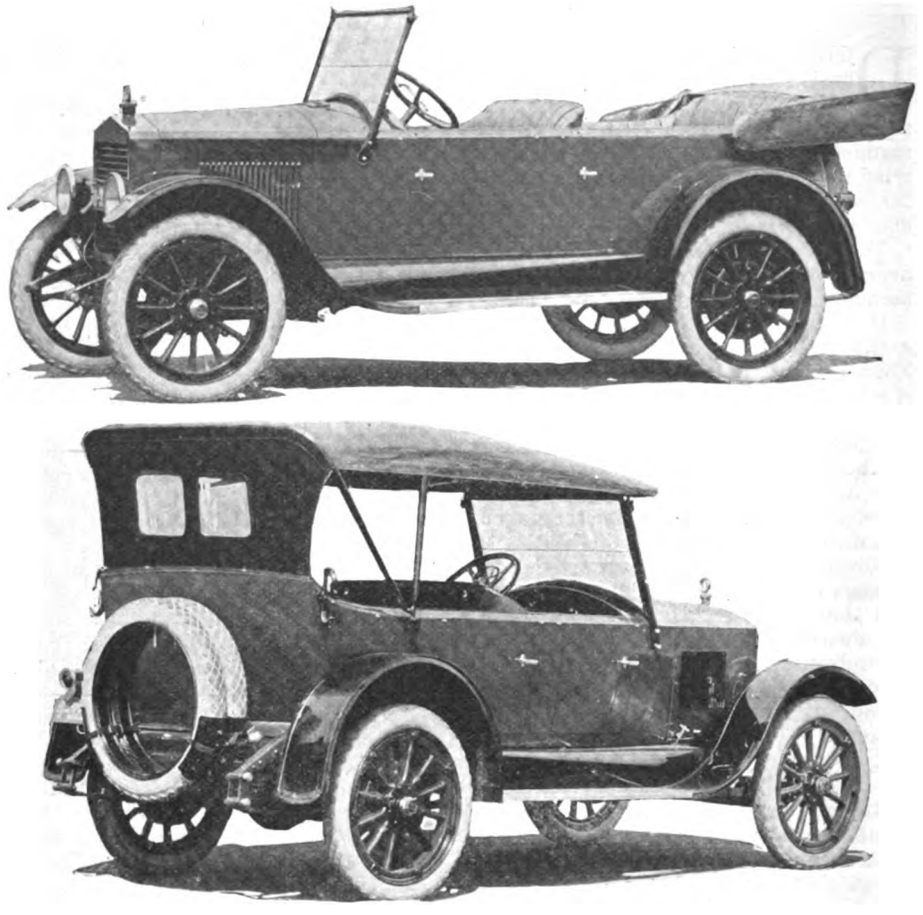
High Transportation Efficiency Object of Essex Car

Directors of Essex Motors All Hudson Officers—Distinctive Light Weight Four Will Be Marketed Through Hudson Dealer Organization

THE organization of the Essex Motors announced in Motor World last fall was followed with more than usual interest because its directors are also officers of the Hudson Motor Car Co. At that time it was stated that the new concern would have its product on the market during the summer of 1918.

It has been known for almost 2 years that a lighter, lowed priced car than the super-six would be furnished Hudson dealers. Although the Essex is being produced by an organization which is altogether separate from the Hudson company, it is being built in the Hudson factory and will be sold by Hudson distributers and dealers, thus giving it the stamp of an established factory and an established selling organization, based on a design brought out by engineers of Hudson experience.



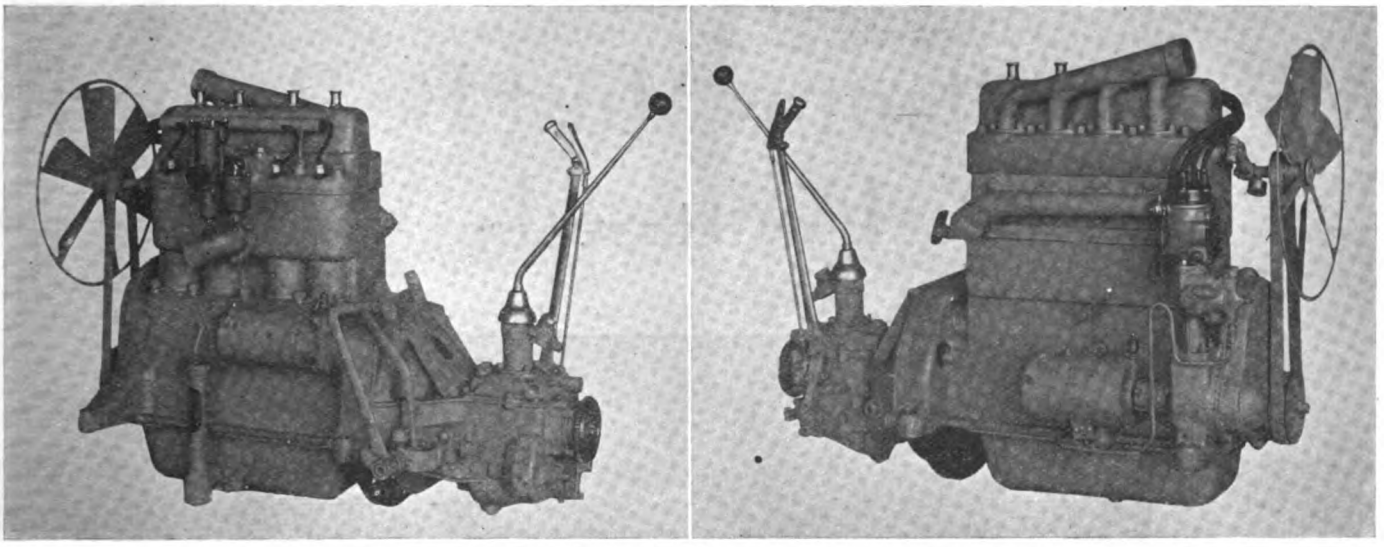
For the present a five-passenger touring car alone will be made. In the fall a Sedan model will be brought out. The body design is unusual, although beyond the more decided use of the beveled edge which is carried to the front end of the radiator, there is little about it which could be termed radical.

The car sells for $1,395, and incorporates the qualities making for low maintenance and economy. The wheelbase is 108½ in. although a side view makes this appear at least 115 in., due to the low hung body, short hood, long cowl and general distribution of space.

Probably the most unique feature of the car is its engine. This is of a lightweight high-speed type, 3⅜ x 5, having four cylinders and developing more than 55 hp. at 2800 r.p.m. This power, with a total car weight of 2580 lb. including filled tank and two extra tires, gives an unusually high power-weight ratio.

A representative of Motor World drove one of these cars over the roads around Detroit and found the speed range between 4 m.p.h. and 63 m.p.h. on high gear. The car is exceptionlly smooth riding, due to its balance and the use of 54 in. rear springs, one half the length of the wheelbase. Due to the use of Lynite aluminum alloy pistons and a fully counter-balanced crankshaft, there is no noticeable period, although this is generally found in the neighborhood of 28 miles per hr. on four-cylinder cars.

The engine is of special interest being unique in many particulars. It is peculiarly adapted to a car of this short wheelbase because of its short length. Although developing in excess of 55 hp. it is but 29 in. overall, thereby using but little of the wheelbase length. The intake valves are in the head and the exhaust valves on the side. The top of the cylinder head is removable, the manifold carrying the carbureter, being bolted directly to the head.



The Essex has the ultra-modern beveled edge body, the straight lines being carried even to the radiator. The lower view shows the back of the body and the high seat backs

The flow of gas from the carbureter is downward into the top of the cylinders, thus distributing the gas evenly into each cylinder. One of the objects of this method is to overcome starting difficulties in winter, as well as to assure even distribution. Another factor in the distribution of the gases is that the cylinder head and manifold passages are internally machined.

The cylinders are cast in a block. The engine is made up of three main castings; the cylinder block, cylinder head, and the crankcase, which is aluminum. There is an oil pan of pressed steel which can be dropped and which provides access to the main bearings. The design has been particularly carefully worked out for free intake gas passages. The machining of the ports which are of large diameter and the placing of the intake valves in the head, these valves being 2 1/16 in. diameter in the clear, permit of high volumetric efficiency and preclude the possibility of wire-drawing up to speeds of 3000 r.p.m. The car is so geared that the motor is turning over at 3000 r.p.m. at a car speed of 60 miles per hr. Inasmuch as the car is capable of more than 60 miles per hr. the speed possibilities of this little powerplant may be appreciated.

In accordance with the necessity for permitting high rotative speed, the crankshaft is of large diameter. There are three bearings; the front having a diameter of 2 1/16 in. and a length of 2¼ in., the center 2 3/32 by 2⅛, and the rear 2⅛ by 2⅝ in. The valve drive is taken through helical timing gears with the intake and exhaust valves both operated

Digitized by Google

The Essex engine has a very short overall length. The intake valves are in the head and the exhaust valves are at the side. The carbureter is mounted directly on the cylinder block and the distributor and generator mounting are very accessible

on the same camshaft. The cams are integral with the shaft which is carried in four nickel babbitt bearings. The intake valves are operated off a rocker arm, while the exhaust, being on the side, is actuated through straight push rods.

Thermo-syphon water circulation is used, the cooling system being to a large degree controllable by the operator through hand-operated shutters on the radiator. A Boyce motometer is part of the equipment. The water enters at the center of the left side of the waterjacket and is carried off slightly to the right of the head. This gives free water circulation around the plugs and valves through large jackets.

Lubrication is by constant level, circulating splash. The reservoir is in the pressed steel oil pan, bolted to the base of the crankcase. This pan is so exposed to the air draft resulting from the motion of the car that the oil is kept cool. The oil pump is connected with the throttle so that the length of the stroke of the oil pump is in relation to the throttle opening. From this point the oil overflows into splash troughs in the usual manner and the bearing surfaces are lubricated by the spray from the connecting rods.

Gasoline is supplied through the Stewart vacuum system, the gasoline tank being in the rear, having 13 gal. capacity and protected by being within the frame extension. The tank carries an automatic gage.

The carbureter is made particularly for the Essex, being a product of the engineers who designed the car and is a piston type in which a piston is raised by the suction of the engine, lifting in its turn the metering pin which governs the gasoline feed. For starting there is a strangling device.

Delco electric equipment is used for lighting, starting and ignition. Lighting and starting is by the two-unit system with the generator mounted on the right side of the engine, being fastened to the crankcase by means of a strap around the center of the generator housing. The drive is taken off the same gear which operates the Delco timer-distributer unit. The starting motor is mounted on a flange on the left side of the crankcase engaging with the fly-wheel by means of a screw gear. The electric lamp equipment includes parabolic head lamps with dimming attachment, instrument light, tail-light, and there is also an electric motor-driven horn located beneath the hood. The electrical switches are equipped with security lock and keys. The spark plugs are in the head just to the side of the intake valve.

Essex Specifications

Price, touring	$1,395
Make of engine	Essex
Number of cylinders	Four
How cast	Block
Bore	3⅜
Stroke	5
S. A. E. horsepower	18.2
Ignition	Delco
Carbureter	Essex
Starting-lighting system	Delco
Clutch	Disk
Gearset	3-speed
Wheelbase	108½
Tires	32 x 4
Wheels	Wood
Steering	Left
Control	Center
Type rear axle	Floating

The multiple disc clutch is contained in an oil-tight case in the center of the flywheel, thus forming in connection with the engine and gearbox a unit power plant. The clutch has cork inserts giving a soft engagement. The gearbox is a standard three-speed type mounted on roller bearings throughout, provided with a lock to hold the gears in neutral position. The rear incorporates Hotchkiss drive with semielliptic springs mounted or shackled at the rear on continuations of the frame unit. The rear axle is a floating type with a reinforced pressed steel housing in which the driving gears and differentials are mounted on a separate carrier bolted to the housing. This carrier, together with the assembled gears, can be removed without taking the axle from the car. The driving gears are helical type. The ratio in the rear axle is 4.75 to 1.

One of the unusual features of the car is the size of the brakes. The brake bands are 14 in. in diameter and 1¾ in. wide. These are on the rear wheels, which carry 32 by 4 in. tires. Wheels have twelve-spokes front and rear. The spring suspension covers an unusual proportion of the wheelbase, the front spring being 36 in. in length and the rear 54 in. Both springs are 2 in. wide. This gives a total of 90 in. of spring length out of a wheelbase of 108½ in., or 83 per cent of the wheelbase length. The frame is also unusual in its dimensions and construction. It is a channel-beam type 6 in. in depth at the point of greatest stress. The powerplant is bolted to the frame at the rear direct to a cross member. The frame is strengthened both at the front and rear by tubular cross members.

Due to the short engine and the use of the unit powerplant, together with an absence of lost space between the radiator and engine at the front end, it has been possible to put an unusually roomy five-passenger body on this car. The driver's compartment can be entered or left without difficulty and the operating levers are within easy reach. In appearance, the body is distinctive owing to the beveled edge running from the front end to the rear. This gives a noticeably straight effect. The shape of the radiator is distinctive being a straight angle on top instead of a curve, and the slanting windshield set well back on the cowl presents an attractive appearance. The seats have high backs reaching the passenger's shoulders on an average height man. Cushions are deep and set low so that at no time are the knees of the driver above the edge of the car.

Why Headlamps Must Be Properly Focussed

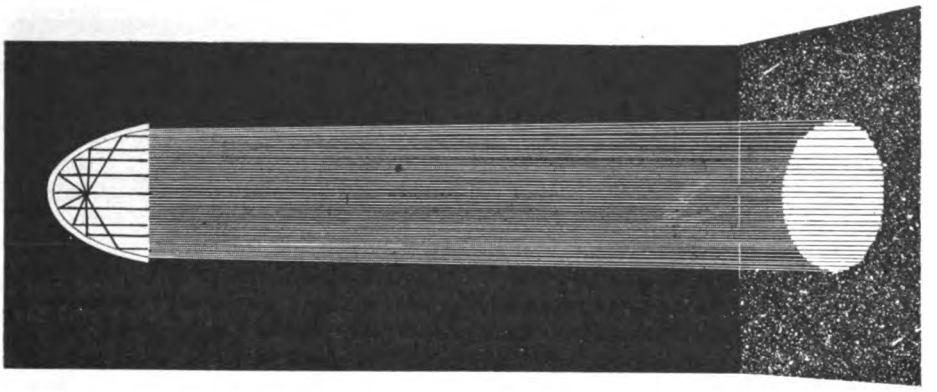

Fig. 1—Showing the almost cylindrical beam of light which issues from the parabolic reflector of a headlamp when the bulb is correctly placed at the point of the focus

1—Unless headlamps are properly focussed it is impossible to obtain proper illumination of the road.
2—The various types of glare eliminating lenses are designed to be used with headlamps that are properly focussed and accurately adjusted.
3—The addition of a glare removing lense to an improperly focussed lamp will not give the correct result.
4—Therefore, the first essential to good illumination and the elimination of objectionable glare is the proper focussing of the lamps.—EDITOR.

LIGHT projected from headlamps is almost entirely composed of beams from the filament of the lamp going to the reflector and reflected from there.

Light beams have the peculiar property of reflecting from a surface at the same angle that they strike it.

In other words, the angle of incidence and the angle of reflection are equal.

The reflector of a headlamp is made in the form of a parabola, which is a curve having a point called a focus. The curve is so designed that no matter where a beam of light be thrown from the focus to a point on the reflector, the angle of the reflector at that point will be such that it will reflect the beam parallel to the axis of the parabola.

The total number of all these beams are what form the cylinder of light which issues from a correctly designed headlight with its bulb at the point of focus, Fig. 1. Of course, an absolutely cylindrical beam would not be desirable, as the illumination would be too restricted, but that is impossible of accomplishment as the source of light, that is, the lamp filament, cannot be concentrated in a single point.

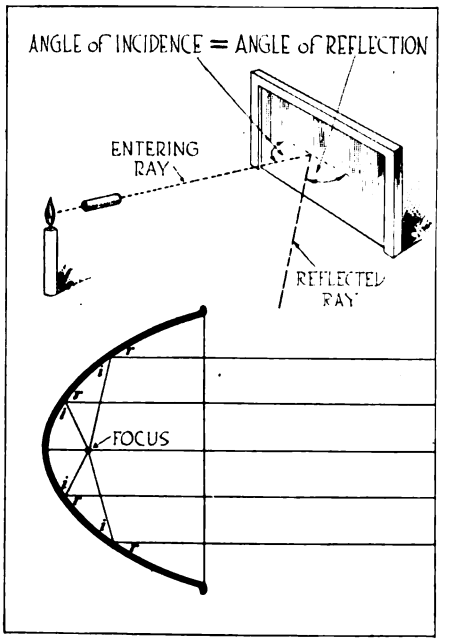

Fig. 2—Diagram showing the law of light; the angle of incidence is equal to the angle of reflection in the case of a beam of light striking a plane mirror, and below, as the same law applies to the light reflected from the parabolic reflector of a headlamp

The fundamental law of light already referred to, that the angle of incidence is equal to the angle of reflection, and the application of this law to the parabolic reflector of a headlight, is shown diagrammatically in Fig. 2. It will be seen that the angle of incidence of any one of the beams of light is the same as the angle of reflection of the same beam, no matter at what point on the parabola the beam strikes the reflecting surface.

It is only possible to make one curve that has this property, but it is possible to cut the ends off the curve at any point without affecting the back part of the reflector.

The main fact to be kept in mind is that there is only one point located in the parabola which will throw the light beams to all parts of the parabola at angles so that they will be reflected parallel to the axis.

Digitized by Google

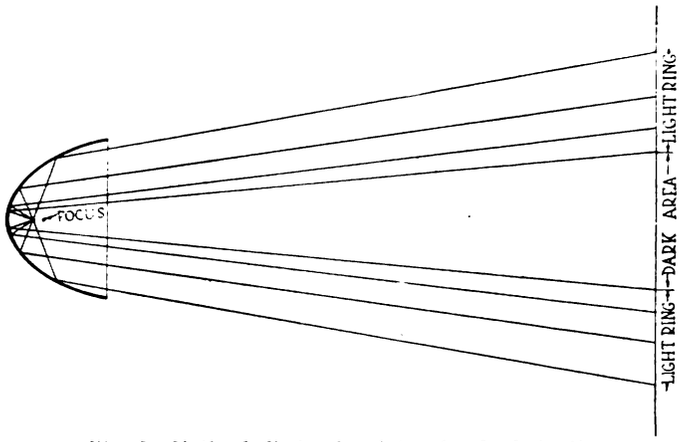

Fig. 3—If the bulb is placed too far back in the lamp the resulting beams of light will diverge, leaving a dark area in the center, surrounded by a weak ring of light

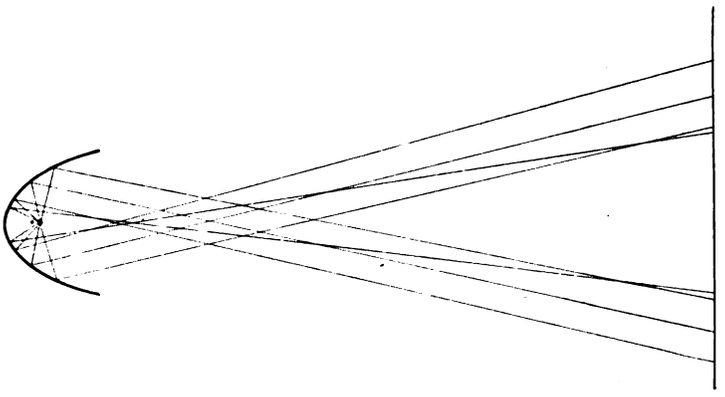

Fig. 4—If the bulb is too far out, that is, is situated in front of the point of focus of the reflector, the rays of light will cross at a point near the lamp and cause a weak widespread illumination

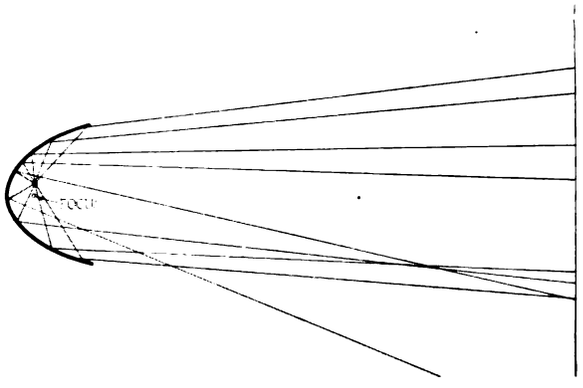

This is why it is so essential that bulbs be properly focussed.

If a lamp filament is placed at any other position than the focus, the rays issuing from the reflector will either diverge, giving an extended, weak light, or else they will concentrate in a ring around a dark central circle, Figs. 3, 4 and 5. Neither of these conditions is to be desired, consequently the filament must be in its correct focal position to give a powerful, even light in a small area.

Almost all headlamps are provided with means for moving the bulb in and out on the line of the axis, so that this adjustment is not difficult. It is simply a matter of moving the bulb in and out till the lighted area is even, well lighted and the proper size.

If it is impossible to secure this result, there must be some defect. Headlight bulbs are made with focal lengths of ¾ and 13/16 in. and with the filament concentrated in as nearly a point as it is practical to manufacture.

Fig. 5—If the lamp is above or below or at either side of the focus there will be diversion and crossed beams that will give insufficient illumination at a distance

Although both of the focal lengths should answer equally well, perhaps the particular lamp construction will not allow the filament to extend or recede far enough and the other focal length bulb may be tried.

Be sure that the bulb does not have an extended or long filament. It is impossible to get the correct focus with such a filament. There is also the possibility of the filament being out of the axial line of the reflector on account of the socket connection being too loose, bulb defective or something bent in the socket support. Proper remedies to these cases will bring the filament to its correct position.

Lauraine Car Generator

A GENERATOR which may be either gear, chain or belt-driven from the car engine, is being manufactured by the Menominee Electric Products, Inc., 1765 Broadway, New York City. This generator has a normal output of 50 watts, 6 volts and 8 amperes. Under charging conditions the generator begins to charge the battery at about 900 r.p.m., the voltage at that speed being 10½, and the amperage just overcoming the current of the battery. Voltage rises to 11¾ at a speed of 1600, and amperage rises to 7½, which is approximately the maximum in each case.

The generator is built in two types, both being identical, with the exception of the bearing equipment. Model FP is provided with phosphor-bronze bearings, lubrication being taken care of by a wick oiler with return groove to prevent oil throwing. Type FB is provided with Norma ball bearings.

A Ward Leonard regulator is used, and this may either be mounted in a unit with

the generator, in which case there is only one binding post, the ground return being through the frame; or, if desired, the regulator may be mounted at a distance from the generator. In this case, there would be three leads. The armature is laminated, and made up of sheets of high-grade armature steel. It is shunt wound. The commutator has 24 sections, insulated with Canadian mica. Carbon brushes are specified, and, as the armature is carefully balanced, good commutation is obtained at all speeds. The shaft is of high-grade steel, polished, and ½ in. in diameter. The frame is of the bi-polar type, of semi-steel.

The entire generator is finished in glossy black enamel, and is mounted to a plate by means of two ⅜-in. studs in the bottom of the machine. To obtain the correct speed for charging, the generator should run from the engine at 2:1 for medium-speed engines and 1½:1 for high-speed engines. The price of the Model FP with plain bearings is $25, while the ball-bearing Model F B lists at $30.

To Probe Entire Airplane Program

Searching Investigation Should Reveal Much to Clarify Situation Without Helping Our Enemies

WASHINGTON, May 13—The entire airplane program is to be probed. Following a letter addressed to President Wilson by Howard E. Coffin in which he "requests and urges that an official inquiry be had in order that the reputations of innocent men may not be ruined," the President has replied saying: "The Department of Justice will co-operate to the utmost in seeing that all charges are probed and the truth got at."

This investigation should result in making public volumes of information which will create some optimism among the American people.

Many Misleading Reports

Many misleading reports of a critical nature have been given very general circulation. A case in question was that recently a hydroplane with a Liberty engine was flying over an aviation field near the capitol, when a single-seated French fighting plane drew near and not only flew around the American machine but gave a demonstration of fighting stunts that the hydroplane was never expected to perform.

There was only one inference from the report, namely, that our planes were vastly inferior and not up to fighting requirements. This story went broadcast. It discounted our own machines.

The error lay in the fact that it was utterly ridiculous to compare the two machines. They were intended for entirely different work and each was built for its specific job. The French machine was a stunt battleplane. The American hydroplane was for observation and other purposes.

When the pilot of the French machine read the comments in a Washington paper he was thunderstruck at the ignorance of the paper and amazed to think that such unreasonable and ridiculous comparisons should be imposed on the American public. Such a comparison would never have been thought of in France.

Borglum Report Discredited

The general discrediting of the alleged official report by Gutzon Borglum, the New York sculptor, in official Washington, is one clarifying feature of the week. Until the correspondence between President Wilson and Borglum was made public there was a very general feeling that the President had commissioned Borglum to furnish an official report.

This has been specifically denied. Borglum imposed himself upon the President, and, as the President might have done with any other friend, he suggested that officials would be glad of any information that would shed light on the highly embroiled aircraft situation.

As the Borglum report has not been made public, it is not definitely known what it embraces, but sufficient has been made known generally to discredit the report, and it is fortunate that a Senate investigation requested by Coffin will take the place of any reports such as the Borglum one.

Unfortunately, too much circulation has been given to the report of the Aeronautical Society of New York. This report has been peddled around for publicity purposes, and can only be construed as a sorehead production. It deals too much in generalities to be of any value.

It is most unfortunate that the rumor of the Liberty engine being nothing but a Packard engine should have been given such circulation. This looks like driving a wedge into the industry. Such a rumor would never have gained circulation had stories of the Liberty engine, which were written as long ago as June, 1917, been permitted to be published. Officials of the Aircraft Production Board wanted such information given out, but it was stopped in other ways.

Based on Foreign Design

The public should know that the fundamentals of the Liberty engine are based on European designs, and that the present engine is not the experimental engine developed by the Packard company, and for which it was reported that the Packard company is now asking the government for a sum between $500,000 and $1,000,000 to pay for the development of its aviation engine—an engine it bodily set aside when the development of the Liberty engine was started.

The design of steel cylinders of the Liberty engine, which are made from forgings, and have stamped water jackets welded in place, were taken from the Mercedes racing cars which won the Grand Prize race in France in June, 1914, scarcely a month before war was declared. We know that Mercedes was manufacturing aviation engines of this type in great quantities before war was declared, and that when war was declared there were over 3000 of these engines ready for use. There are engineers in America to-day who visited the Mercedes factory in Germany and saw these engines.

The Liberty Engine

In the Liberty engine practically no effort is made to interfere with this design of cylinder. The valve position was not changed. There may have been some detail changes, but fundamentally the cylinder design originated in Europe and not in America.

The present Liberty engine has the two groups of six cylinders set at a different angle than the original Packard aviation engine. Many other examples might be cited to show that the present Liberty engine is not a Packard engine, although there may be many details in it that were Packard, the same as there are many details developed by other companies. The connecting-rod design was developed by DeDion. It is approximately the same as used in Cadillac cars, which copied the DeDion practice. So it is with other details entering into the design. In view of this it is unfortunate that the impressions should have gone abroad that it is a Packard engine.

Credit Where Credit Is Due

Packard must be given due credit for the development work it did during 2½ or 3 years previous to the war, and nobody will have any thought of not giving credit where credit is due. Undoubtedly the company spent over $500,000 on this development work previous to our entering into the war, and unquestionably much of this experience enabled Lieut.-Col. J. G. Vincent to make the progress that was made in the design of the Liberty engine. This, however, is quite different from calling the present Liberty engine a Packard engine.

At present it would seem that all accusations as to profiteering, etc., on the part of airplane manufacturers on the $640,000,000 appropriation are most groundless, and perhaps the most ridiculous rumors of the day. Such rumors are based on the condition that so few planes have been manufactured. The report has been circulated that each of the planes that we had on the fighting front in Europe cost us approximately $140,000,000. This is about as ridiculous, although it may be true, as to say that the first automobile of a given model may cost $150,000, which sum includes development costs and jigs and tools.

How Some of the Money Was Spent

Some recent reports have been given out as to some of the ways in which the $640,000,000 has been expended. Some of these items are as follows:

A—For airplanes, engines, and general machine equipment	$163,000,000
B—For hangars and aviation fields in U. S. A.....	42,000,000
C—For aviation fields, etc., in France	31,000,000
D—For gas balloons	5,000,000
E—In the hands of disbursing agents	31,000,000

This gives a total of $272,000,000, but it is stated that the War Department has already expended $307,000,000 for air-

Digitized by Google

planes and fields, not all of which appears in this tabulation.

There is a balance on hand of $433,000,000 not expended which gives a pretty general impression of how the Aircraft Production Board will be able to explain where the $640,000,000 has been expended without any profiteering.

Some conception of the size of the Signal Corps may be obtained from the following information. The personnel includes the following:

Military aviators	3,600
Graduates of aviation schools	6,100
Men examined and waiting..	5,000
Flying and non-flying officers in this country	15,000
Total Signal Corps roster...	133,000

It has been given out to-day that production for the week of April 27 was 136 combat and bombing planes, which is taken to mean the DeHaviland type fitted with Liberty engines. In addition there were 500 combat and bombing-plane engines. The first full boatload of Curtiss fighting airplanes was shipped to France last week.

Reports circulated in this country to the effect that contracts for 5000 Liberty engines have been canceled in favor of foreign contracts are untrue. No contracts for Liberty engines have been canceled.

Col. E. A. Deeds, who has been accused by Gutzon Borglum of being pro-German, and having changed his name from Dietz, and as having deliberately retarded aircraft production, welcomes the investigation, and states Borglum came to him last summer with a fish airplane plan based on a principle by which air was to be drawn into the fish from the forward end and blown out in the rear, the aviator staying inside and operating from there.

Deeds rejected the plan, which was also later rejected by the Aircraft Board. Deeds also had differences over money matters with Borglum a year ago regarding sculpture for Deeds' son's mausoleum, and with a memorial to Wilbur Wright which was to have been erected in Dayton. Deeds would like a military court martial investigation to clear his name.

Why Production Was Delayed

Airplane engine production is not where it was expected to be. Only one company, namely, Packard, is in quantity production on regular production basis. It has been turning out approximately 100 engines a week for some time, and should soon be gaining on this schedule.

It is known that its production has been hampered by difficulty in the manufacture of certain parts of the engine, delay having been caused, for example, by the problems involved in the manufacture of connecting rods. Other factories—for example, Marmon, Lincoln, Cadillac and Trego—have been making parts for weeks, and soon should be on a production basis. Marmon and Lincoln have built new factories and equipped these especially for this work. The Trego factory has been similarly fitted up. Without any serious unexpected delays it would seem that production should be tripled within the next couple of months.

There have been other factors that have held back the production of completed planes, these being delays on certain equipment, such as the machine-gun mounting referred to a week ago. The firms in the automobile industry cannot be blamed for the delay in production, as the question of machine-gun mounting was one that Washington decided upon. There were in one factory many practically completed planes which were held up for some months due to the factory not receiving from Washington the complete scheme of mounting all the equipment.

Have Been Delays

There have been delays in the development of the Liberty engine. It was unfortunate that the engine should have been approved at first without a pressure oiling system to the crankshaft bearings and the lower connecting rods. The first engines were produced without this. They burned out bearings in a matter of 8 to 10 hr. in endurance tests. Some engines were shipped abroad with the first oiling system. It is not surprising that some connecting rods have broken in French tests due to this. That was one of the troubles that perhaps should not have occurred. Many of our engineers knew better, but they were led to a compromise, on the ground that other engineers in the work had aviation engine experience and declared that the original design was satisfactory.

Perhaps this lubrication difficulty would not have been so serious had it not been that the engine first designed as a 330-hp. unit was stepped up to a 450-hp. rating. It is not surprising that connecting rods designed for 330-hp. should fail under a 450-hp. load. It is not surprising that an oiling system that was sufficient in one should fail in the other. It is not surprising that a radiator large enough for 330 hp. would not cool the 450-hp., and that heating should result.

It is useless to endeavor to cover up the fact that a great many changes have been made in the engine. It is reported that all told over 1700 changes have been made.

This figure is misleading.

Hundreds of these have been very minor changes in blue prints, which never affected anything further than blue prints. This does not conceal the fact that there have been hundreds of engineering changes.

American Engineers' Work

We could scarcely expect our engineers to become supermen overnight. They did the best that was humanly possible. They consulted with English engineers, French engineers, Italian engineers, and sent a commission headed by one of our leading engineers, Major Howard Marmon, to Europe to study conditions.

The Liberty engine was developed during his absence, and it is not surprising that when he returned from his investigation on the French and Italian fronts, and after visiting many airplane factories, he should recommend changes in the engine; and that French, Italian and English engineers should also have additional information to that available through the representatives of these countries in Washington when the Liberty engine work was started.

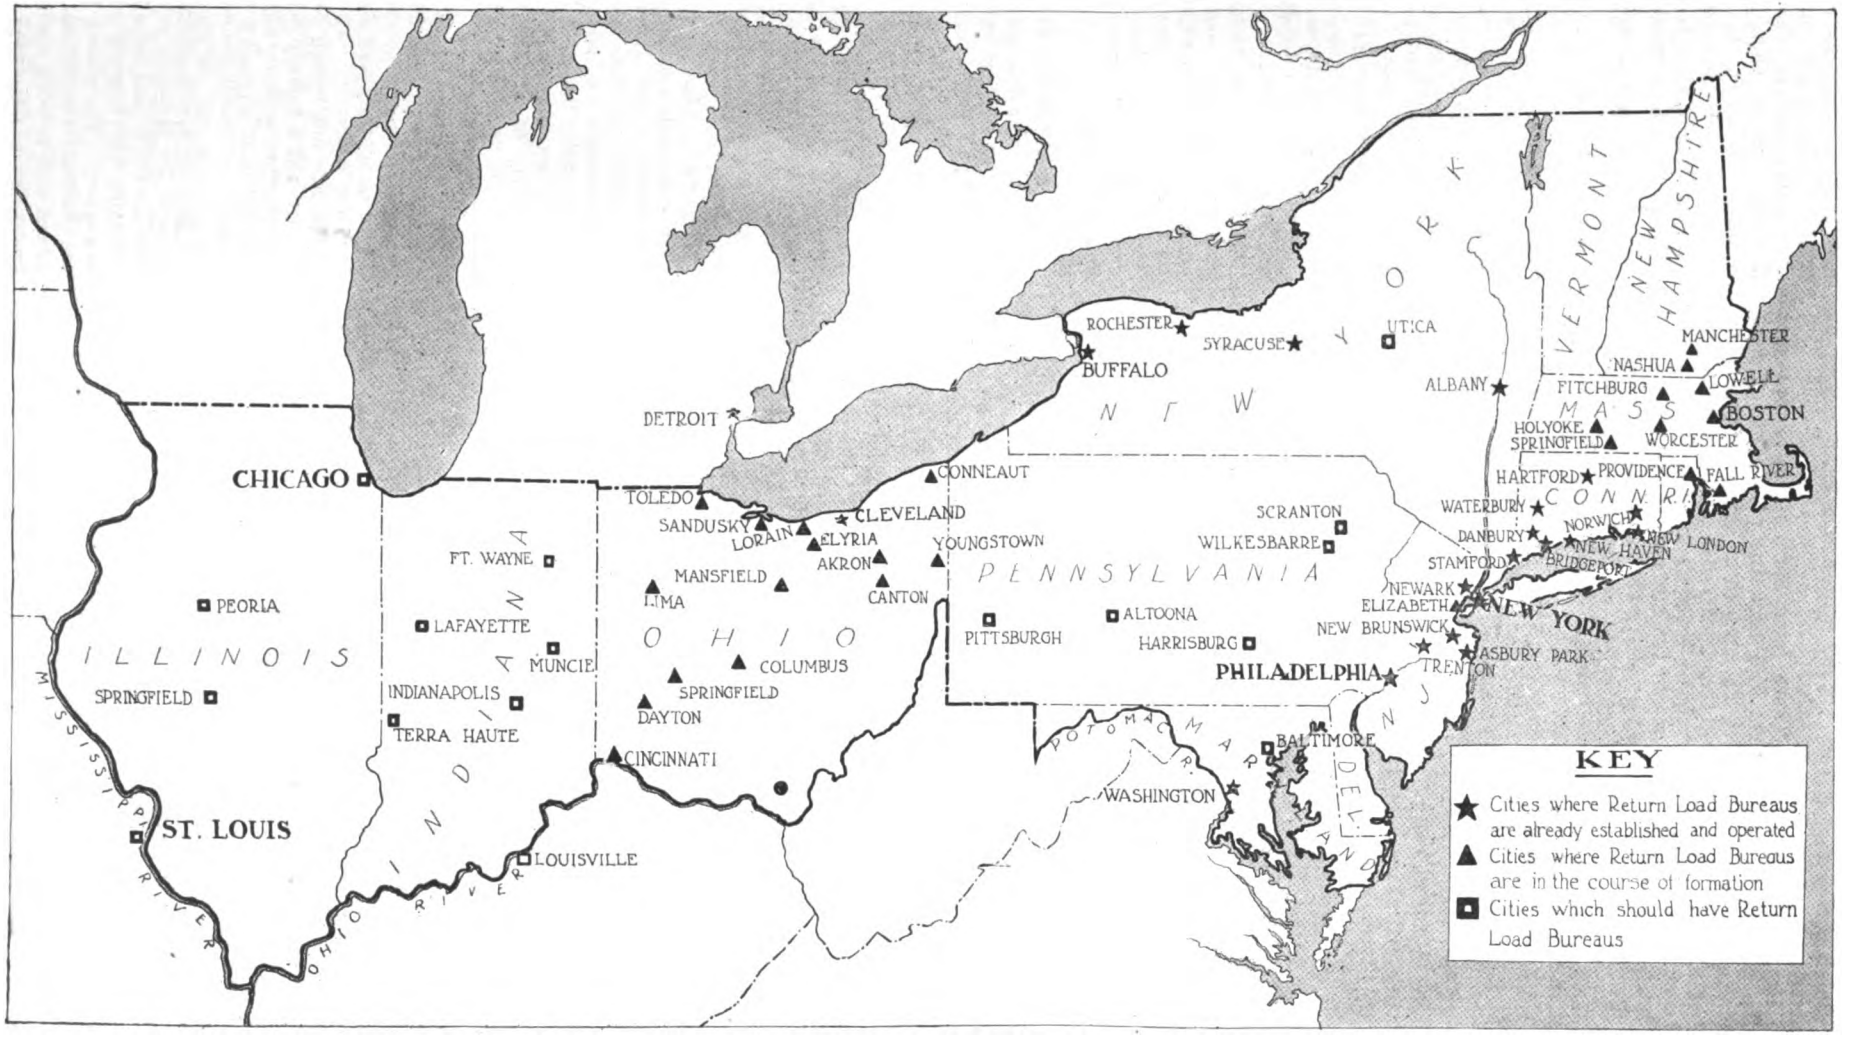
Other Engines Being Built

The airplane activities in America are not all confined to the Liberty engine. The manufacture of the Hispano-Suiza engine for training purposes has been going along in apparently a satisfactory manner. The Wright-Martin Co., manufacturing this engine, spent many millions in learning how to produce it and get into production. It is stated the figure approximates $10,000,000, and this is cited as an example of the difficulties involved and the time necessary for a factory schooled in high-class work to get into production.

The Bugatti, an Italian design of engine for scouting purposes, is being taken up, and some factories have been working for many months on getting it shaped up for production. The Bugatti is considered one of the best types of aviation engines built in Europe.

Development Takes Time

Reports from Europe tell of the great difficulties our Allies have had in the development of new types of aviation engines and of the long time required in such development. Fiat, which is one of the largest producers of automotive apparatus in Europe, has been known to have certain sizes of engines under development for considerably over a year, but is not yet willing to go into production on them. The same applies to some French engineering firms of the highest standing.



The criticism has frequently been made against the policy of the Aircraft Production Board in not distributing its aviation engine contracts to scores of firms in the automobile industry. The board has constantly defended its action on the ground that a factory designed for the production of a complete automobile would not be efficient in the production of Liberty engines.

Such a factory has a part for engine manufacture and assembly. It has a part for gearbox manufacture and assembly. There is another part for axle manufacture and assembly. All of these departments are not suited for engine manufacture, and a factory desirable for building aviation engines has to be specially laid out and equipped for that line of work.

There have been many complaints that three of the factories getting Liberty engine contracts had not only to build their factories but entirely equip them with machinery. The reason for this was that the Aircraft Production Board was convinced that to build engines in production quantities, as demanded by Europe, could only be accomplished by such a policy.

Return Loads Bureau Development at a Glance

The area in which it is planned ultimately to establish statewide Return Loads Bureaus extends clear east from the Mississippi and north of the Ohio and Potomac Rivers to New England. This territory includes the states of Illinois, Indiana, Ohio, Pennsylvania, Maryland, Delaware, New Jersey, New York, Connecticut, Rhode Island, Massachusetts, and the lower portions of Vermont and New Hampshire. As will be noticed, those bureaus actually established are so far along the Eastern seaboard. Connecticut is the only state with a statewide organization at present actually in operation

Digitized by Google

34 Cities Have Return Loads Bureaus

Six States Establish Headquarters and Movement Is Spreading—New England Linked Up

NEW YORK, May 13—There are today 34 cities in the United States with regularly established Return Loads Bureaus, and the movement is spreading to include many others.

During the past 2 weeks the greatest development has occurred in the State of New York, where bureaus have been established in New York City, Albany, Buffalo, Rochester and Syracuse. In New York City the bureau has been established by the Merchants' Association, which has appropriated $5,000 for carrying on the work. The Merchants' Association, however, is not co-operating with the organizations of the other bureaus in the upper part of the state nor with other associations which are endeavoring to inaugurate similar bureaus in the Hudson River valley between New York City and Albany to tie up return loads transportation between New York State and Connecticut.

Eventually Return Loads Bureaus will be established in the entire territory east of the Mississippi and north of the Ohio and Potomac Rivers, which includes the States of Illinois, Indiana, Ohio, Maryland, Delaware, Pennsylvania, New York, New Jersey, Connecticut, Rhode Island, Massachusetts and the lower halves of Vermont and New Hampshire.

For the present the Highways Transport Committee in Washington is confining its efforts to the establishment of Return Loads Bureaus on the Eastern seaboard, since it is in this territory that the greatest amount of congestion is liable to result during the coming winter. In this area there are now in operation thirty-four Return Loads Bureaus in the States of Connecticut, New York, New Jersey, Ohio, Michigan, the District of Columbia and Pennsylvania.

New Jersey Maps Routes

One of the most important developments of the system of the Return Loads Bureaus which is being perfected in New Jersey for operation between New York City and Philadelphia was inaugurated within the past few weeks by the officials of the Motor Truck Club of New Jersey in Newark, in co-operation with the New Jersey Assn. of County Engineers, in designating certain routes through the state connecting New York and Philadelphia as Return Loads Routes, and for the strengthening of bridges along these routes wherever necessary to carry a maximum load of 30,000 lbs. as allowed by the New Jersey Motor Vehicle law.

These suggestions were made by T. J. Wasser, County Engineer of Hudson County, who was brought into conference with the Motor Truck Club's committee by Charles T. Kavanagh of Bayonne, the committee chairman. Wasser is known as the father of the New Jersey motor truck law, as he was chairman of the special commission which drafted the measure under appointment of State Motor Vehicle Commissioner Dill.

The routes chosen were what are known as Route No. 1 and Route No. 13 of the New Jersey highway system. Both routes are the same from New York to New Brunswick, traversing the Lincoln Highway. From New Brunswick, Route No. 1 goes by way of Hightstown to Trenton, while Route No. 13 takes a course through Kingston, Princeton and Lawrenceville to Trenton. The Lincoln Highway is again followed from Trenton to Philadelphia.

Other routes to various other centers in New Jersey, such as to Camden, Atlantic City, Asbury Park, Morristown, etc., will be selected later. Coincident with their selection will be started an agitation to make improved highways of them where such condition does not now exist. Also the agitation will be continued to keep the roads always in good repair.

Return Loads Bureaus

The fact that the county engineers, under whose supervision road work is done in New Jersey, is co-operating in the plan, practically assures that the work will be done. The same officials have charge of the bridges throughout the state, and their co-operation assures bridges substantial enongh to withstand 30,000 lbs. This action is one of the biggest road improvement projects that has taken place in New Jersey since the advent of the motor truck.

The New England Highways Return Loads Association was formed in Providence, R. I., on April 18 for the purpose of establishing Return Loads Bureaus throughout all of New England, but more particularly at the present time in Rhode Island and Massachusetts. Connecticut's present very efficient bureau, with fifteen individual bureaus located in the large industrial centers of the state, will co-operate with those to be established in Massachusetts and Rhode Island.

This will result in the entire New England district being served by its motor-trucking equipment to the best possible advantage during the summer of 1918 and in the winter of 1918-1919. Officers of the new association were elected, as well as an executive committee of six, made up of two members from each of the States of Connecticut, Massachusetts and Rhode Island. The working organization is now being planned and letters are being prepared to be sent out to shippers and truckmen for the necessary information.

Detroit Dealers in Red Cross Drive

DETROIT, May 13—The Detroit Auto Dealers' Association will participate in the coming patriotic fund campaign. Three teams having been named from among the automobile men to work with the division under the direction of Howard E. Coffin. In the former drives the dealers have been very active, but not as an association unit as in this case.

W. L. Walls of the King Auto Sales Co., and Walter J. Bemb of the Bemb-Robinson Co. are captains of ten-men teams from the passenger car establishments, and John H. Thompson of the Thompson Auto Co. will direct the energies of the truck men, who have a team of their own. The men comprising the various teams are:

W. L. Walls, captain, G. O. Simons, S. C. Comstock, Wayne Murray, J. E. Morehouse, L. R. Fast, George W. Franklin, George H. Zuver, Thomas Walker, E. L. White. J. H. Thompson, captain, R. L. Owen, W. J. Gordon, Harry R. Graham, J. C. Ayers, A. H. Murray, L. F. Mullin, Frank Foster, G. E. Bleil, William F. V. Neumann. W. J. Bemb, captain, J. A. Schulte, A. L. Zeckendorf, E. S. Hilton, H. S. Quinn, C. E. Baker, C. C. Starkweather, C. E. Dawson, W. J. Doughty, H. H. Shuart.

J. Louis Moutier

Bertram G. Moutier

Detroit Organizes For Great Red Cross Drive

Whole City, Including Factories, to be Worked Under Complete Zoning Plan

DETROIT, May 13—To do away with a series of war donations one coming on top of another—Detroit has combined all activities into one and will launch a Red Cross campaign to be known as a Detroit Patriotic Fund May 20, coinciding with the national campaign for the American Red Cross. Detroit has pledged to subscribe $7,000,000. The committee has divided the city into ten sections, with a district chairman for each. The Factory Division, under supervision of Witter J. Peabody, will work on the same basis as in the Liberty Loan drive, and managements of plants will be asked to underwrite the contributions of employees.

A schedule of donations for factory workers has been worked out that is considered equitable in every way. It calls for a minimum gift of $1 per month for those earning up to $20 per week; $2 per month for those earning $20 to $30; for those earning $30 to $40, $2.75 per month; $40 to $50, $3.50; $50 to $60, $4.25; $60 and over, $5 per month.

For those better able to give, another schedule has been worked out. Up to $5,000, 3 per cent; $10,000, 4 per cent; $20,000, 5 per cent; $50,000, 6 per cent; $75,000, 8 per cent; $100,000, 10 per cent; $200,000, 12½ per cent; $300,000 and over, 15 per cent.

These schedules are based on an estimated annual income for Detroit and Wayne County of $325,000,000, of which $200,000,000 is received by persons earning $3,000 and under. They are not to be regarded as assessments in any sense, but merely as a guide. Some will give less, others more than the schedule calls for, but if the average is maintained in each class the allotment money can be raised.

Solicitation plans follow two different but interrelated lines—geographic and functional. The geographic division of the territory has ten general districts laid out in such manner that each holds about the same number and value of prospects. Prospects will be solicited at places of business primarily. Individuals and not corporations will be the basis of solicitation, although corporation gifts will not be declined if tendered.

In charge of each of these districts is a district chairman, and each will have 10 to 20 teams.

Second is the functional division of solicitation, of which individual givers and industrial plants are a part. The supervisor of industrial plants, in conjunction with the Manufacturers' Committee, has developed a plan for organized solicitation in factories. The primary essential of the plan is that work be done in co-operation with factory managements. The management should be asked to assign to a team at work in any plant some official to act as a member of the team and give active help in working out details of solicitation in the factory.

It is suggested that each factory team carry with it a speaker. Mass-meetings should be held. The management will act as a collector for the fund, deducting weekly amounts of pledges from the donor's wages and transmitting it monthly to the Detroit Patriotic Fund.

Advertising in sufficient quantities has been supplied, as well as 300,000 buttons, 5,000 factory posters, 10,000 6-in. emblems or stickers and 250,000 handbills in all principal languages.

Red Head Men in Convention

NEW YORK, May 13—The salesmen of the Emil Grossman Mfg. Co. have been in convention here May 10-13. The convention included meetings at the Astor, visits to the company's plant, to the J. Walter Thompson advertising agency, and to the Trenton pottery where porcelains are made. Those who attended were:

Emil Grossman, president; L. M. Schwartz, vice-president; J. N. Lowe, H. G. Wedler, W. M. Farans, L. Rosenberg, R. Cony, M. A. Edlis, F. R. Dworak, C. B. Charmatz, C. E. Lund, G. S. Salomon, Jos. Sacks, Chas. Weinberg, S. S. Frank, S. Prince, L. V. Hansen, J. Burke, R. L. Thornton, Thos. J. Irving, S. H. Richey, D. M. Lay, John U. Reber, R. Isaksen, J. F. Melzer, W. H. Grainger.

4-7ths of Organization Will Follow the Flag

Four of the Seven Moutier Brothers in Selective Draft, None Claims Exemption

PEORIA, ILL., May 13—Four of the seven Moutier Brothers who operate the Crown Auto Co. in this city are in the selective draft, three of them are in class A-1 and one is in B-4. In order to readjust their business to war time conditions, they are selling one of their branch organizations and are making numerous changes in the headquarters outfit here. Those in class A-1 are Bertram G. Moutier, who is business manager and buyer; Frank L. Moutier, manager of the branch in Eureka, Ill.; William A. Moutier, superintendent of the electrical department; the brother in class B-4 is J. Louis Moutier, manager of the LeRoy branch. All of the brothers have received thorough mechanical training and their organization is considered one of the best selling business and mechanical outfits in the central west. Not one of the brothers is claiming exemption.

Michigan Cancels Tractor Contract

DEARBORN, MICH., May 6—Because of the advanced season and the fact that much of the farmers' work was well under way, orders for Fordson tractors which were contracted for by this state did not come in as promptly as anticipated. The War Preparedness Board has canceled its contract with Henry Ford & Son. No orders were accepted after 12 noon April 27. Up to date Ford & Son received orders totaling 567 tractors. A number of orders held back at the board are still expected, which will increase this sum slightly. Sixty-two counties have been purchasers, Wayne County leading with a total of fifty-one tractors. Future requirements of the farmers will be handled through agents, of whom there are seventy appointed already. No price has been set as yet, but indications are that the retail price will be 800.

Close Business for 6 Weeks to Harvest

Whole Trade in New Mexico Town Votes to Shut Shop Beginning June 15 to Reap Wheat

CLAYTON, N. M., May 13—The Clayton Garage Dealers' Association has voted to close up the motor car business for a month or six weeks, beginning June 15, in order that all connected with the trade may help harvest wheat.

Only so much of the garages and salesrooms will be kept open as is necessary for maintaining a minimum of business.

The association is notifying other associations of what it has done, and is asking that similar action be considered in other sections. (Motor World would like to hear from other associations and readers on this subject.) The letter to other organizations, explaining the action, follows:

Gentlemen: At a regular meeting of the Clayton Garage Dealers' Association, held Tuesday, April 30, 1918, a motion was made, seconded and carried that you gentlemen be informed of the following resolution: We are engaged in the greatest conflict in the history of America. Between two and three million men are in arms. Five million more men are employed in shipbuilding, munition factories and industries pertaining to war. Behind these men one hundred million anxious hearts yearn for the boys on the battle front. In them, we have staked the future liberty and justice of the world. In us they have entrusted their lives for munitions and supplies. To furnish them with sustenance is our duty and should be our pleasure. Our failure to supply them with plenty would brand us as slackers and traitors. To have food and fail to take care and preserve it would be the greatest sin in the eyes of our maker.

Therefore, be it resolved that the Clayton Garage Dealers' Association close their shops and business houses beginning June 15, 1918, and continue the same to be closed from one month to six weeks; taking all able bodied owners, managers, and employees for service in the wheat field as the harvest so demands. And be it further resolved that each garage keep its office open selling supplies, repairs and storage; leaving one or two men who are not able bodied, and women, to take care of such trade. Be it further resolved that we shall advertise from now until harvest that our shops will be closed at that time, and until we all return when we shall resume our work as before. Be it further resolved that we take this up with other dealers' associations requesting that they earnestly consider the move and loyally support our Government by releasing men from the third largest industry in the world to preserve the wheat crop and doing our part for the boys over there.

Very truly yours,
CLAYTON GARAGE DEALERS' ASSOCIATION,
Clayton, N. M.
Allen Wikoff, Pres.

Deny Hal Reorganization

CLEVELAND, May 2—The rumor that there will be a re-organization of the Hal Motor Car Co. has been denied. Attorney O. O. Vrooman, who was trustee in bankruptcy of the company states: "As trustee I sold the assets of the company to a Chicago auction house and they have sold the assets on their own account. There will continue to be a Hal Motor Car Co. for the purpose of repairing and providing parts for Hal cars previously sold, but to the best of my knowledge there will be no re-organization of the company and no further production by it of new Hal cars."

N. A. D. A. To Meet May 17 and 18

ST. LOUIS, May 12—President Vesper of the National Automobile Dealers' Association said to-day that he expects every member of the Board of Directors of the association and every member of the War Service Committee to attend the special meeting to be held May 17 and 18 at the Missouri Athletic Association clubhouse.

"This meeting," said Vesper, "will have as its topic the arranging of means to carry out the six suggestions made by the War Service Committee and which have been accepted by the Government. The men of the trade are beginning to realize that it is life or death and that we can live only by practicing strict economy, because if we do not do this and we have money enough to bridge over, the government is likely to close those who ignore suggestions.

"We are in the position of the man in a sailboat who sees a storm cloud coming rapidly. The only thing he can do is to trim his sails and get ready. If the storm hits him, he has a chance to live. It is passes by, he has not lost anything except a desperate risk. But this storm is not going to pass by.

"The trade realizes that the storm is not going to pass over us and that is the reason we have had acceptances from practically everybody."

Grand Rapids Joins N. A. D. A.

ST. LOUIS, MO., May 12—The Grand Rapids, Mich., Automobile Dealers' Association has come into the N. A. D. A. with its entire membership.

Class B Sterlings En Route

MILWAUKEE, May 11—Thirty Class B military trucks, assembled by the Sterling Motor Truck Co., Milwaukee, were dispatched from the plant on Thursday, May 9, under their own power to Baltimore, Md., in charge of Capt. Alex Brunson and his company of 86 men, which has been stationed at the factory for the last three weeks to study the construction and maintenance of the trucks. The trucks were accompanied by three Dodge officers' cars. This is the second convoy of military trucks to be dispatched overland from the Sterling factory, ten Class B cars having recently been sent to Camp Grant, Rockford, Ill., in charge of a detachment of soldiers from the camp. This trip was made in less than two days.

Now Holley Carburetor Co.

DETROIT, May 11—The name of the Holley Kerosene Carburetor Co. has been changed to Holley Carburetor Co., which has just been incorporated with a capitalization of from $100,000 to $150,000.

13 Miles of Bad Road Mean Side Trip of 300

But Texas Is Going to Improve It Thereby Opening Gateway Across Rio Grande

KANSAS CITY, May 13—Thirteen miles of roads are to be improved this summer which will prove of tremendous value to an area as large as several eastern states but forming only a small corner of Texas. This thirteen miles is the shortest distance and most available route across the sand dunes northward from the Rio Grande valley, and will be one element in the motor vehicle highways connecting Brownsville with Corpus Christi and San Antonio.

The Rio Grande valley, in the southern part of Hidalgo County and eastward to Brownsville, has been settled largely by people from the middle western farming states who had money and sought the ideal conditions for agriculture. They have paid two to three hundred dollars an acre for the land; raising crops by irrigation. Most of them have motor cars, of the higher-priced variety. On some of the smaller farms, where deep plowing is not necessary, there are tractors. These are the kind of people who want to do things in the very best way.

Detour of 300 Miles

But the district has been isolated from the rest of Texas by the sand country in the north. The people with their high-powered motor cars have had to go two or three hundred miles out of their way to get to the more strictly settled portions of Texas. The King of Trails highway, extending due north from Mt. Allen in Hidalgo County, through Brooks County to Corpus Christi, is routed over this thirteen-mile stretch of sand road.

The road is now impassable. But Brooks County, in which it is situated, has $35,000 in the treasury to arc-surface it; has $20,000 of federal aid and $5,000 of state aid available. It will build this road this summer and the people of the Rio Grande valley can motor over to Corpus Christi and San Antonio. The latter is 300 miles and the former is 150 miles by this road from Brownsville.

Federal aid was granted to this road because it is part of the post road designated by the government, on the Jefferson Davis Memorial Highway.

Brooks County is a dry country. It has had little more than a sprinkle of rain for three years until this spring. It has good moisture now and a big crop of cotton is expected. The road will be a prime essential in moving the cotton out and bringing in to the farmers the products that they need.

More than that, the cotton crop will give the farmers the compensation they have been needing for their valued persistence in the task of raising crops in that country. The road is expected to do a great deal toward the building of the country, as well as providing a means of communication between the irrigated

Digitized by Google

area to the south and the better known parts of Texas to the north.

Hidalgo County takes care of its roads in great shape. They are rolled and dragged after every rain. Since rains do not come frequently the people of the county flood the roads occasionally from the irrigation ditches and then drag them. These roads are as hard as rock and are perfect highways.

Changes in Price

NEW YORK, May 13—The following changes in price have been made during the past week:

	New Price	Old Price
Daniels, all models..	$3,500	$3,250
Dixie, 2 and 5-pass...	1,095	995
Dodge, touring.	*985	885
Sedan	*1,425	1,350
Peerless, 7-pass. touring and 4-pass. roadster	2,550	2,340
Coupe	3,050	2,850
Sedan	3,250	2,990
Velie, model 38, 2, 5 and 7-passenger ..	1,390	1,340
Sedan	1,935	1,885
Model 39, 7-pass..	1,645	1,595

*Effective June 1.

Expect Record Michigan Registration

LANSING, May 8—According to present indications more licenses will be issued in Michigan this year than were issued in 1917, when the state department licensed 227,000 motor vehicles. Owing to the war it was believed that fewer cars would be operated this year, but already 206,000 permits have been granted. It is now estimated that the total licenses for 1918 will exceed 250,000.

Here's the Community Dealer

MILWAUKEE, May 13—George W. Browne, Automobiles, Inc., 510-520 Broadway, Milwaukee distributer of the Overland and Willys-Knight, has announced a plan of establishing a system of community dealers. The first appointment is that of the Edgar F. Sanger Co., 156 Farwell Avenue, Milwaukee, which will act as authorized retail dealer and service station for the Willys line in the Milwaukee county territory. Other community dealers in various sections of the city and country will be appointed shortly.

Goodrich Publishes Annual Truck Book

AKRON, May 7—The 1918 edition of the annual truck book, "Motor Trucks of America," published by the B. F. Goodrich Co., is ready for distribution through the company's branches. This book is for the benefit of truck manufacturers, their agents and salesmen, as well as the prospective buyer of trucks. The photographs and specifications shown are furnished, checked and approved by manufacturers. They are arranged to permit easy comparison of the details of any two makes.

Cattle by Thousands Saved by Motor Trucks

Farmers Find It Impossible Without Trucks to Get Sufficient Feed—Prove Economical

DALLAS, May 10—Motor trucks not only have proved profitable investments in south, southwest and west Texas, but they have saved the lives of many thousand head of cattle and sheep in this great cow country. In fact, it is estimated that tens of thousands of cattle have been saved.

For without motor trucks that are in service from railroad points enough feed never could have been hauled across the plains to the great herds of cattle in this drouth-stricken section of the cattle region of Texas. Cattle men and business men of this region of the state are of one accord that the motor truck has saved the day. In addition to hauling the feed, many trucks have been used in hauling water to the cattle. In other instances the motor trucks have been used to haul the cattle from the drouth-stricken region to green fields.

As a result of this work there are few cattle ranches that are not provided with from one to five trucks. The owners say they are paying investments, and they intend to buy more. In addition to this, in that section of the state many men have quit other lines of business, have organized truck companies, and are using these in freighting.

Not only have the trucks proven of vital importance in the transportation of all kinds of foodstuff, but they have proven to be more economical by far than horse or mule teams, according to the cattle raisers. Also the individuals and concerns engaging in the trucking business, and charging so much a ton-mile, according to loads, have made a rich harvest. Men whose farms failed because of the drouth have gone into service on the trucking lines and the cattle raisers say with trucks they are getting their foodstuffs much cheaper than they could before.

More Room for Martin-Evans

NEW YORK, May 13—The Bolton-Wechtel Co., Inc., 1188 Bedford Avenue, at Putnam Avenue, Brooklyn, has purchased the battery, magneto and speedometer portion of the business of the Martin-Evans Co. The building will be remodeled so that service can be given on starting and lighting systems, and the Martin-Evans Co. will move to a new five-story building now in process of construction at Bedford Avenue and Bergen Street.

Munitions Money Makes Buyers

PHILADELPHIA, May 13—Shipbuilding and war munition plants within a radius of 25 miles of this city have increased the number of men earning a salary of $7,000 and upwards a year to 500,000, and this has proved good for the automobile trade, dealers assert. There are more than 300,000 prospective buyers in the territory. In 1917 alone, Pennsylvania increased its motor vehicle registration by 94,505. Nearly 500,000 motor vehicles are registered in this territory and more than $4,000,000 was paid in license fees in 1917. At the present rate of registration it looks as if these figures would be greatly exceeded.

Stewart Tank Patents Valid

CHICAGO, May 7—That the Stewart-Warner patents, covering its vacuum feed system are valid but have not been infringed by the Thermo-Vacuum System, is the gist of a decision which has just been rendered. The suit was brought by Webb Jay and the Stewart-Warner Speedometer Corp. against Frederick Weinberg and the Auto Parts Co., Detroit, and charged infringement of patents No. 1,067,814, issued to Higgonson & Arundel; 1,132,273, to Jay; and 1,134,457, to Jay, upon a vacuum tank for automobiles. Judge Sanborn, in the United States District Court for the Northern District of Illinois, rendered the decision. The Stewart-Warner Corp., which alleged that ten claims of the two Jay patents were infringed, will appeal.

Ship Cars on Barges

LOUISVILLE, May 13—For the first time in the history of local inland waterway transportation automobiles are being shipped South on barges. The towboat John Barret passed down the Ohio River this week with three big barges loaded with 400 new machines bound from Cincinnati to Memphis, Tenn. A large number of the cars were sent from Detroit to Pittsburgh, and there loaded on the barges and taken down the river to Cincinnati.

Kansas City Dealers Buy $3000

KANSAS CITY, May 13—The Motor Car Dealers' Association of Kansas City bought $3,000 worth of Liberty Bonds of the third issue out of its treasury. The association already owns one thousand dollars' worth bought of the second issue. No campaign was made among the members this year because of the different plan of the central campaign committee; during the previous Liberty Loan campaigns, motor car dealers subscribed at one of their meetings, individually, for $15,000 worth of the bonds.

Ohio to Complete Work on National Road

COLUMBUS, May 8 — Instructions have been issued by Ohio officials to finish the gaps of the National highway between Columbus and the Ohio River, as several stretches are still to be improved to make an ideal highway to the east. Convicts will be used to complete the work, which will be rushed as rapidly as possible. In Muskingum county a stretch of 12 miles will be paved with brick and in Guernsey county crushed stone will be used.

Japan Will Subsidize Both Cars and Trucks

Government to Encourage Ownership of Foreign Vehicles—Stimulate Production

TOKIO, JAPAN, April 9—Special Correspondence.—The government of Japan is to help its citizens buy American motor cars and trucks by granting them a purchasing subsidy of not over $500 and in addition, for 5 years an annual maintenance subsidy not to exceed $150. In return these cars may be collected by the Minister of War for military service when needed. Each car or truck to qualify must have a carrying capacity of at least one English ton, 2240 lb.

The Diet in Tokio recently passed the military motor car subsidy law, and it was at once promulgated by the Emperor, the Premier, Count M. Terauchi and the Minister of War, K. Oshima.

Besides buying imported cars, the law encourages Japanese to make cars. A manufacturing subsidy of $1,000 or less is to be granted on such cars as qualify, and which are made by Japanese or by Japanese-owned corporations having their factories in the Empire.

There are now three concerns in the Empire classed as automobile manufacturing companies. Furthest advanced is the South Manchuria Railway Co. which, at Dairen, has built a factory and turned out four cars, which are now being subjected to experimental tests.

The two largest shipbuilding companies in Japan are now erecting automobile factories. The Mitsubishi Dock Co. at Nagasaki will construct airplane motors as well as cars, while the Kawasaki Dock Co. at Kobe will build only motor cars. In addition, the Japan Car Works at Nagoya is assembling cars, all the important parts of which have been imported from America. Motor car manufacturers are in a position to judge for how long a period the great bulk of the subsidies will go to American cars.

In time of war, when the cars have been collected and are in military service, their owners are to be given a "certain compensatory amount of money" by the Minister of War.

Subsidized cars may not be exported or sold or rented to foreigners and may not be given as security.

Frequent inspection of the cars by mechanics of the War Department will detect faults which will be ordered corrected within a certain period. Should the repairs not be made on time, the owners "shall be disqualified and suffer suspension of the right to the subsidy."

A supplementary article of the law says: "A person who posseses foreign made motor cars which have a capacity equal to that of the motor cars qualified by the law, and who uses the cars himself or allows a third person to use them, shall be granted a subsidy of not to exceed $500."

In Japan, horses are scarce and most of the trucking is done by husky youths who pull two-wheeled carts without sideboards. But labor is in strong demand now in Japan, and the use of American trucks would release thousands of youths for service inside factories, instead of on streets.

The time has come in Japan when the purchase of motor trucks is profitable and with a new subsidy, it is expected that a good field for American trucks will open up in Japan, especially in Tokio and in Osaka, the Pittsburgh of the Empire.

The sale of passenger cars also will be promoted and, by the way, the open car is a rarity in Japan; because of the wind and dust the glass enclosed cars have the call.

Truck Production 100% Increased in 3 Months

NEW YORK, May 13—During the first 3 months of 1918 the production of motor trucks by members of the N. A. C. C. increased 100 per cent over the production of these companies a year ago. With this gain in production it will not be surprising if the total output of motor trucks represented a higher value for 1918 than the output of passenger cars, which would represent a complete reversal of figures, because heretofore the production of motor cars has been many times greater than that of motor trucks.

On a basis of producing 310,000 trucks this year at an average price of $2000 the total production value would be $640,000,000. There is no figure as to what the output of passenger cars will be, but during the calendar year it will be much less than a year ago. On a basis of 800,000 passenger cars at an average price of $700, the total value would be $560,000,000.

At the regular meeting of the National Automobile Chamber of Commerce four new truck concerns were taken in as members, namely, Sanford Motor Truck Co., Syracuse; United Motors Co., Grand Rapids; Ward Motor Vehicle Co., Mt. Vernon, N. Y., and the Standard Motor Truck Co., Detroit. It is expected that truck membership in the chamber will increase rapidly now that there are practically two memberships, one for the motor truck makers and the other for motor car makers.

Urge Federal Road Program

NEW YORK, May 13—The N. A. C. C. at its board of directors' meeting last week adopted a resolution urging the Federal Government to adopt a highway program which will admit of the highways carrying their proper share of the transportation burden of to-day. A report from the roads committee of the chamber showed that 400,000 motor trucks are now in service, and that the first indication of the part the motor truck is going to play is the assurance that short-line railroads are going out of existence and that no more of such will be built.

Make Common Carriers of Trucks in Nebraska

Railway Commission May Take Supervision of Regularly Established Routes

OMAHA, May 13—Regulation of automobile truck lines by the Nebraska state railway commission as common carriers after having been regularly established is forecast in the statement issuing from the office of the commission to-day.

Willam S. Forword of Omaha, indicating to the commission that a daily truck service is contemplated for early establishment between Omaha and certain neighboring cities and towns, asked the commission whether the service given by such a line in hauling freight, and the rates to be charged, come under its jurisdiction. The reply was that trucks so engaged would be considered common carriers, and regulations applied accordingly.

Motor truck service has been given considerable attention recently by the Omaha Chamber of Commerce, but the fact that road conditions in Nebraska are such as now obtain have tended to discourage those who might otherwise be interested.

It is pointed out that motor truck service, on order to be maintained upon any semblance of schedule, must be assured permanent and dependable roads over the routes covered. Nebraska roads have not been of this nature over any appreciable section of the state. But with the awakening of interest in federal aid for road building during the past year, and the advent of the road-working season, considerable advancement in this respect is anticipated during this year, and the prospects for motor truck routes correspondingly brightened.

In this connection the principle of the Return Load Bureau as a measure to conserve labor and relieve rail traffic congestion is also being freely advocated. Commercial and civic bodies are indicating a steadily increasing interest in this matter.

May Revive A and AA Trucks

WASHINGTON, May 13—Despite the many rumors and predictions that the A and AA standardized war trucks are to be shelved, it now appears likely that they will be a part of the military program as originally planned. It is definitely known that certain officials favoring standardization of trucks have influenced the Secretary of War, Newton B. Baker, who is an exponent of standardization, to look into the truck program. It is known that Secretary Baker favors the standardized truck program.

BROOKLYN, N. Y., May 14—The Goodyear branch at 1172 Bedford Avenue, will be discontinued after May 15 and the business will be handled from the New York branch at 10 Central Park West and the Long Island City branch.

Manufacturers Pledge Government Every Aid

No Curtailment Questions Entirely Answered—Steel Needed for Ship Program

NEW YORK CITY, May 13—The question of curtailment of the motor car industry by the War Industries Board at Washington is in statu quo at the present time.

Members of the motor car industry met in Washington Monday and Tuesday a week ago and on the following day the Board of Directors of the National Automobile Chamber of Commerce deliberated on the subject. The committee headed by W. C. Durant, representing the motor car industry, is handling the matter and nothing definite is known as to when the case will again be taken up with the War Industries Board.

According to the agreement made between the industry and the War Industries Board, the present 30 per cent curtailment period expires July 31, and in accordance with that agreement the industry must arrive at some conclusion with the War Industries Board for the 1919 season.

The steel situation is the pressing one and whatever curtailment for next year is decided upon will be dictated very largely by the supply of steel. The Shipping Board, under Edwin N. Hurley, has announced that it is building 4,000,000 tons of shipping, but Chas. M. Schwab, who has assumed charge of ship production, declares that he is going to build 6,000,000 tons. This will mean a heavy drain on the steel resources of the country.

The proposal not to ship steel to any other industries for a period of 60 days seems to have been primarily intended to stock up the shipyards with steel so that next winter there will not be any holding back of the shipbuilding program because of a failure of our transportation system similar to that of last year. The War Industries Board is determined that those primary war industries such as shipbuilding, etc., will be cared for no matter how other industries have to suffer.

The N. A. C. C. has given out the following statement, indicating that it is working in harmony with the War Industries Board on the question of curtailment:

Representatives of the National Automobile Chamber of Commerce, W. C. Durant, John N. Willys, John F. Dodge, Walter E. Flanders, C. C. Hanch, and Hugh Chalmers, have just completed a three-day session reviewing with the War Industries Board, the War Department, the Railroad Administration and other government departments the situation in regard to the supply of raw materials and transportation.

After a thorough investigation the committee was convinced that the government demands were very great and conceding that these demands should be given unquestioned priority, volunteered all possible assistance and pledged the entire resources of the industry to speeding up the war program; keeping in mind at the same time its accomplishment, with as little disturbance to general business as possible.

Until the government needs are more definitely known, the industry, in addition to the manufacture of airplanes, tanks, tractors, shells, mine-anchors, helmets and other munitions, will apply itself to helping to solve the great problem of transportation which is directly in its line.

New York Now Has Lamp-Testing Law

Statute Provides That State May Test Anti-Glare Devices That Are Submitted to It

ALBANY, May 13—Makers and sellers of lenses and other anti-glare devices may now learn definitely from the state whether their devices are within the headlight regulations. The provision is Subdivision 6 of the recently passed amendment to the highway law, relating to lights on motor vehicles.

The law provides that lamps shall not exceed 24-candlepower, that rays shall not rise above 42 in. at 75 ft., that the illumination shall fall 10 ft. to the sides at 10 ft. ahead, that the light shall be visible 250 ft. ahead and in unlighted streets and on country roads the lamps shall make objects visible at 250 ft. On trucks of 2 tons and over, so governed as not to exceed 15 m.p.h., the lamps shall be visible 200 ft. and shall illuminate unlighted roads for 150 ft. Taillights shall make the license number legible at 50 ft.

The testing subdivision follows:

"Any person may submit to the secretary of state a device for controlling the front lights of motor vehicles so that they shall comply with the provisions of this section while the vehicle is proceeding, together with an application that such device be tested as prescribed by this section. Such applicant shall pay to the secretary of state a fee of fifty dollars. Thereupon the secretary of state may submit such device to a qualified technical expert or experts from the physical laboratory of a university or technical school within the state of New York, under the jurisdiction of the university of the state of New York, with a request that it be tested as to its compliance with the provisions of this section. Upon notice from such technical expert or experts that such test has been made and that such device complies with the provisions of this section, the secretary of state may issue a certificate to the applicant describing the device and certifying that such test has been made and that the device complies with the provisions of this section. The expense of such test by such technical expert or experts shall be paid from the fee collected from the applicants, and the balance of such fee, if any, shall be paid into the state treasury.

Truck Name Changed Back to Stegeman

MILWAUKEE, May 13—The Stegeman Motor Truck Co. has changed the name of its six-cylinder truck from Hercules back to its original cognomen, Stegeman.

During First 3 Months 38,000 Cars Go Overland

Drive-aways by Dealers Relieve Railroads to the Extent of 10,000 Freight Cars

NEW YORK, May 13—How the motor car industry is co-operating in conserving transportation is shown by the fact that in the first 3 months of 1918 38,000 motor cars were driven over the roads to the dealers and distributers by eight of the larger manufacturers. This represented 33 per cent of their production. This number of driveways relieved the railroads to the extent of 10,000 freight cars.

Reports from different companies show that a large percentage of their cars are being driven away overland within a radius of 500 to 600 miles. During the past 60 days the Mitchell company has through its dealers driven away 33 1/3 per cent of its production, most of the cars going to Iowa, Missouri, Ohio, Kentucky, Pennsylvania, as well as the nearby States of Illinois, Indiana and Wisconsin.

Studebaker has led driveways to all points in the East, to as far South as the Gulf, and to several points as far West as Nebraska and to Colorado.

Haynes reports that 60 per cent of its output is being delivered by driving overland. One-third of the coal production is being driven away by dealers. Twenty-five per cent of the Anderson output from Rock Hill, S. C., is being driven overland. Dort reports that 20 per cent of its production is being delivered in this way. Crow-Elkhart says that 40 per cent of its distributers, meaning those located in the Central States, are driving the cars away.

Gasoline Production Increasing

WASHINGTON, May 14—Average daily production of gasoline during January increased almost 2 per cent over that during December, 1917, and the February average daily production showed a 6 per cent increase over January, according to figures compiled by the Bureau of Mines. The January production in gallons was 234.714,062, and the February total 225,823,365.

Production of kerosene, on the other hand showed a marked decrease. The average daily output for 1917 was 4,389,082 gals. In January this was only 3,707,314, and in February 4,182,434 gals.

There was a large increase in the amount of stocks on hand during these two months, practically every kind of oil being stored away in great quantities. On December 31, there were 412,256,833 gals. of gasoline in reserve. On January 31, this was increased to 469,277,166 gals., a gain of 14 per cent. On February 28, the stock on hand was 518,794,609 gals., or 11 per cent more than the amount on hand a month previous.

Prominent Tradesmen Assume New Duties

Resignations and Promotions Place Workers in New Places

J. C. Enell this week assumes charge of the Federal truck department of the Birmingham Motor Co., Birmingham, Ala. For a number of years Enell has been identified with the Federal factory in Detroit as transportation engineer and also in various other capacities.

George P. Schulte of St. Louis has been made salesmanager of the Dearborn Motor Sales Co.

George L. Brush, formerly sales manager of the Maxwell Motor, Harroun Motors, and Elgin motor car companies of Canada, has become identified with the sales department of the Olympian Motors Co., Pontiac, Mich.

Arthur C. Leverton, formerly vice-president of the H. L. & W. Sales & Mfg. Co., Detroit, has been appointed factory manager of the Federal Motor Truck Co., Detroit.

A. H. McIntyre, for the past few years in charge of the wholesale department of the Saxon Motor Car Co. for New England, has accepted a similar position with the Paige-Detroit company in Boston.

E. C. Baynes, formerly with the Hubbard Spring Mfg. Co., Pontiac, Mich., has been placed in charge of the Detroit sales office of the Parker Mfg. Co., Ann Arbor, Mich., manufacturer of high-speed drill chucks, arbors and special tools.

Raymond Thomas MacFarland has been appointed sales director of the Hupmobile Sales Corp., Philadelphia, succeeding Robert McCormack, who resigned recently. An entirely new sales staff comes with MacFarland, two of his assistants, **A. E. Johnston** and **J. A. Brown,** both from the Hupp Motor Co. of Detroit, already being at work in the Philadelphia salesrooms. **Harry Faber,** the Hupp representative in Washington, will join the force shortly and two others, whose names are not announced, will become part of the staff within a few days.

Arthur G. Fischer has been made sales manager of the Hanley-Cadillac Co., Cadillac and Dodge dealer, Huntington, W. Va. For some time Fischer was manager of the Huntington branch of the Packard Columbus Motor Co.

Charles S. Pike, formerly sales promotion manager of the Paige-Detroit Motor Car Co., has been appointed truck sales manager of that company. He was succeeded in Washington, D. C., as Paige representative by Frank Caulk, formerly of the Aluminum Castings Co., Detroit.

Edward V. Oehler, Milwaukee, who resigned as an assistant wholesale manager of the Hoppe-Hatter Motor Co., Milwaukee, state distributor of the Paige, to become a member of the National Army, has qualified for a commission as a second lieutenant of infantry in the third officers' training camp at Camp Custer, Mich.

George H. Williams has retired as vice-president and sales manager of the Edwards Motor Car Co., 178-180 Seventh Street, Milwaukee distributor of the Dodge, to devote his entire attention to the management of the E. & W. Mfg. Co., Milwaukee, organized some time ago by Frank J. Edwards and Williams to manufacture a one and two-ton truck attachment for the Ford and other makes of cars.

J. M. Riordan has resigned as sales engineer of the Grant Lees Gear Co., Cleveland, which position he has held for the last three years, to become associated with the sales organization of the Cleveland Milling Machine Co.

H. W. English, Spokane, has been made district sales manager of the Columbia Motor Truck & Trailer Co., Pontiac, for the Pacific northwest. He has for the last few years been associated with the Republic Motor Truck Co. in that territory.

E. H. Habersham, Baltimore, has been appointed district sales manager for the Columbia Motor Truck & Trailer Co., for the southern states east of the Mississippi River.

A. H. Pearsall has been made district sales manager, with headquarters at Chicago for Illinois, having formerly been branch manager of the Studebaker Corp. at Chicago.

R. Scott Smith, formerly district manager of the Federal Motor Truck Co., Detroit, has joined the Standard Motor Truck Co., Detroit, as district representative.

B. C. Wilson has become associated with the Miller Rubber Co., Akron, where he will handle advertising. He was formerly connected with the Associated Press, in Detroit, later joining the staff of the Martin V. Kelley Co., Toledo, advertising agency.

E. W. Abrogast, recently with the F. B. Stearns Co. at the factory, has returned to his former home in St. Louis as sales manager for the Cole-St. Louis Auto Co.

A. F. Groebl, for several years on automobile selling staffs in St. Louis, has been placed in charge of the newly established Lalley-Light department of the De Luxe Automobile Co., St. Louis.

L. E. Browning has been appointed district manager of the Republic Rubber Corp. in Montana, Idaho, Utah, Wyoming, Colorado, Arizona and New Mexico, with headquarters at 1546 Broadway, Denver, Colorado.

C. P. Henderson, general sales manager of the Cole Motor Car Co., Indianapolis, has resigned and on June 30 will become representative of the company on the Pacific coast.

N. W. Barton, who was manager of the Chicago branch of the Olds Motors Works, Lansing, has been transferred to the factory as Eastern division sales manager.

A. A. Gloetzner, former sales manager for the Covert Gear Co., Detroit, is reported to be somewhere in France as an engineer with the United States forces.

Arthur L. Shipman has been appointed receiver of the Pope Mfg. Co. to succeed the late Colonel George Pope. He is a member of the law firm which was counsel for the late Colonel Pope.

J. C. Ford, formerly manager of the Brooklyn (N. Y.) Goodyear branch, has been made manager of the Viking Tire branch in Brooklyn.

D. Y. Husselman, formerly office manager of the Kelly-Springfield New York branch, has been made manager of the sales promotion department. **J. D. Ertel,** formerly office manager of the Minneapolis branch, succeeds Husselman as New York office manager. Both have been with the Kelly-Springfield Tire Co. about 5 years.

9 Standard Tire Sizes Approved

NEW YORK, May 13—Automobile manufacturers, through the National Automobile Chamber of Commerce, have formally approved the schedule of nine standard sizes of pneumatic tires drawn up by the War Service Committee of the Rubber Industry of the U. S. A. and published last week in Motor World. These nine sizes, including 30 x 3½, 31 x 4, 32 x 3½, 33 x 4, 34 x 4½, 35 x 5, 36 x 6, 38 x 7 and 40 x 8, are to be used in equipping all passenger and commercial vehicles up to 2 tons capacity.

The suggestion that the number of sizes be reduced to these nine standard sizes from more than 200 sizes which now are made came originally from the Commercial Economy Board of the Council of National Defense. Car manufacturers have been asked to use only these sizes on cars produced after July 31, 1918.

The complete adoption of the schedule eventually will mean a great reduction in the number and size of tires which must be produced by manufacturers and carried in stock by dealers. In addition to eliminating about 190 sizes, the schedule also does away with all styles of beads except clincher, which is used for only the 30 x 3½ and 31 x 4, and straight side, which is used for every other size. Quick detachable and Q. D. clincher are eliminated.

The N. A. A. A. J. and the M. A. M. A.

Chicago, May 8, 1918.

Editor Motor World: Herewith a general letter sent to our members today, which is self-explanatory. If you can publish the letter in whole, in part or in substance we shall appreciate it. —Wm. M. Webster, Commissioner, National Association of Automobile Accessory Jobbers, Chicago.

To our Members of the N. A. A. A. J.:

A number of the general letters of the Motor and Accessory Manufacturers' Association of April 23, regarding our accessory show, have reached this office, stating among other things that they will "assume jurisdiction" over our show.

I incline to the belief that if they rightly understood just what we had in mind, of giving, a trades show without charge, they would not have given the matter a second thought or assumed an arbitrary position. It may interest you to know that long before our association decided to embark in the show business, arrangements were on foot, plans well under way, blue prints had been prepared and options secured to start a similar undertaking for the especial benefit of the accessory manufacturers, inspired, I understand, by a number who became dissatisfied with the treatment they had received and others who were willing to join hands with them. The feeling in this direction is so strong—has become so thoroughly crystallized—that mere resolutions or arbitrary mandates will not keep it down, but an accessory show of the kind we propose to give is bound to come.

The announcement issued on March 29 brought out a great number of letters and in many cases the authors very severely criticised the treatment accorded them on show matters in the past. Some openly expressed their dissatisfaction and stated they had about concluded to discontinue making exhibits at the annual shows, while others took the stand that if the order issued on this matter was enforced they would resign from that association, rather than submit. It might not be amiss if others feel in the same way to at least take it up with these people and explain the great injustice they are imposing upon you, provided you think well enough of it, or if it is of sufficient importance to you to do so.

I am trying to reconcile their inconsistency in differentiating against our show when it is a known fact that their members have made exhibits during show time in different hotels, where they bought space and where no admittance fee was charged—that is our case identically—a distinction in practice without a difference in principle.

In the many letters I have sent out pertaining to the show I have studiously refrained from making any mention whatever of, or alluding to, these expressions of dissatisfaction in any way, feeling it was not just the proper thing to do and preferring not to say anything that might be construed that we were even trying to make capital, or in any way take advantage, of them, but I now feel I should give you all the facts.

I firmly believe nothing has so materially contributed to the marvelous growth and splendid success of our association as the broad spirit of liberality and fairness, in which it has at all times conducted its affairs and while it is true we are sympathetically jealous of our rights and exercise all fair and honorable means in guarding them, for this right minded persons can only respect us.

It matters not where, when or how our members show their goods, improve their condition or promote their interests, so long as they properly conduct themselves and make a creditable exhibit in the show we intend to give. I feel it a sense of duty, however, to here clearly point out to you and especially to such of our members who may for the time being, through coercion or otherwise be kept from exhibiting at our show, that exhibits in your line will be made by one or more of your competitors, who will naturally make friends, take orders, sell goods and open new accounts, possibly with your customers. Just how long you can, or will, stand this sort of thing time alone and your ledger accounts will tell, for the great army of the better class of jobbers who you know attend our conventions, will also attend our show and they are a factor which must be reckoned with, for they certainly control the purchasing power and that supports shows.

It is equally fair to presume that they will not take kindly to any assumption or interference with what they may consider their rights, for all letters received at this office from the jobbers throughout the country lend the highest possible indorsement to our show propaganda.

Another important consideration is if you absent yourself from such a splendid opportunity of being thrown directly in contact with your customers — the jobbers — as we offer, and which opportunity has, as a matter of fact, never before been offered in this condensed and practical form, you will naturally be the loser.

In the maximum space at our command all but about thirty units have been subscribed for and at this writing I am worried a great deal more about how we are going to be able to take care of our members and supply them with space than I am about anything else.

This somewhat lengthy letter is not sent for the purpose of unduly influencing you one way or the other, but rather for the purpose of pointing out to you the various phases of the situation, for in so far as our show is concerned it will go on to the end and will be a success beyond any doubt and I regret very keenly, as I stated in the opening of this communication, the attitude of that association on this question, and after you have had answers to some of these questions and other points I have made, cleared up to your satisfaction, you will then be in a reasonably good position to decide what you may wish to do.

A current issue of a trade journal states "our application has been turned down by the directors of that organization." That is not so, as we have made no application nor have we had any correspondence with that organization about the show one way or the other.

You know it is not only my wish, but it is our disposition and policy to go along in peace, harmony and good will with all kindred organizations and to do those things which will bring out the maximum of good with the minimum of friction in the firm belief that there is room in this country for all and that the policy of "Live and let live" is bound to and finally will prevail against all odds.

Respectfully submitted,
WILLIAM M. WEBSTER,
Commissioner.

Firestone Separate Rim Division

AKRON, May 9—As a matter of operating economy and efficiency, the Firestone Tire & Rubber Co. is separating its rim manufacturing division from the tire and rubber company, so that the rim plant may be entirely in the hands of skilled steel men. The Firestone Steel Products Co. is being formed to take over the rim end of the business. The stock of the new company will all, except directors' qualifying shares, be owned by the Firestone Tire & Rubber Co. J. G. Swayne, present manager of the rim plant, will be vice-president and factory manager of the new company, and present officers and directors of the rubber company will have leading places in the new concern.

It is stated that the plant uses 30,000 tons of steel a month.

Humphries, Leverton, Williman Join Hands

DETROIT, May 9—The H. L & W. Sales & Mfg. Co., manufacturer of tools, jigs and fixtures, comprises S. H. Humphries, now factory manager of the Wright-Martin Airplane Co.; A. C. Leverton, who was superintendent of the Chalmers Motor Co., Detroit, for 3 years and A. B. Williman, who was superintendent of purchases of the Hupp Motor Car Corp., Detroit.

U. S. Light Buys $105,000 Bonds

NIAGARA FALLS, N. Y., May 13—The final computation shows that the U. S. Light and Heat Corp. bought third liberty loan bonds to the extent of $105,000, $55,000 of which was taken by employees. The purchase on the second loan was $102,000, $52,000 of which was taken by employees. On the first loan employees bought $22,000. This makes a total of $229,000 worth of bonds that the corporation has taken.

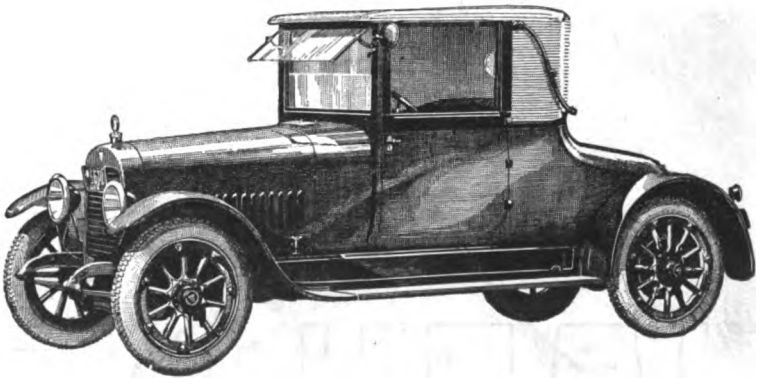
Hudson Body Types Are Distinctive



Hudson has created many distinctive body types.

The lines of the Hudson Super-Six set a standard for others. At the New York Show this year there were 22 other makers of cars that had patterned new models after the popular Hudson Speedster of 1917. Such is the prestige that Hudson has gained as a designer of fine body types.

None ever built, however, has proved more attractive than those of the present series, of which there are ten different models, as follows:

Seven Passenger Phaeton
Four Passenger Phaeton
Runabout Landau
Four Door Sedan
Touring Limousine
Town Car
Town Car Landau
Limousine
Limousine Landau
Full Folding Landau

This is the new Runabout Landau. It is the smartest car of the year.

Hudson Motor Car Company, Detroit, Mich.

"NORMA"
PRECISION
BALL BEARINGS
(PATENTED)

Day-in-and-day-out dependability never counted for so much—never was worth so much—never was so sought after—as now. To be ready at all times with the full measure of service—to be capable, if need be, of the super-effort that emergency may demand—can any small price-difference be considered for a moment, beside this?

"NORMA" Precision Bearings, in the high-grade ignition apparatus and lighting generators that are rendering maximum service today, are potent factors in the consistent performance which makes these accessories to be preferred where dependability is sought.

GRAY & DAVIS STARTER for FORD cars

The well-beaten path made by thousands of Fords equipped the Gray & Davis way is being followed by many Ford owners. Every Ford equipped with a Gray & Davis system becomes a successful traveling salesman.

Therefore, live dealers can readily see the opportunity that awaits them in selling Gray & Davis starters. Profits are generous—solid, substantial business is built up and customers retained through satisfactory service rendered by G&D Starters for Ford cars.

Write today, as there are thousands of Fords waiting to be equipped the Gray & Davis way.

Booklet A-62 upon request.

How One Dealer Is

Fighting The War

In His Own Shop

1—COSTS WERE RISING 2—LABOR WAS SCARCE 3—PROFITS WERE DISAPPEARING

By Ben S. Brown

WHEN the Great War stretched its paw out over America and began to stick its fingers into the whirring wheels of industry H. A. Dougherty, who sells the Republic truck as the H. A. Dougherty Motor Co., in Kansas City, began to think.

He saw costs rising. He saw labor hard to get. He saw profits getting less instead of greater. He saw a dim and uncertain future, with the Great War nobody knows how long—and then he began to figure.

There was a demand for bodies for the trucks he was selling. He was making these bodies, but wasn't making any enormous profit out of them. He determined to try in this department a first effort at so shifting his inside organization that his old business machine would grind out more dollars.

He saw that the Great War was one of soldiers, sailors, mechanics, farmers, carpenters, dealers, garagemen, salesmen, office girls and all the rest of the hundred millions in this country—plus money, time and effort. *And so he began to fight the Great War right there in his own shop.*

Dougherty has always been a good picker of men. After picking a man he tells him what result is desired and lets the man get the result.

Wherefore, he picked Sam Simon last August and told Sam to do things with the body shop. He told Simon he probably would have to build a new building and do a lot of other things—*but that he must cut the costs and GET THINGS OUT ON TIME.*

Simon spent about $1,000 in the installation of minor helps to operation.

In two months this thousand dollars was saved, the production was doubled, the net profits were increased greatly and the wages of the men were raised twice. A double production was being got out by practically the same number of men as had previously been employed; and despite the rapid increase in the cost of materials, the prices of the product were not increased.

How did Simon do it?

Looked Around for Two Weeks

Here let us give just an introductory hint on Simon's methods for the man who may want to follow Simon's example. He had a new job here and a big one. He was working for a man who had got good results from other fellows and he knew he had to make good, but—*he spent the first two weeks just looking around and practically doing nothing. In this time, however, he found out where time was wasted, where space was wasted, where money could be saved and where more could be earned—and then he got busy doing things.*

The question of space was important, and it is important to every body maker however cheap rent may be in his community. If materials can be stored near the place where the workmen will have to use them much time of the workmen or of the helpers is saved. So Simon tackled the question of saving from the standpoint of the convenient and economical storage of materials.

In many establishments lumber is stored just as it comes from the mill or the train. When a carpenter or cabinet maker needs a piece of lumber he does one of two things. Either he takes the first board he gets his hands on and saws it to the proper length, or he fiddles around through the pile until he finds exactly what he should take for his purpose.

Standardized Lumber

Simon discovered that practically every body or cab required a certain number of pieces of a certain size of board, and certain numbers of certain other sizes; and that boards used for other purposes in the shop could always be cut from certain standard lengths and widths. It was comparatively simple to further standardize the requirements of various departments as to the sizes of boards they used.

One of the first radical changes in the Dougherty plant, therefore, was the provision for storing lumber. It is now one man's job to pile the lumber as it is received. It is sorted and all pieces which are to be used for definite purposes are put on their proper shelves and in their proper piles.

On one shelf, for instance, are boards which will be used for no other purpose than floors of express bodies. On another shelf are boards for runningboards. The man who sorts the lumber—and other workmen also—use the lufkin rule, which greatly facilitates the identification of particular sizes and actually saves waste of lumber through making unnecessary the sawing of a board which the eye had not properly sized up.

How It Is Done

The method of meeting the problem of having on hand sufficient of various sizes for the various purposes is well illustrated in the case of the shelf for lumber for express body floors. On this shelf are 6-in. and 4-in. boards and the stockman can see at a glance how many of these sizes he has on hand without referring to his record.

WHEREFORE

H. A. Dougherty

1—Made labor-saving devices.
2—Cut out waste time.
3—Worked out many efficiencies.
4—Doubled production with the same force.
5—Raised the wages of the men.
6—Did not raise his prices.
7—Made his profits greater.

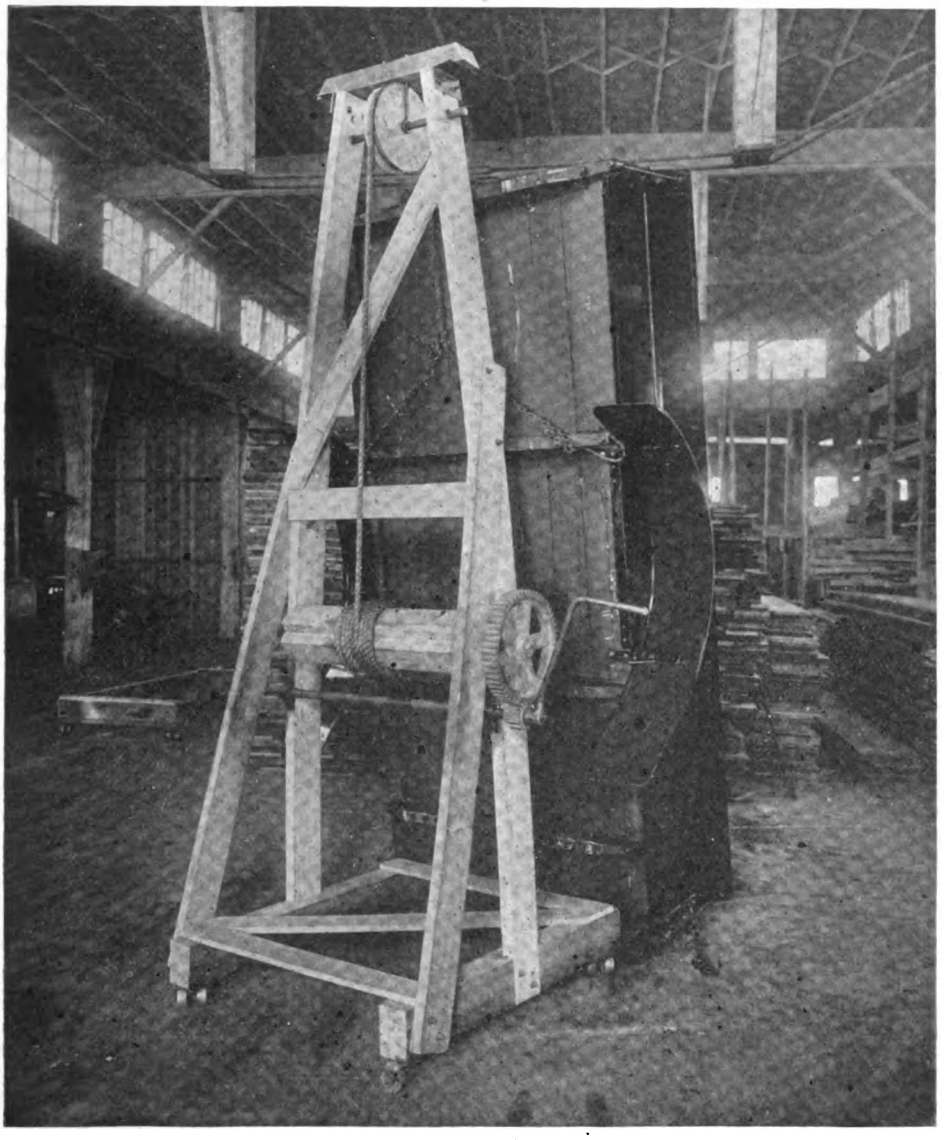
Digitized by Google

Nor is it left to the workman to figure out how many of these boards he will need for a specific order for a floor. The dimensions are calculated in the office and an order written there which designates the number of pieces of 6-in. or 4-in., or other widths which are to be taken from this shelf to make the floor.

The workman merely reads his orders, takes the proper number of boards of the designated width—all the boards are marked with chalk—and goes ahead to make his floor.

Standardized Irons

A similar system—similar standardization—has been introduced into the department of irons. For a few dollars a storage rack was built in which each size of iron has its separate compartment. There are no bars or strips lying on the floor. One would be surprised at the statement of the saving of time and money effected by this inexpensive and simple system of storage. Stockkeepers can see at a glance just which kind of irons are running short and can record. There is never any holding up of a job because of the lack of a rod or strip.



The rods and strips had formerly been cut with a chisel to lengths desired. Simon watched a man with a chisel and discovered that forty strokes were necessary on the average to cut a piece. *He spent a few dollars for a pair of shears with which a boy can cut all the irons needed in the big shop and have plenty of time left to operate the punch press.*

THE SHEARS SAVED THEIR COST IN LESS THAN A WEEK.

Saved Time by Machines

The men had been drilling the many holes necessary in the strips as the strips were needed. Two punch presses were installed and both of them paid for themselves in two weeks. *One of these presses can punch 20 holes while a man is drilling a single hole.* One man does practically all the punching. For the standard work he has a sample always at hand and a special sample is marked for the odd orders.

The handling of irons referred to is something that can be done in any shop. Another accomplishment of Simon, however, is something that happens once in a lifetime. He had watched the blacksmiths forging out the irons by hand, and it had seemed to him a pitiful waste of their time as well as an unnecessary expense on the firm. There were eight men at the forges, almost constantly employed on these irons, and they never could keep up with the other departments.

Type of body hoist and carrier used by the H. A. Dougherty Motor Co., Kansas City

Saved Time of Blacksmiths

Lots of the other persons with ideas of system and standardization in their minds had been distressed to observe the almost unlimited variety in the sizes and shapes of the accessory irons and braces. It did not seem logical that a commodity which could be used by so many thousands of plants should have to be made by each of these plants at such large expense in time and labor. Some of these irons cost as much as $2.20 to forge out by hand and the large majority of them cost from that price down to $1.60. Probably nine-tenths of the body makers who read this will think the figures are exaggerated, but they are actual records of the time taken and the cost of materials.

This is obviously an unnecessary expense and burden on the plant. Simon decided that it was a duty that should be performed by some manufacturer and started out on a missionary task of trying to get a manufacturer to make the dies and issue standard irons. He ran up against the stone wall of several thousand dollars' deposit for the making of the dies, but he finally convinced the manufacturer that the body business was growing so rapidly that its standardization was inevitable.

The dies have therefore been made by the manufacturer at his own expense, and twenty-two different styles of iron are now being issued, the Dougherty body factory being only one of many customers who are sharing the benefits of this development in the trade.

Enormous Cost Cuts

The reduction in cost of the braces and other irons used in making bodies is one of the miracles of modern business. The disparity is ridiculous between the former cost and present cost of these irons. Braces which when forged by hand cost $2.20 now cost 22 cents. Irons which ranged in price from $1.20 to $2 now range from 15 to 20 cents.

Not only is the price so greatly reduced, but the quality is greatly improved. In many cases the braces are far stronger than when a blacksmith had to weld a collar and file it out. Wherever an iron has to be welded the manufacturer does it by electricity and therefore far better than it can be done by a blacksmith with his forge.

Cheapens Many Operations

The effort to standardize the problem of iron has opened up a lot of new opportunities for cheapening operations and production. It has been discovered, for instance, that very few changes are necessary in a few standard sizes and shapes of iron to adapt them to almost any kind of body job. Braces are ordered in these few standard sizes and

Digitized by Google

these can be bent or rebent by the blacksmith into almost any shape desired. Simon may be slightly more expert in the art of interchanging parts than some, but he has demonstrated that this interchange can be effected with very little trouble with a great saving in stock and in time.

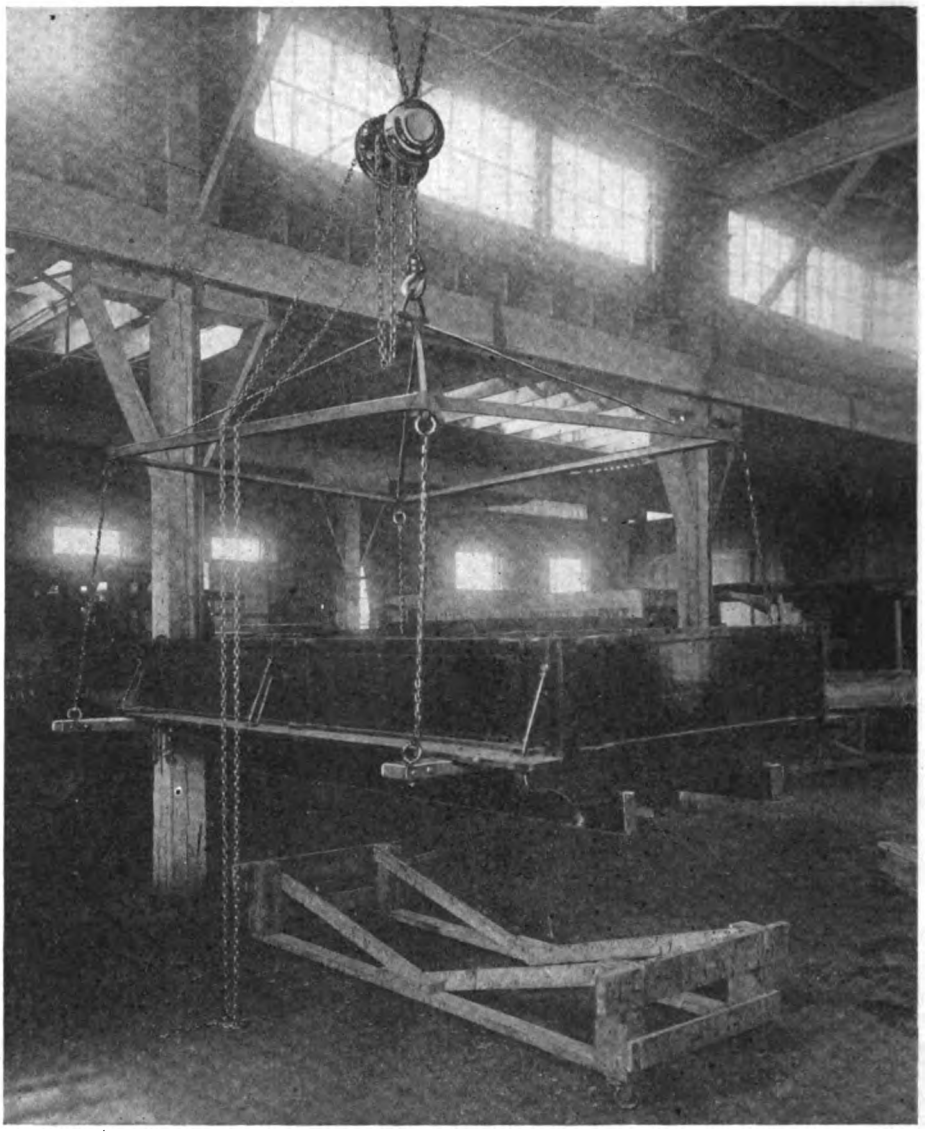
The standardization of iron and the contract with the manufacturers have been saving the Dougherty company about $5,000 a month.

Saved in Trimming

In a room 20 x 25 the Dougherty company has its trimming department for its large production of cabs. The sewing machines are installed in pairs, shelves built around them with a depressed platform between, upon which the scraps are shoved.

In this room is another of the simple installations which cost little money and save a lot of time. Two 2 x 4s were projected several inches from the wall with braces; slots in the outside edge of these 2 x 4s hold ⅝-in. rods. On the rods are the rolls of fabric, artificial leather, buckram, etc., convenient of access to workmen, much the same as large rolls of wrapping paper are mounted in stores.

A large cutting table is set 18 in. from the rack, and the fabric as unrolled can be laid on the table so that when a cut is to be made the fabric can be laid on the place where it is to be cut into shape for the machine.



The equipment of the entire trimming department is in harmony with this illustration. There are places for everything so that a workman may know exactly where to go for what he wants and the stockman may see exactly the amounts of any particular items on hand.

Labor-Saving Devices

Numerous devices have been installed in the general large workroom for facilitating operations. There are the electrical blowers on the forges, for instance, which cost $32 a piece, and which save, as only one item of economy, the wages of a helper, or the time of the blacksmith himself.

Fifty dollies—low platforms or frames on wheels—are in use for shifting the bodies in their process of manufacture. The body is put onto a dolly as it is framed and remains there until it has been painted and is ready to be put on the chassis or shipped.

One of the principles upon which Simon has attacked his problem of more efficient operation is that the easier the work is for the workman the better the results, and when he saw eight or ten men struggling with a heavy body to lift it onto the chassis he saw a condition that was not logical or economical. He therefore rigged a chain hoist to lift the bodies. The hoist is equipped with a frame, made of four angle irons, and from each of the four corners depends a chain. Beams with rings in their ends are put under the body, hooks on the dangling ends of the chains attached to the rings, and the bodies lifted as high as desired by the hoists. At first the men were inclined to ride in the bodies, but this practice was discouraged.

Another special type of body hoist and dolly used by the Dougherty company in the production of commercial vehicle bodies

Different sizes of chains are provided so that the heaviest bodies can be cared for without hazards. Chains of different lengths are also provided.

Another of the special devices on the main floor is a body carrier. This machine lifts the big truck bodies, carries them to another part of the room and stacks them end up in a row. Incidentally, this sort of stacking uses up only about 10 per cent of the space formerly used for storing the bodies, since the body occupies about 18 to 24 in. of floor space.

Work Made Easier

The body carrier—see illustration—consists of a pair of 2 x 6s, 10 ft. high, and a base about 4 x 4s, about 4 ft. square. The two uprights are braced at one side of the base, the uprights being in the center of the bars. The front half of the base is clear. In the upright is set a drum, on the end of which, outside, is a pinion operated by a crank. At the top of the frame is a wheel over which a rope extends from the drum. A hook on the end of the rope catches the body and lifts it endwise onto the platform on the base of the frame, and the frame, which is on wheels, is then rolled to the place where the bodies are stacked.

Cab-Making Economy

A surprising economy in the production of cabs has been attained in this department of the Dougherty shop, and it was brought about by system and standardization.

One man spends most of his time cutting the lumber for cabs. There are always on hand the boards of the necessary sizes for 20 cabs. Previously in this shop—and perhaps in most others—the lumber for each cab was cut as needed. The new system shows a cost of $5.40 for the lumber and labor for one cab ready for assembling. One man can assemble 10 cabs in 36 hr.

The cabs go through a definite routine after assembling. The trimmer puts on the top, after which the cab goes to the finish shop. It receives one coat of lead, and the blacksmith puts on the bolts and forges. It goes back to the painter, who

Digitized by Google

And this is the trimming department where the upholstery is cut and fitted to the bodies built by the Dougherty company

finishes it and to the trimmer, who puts on the curtains. *The routine is so well established that one man never has to wait on another to receive the work.*

The sizes of lumber for various types of cabs are standardized; the order comes from the office with the sizes and number of pieces designated. The order is so definite and clear and the lumber is so well arranged on the shelves that a new and unskilled man could assemble the cab.

Incidental to the separation of the cab lumber, one man does all the drilling of the holes and he becomes expert in this work.

A few features of the office end of the business are also eliminated. Every order for a job is issued from the main office of the Dougherty company in triplicate. One copy is retained, one goes to Simon and one to the shop. On the back of the shop copy are entered all the items that enter into the cost of the job. In this connection it should be mentioned that the cost of labor in stock, lumber, paint, etc., is added to the value of the stock, not only the cost of preparing lumber for use but the wages of the stockman too.

The bookkeeper at the shop, by referring to time tickets, can add to the record on the back of the order, which record also already has the entrees of stock used and the time of workmen on the job. A certain proportion of overhead is added to each job—and after all the costs are accounted for the profit is added before the final figure—which is called the cost—is attained.

A minor feature of the order plan—but important—is that the copy which goes to the shop is on cardboard.

The system that has been worked out has proved valuable to the Dougherty business. It has solved many war-time problems and is enabling the company to make up for some of the volume of business that abnormal business conditions tend to decrease.

The God of Luck

WHY is it that business men have no conception of the motor industry as a business?

A prominent business man came in to me and talked trade. He had a car a few years old. I quoted him my figures and he wanted to know if I expected him to give his car to me, that a used car dealer offered him more.

How much are you getting now for your Blank brand hosiery? I asked him. He told me that the price was $6 a dozen pairs. Then I asked him if those were not the same sort that he sold for $3 and $4 a dozen a year ago and he agreed that they were. Why have they advanced? I asked him. Because materials, labor, everything has gone up in cost, he said.

Well, don't you suppose I'm feeling it, too? I queried. Don't you realize that I am paying more wages, more rent, more light and heating bills to do business; that my overhead has increased like yours, and yet my commission has remained the same; that out of this commission must come my expenses, and I must maintain a service station to take care of you when anything happens; that the used car dealer bought the car, or sold him something else, and that ended the transaction, with no come-back?

Here was a business man who was boosting his prices to meet competition and I was paying his prices for my wearing apparel without any kicking, yet the minute he turned to buying a motor car he looked upon it as outside of the ordinary business channels. Finally I convinced him that business was business no matter what was sold. It seems to me that motor dealers are responsible for this sort of thing by over-priced trading, and only a providential shortage now is coming to rescue them. *The God of luck seems to have a penchant for hovering over the motor industry to save dealers from themselves.*—Alfred Cutler Morse, Boston, Roamer and Westcott.

Any Rags, Any Bones, Any Bottles To-Day?

Does the Jobber's Salesman Sing the Same Old Story in the Same Old Way?

YEARS ago we used to sing the song and we never thought at the time that it had any application to salesmanship, but lately there are some who maintain that the man who wrote it was a jobber and that he wrote it just after he had kicked all his salesmen out of the conference room with directions to go out on the road and sing a new song and build up some new business.

Whether they did or not isn't explained, but it is asserted that there is to-day a rather large army of jobbers' salesmen who are still in the order-taker class and are passing up the big opportunity for increasing their sales and tying the dealer to the jobber by a chain of good-will.

Two Types of Salesmen

Jobbing salesmen may be classified as of two types: Those who think and those who don't think. The latter sometimes think they think—but they only think they think they think.

The salesman who gets ahead is the one who thinks. He gets ahead because he builds business and becomes a valuable man. Sometimes he becomes so good and proves to be such a thinker that he cuts loose and sets up in business for himself. He does all these things because he thinks.

If he plays pool evenings he thinks as he plays pool. If he plays poker he thinks as he plays poker. One of the most revolutionary thinkers of the business world got his idea for a revolutionary business system out of a poker game.

He Doesn't Think

The non-thinking salesman, when he plays pool, simply sees so many balls, a green top and the spots where countless cigarettes have decorated the edge of the table. If he plays poker he regards it as something with which to kill time until he once more has to resume the monotony of existence.

It is said of the non-thinking salesman that he walks into a dealer's store—or what ought to be a store—and operates somewhat as follows:

> ANY rags, any bones, any bottles to-day? It's the same old story in the same old way.

"Well, Bill, what is it to-day?"

"Oh, I don't know."

"Let's see your want list."

"Here she is."

"Oh, yes. Patches, anti-rattlers, carbon remover, priming plugs and piston rings. I'll shoot 'em down to you real quick, Bill."

"All right."

"DidjahearthisoneBill?"

And they're off, as the kid said when he stuck his fingers in the lawnmower.

What Happens Then

The house ships the goods, the dealer puts it in stock, he sells some of it to insistent customers, he pays the bill—sometimes, when he happens to think of it he adds to the want list—and so the wheel goes around. It can't go around much faster because there is no one to inject the necessary lubricant and acceleration.

At some of the conventions of the National Association of Automobile Accessory Jobbers there has been a little discussion of the question of the jobber's salesman and how to make him a more important factor in the motor trade, but thus far nothing very drastic has been done. Once in a while somebody spills a bit of stuff on the subject, but the routine business of the meetings gets in the way, everybody wants to have the convention end on time and so the poor jobbing salesman goes happily on his way without anybody telling him of that beautiful heaven to which all salesmen go if they work right. *He remains a heathen because he never got to Sunday School.*

At the present time there isn't a more important subject in the jobbing trade than that of the jobbing salesman. Manufacturers are turning out goods, advertising and promotion are paving the way among retail customers, jobbers are stocking the goods to meet this demand, dealers are anxious to make money but not all of them know how, and the jobbing salesman, a most important section of pipe in this outlet of merchandise, creates a sort of bottleneck through which only a certain amount can go. No matter how much is manufactured it can't get into distribution unless the jobbing salesman lets it—or forces it out. *Consumer demand can help, but of itself it is an inefficient mover of goods.*

There are different ways in which the jobbing salesman can acquire a new song, a constructive story, a new viewpoint of life. The jobber can develop educational facilities within his own organization. The inspiration can be passed out in varied forms, but in the end the new song will be much the same.

Two Kinds of Dealer

To-day there are two types of dealer. There is the accessory merchandiser who really sells a lot of goods and makes money at it. He has a good store, good display fixtures, good window, good sales methods, a good stock wisely bought, real cost analyses and a business system that develops his sales possibilities to a high degree.

This man is the star on the jobbing salesman's list. He buys goods freely—and rapidly depletes his stock. He then buys more. It is a pleasure for the salesman to call there because he knows he is going to sell goods.

The other type is in need of help. His store and display methods and facilities are poor. He doesn't know how to sell goods. Often he has been a mechanic or has followed some line of work that didn't teach him sales and business. He can't be expected to become a hundred per cent merchandiser over night. But he can be expected to have a little spizz and enough energy to keep going along the right line if some one gives him a push now and then.

Pushing the Flow

This dealer is the final "pinched spot" in the pipe line of distribution. The "pinched spot" just before is the non-

Digitized by Google

thinking jobbing salesman. The two of them can do more to hold up the accessory factories than a dozen Garfield orders.

The thinking salesman reasons thus: "How can I increase my sales? Answer: By getting the dealer to buy more.

"How can the dealer buy more? Answer: By selling more.

"How can he sell more? Answer: By my teaching him to sell more."

Wherefore the thinking salesman gets after the unprogressive dealer and makes a merchandiser out of him, thereby increasing the salesman's orders, building up the jobber's volume of business and making the factories spin faster and faster. Incidentally the dealer outlet is made larger and larger and the activity and increased prosperity expand all up and down the distribution line.

Having asked himself: "How can I teach the dealer to sell more goods?" the jobbing salesman begins a systematic campaign.

Must Be a Diplomat

He can't rush into a dealer's store, bawl him out and black-snake him into being a good merchandiser. Human beings aren't reformed that way. The salesman must be diplomatic. He must warm his way in. *He must acquire goodwill.* Just how he shall do this is largely up to the salesman.

But let us suppose a typical example: Casey runs a garage. He has the usual four-square building with one corner called the repairshop, one corner called the stockroom and another small section alleged to be the office. Almost any part of the whole layout looks the same.

Casey couldn't sell accessories on a bet in an atmosphere like this.

What must the jobbing salesman do?

First, he must get Casey to clean up the place.

Second, he must install an adequate office and equipment.

Third, he must put in display fixtures and a stockroom.

Fourth, if there is a window he must make it work. If there is no window he must make one.

Fifth, he must teach the dealer how to advertise, how to sell, how to use road signs, how to get customers, how to net profits and how to be a worth-while factor in business.

Makes Outlet for Goods

If he can do all these things he can make a good dealer for himself. Eventually he may lose the dealer—but he won't lose all of them. Furthermore, the dealer will consider the salesman as a co-operator, a fellow worker, a benefactor. The good-will the salesman creates can never be taken away from him, because good-will is that sort of product.

But, to go back to the beginning, how is the jobbing salesman going to get Casey to clean up the garage, a department which, supposedly, has nothing at all to do with the salesman's particular line of business. Isn't the dealer going to consider the salesman as interfering in something that is none of his business if he tries to stick his finger into the garage end of the establishment.

How It Might Be Done

Certainly! But, as was said before, the salesman must be a diplomat, a thinker. He must get on good terms with the dealer, they must discuss business, future prospects, competition and all sorts of things. And then some day in a casual off-hand way the salesman may say: "Casey, do you know, I've often thought I'd like to run a garage and try out some of my ideas. I think I could make some money. What do you say to you and me trying them out in your garage?"

Or: "Casey, did you ever figure out how you could get a lot of business away from your competitors? I'd make my garage talked about. I'd make it different from the rest. I'd—" etc., etc.

Some such start as that might be made. And then the salesman could point out the condition of the other garages and suggest a clean-up, paint-up campaign. He could camouflage the whole idea by saying he proposed to advertise for female trade, and make the clean-up one of the first steps toward this camouflaged ideal.

Each Man Help Himself

There are all sorts of ways the salesman might warm his way in. The exact method is something each salesman must work out for himself. *If he is a good salesman fundamentally he will have no difficulty on this score.*

After that, he must get Casey interested in costs and accounting. He must cite a few examples of it costs So-and-So so much to keep a car over night and that So-and-So spends such-and-such per cent of his gross business for newspaper advertising. By citing what others do *Casey's mind may be made fertile for the seed of suggestion as to figures in his own business.*

From these things the movement goes step by step to the point where Casey has a clean, attractive garage, a neat office, good accessory display fixtures, a real window display and good advertising and is using manufacturer's literature as inserts in his outgoing mail, *which mail is written on a typewriter.*

Then the salesman shows Casey how to sell. He teaches him how to carry a windshield cleaner in one hand while he takes gasoline change to the transient customer. He shows him how to adjust it quickly, demonstrating how it works. He instructs Casey in pushing slow-moving goods and helps him along the road to greater profits.

Finally the dealer arrives at the point where he is making money—but now and then problems arise. He wants to know things. And where does he naturally turn?

Where else but to the man who has come with him step by step all the way from greasy overalls and a daily wage to a starched collar and real net profits.

Ponder This

Take this thought: It is the jobbing salesman's chance to demonstrate the old statement that from his chin down a man is worth only $3 a day. It is the salesman's chance to take himself out of the class that sings:

"Any oil, any soap, any patches to-day?
"It's the same old story in the same old way."

Ford Philadelphia Plant Not Commandeered

PHILADELPHIA, May 17—Louis C. Block, general manager of the Ford Motor Co. here, announces that following a voluntary offer of the company to allow the United States Government the use of a portion of its $1,000,000 ten-story building, the United States Army Quartermaster's Department has availed itself of the opportunity and taken over six floors to be used for storage reserve purposes. The building has not been commandeered, as at first announced, the arrangement being a purely co-operative one, in accordance with the wishes of Mr. Ford, expressed since the company has been working on large government contracts.

The Tire Dealer's Part in National Conservation

By G. E. Brunner
Manager, Service Department, The Goodyear Tire & Rubber Co., Akron, Ohio

AS a nation we are tremendously wasteful and always have been. We are wasteful of natural resources, of man power and of finished products. But we have come to the point in our happy-go-lucky existence where we must stop wasting and conserve—or cease to exist.

The automobile industry has been typically wasteful, not so much in its use of raw materials as in the distribution and consumption of its many products. And it has been extraordinarily wasteful of man power. As a result of the popular impression this wastefulness has created, and in spite of the tremendous industrial importance of the automobile, the government at first classed it as a luxury.

Now one of the biggest wastes in the automobile industry takes place right here in our own part of it—the tire business. Last year it was estimated that over $150,000,000 in tires went out of service prematurely. And a good many million dollars' worth of man power went into wasteful channels in unnecessary and extravagant forms of free service. Now this waste must absolutely be eliminated if the industry is to go on.

Tire Dealers Can Help

The tire dealer who realizes this and gets his business in such shape that wastefulness is done away with is the one that will survive. There is no place for an exaggerated service at this time. Service must add directly to the value of the product or to the prolongation of its usefulness, or it is unnecessary and a waste, and as such must be eliminated.

The service that is needed to-day is the preventive service that teaches the tire user how to use his tire properly and how to foresee and prevent troubles before they start. This is the kind of service that must be rendered by every successful tire dealer. The purchaser of a new tire must get proper instructions in using that tire, and these should be made so clear to the customer that the chance will be better than ever that he will get full mileage from it.

Tire Users Must Be Shown

In cases where he does not get full service he should be given such follow-up instruction and advice as the condition of his tire shows he needs. His own injured tire should be made an illustration of the necessity of paying attention to the laws of tire conservation.

G. E. BRUNNER

When the customer sees how failure to follow the advice given him when he bought the tire causes its premature demise there is not much question about the care he will give his next tire.

In case the tire still has some service in it, the customer should be shown the advisability of having it repaired or put in condition to give extra mileage by the use of some inexpensive tire-saver. He should be made to realize the extravagance, under present conditions, of taking any tire out of service as long as there is mileage left in it.

In cases where the tire is completely worn out because of neglect or abuse, the cause of the trouble should be made so clear that there would be little likelihood of the customer having the same kind of trouble with another tire.

User Must Pay for Own Experience

There is no sound reason why any one but the owner should pay for his own mistakes and experience. Neither the dealer nor the tire manufacturing company can afford, at this time, when conditions force him to operate his business most efficiently, to sacrifice any profit or take upon himself any loss that should be borne by one of his customers. For if he does take this loss he must either go to the wall or pass it back to the other customers from whom his profits are derived.

While it is frequently hard for the direct representative of a tire company to make a man understand that his failure to get good service from his tires is really his own fault, and that the loss should be borne solely by himself, it is not so hard for the dealer to point this out. In fact, the dealer can generally gain additional good-will from the customer by showing him his mistakes and how to eliminate them in the future. Then he is in position to sell a new tire and make his legitimate profit on it.

Policy Adjustment Expensive

The policy adjustment is one of the things that has made the use of tires so expensive. It is decidedly out of keeping with the spirit of the times. It is opposed to the idea of conservation. It is the direct encourager of prematurely worn out tires and of wantonly wasted tire mileage.

The place where this waste can be eliminated is the service station. But, so far, only a few service station dealers have recognized the advisability of operating on this basis. As a result a great preponderance of tire replacements are policy adjustments, which hand the customer a tire to which he is not entitled simply to keep him from purchasing a competitive make of tire. Each one represents a tire worn out because of misuse or neglect, *lost profit to the dealer, increased overhead expense for the tire manufacturer and an unnecessary consumption of the country's economic resources.*

The following is an actual case in point: A motorist brought in to his dealer a 33 x 4½ tire for examination. After looking it over carefully the dealer, who conducts a tire repair department, found that the carcass was in good shape and offered to retread it for $17. The motorist then took his tire over to the tire manufacturing company's branch and asked for an adjustment. The adjuster, to "hold him in line," extended *one of his policy* adjustments and gave him a new tire for the old one and $25.

Now it should be remembered that this was not a defective tire. The motorist had received good mileage from it and, aside from the poor condition of the tread in places, it was in good condition. Yet the tire company gave him a new tire at a loss; *the dealer lost the job of retreading and made nothing; and the motorist got a new tire to which he was not entitled.*

Digitized by Google

Now, had the dealer secured the job of retreading the tire, he would have made a good profit, the tire company would have made its profit on the materials used in the repair, and the new tire would have been available for another customer who would have been glad to pay the regular retail price. And, above all, the motorist would have been completely satisfied with the extra mileage he would have secured from the retreaded tire.

A truth that must be impressed on the tire using public is that tires, and not adjustments, furnish the basis of satisfactory mileage. A motorist who buys a good tire and takes care of it obviously gets greater satisfaction than the one who is continually teasing his dealer for an adjustment. Usually the motorist who is shown the greatest favors, from a "policy" standpoint, is the first one to switch to some other tire, if his adjustment favors do not come fast enough. So after continually losing your profits in adjustments on non-defective tires, you lose your customer too.

If manufacturers in other lines, take the shoe people, for instance, were to be as liberal in adjusting shoes as the average tire dealers and manufacturers are in adjusting tires, the leather stock of this country would be depleted immeasurably.

And at this time when it is so difficult to obtain rubber from the great plantations of Asia and the Malay Archipelago, on account of the great scarcity of ships for transporting it across the Pacific, it behooves everyone connected with the manufacture, sale or use of tires to conserve to the limit. And the tire dealer is going to play a very important part in future conservation of tires, for it is through him that conservation principles must largely be preached to the great army of tire users in this great country.

Farm Tractors Increase Crop Acreage

ONE of the outstanding facts of tractor operation is that in a very large proportion of instances the tractor owner increases his crop acreage. Sometimes this has been accomplished by bringing more acres under tillage on the original farm, but more frequently the farmer has found his capacity for work so increased by the tractor that he has acquired more land by purchase or lease.

This has come about not altogether because a tractor increases the efficiency of the farmer, thus enabling him to till more acres, but also because it has been determined that it is more economical to till larger areas where the work can be done with a tractor.

Should Be Used 50 to 75 Days Yearly

According to the capacity of the tractor, its economical employment demands that it be used from 50 to 75 days in a year. This includes belt work as well as draw bar work. The farm of average size, under old-time crop rotation methods, does not ordinarily provide sufficient work for a 10-20 or a 12-25 tractor to make up the required economical number of days. Hence the tendency to increase the acreage.

Gathering Statistics

Accurate cost accounting is not common with farmers, hence it is difficult to procure reliable figures on the cost of tractor operation. Occasionally, however, some one who has the ability to do so collects information which has a degree of validity. For instance: A trained statistician from the extension department of the Minnesota School of Agriculture recently compiled some statistics covering tractor operation in Kittson County, Minnesota. Fourteen tractors were considered. These tractors on the average worked 80 per cent of their time on straight tractor work, and 20 per cent on custom work, a fact which was allowed for.

The cost of operation was based upon amounts of fuel and oil consumed in plowing, on 80 per cent of repairs, interest and depreciation, and on the value of the food saved by the substitution of the tractor for horses in performing the operations considered. The results showed that where a tractor plowed less than 300 acres the cost was $1.99 per acre, while the cost fell to $1.24 an acre when more than 300 acres were plowed.

Not too much dependence can be placed upon a single instance, of course, but this one has unusual value because of the great care which was exercised in compiling the data. However, whatever value may be denied to the findings as being typical of tractor operative cost in general, the fact that it is more economical to employ the tractor on larger areas is established, and this is the important thing.

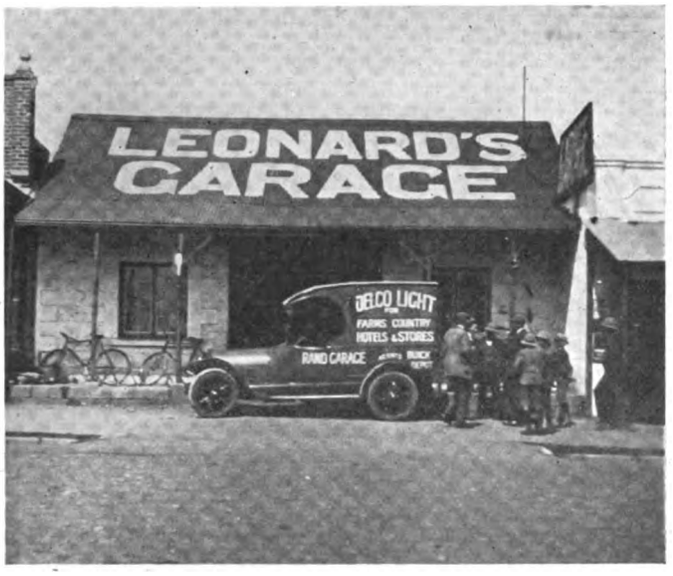
Acreage Increased

Whether farmers who have heretofore increased their acreage have done so in the consciousness that it was economical so to do does not matter very much. The fact remains that the acreage was increased, and that it was economical so to do appears to be a legitimate conclusion from such facts as are at hand.

Stock of Tractor Parts Must Be Easily Available

ASIDE from all other considerations, perhaps the most important thing for the farmer who purchases a tractor to know is that an ample stock of repairs is conveniently accessible. The economic value of the tractor rests upon its constant and instant availability to handle the peak load of the farm at the time and within the time when it is most important and advantageous for the farmer. Anything which interferes with or interrupts this readiness and efficiency tends to destroy the entire theory upon which tractor farming is based.

Assuming that the farmer is competent to meet the common motor difficulties which arise in the operation of a tractor, he need then fear nothing serious except the breakage of parts. This is liable to occur at any time. Parts never break, however, when the machine is standing in the shed, nor during the off season, but always when the tractor is at work and when delay of any kind is a serious matter. Should delay be prolonged because repair parts are not immediately available, it might easily spell calamity. The man who relies upon his tractor to do the heavy work of his farm virtually has put all of his power eggs into one basket *and he cannot afford to have anything go wrong with the basket.*



This emphasizes the important part the tractor dealer must play in tractor economy. His obligation by no means ends with the sale of the machine. It persists throughout the life of that machine to the extent of being ready at any and all times to provide such repairs as may be needed to keep the tractor effectively at work. This necessitates carrying in stock an ample supply. The amount of capital which may be tied up in this way is of small consequence in comparison with the amount of good-will and the reputation for preparedness which the dealer will establish.

The automotive dealer can in no better way justify his claim to the title than by being in a position instantly to meet demand for repair parts on the tractors he sells.

Continental Has $20,000,000 in Orders

DETROIT, May 20—On April 30, when the first half of the fiscal year of Continental Motors Corp. ended, the orders on its books, in process of manufacture and unfilled, amounted in the aggregate to more than $20,000,000—a considerable gain over the situation at the beginning of the fiscal year. Large additional orders have been received from the Government.

A typical garage in a small South African town of 5000 people. This is Leonard's Garage at Standerton. He sells farm lighting systems

Dealer Sells

Farm Light System

in

Wild South Africa

Even though the country is semi-developed and the difficulties are great, this South African dealer is making profits out of the farm-lighting system.

By M. Edward

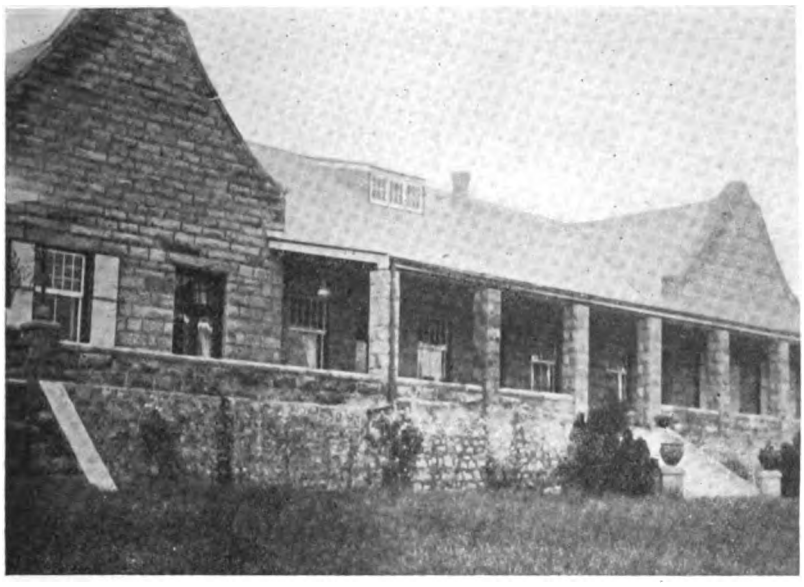
THIS story is written by M. Edward, Motor World's special representative in South Africa. Edward operates an advertising, photographing and news service in Johannesburg and is familiar with conditions in America as well as in the Transvaal, for he visited the United States some time ago and studied comparative conditions. His work keeps him in close touch with motor car conditions and the trade in South Africa.—EDITOR.

JOHANNESBURG, SOUTH AFRICA, Feb. 28—The farm-lighting system has made a strong appeal to the motor car dealers of South Africa, who see in it a fine addition to the modern products they have for years sold to the farmers of this prosperous territory.

Farm light is especially salable because there are many farms so far from electric lighted towns that the use of city light is practically an impossibility. The country contains many farms whose owners are abundantly able to buy these systems and who want to make their country homes as livable as possible.

One of the first to take up the farm-lighting system is the Rand Garage, Johannesburg, which is the Buick dealer and distributer. After securing the agency this dealer fitted a 1917 Buick with a specially constructed body, carrying a complete Delco set.

With this outfit it is possible to demonstrate to the farmer who lives away back, hundreds of miles from the towns. Much business has been done by this means, although the terrible condition of the



Upper—When the farm light demonstrating car goes out in the country on its merchandising mission it traverses such country and covers such roads as this. Not unlike our own rolling prairies, is it? This is Ermelo

Lower—Little things like bogs are no discouragement to the South African dealer, and they are not unknown to our own country dealers. But what of it? Each trip means more business

Digitized by Google

What would this place be without electric light? It is "Rusthoff," the residence of General Botha, and he has installed a Delco plant to lighten the labor on his farm

General Botha himself is the man in dark clothes, seated in a chair, watching the installation of the Delco plant on his property

roads, due to a very rainy season, has made the task difficult.

Many times oxen have been called into service to draw the stalled demonstrating car out of bogs and mudholes, which are encountered frequently in the middle of what are supposed to be the country's regular roads.

The first trip over the Transvaal required two weeks, yet during that time the car covered 400 miles and dealers were secured in many of the smaller towns of the country. The demonstrating car also sold an outfit to General Botha, the Premier of South Africa, whose farm the car visited.

This pioneer trip convinced the proprietors of the Rand Garage that there is a big future in the farm-lighting system as an adjunct of the motor car business, and plans are being made for an active campaign for merchandising this article throughout the Transvaal.

Country conditions here, as affects the farm lighting system, are not unlike those in the American West, where the areas are great, the homes not always close together and the prosperity generally sufficient to make the farmer an excellent prospect for electric light and power.

Upper—Crossing Blesbok Spruit, one of the many unbridged streams that become impassable during the rainy season. But the farm lighting dealer makes money when the sun shines and does his business before the rains swell the streams

Lower—In America the farmer who hauls you out with a horse is a familiar character. They have him in South Africa, except that he does it with a couple of yokes of oxen. It's all in a day's work for the farm lighting dealer

Army Schools Want Catalogs

DETROIT, May 17—The Department of Mechanical Engineering, Michigan Agricultural College, East Lansing, Mich., which will train 500 soldiers along the lines of automobile mechanics and automobile repairmen, would like to receive copies of all trade literature, such as catalogs, instruction books, etc., possible. Concerns desiring to assist in this should address their matter to J. A. Polson, Professor of Mechanical Engineering, Michigan Agricultural College, East Lansing, Mich.

You Can Fool the House for Quite a While BUT You Can't Fool Yourself for a Single Minute

By Ray W. Sherman

"WHAT shall we do about young Roper?"

Tommy Trumbull, sales manager for C. J. Reilly, Inc., distributer of the Sennett in and about Callawassa, turned to Reilly with this inquiry about one of the young lads who had been added to the sales force some time previously. Most of the youngsters were panning out well—but Roper, while he started well, didn't seem to be holding up to par.

"I don't—" Reilly started to reply, but just then young Roper walked in—at 9.30 in the morning.

"Gee, but I had a bad morning!" he exclaimed, as he hurried toward the desk.

"Yes?" Reilly's inquiry was short.

Roper hastened to explain: "Yes, I'm sorry too. It cuts fearfully into a day's work. I'll have to spin some to make up for this lost time. Wouldn't wonder but I'd have to work some this evening to get up to schedule."

Neither Reilly nor Tommy said a word.

Poor Mother

"Mother didn't feel at all well this morning," Roper rambled on. "She had quite a bad spell. I thought for a while it might be serious. I was quite alarmed for some little time. But I left her resting comfortably. And to top it all off I had to wait twenty minutes for a street car. You know, things like this upset me so I can hardly work."

Roper began to dig out prospect cards and gave an excellent imitation of a late-arriving young man trying to give an appearance of doing an hour's work in five minutes.

Roper made hurried notes, stuck a couple of booklets in his pocket—and started out, almost on a run.

"Oh, Roper!" Reilly called.

The young salesman stopped like a boat that is snubbed by an amateur.

"You've had a bad start this morning. Why don't you take it easy for an hour or so and get your mind settled. There are one or two things we ought to talk about. We haven't looked over your files together in a long time. Let's do it now. Then you can make a better start by and by."

"All right!" Roper returned and hung up his new straw hat—which was so new it hadn't even been sprinkled on yet.

Reilly drew forth the master file summary of Roper's work, and Roper brought over his own individual file.

"Let's see," began Reilly. "Sales—sales—let's see. Three months—one touring—one roadster—one touring—one used car—four sales in three months. Not very good, do you think?"

"Well—" Roper explained. "You see, I've done a lot of work that should result in sales later on. If you will look at the past record you will find that I did well the first three months. I sold ten cars. But lately I've been doing a lot of missionary work and—"

"Yes," Reilly interrupted, "your cards indicate something of the sort. You have turned in the usual number of calls each day and the record indicates that you must have been very busy, but don't you think it's rather unfair to you to keep you on a line of work that isn't producing sales? Wouldn't you rather be selling than playing missionary?"

"Yes, I would!" It was the only reply Roper could make.

"Now—let's see—where were you going this morning?"

Roper drew forth several cards.

"Oh yes—Sanderson—steel mill man—been called on six times—says he's going to buy later—seems interested, and all that. H'm. Griffin—undertaker—needs a new car—had his old one two years—wants new car, but says business is bad—may buy later."

"Yes, it has been hard pushing on some of these fellows!" declared Roper.

Hard Work, but—

"It surely is hard work to sell cars," admitted Reilly. "I wasn't quite sure I could do it myself—but—" and here Reilly drew from his pocket and laid before the wide-eyed Roper a signed order by Sanderson for a sedan and with it the check for payment in full.

"Last evening—golf club—five minutes of conversation—easiest sale I ever made." And, answering Roper's unasked question: "He said he had been thinking about the car for some time. He said somebody or other from our office phoned him once in a while or mailed him a catalog, but he said he never got a chance to give anybody his check. He seemed really relieved when I volunteered to take it."

Roper said nothing. If the moisture that oozed out from under the hair on his brow could have dampened the inside of his throat he might have been able to speak.

"Roper—," Reilly looked squarely at the young salesman, "let's quit kidding. I don't want to kid you—and you can't kid me—only so long. I'm not an old cock by any means—even if my thatch is thin. I get around this town some, and while I don't believe in playing spy there are some things I can't help hearing.

"Now—you've got a new girl, and between you and me I don't think she has all the sense she ought to have or she wouldn't let you waste time on her the way you have. I know the tea room in the Mortcroft is a cosy little place, it's cool, they have fine music, the floor is great, you're young, the temptation is great—but it doesn't sell cars. Am I right?"

Roper said nothing, so Reilly continued:

"In your position you are placed on your own responsibility. Your time is your own. You have a drawing account, and that's the only string I have on your time—but I do expect results. You can spend all the time you want to in tea dances, you can lie in bed as late as you wish in the morning, you can come in any time you prefer in the morning, but when you get to the point where you are hurting the company's sales business I maintain that I have a right to protest.

"These fly-in-and-fly-out calls you make on prospects, these phone calls that you make just so you can report so many calls a day, and all this other camouflage hurt our business. You either antagonize prospects or else get them warmed up for some other man to get. An on-the-job salesman could have stolen this Sanderson order from under your nose—and you wouldn't have had any explanation. These prospects have been found by this company at a big cost, and whenever you ruin one you hurt our business.

Can Get Big—Sometimes

"You can make reports that look fine, you can seem as busy as a bee, you can cover up and get by, you can— Roper what time did you get up this morning?"

"Quarter to nine."

"What was your mother doing when you left home?"

"Washing dishes."

"How long did you wait for a car?"

"I rode down with a friend in his motor car."

"And for three months you have been hurting and fooling yourself. Your tea dance friends won't care to associate five years from now with the man who isn't a success. Buildings are built by work—not on reports and blueprints. You can fool the company for quite a while, Roper, but you can't fool yourself for a single minute.

"Now—" Reilly patted him on the back. "Let's start all over again."

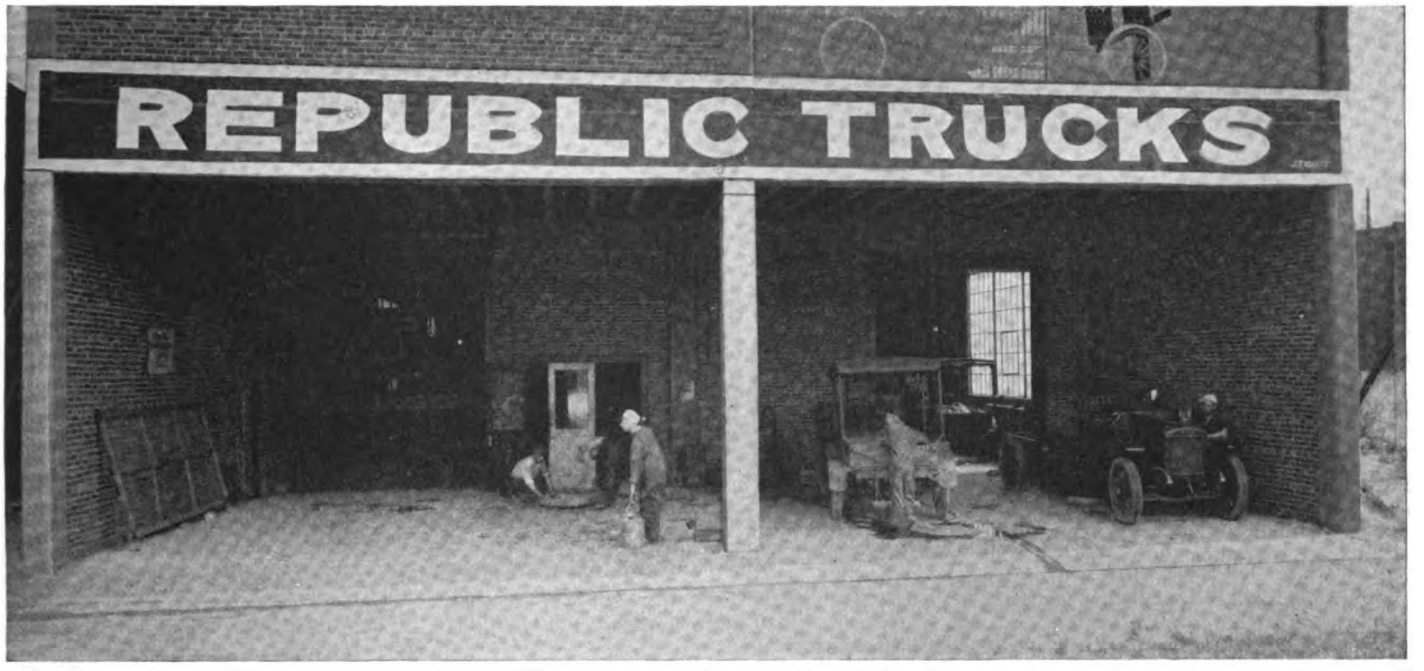

Fig. 1—A service entrance of this kind will relieve congestion in the truck repairshop, and thus speed up service. This is the Martin-Whitehill Co.'s Republic truck service station entrance in Pittsburgh

REQUIREMENTS of a Truck Service Station

By S. T. Williams

THE first thing that a passenger car dealer has to get into his mind when he starts to handle trucks is that it is going to cost him more to give adequate service on trucks than it did on passenger cars.

First, he cannot accommodate as many trucks as passenger cars.

Second, the work is heavier work, and requires special lifting devices.

Third, the amount of work done by any one mechanic is less.

All these factors tend to increase the shop overhead and decrease the income unless correspondingly increased charges are made to compensate for the increased expense. And adequate service is necessary to successful truck merchandising even more than in passenger car merchandising because a truck is a utility, a necessity, and a passenger car may or may not be.

Given the same service station as was used in passenger car work, when trucks are introduced, the capacity of the station is about cut in two. Many trucks occupy a space of about 22 x 10 ft., as against the passenger car's 15 x 7 ft. And the aisles must be wider, as it is not an easy matter to jack a truck up and slew it around on slewing castors.

If an elevator be used, the average passenger car elevator will be found

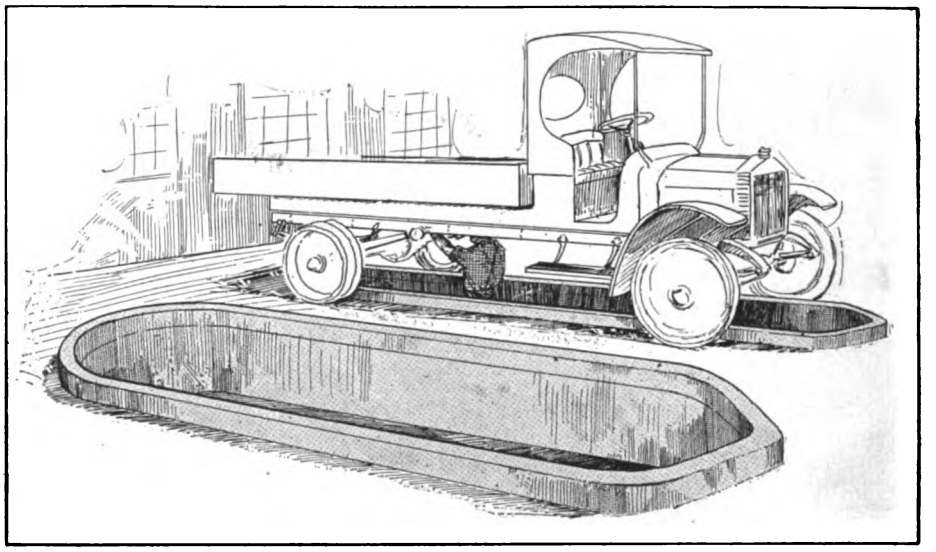

Fig. 2—The use of pits in the truck repairshop eliminates much of the heavy lifting

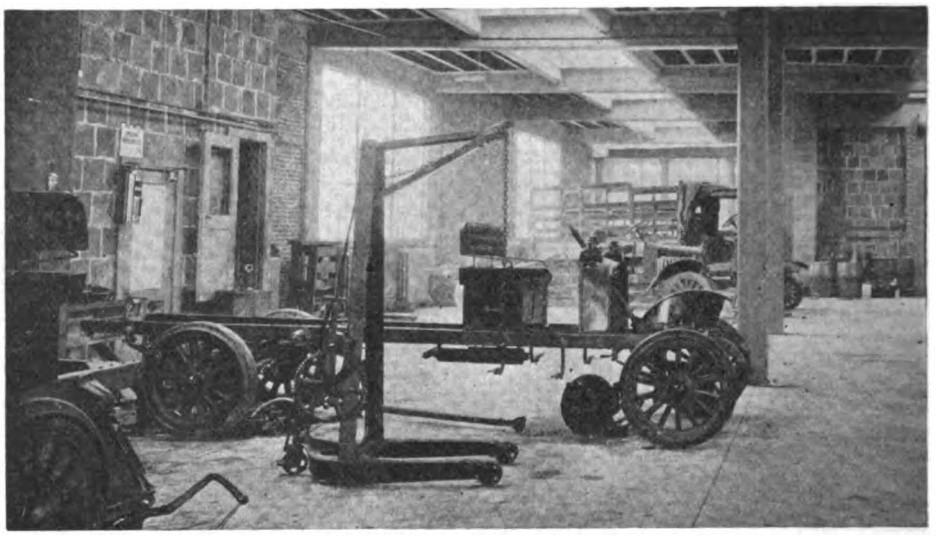
Digitized by Google

too small. General practice seems to recommend a 22 x 10-ft. elevator of about 10-ton capacity. And if old buildings be used a competent building inspector should be consulted to see that the floors possess ample strength to carry the trucks that will be placed upon them.

Give Minute Service

One way that many truck service stations avoid congestion and the necessity of moving the trucks about is by the use of a minute service entrance, shown in Fig. 1. This entrance is simply a large three-sided room at the rear of the station. All trucks requiring minor repairs or adjustments are run directly from the street into this room and the work done immediately. It is easier and cheaper to bring the tools, mechanics and parts to the truck than it is to bring the truck into the repairshop. *A quick service entrance of this kind will do much to lower the overhead, relieve congestion and speed up truck service.*

Pits are not an absolute necessity in passenger car work, as it is an easy matter to hoist the car up on racks and render all parts accessible. But the tendency in truck repair stations, where the best practice prevails, is to provide a pit for each repair stand in the repairshop. They are either wood or concrete, about 3½ ft. deep and provided with a guard rail that not only guides the truck into place but also prevents it from running into the pit. By the use of a pit of this nature all parts are instantly accessible, the mechanic can work from a comfortable position and frequently the necessity of hoisting or jacking the truck up is removed. Thus the mechanic can do more work.



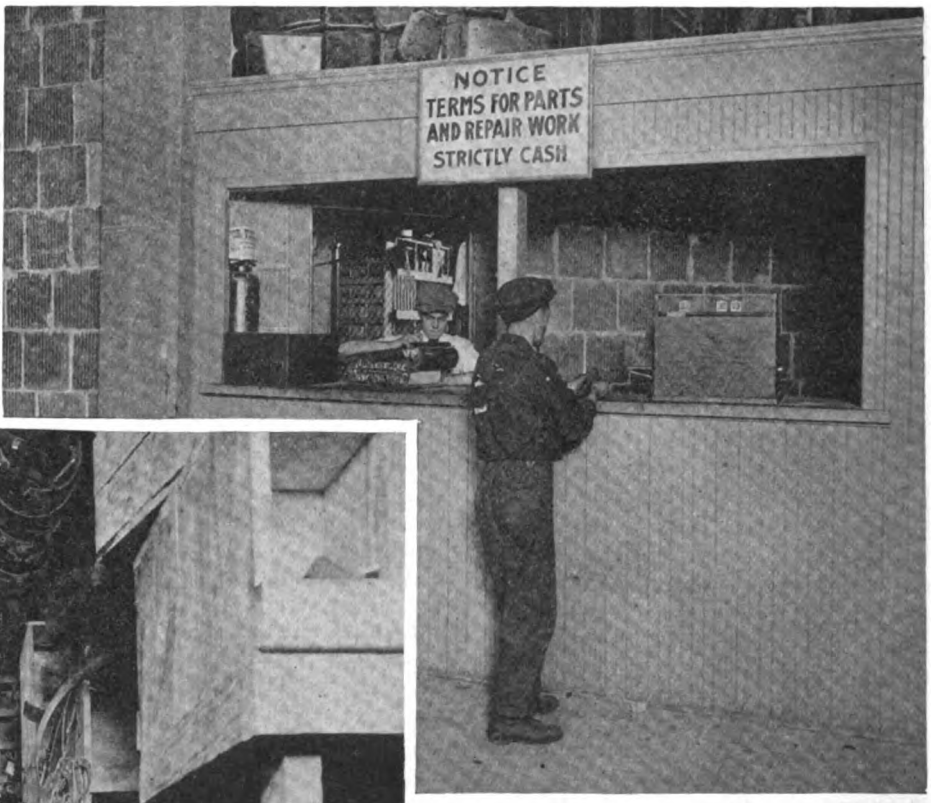


Fig. 2A—A properly organized truck service station should be equipped with some sort of a crane for heavy lifting. If the ceiling beams can be used, this is simple; otherwise a portable crane should be provided

Figs. 3 and 4—A well-arranged stockroom is essential. This shows the stockroom of the Martin-Whitehill Co., Republic dealer in Pittsburgh. The view above is the window through which parts are passed

Hoist a Necessity

Likewise, in passenger car work an overhead traveling hoist is often regarded as a luxury. But where much truck service is to be given it is a necessity. Truck units are heavy—usually far too heavy for one man to lift—but with

Digitized by Google

a 5-ton chain block and an overhead traveling hoist the parts can be lifted, moved or assembled with ease. And in the smaller shops the portable shop crane answers the same purpose.

In addition to the above equipment, the usual machine tools, etc., are necessary. The amount depends entirely upon the number of trucks receiving service, the distance of the station from the source of supply of parts and the ability of the mechanics. The following are the tools that the average truck repairshop has found necessary:

1—Forge, anvil and hammers.
2—Large capacity arbor press.
3—Air compressor and air hammer.
4—No. 20 power drill.
5—Sixteen-inch engine lathe.
6—Twenty-five-inch heavy shaper.
7—Bench grinder.
8—Welding outfit.
9—Portable crane.
10—Miscellaneous tools.

Inasmuch as trucks are only machinery, and every minute a truck is laid up money is being lost, it is necessary that the dealer have an adequate supply of repair parts on hand. For these a stockroom should be provided, and if the arrangement be that shown in Fig. 3 but a small amount of space is necessary.

The smaller parts are placed in bins around the walls and the larger parts, such as axles, springs, etc., are placed on racks in the center of the room. The heavier parts are on the lower racks and the lighter parts on the top racks. *This avoids much unnecessary lifting.*

By making the stockroom only a half story high the space above may be used for storage of sheet metal parts, such as mud guards, hoods, splash plates, etc. And the stock should be placed in charge of a competent clerk who is accountable for every piece that leaves the room, keeps the stock up to normal, and who usually has time to handle all of the shop system work.

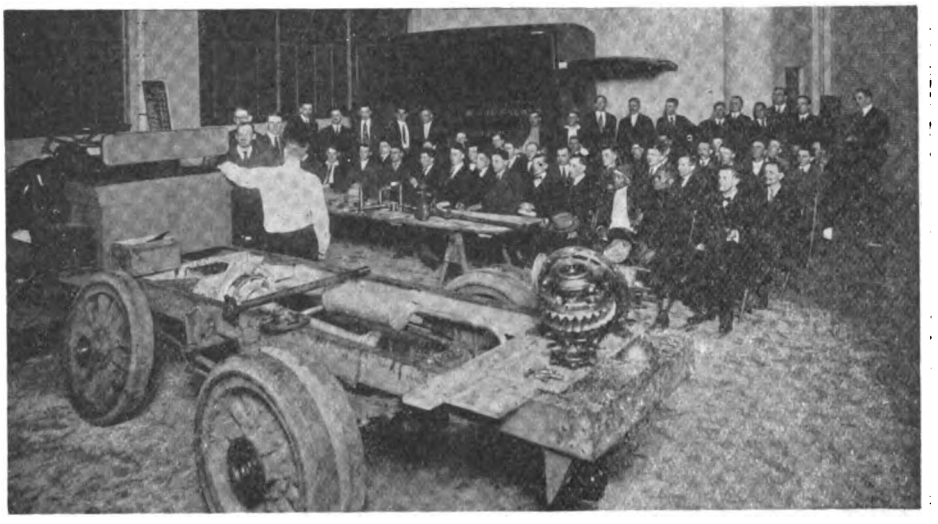

Fig. 5—Truck driver school conducted by the Pittsburgh Packard Co., Pittsburgh

It was stated that truck service costs the dealer more to give than does passenger car service—yet that efficient service was essential to successful truck merchandising. Several methods that have proved successful in reducing truck repair overhead, and increasing the capacity of the shop have been given. But the live merchant can do more than this. He can and should *educate the drivers of his trucks to give the trucks a chance. For it is cheaper to prevent a disease than to cure it.*

The treatment a truck receives is far different from that received by a passenger car. First, the owner is rarely along and the tendency to speed, overload and abuse the truck is not restrained. These, combined with too infrequent lubrication and inspection, tend to make the truck depreciate much more rapidly than it should. When the truck is in use it is in the hands of the driver *—so educate the driver, cut down the necessity for repairs, and remove the necessity for service.*

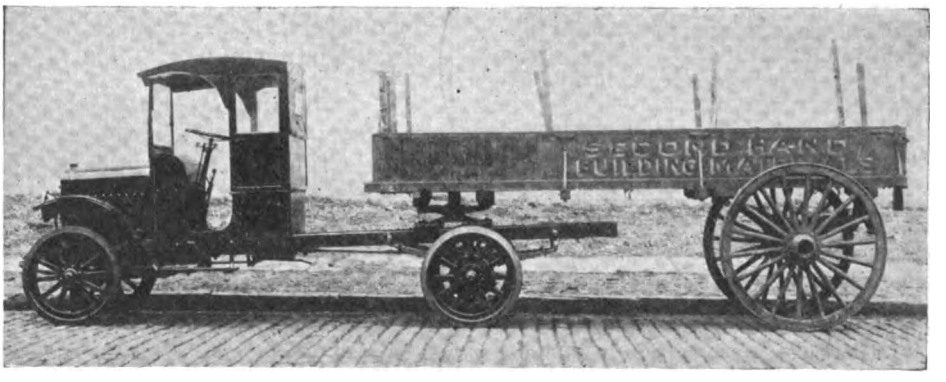
Many truck dealers conduct a school for all drivers of their trucks. Meetings are held weekly, or monthly, as necessary, and the drivers are taught to make all the common adjustments and repairs on the trucks. They are taught the necessity of lubrication and inspection and the effect of overloading and overspeeding. They learn that they are in charge of a large investment and that only by making that investment pay can they increase their earning power. In the places where truck schools have been held by the dealers a marked decrease in the service problems has been noted.

Truck business is profitable business. *Educate your drivers, provide an adequate shop and give service on the basis that future business depends on present service.*

Converted Trailers Increase Truck Sales

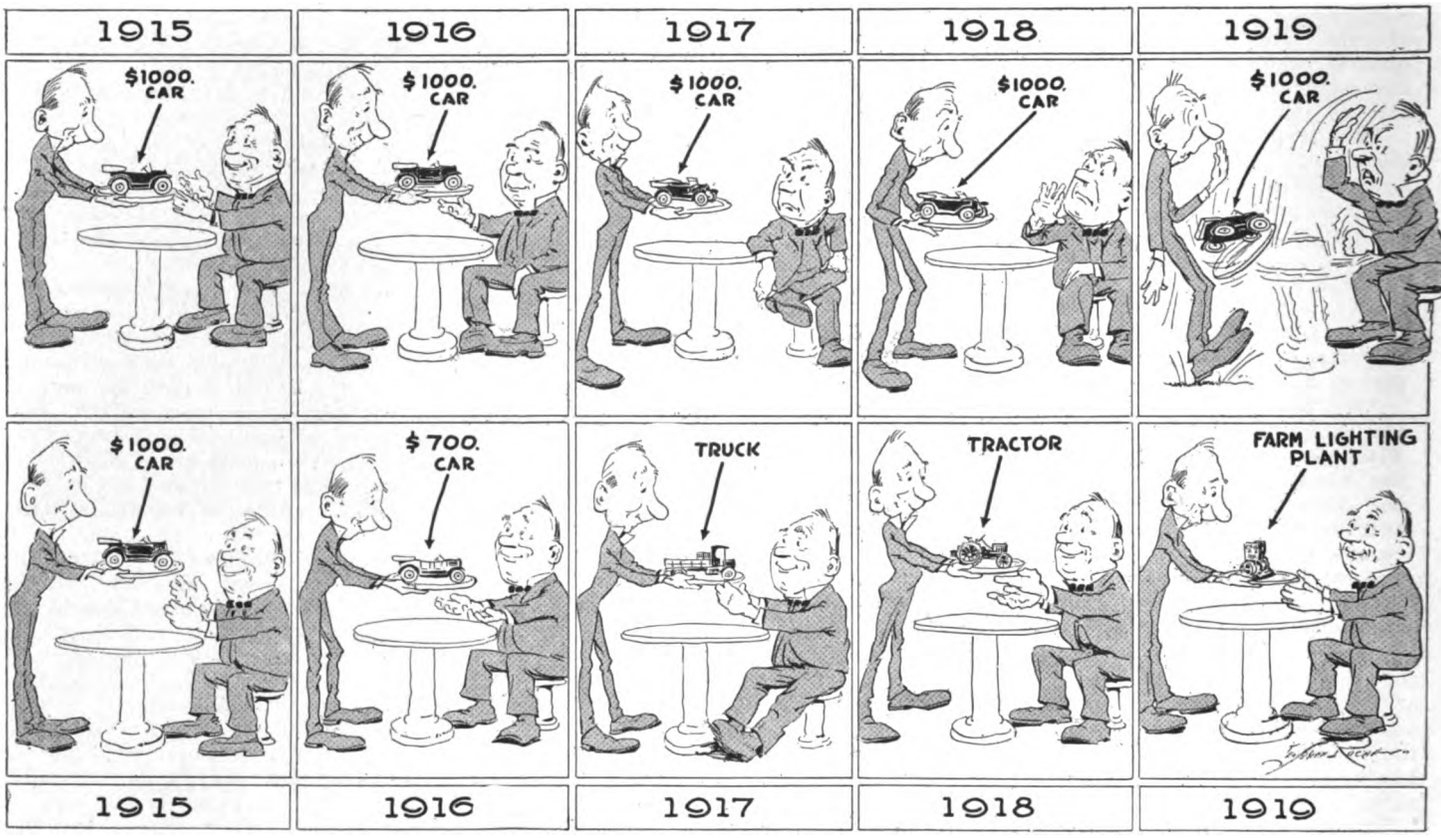
A CONSIDERABLE number of potential truck prospects are deterred from purchasing solely on account of the wastage that would be incurred by junking their horse-drawn equipment. Harry J. DeBear, directing the energies of the Maxwell in New York, has made a special drive at this class of prospects with considerable success.

Instead of discarding horse-drawn vehicles the front wheels are removed, a Martin rocking fifth wheel fitted and the trailers thus formed are used in connection with standard Maxwell worm-drive truck chasses. It is recommended that at least three such trailers be used in conjunction with each truck, so that the truck can be kept busy hauling one trailer while the others are being loaded or unloaded.



With horses selling at the high prices now prevalent, it is estimated that the profit alone on the sale of six or eight horses should pay for one truck and for the conversion of three wagons into trailers.

In converting the truck and wagons to this use no change is made in the truck chassis, the lower half of the fifth wheel being bolted or riveted to the frame over the axle.



The operation of attaching the upper half of the fifth wheel to the wagons would differ slightly in different makes, perhaps entailing the use of extra braces or additional pieces of wood for strength or to fill out.

The entire cost of fitting up a wagon in this way has been found to average $70 per wagon, the cost of the work on the truck being almost negligible. This would make the cost of the Maxwell truck chassis and three trailers $1,405.31 in New York, including freight and war tax.

The fifth wheel on this job is 24 in. in diameter. No trouble has been experienced with the wagon bearings up to 20 m.p.h. fully loaded.

Whetting the Public's Appetite

Do Sales Run in Cycles?

The Dealer and the Automotive Idea

DOES a buying public, especially in smaller towns, ever become surfeited with one make of car?

Does the dealer in one particular make of car ever find his sales falling off during succeeding years because he seems to have sold to the public about all of his particular make of car that his town or section will absorb?

That such is the case is the theory advanced by Milton W. Koenig, advertising manager of the Weber Automobile & Implement Co., one of the largest automotive institutions in St. Louis.

That is held by Koenig to be one of the strongest reasons why the dealer of to-day must become automotive. He must sell more than one particular make of car, and it is highly to his advantage if he sells something besides motor cars themselves.

"I have noticed," said Koenig, "that passenger car sales run in cycles. A dealer will have an excellent year on, let us say, Hupmobiles, and it might be expected that the next year he would do even better, but it often develops that the next year his limited buying community has been saturated with Hupmobiles and he finds sales harder than ever.

"In that case we turn him to the Maxwell car, which we also handle, and he comes through the year with a good business in that particular vehicle. It is in a different price class from the Hupmobile and he has a good season.

"Perhaps by intensive selling he may stock up the community on Maxwell cars. His Hupmobile sales may come back to a certain extent, but in order to give him a third prosperous year we turn him to truck sales. We show him how to concentrate on this line of effort and the result is that he has a third successful year.

"The tractor trade is just beginning and we are urging our dealers to get into it and cash in on its possibilities. If they do that and in addition keep their other branches of business going there is no reason why they cannot have a good year every year, whereas if a dealer handles only cars or especially one make of car, he might have some pretty lean years.

"I believe that many of the changes in selling representatives of passenger cars are due to the fact that communities get saturated with that particular make. In a small community not every man wants a car like his neighbor. Then, again, no community can be suited with one price

of cars. To meet the demands of his natural customers a dealer must have several prices to offer and also several sizes of car.

"We keep before our dealers always the fact that our showrooms and shops are available to them and, if they do not want to carry a certain kind of truck or tractor in stock to meet a demand that might temporarily be limited, they can bring their customers to us and we assist them in making sales. Many of them do this. Of course, that impresses the dealer as a good deal of a pick up and it pleases him, too.

"We handle the National at $2150, the Hupmobile at $1250, the Maxwell at $745, the Maxwell truck at $825 to $1085, the Armleder truck at $2750 to $3600, the Minneapolis and Keck-Donnerman tractors, the Alamo lighting system, the Sandwich portable gas engine, and tires and accessories. In addition we have steam engines, threshing outfits, power feed cutters and other farm or city utility tools that are run by means of power.

"If it came to a question of shortening or lengthening the line that we handle I would lengthen it. A varied line such as we have is a great thing to reduce overhead and to maintain the shop.

"We always are having a busy season. There are no dull times, for, in addition to the lines that we sell new, we trade in many used cars, and we have our shop to put these into excellent condition when other goods are moving slowly. We keep a supply of used cars waiting for the shop men all the time.

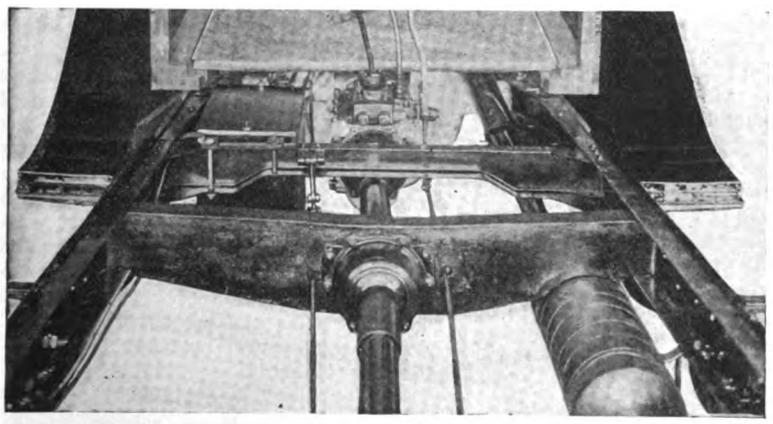
"Cars and accessories are a new line for us. We took them up only a few months ago. We have not pushed them hard because we have not yet assembled a line that is suitable for cataloging. We are rapidly reaching that stage and we expect that part of the business to develop rapidly. We have a very good trade already among dealers who have profited by rather limited circulars and who have familiarized themselves with the line we sell when in the store.

"We find our dealers are ready and anxious, especially those in towns too small to have accessory stores to handle accessories in connection with the parts for the cars they sell.

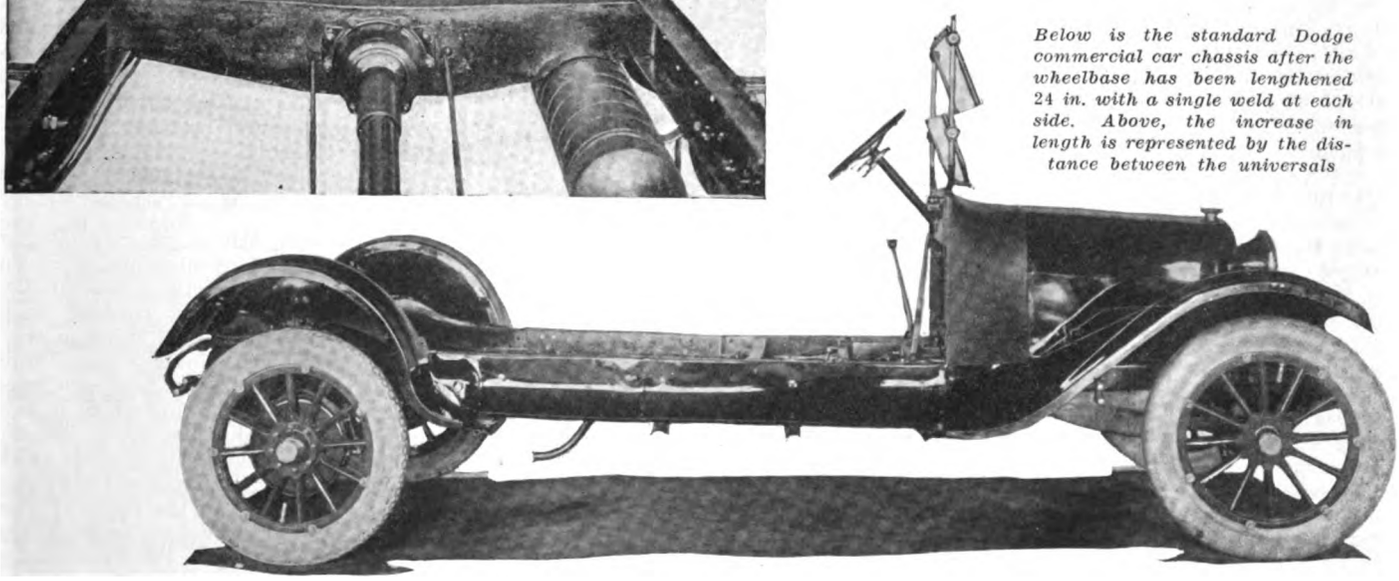
"I do not see any future for the dealer who confines himself to one line except those who sell the very cheapest cars where the service department will supply an upkeep for the overhead.

"One difficulty we have encountered is to get men on the road to sell our varied line. It is hard to get them to push two kinds of passenger cars. It is still more difficult to get a passenger car man to speak a word for a truck and still more difficult to get him interested in the tractors. As to the machinery, they do not mix at all, but this can and will be overcome as necessities of the trade assert themselves. There is no question but what business is going to be done this way and some way assuredly will be found for the handling of it."

Lengthening a Chassis 24 In. with Two Welds



COLT-STRATTON CO., New York dealer in Dodge Brothers cars, has devised the following method of extending a chassis with the use of a single weld in each side member:



First the chassis frame is cut as far to the rear as possible. The front section of the cut chassis is then fitted to the rear section of a second chassis which has been cut as far front as is necessary to give the length of wheelbase required in the extended chassis.

Of the two remaining sections of the two chassis which have thus been cut, the front section with the short side members is used in making a 1½-ton truck or a 3-ton tractor by combining it with a Torbensen internal gear drive rear axle attachment, for both of which types of heavy hauling device this company has built up a good business, as described recently in this magazine. The rear section of chassis No. 1 is salvaged by disassembling its parts and returning them to stock. The result is a saving in cost of about $25 on each extended chassis turned out, and a more substantial job because of the single weld.

In the extension of the driving mechanism, the parts used include a section of drive shaft and housing cut the necessary length, a standard universal joint, a rear transmission bearing, a supporting cross member of 6 x 2 x ¼ channel iron made with a 5 in. return on each side of the channel frame, hot riveted; also two brake rod extensions of the necessary length, welded in.

The acetylene welded section of the frame is reinforced by steel plates 3⅝ in. wide by ⅝ in. thick, cut 12 in. longer than each side of the joint and hot riveted. The entire job is done in the Colt-Stratton blacksmith shop.

Below is the standard Dodge commercial car chassis after the wheelbase has been lengthened 24 in. with a single weld at each side. Above, the increase in length is represented by the distance between the universals

THE LAW

By George F. Kaiser

As It Applies to
Dealers
Repairmen
Garagemen

Be Reasonable

THE sale of a business with an agreement that the seller is not to re-engage in the same line for a certain time within a certain specified distance is not uncommon.

Recently an interesting case like the above was submitted to me for an opinion. A garageman who operated in a small town sold out his business. He was well known and well liked in the town where he was located. The buyer, not wanting him to open up a new garage in opposition, insisted that he sign an agreement that he would not re-engage in the same business in the entire state for ninety-nine years.

About a year after the former dealer sold out his business, he opened up a new garage and repairshop in his old town about a block away from his old place of business, and commenced to solicit business from his old customers. The man who had bought the business from him very naturally objected but did not succeed in getting any satisfaction. He then determined to get some legal advice as to what he had the right to do. I advised him that I thought that the courts would decide that the restrictions he had made as regards the other man's re-engaging in business were invalid because they were unreasonable and that he would therefore be unable to recover any damages for breach of contract.

Be Careful of Agreements

In a case of this kind where a person buys a business and wishes to protect himself against the possible future competition of the seller he must be very careful that any agreement made restricting the seller's right to re-engage in business is reasonable. If the buyer in the case I mentioned above had provided that the seller should not re-engage in the same line of business within five blocks for ten years or within ten blocks for five years, the restriction undoubtedly would have been valid because the business was a local one, but where a man who conducts a purely local business is restrained from re-engaging in the business, in which he is most proficient, for the rest of his life, in any part of a whole state, the restriction is undoubtedly unreasonable and invalid.

The validity of such an agreement depends in every case upon the reasonableness of the provisions as to time and distance. For that reason agreements not to re-engage in business where no time limit or distance limit is specified have always been held to be invalid, because, as the court said, such agreements not only deprive the contracting party of the right to re-engage in such business or trade but also deprive the public of his skill and ability in that particular line of business.

Of course, where a concern doing a business in a large number of states sells out, the restriction can be much more severe as regards time and distance than when the business is merely a local one. In one case where a concern which did business in a number of states agreed not to re-engage in business in any state or territory except Nevada or Montana for ninety-nine years the agreement was held valid because it was reasonable in view of the fact that the concern did business in a large number of states.

Dealer Contract Valid

In a recent case which was brought by a dealer against a motor car manufacturer on a "dealer's contract" the court, in deciding that the dealer was entitled to damages for breach of contract, said: "In disposing of this case we will proceed upon the assumption that when business men negotiate with each other and reduce the result of their negotiations to writing and speak of that which they execute as an agreement between themselves" that the purpose was to accomplish something. Although it was contended that the contract was void and invalid the court decided that it was good because it was the intention of the company to sell cars and of the dealer to buy them, pay for them and resell them.

Must Read Contract

Another rule of law that is not generally understood or if understood is not always followed by dealers is that a person is obliged to read a contract if he is able to read or have it explained to him if he cannot read, or else he cannot deny liability under it unless there is fraud, misrepresentation or deceit on the part of the other party.

By way of illustration: If a man comes into a dealer's place of business and wishes to sell certain goods, and the dealer agrees to buy them and signs his name without carefully reading the contract, he is bound by the contract provisions, and if a clause such as "All the conditions of this contract are mentioned herein" is contained in the printed form presented by the salesman, any verbal agreements that the dealer may have made with the salesman are invalid and the courts will hold that the written contract contains all the terms agreed upon.

The courts have time and again decided that when a person who can read and write executes a contract he is bound by it when there is no fraud, misrepresentation or deceit, and the fact that he did not read it or was ignorant of its contents is no defense, for he should have read it.

The courts have further held that a man who cannot read or write is under a duty to have the contract explained to him in order that he may understand its contents, and if he fails to do that he is bound by it and must take the consequences.

Olympian Motors in Production

PONTIAC, MICH., May 20—Olympian Motors Co. shipped its first car April 29. Production is now ten cars a day, and this is expected to grow to fifteen daily within a week.

Changes in Timken Personnel

DETROIT, May 20—Several changes have taken place in the organization of the Timken-Detroit Axle Co., due to the resignation of Eugene W. Lewis, former vice-president and director of the company, who has accepted a position with the Government. A. R. Demory, vice-president, will become vice-president and general manager. Frederick C. Gilbert, secretary, will become vice-president in charge of sales and advertising. C. W. Dickerson, treasurer, will have the added office of secretary.

More Fordsons Ordered

DEARBORN, MICH., May 20—Orders have been placed by distributers of the States of North Dakota and South Dakota for 500 Fordson tractors each. Minnesota will take 1000 Fordson tractors. The Fargo Motor Sales, Fargo, will handle sales in the first mentioned State; Herring Motor Co., which is handling the Nebraska and Iowa distribution, will also handle South Dakota sales; W. H. Schmeldel, St. Paul, will take care of the distribution in the State of Minnesota. Uruguay, South America, and Haiti have each taken 100 Fordsons.

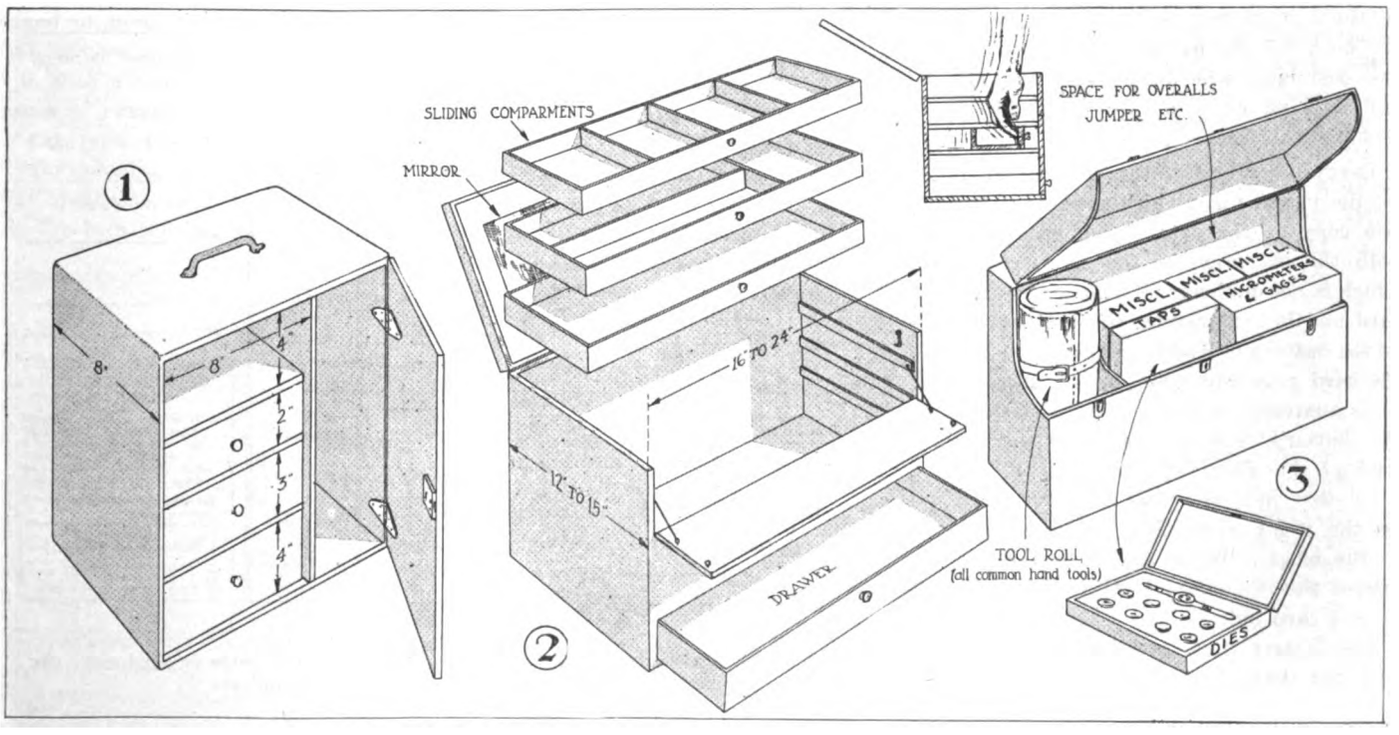
BETTER MECHANICS

No. 68

Storing the Mechanic's Tools

A Place for Everything and Everything in Place

By S. T. Williams



POSSESSION of tools does not signify the ability to use them; but the lack of necessary tools is characteristic of poor workmen. Every mechanic should own certain necessary tools, and their efficient use and preservation necessitate a tool box of some sort.

Tool boxes vary almost as much as the men that own them, but three types seem best: the small, portable box construction, Fig. 1; the bench type, Fig. 2; and the large, portable type shown in Fig. 3. The sizes are not fixed, but may be changed to meet requirements.

Chest No. 1 is entirely satisfactory for the average mechanic, and will carry the essential tools in an orderly manner where they are easily available. It is wood throughout, may be taken to the job, and can be constructed by the average man.

Chest No. 2 is most suitable for the skilled mechanic or shop foreman. It is of the bench type, and will carry all the necessary personal tools as well as the special tools required in particular repair work. The drawers slide to the front, permitting the desired tool to be easily obtained. Storage space at the front is available for overalls, etc., during the time the chest is locked.

The suitcase type chest, Fig. 3, is suitable for the roadman, as the common tools are carried in a roll, and the finer tools in special compartments. When closed it may be most readily carried.

Keeping Track of the Battery

System Used to Identify Batteries, Record Labor and Parts Charges and Check Loaned Batteries

ANY garage or service station charging and repairing storage batteries must provide itself with a system of recording the work done, materials furnished and supply an identification check to the customer.

It is desirable that these operations be simplified to the highest possible degree so that there will not be too much red tape and writing to do when the battery is received from the customer, and it is also necessary that when the battery is ready for delivery there shall be a complete record with it of the work done, materials supplied and the prices to be charged.

The Bolton-Wechtel Co., Inc., Brooklyn, N. Y., uses such a simple, complete system. When a battery comes in for charging or repairs, an entry of the customer's name, address, type of battery and date is made on the form shown in. Fig. 1. These records are on thin white paper, made up in book form, three to a page.

Fig. 1 is perforated and the part to the right of the perforation is given to the customer as a claim check. The part to the left of the perforation stays in the book till the battery is delivered to the customer, who then signs the slip and it is placed in a card index file in alphabetical order.

Every other leaf of the book is heavy manila paper, upon which appears a carbon copy of the data shown on Fig. 1 with the exception of the claim check, which is not duplicated. This is the shop card and it accompanies the battery until the battery is ready for delivery, when the card goes into a box in the office.

As material or labor is furnished on the battery, entries are made on the back of this shop card as shown in Fig. 3, so that it is a simple matter to add up the items when the card gets back to the office. When the battery is delivered this shop card is filed numerically in a card index.

The battery itself is identified with a lead tag, bearing the same number as

How One Dealer Demonstrates Tractors

The Pence Automobile Co., Minneapolis, recently staged this demonstration of the Samson tractor. It created a lot of talk

the claim check, shop card and office card. The lead tag is affixed as soon as the battery is received.

In many cases a battery is loaned to a customer while his own battery is being charged or repaired. A loan slip with serial number shown in Fig. 3 is filled out in such a case, giving the name and address of customer, number of the repair tag, type of battery loaned and type left for repairs, with their respective serial numbers.

As the loan tag bears the serial number of the repair tag, and the repair tag bears the number of the loan tag, it is impossible to forget that in this case there has been a battery loaned. When the loaned battery returns, the loan tag is filed, being marked "returned" and the date.

When cash is paid for charging or repairs, an ordinary duplicating sales book is used, the original copy going to the customer as a receipt and the carbon copy serving as a check on the day's cash receipts. If the transaction is charged, a note is made of the fact on the office slip of the repair tag and the amount is posted to the journal or ledger.

This system is complete, as it furnishes the customer with a claim check, the office with a record of the transaction while the battery is in the shop and after it is delivered, and furnishes the shop with an instruction card and cost card. After the battery is out of the hands of the station, records are available both under customer's name and under serial numbers of the tags.

From Motor World Mechanics

No. 1673—SOLDERING ACID BOTTLE-HOLDER

A holder to prevent soldering acid bottles from being spilled is made by placing the bottles in a box and filling the box with cement. By moving the bottles in the cement before it sets the holes can be made large enough so that the bottles can be removed.—H. H. Ballander, Overton Garage, Overton, Neb.

No. 1674—REMOVING HEAVY TRUCK WHEELS

A heavy truck wheel may be removed by one man after the wheel is loosened up by jacking up the axle and placing a piece of thin steel or tin about 8 x 20 in. under the tire, greasing the plate, and sliding the wheel along the plate after lowering the jack slightly. The grease may be obtained from the wheel bearing. —George E. Wilhelm, B. F. Goodrich Rubber Co., New York City.

No. 1675—AUTOMATIC SIGNAL FOR AIR-COMPRESSING OUTFIT

A signal which will ring an electric bell when the pressure in the tank gets too low or too high is made by removing the glass from the air gage, placing a narrow section of inner tube around the gage case, placing two wires so that they make contact with the gage hand when it reaches 120 or 180 lb. and placing another section of tube over the wires to hold them in place and insulate them. An electric bell is wired up with a switch and dry cells, and one terminal is grounded by wrapping bare wire around the air pipe going to the gage.—C. H. McLean & Son, Newton, Iowa.

No. 1676—CAR SPRING RACK

A rack for car springs is made by drilling holes in the wall or in an easel and inserting old valves in the holes, cotters or nails being put in the pinholes to keep the valves from coming out.—H. R. Spangler, Alamogordo, N. M.

No. 1677—LAPPING CYLINDERS WITH PORTABLE DRILL

A portabe electric drill is used to lap in cylinders by using a piece of ⅜-in. iron rod 18 in. long, one having an eye formed to encircle the piston pin of the lapping piston, the other end being straight, to go in the chuck of the drill.—Max W. Broadie, Fowler, Ind.

No. 1678—VALVE-PIN INSERTER

A valve-pin inserter is made from a piece of ⅛-in. gas tubing 5 in. long, slightly bent at one end. The pin to be inserted is dropped into the bent end, and a plunger made of 1/16-in. wire forces the pin out of the tube into the hole in the valve stem.—R. E. Brown, Auto Inn Garage, Anderson, Ind.

No. 1679—UMBRELLA FOR GASOLINE PUMPS

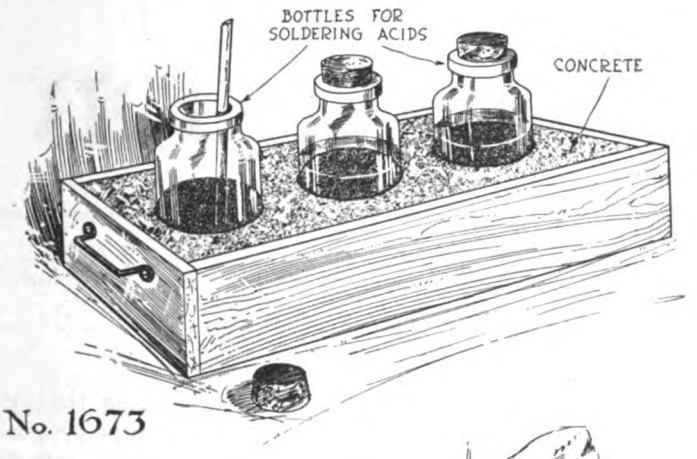
An umbrella is made of sheet metal and mounted on top of a piece of iron pipe, the upper end of which is split. The split ends are turned over and the conical-shaped sheet metal piece riveted on. The lower end of the pipe is driven into the ground. The umbrella is about 30 in. in diameter and stands about 6½ ft. above ground.—Standard Oil Co. of New York, New York City.

No. 1680—ADJUSTABLE BUSHING PULLER

An adjustable bushing puller to fit different size bushings is made from machine steel. It is pivoted and has a cap screw for expanding the legs to the bore of the bushing. The top is threaded and a nut pulls against the U-frame to pull the bushing out.—Charles H. Willey, Concord, N. H.

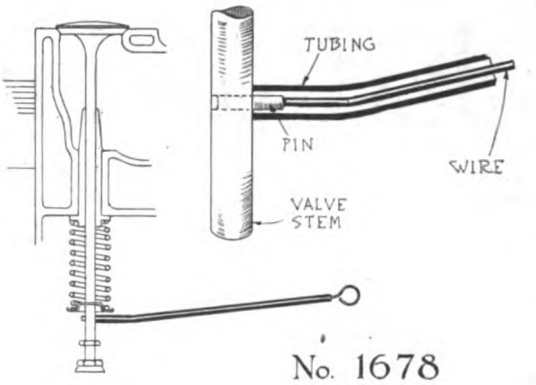
No. 1681—BABBITT LADLE

A babbitt ladle is fitted with a hook bolt for lifting with a wire triangle. A hook riveted to the rim lifts the babbitt pot and a foot on the handle enables the ladle of melted babbitt to be set down without spilling.—Charles H. Willey, Concord, N. H.



Pierce-Arrow Truck on Long Trip

BUFFALO, May 20—Traveling over the same route it followed 7 years ago a Pierce-Arrow truck, which since has been in daily service, will repeat the performance Tuesday, May 28, the anniversary of the trip, when it will run from New York to Boston. The event has been arranged by George M. Graham, chairman of the National Motor Truck Committee of the National Automobile Chamber of Commerce at Washington, who is assistant commercial manager of the Pierce-Arrow Motor Car Co.



$1 a Helpful Kink

HOW often have you been compelled to rack your brain to overcome some difficulty? But when you did find a solution—what a satisfaction it was! Well, here's a chance for you to dig some of those life-savers out of their hiding places and put them to work for your fellow-craftsmen. Send them to Motor World. We will pay you a dollar for every one accepted for publication. The only requirements are these: 1—*Describe the short-cut briefly but clearly, in few words.* 2—*Send a sketch, in pencil or pen, no matter how rough; our artists will finish the job.* 3—*Write on ONE side of the paper only.* 4—*Sign your name and initials, the name of the company you are with, and the town. Write plainly. If your name is unusual, print it in capital letters.*

Editorial Observation

Peace?

IN a short time there is expected a big German drive for peace. Germany is going to set the whole world talking about peace—all of which is intended to break down our war spirit. Germany has no more intention of making peace than she has of giving up the territory she has torn from the rest of the world.

It is a time of peril. A German bearing false suggestions of peace is more to be feared than a German bearing arms. At the present time he can do more harm with peace talk than he can with weapons.

Every man in America must school and steel himself NOT TO TALK ABOUT THIS "PEACE." It is NOT a peace. There never can be a peace until we win it by force of arms—and that time is two or three or more years away.

When Pershing's army crosses the Rhine there will be peace talk—not before.

Last week the League to Enforce Peace held a meeting in Philadelphia. Its aim is to perfect a movement which shall lead, *after the war,* to a union of nations that shall be a police force of the world and COMPEL all nations to live lawfully and peacefully.

But what do you think is the first object of this league? It is *not* peace—it is *the winning of the war.* The 3000 thinkers and leaders of the nation's thought realize that until we WIN this war and win it so there is no doubt as to who won it THERE CAN BE NO PEACE.

The aims of this league are: 1—Win the war in an overwhelming manner. 2—Form a league of nations to ENFORCE peace.

And what do you think is one of the greatest perils these thinkers see ahead? The coming German drive on the western front? No! Our numerous governmental investigations? No!

What then?

The German drive for "peace."

Therefore, beat down this "peace talk" the minute it shows itself. Don't let your friends, employees and business associates labor under false delusions. Tell them: *'To hell with peace! Get on with the war! Then we'll have real peace and not a German peace."*

Meantime, become a leader of thought. Spread the story of the *real* reason why we are at war. It's all right to preach hate of the Germans and all for which they stand, *but let's make sure we understand what Germany is fighting for.*

The facts are these: Germany believes that the "state" is the highest creation. It believes people—their lives, their activities, everything—are only for the benefit of the state. In other words, Germany as a nation is the one greatest thing in the world, and every German is of consequence only so long as he lives and works for the benefit of Germany.

The German people have been taught this from childhood. *Most of them believe it.* That is why you find Germans so persistently unscrupulous in working for Germany. They believe their one mission in life is to serve their nation—and talk of a German revolution is only an idle dream.

Furthermore, German college professors and leaders have taught—and firmly believe to-day—that while morals apply to men they do not apply to states. That is why Germany could ruin Belgium and torture women and children in order to compel submission by terror. Don't you see that this might serve the state in some degree and that therefore it was RIGHT, *because the state is not bound by the laws of morality or humanity.*

There are countless German books that say these very words.

And again, Germany has taught her people to worship—not God, not love, not morality, not kindness, not money—but "macht." "Macht" is the German word for "power." Power is the one great ideal in Prussianism. Weakness is intolerable. A weak man, a weak state, a weak animal, is only something to be put out of the way because it cannot serve to create greater power.

It is Germany's philosophy that states should get power and more power, that they should expand and grow, crush opposition, wipe out everything that stands in their way and grow, and grow, and grow—until there is nothing more left to conquer.

That is why we have the German motto: "Weltmacht oder Niedergang," which means "World power or ruin." In other words: "We shall conquer the world or go down to ruin." A half-peace is not for Germany—and it is NOT for us. OUR motto is: *"World peace* or ruin."

Please read this editorial again—seriously. Every single word in it can be supported by *volumes of books of German origin, by the stories of men who have spent years in German schools, by men who made a calm, cool study of Germany's ideals years before the war began.*

These German ideals were always known, but no

Letters from Readers

THIS page is for the use of MOTOR WORLD readers with something to say. Letters on subjects of interest to dealers, garagemen, repairmen and jobbers are always welcome.—EDITOR.

Wiring a Test Board

Editor Motor World: Please find enclosed a rough sketch of test board which the writer desires to put up in our accessories department for the use of the clerks and am sending same to you to see if you could give me some information in regard to wiring of the same, and the writer would appreciate an early reply on this information, if it is possible for you to give it.—Barker, Rose & Clinton Co., I. L. Wilcox, Elmira, N. Y.

The test board shown in the accompanying illustration will perhaps suit your purpose if the mains in your neighborhood are alternating current. The transformer shown is one which will reduce the voltage from 110 to that usually required for automobile lamps and instruments.

In order to use the volt-ammeter, the change-over switch should be connected to the two terminals of the instrument so that when fuses are being tested the meter will read the number of amperes flowing through the fuse. Note that this change-over switch is only used for ampere readings across the fuse tester contacts; for all other readings the switch arm should remain on the V side of the switch. The safety gap shown across the contacts may be placed behind or in front of the board. Its purpose is to prevent a breakdown in the insulation of the high-tension winding in the coil if too high a voltage is generated.

Interference With Drive-aways

Editor Motor World: I am enclosing herewith copy of a letter which I have written to the chief of police of Binghamton, N. Y., and which I think covers the matter of police interference with drive-aways pretty thoroughly. I am also enclosing a clipping of the editorial referred to.—A. E. Maltby, President Philadelphia Automobile Trade Association, Philadelphia.

April 30, 1918.

Mr. C. P. Cronin,
Chief of Police,
Binghamton, N. Y.

Dear Sir: Word has come to me that you stopped a driver of one of our members, who came through Binghamton recently in a drive-away of cars from factory to distributor.

An association of this kind is very strong for the strict compliance of the law, both as to speed and in the matter of licenses, but under the stress of war conditions, and in an endeavor to help out the Government in the matter of transportation, we feel that the letter of the law could be overlooked in such cases as this particular one. We had some trouble in Pennsylvania at the start, but when the matter was called to the attention of the Highway Commissioner, he issued instructions to the police officials throughout the State to refrain from reporting such conditions as this.

I am enclosing an editorial which appeared in one of our morning papers to-day, which illustrates my point very clearly.

I believe various authorities throughout the boroughs, towns, cities and States should recognize the fact that the drive-away from factory to point of distribution is a patriotic move on the part of the automobile dealer and manufacturer and no hindrance should be put in the way of the drivers of such cars, everything else being considered. Willful infractions of the law, such as reckless driving or excessive speed, should be punished, and we would ask for no leniency in such cases. But in the matter of license tags and various other small infractions of the letter of the law, I believe judgment and common sense should prevail, rather than technicalities.

Trusting that you will take this letter in the spirit in which it is written, and that the automobile trade may have your cooperation as well as that of all other highway or police officials, I am, very truly yours, Philadelphia Automobile Trade Association.

Jeannette Went Over Big

Editor Motor World: Jeannette, Pa., has gone over the top in the Third Liberty Loan drive. At the beginning of the drive the Pennsylvania Rubber Co. offered to duplicate every bond which was sold in the factory and office, and the final subscriptions for the Pennsylvania Rubber Co. amounted to $85,000. In addition to this the company issued to Jeannette the challenge that if they raised $200,000 independent of this company's subscriptions we would double it. The latest reports show that the subscriptions amounted to $585,500 against a quota of $276,950.—Pennsylvania Rubber Co., L. P. Stephenson.

Mechanics, Attention!

Editor Motor World: The letter by C. Richard of Toledo, published in the May 1 issue of Motor World, made a bulls-eye.

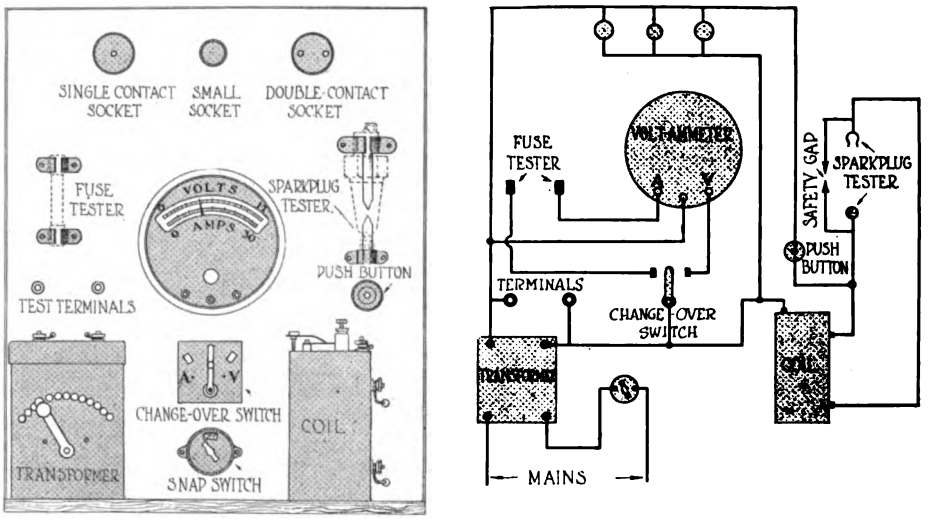
When he says "There are no inducements for men to start in the repair business" he states an absolute fact.

There is a concrete basis for every fact; let us get down to the basis of this one:

Three years ago garagemen were charging 60 cents an hour for repair work. They paid A-1 mechanics an average of 40 cents an hour. Now the garages charge $1 an hour to the customer and pay the mechanic 50 cents an hour.

This is how it works out:

40 cts. is to 60 cts.
as
50 cts. is to $1.00
} Notice the discrepancy



This, and *not the war*, is responsible for the shortage of mechanics.

At meetings of manufacturers and business men, the orators comment extensively on how necessary it is that the workers should be treated squarely—given a 50-50 deal. All nice talk but it buys no war bread, no war bonds or stamps.

Now! If they will talk less and act more; give the workers a 50-50 deal, there will be no trouble in disposing of all the Liberty bonds and thrift stamps the government has to sell.

If the repairman got a 50-50 deal he would get from 60 to 70 cents an hour instead of 50.

Three years ago a mechanic could save

Wiring for a board to test fuses, lamps, plugs, etc.

Digitized by Google

money on 40 cents an hour and live well. I know because I did it. But now! With the cost of living up from 50 to 150 per cent and wages up only 25 to 40 per cent how can the repairman live decently, feed and clothe his family and buy Liberty bonds?

It is time we had less talk and more action.

Norval A. Hawkins, in the May 1 issue, page 8, covers it thoroughly in the last paragraph. Must not kill business. Let every reader of Motor World take up the May 1 issue and read Mr. Hawkins' article—read it carefully, seriously and then take it to heart. It is the finest article I have seen along this line. It dispels pessimism and gloom for it breathes optimism in every line. And we surely need optimism now if we ever did. Yours for bigger and better business, C. R. Pierson, Foreman Hart Motor Co. (Ford Agency), Salineville, O.

New England Business

Editor Motor World: From our experience we can say that business in New Haven is pretty good.

At the present time we are running ahead of the business that we did up to this time last year and it looks as though, if we can keep on getting cars we will keep right along at the present clip or better.

Of course, you know New Haven is a munitions town and things are booming here a little more than they are outside of the munitions belt. From our experience in some of the smaller towns outside of New Haven, like Middletown and Meriden where there is very little or practically no munitions business, things are not nearly so good, so I can readily see where you might get a report that business in New England is not quite as good as had been expected.

We are keeping several men busy making trips from the Buick factory, driving cars over the road and at the present time Buick is doing fairly well on taking care of us in letting us have what we need.

On White and Peerless we get our cars from New York, some being driven and some coming by express.—The White Motors Co., W. A. Rutz, General Manager, New Haven.

P.S.—Most of the other local dealers report business to be pretty good with them.—W. A. R.

Chamber Recommends Policies

Editor Motor World: We notice a letter in your April 3rd issue headed "Going on Cash" which indicates that the Editorial Department of Motor World apparently does not know that the National Automobile Chamber of Commerce has approved standard forms of service and repair parts policies as well as getting out the gasoline poster. For your information we are enclosing copies of these standard forms. A number of the leading automobile manufacturers have already adopted them.—National Automobile Chamber of Commerce, per H. W. Perry.

STANDARD REPAIR PARTS POLICY of the BLANK MOTOR CAR COMPANY

(Prepared by the N. A. C. C.)

The purpose of this policy is to place the relations between the Blank Motor Car Company and its dealers on a definite, fair, uniform and businesslike basis

(1) **STOCK OF PARTS.**—The dealer will be required to maintain a minimum stock of both "current" and "service" parts as specified by manufacturers, to be paid for by the dealer on or before the 20th day of month following delivery.

(2) **CENSORING OF ORDERS.**—To prevent the over-stocking of inactive parts by the dealer or the purchasing of an excessive stock of any parts, the right is reserved by the manufacturer to reduce in quantity the number of pieces of any part or parts ordered by the dealer.

(3) **INVENTORIES.**—The dealer will be required to furnish an inventory of current and service parts upon request. The manufacturer reserves the right to send an auditor to verify inventories and reduce or increase stock as he sees fit in accordance with Clause No. 1.

(4) **SHIPMENTS TO DEALERS' TERRITORY.**—So far as possible, the dealer will be required to see that all orders for parts from his territory are placed through him.

(5) **DISCOUNTS.**—Discounts to garages or repair shops will be at the discretion of the manufacturer.

(6) **DESIGNATION OF PARTS STOCKS.—Stocks of parts shall be designated as follows:**

(a) **Current Parts.**—All parts used in cars of models being produced by the factory.

(b) **Service Parts.**—All parts for models no longer being produced by the factory and which have not been superseded by other parts that are interchangeable with them.

(c) **Obsolete Parts.**—Parts that have been superseded by other parts that are interchangeable with them.

(7) **RETURN OF PARTS.—**

(a) **Defective.**—Parts claimed defective under the 90-day warranty must be returned to the factory, with shipping charges prepaid, within 30 days from time defect claimed manifests itself.

(b) **Obsolete** parts shall be returned only as ordered by manufacturer.

(c) **Surplus** parts may be returned only by individual arrangement with the manufacturer.

All parts shipped to the manufacturer by dealer shall have transportation charges prepaid, and be properly tagged.

In case of parts claimed defective (a), the date when defect was discovered, number of the car, and owner's name and address, must be given.

(8) **NOTIFICATION OF OWNER.**—The manufacturer reserves the right to communicate direct with owners concerning replacement and disposition of parts returned.

(9) **DISPOSITION OF RETURNED PARTS.**—The manufacturer reserves the right to dispose, within 30 days, of parts returned, without assuming liability unless covered by shipping instructions or adjustment is accepted.

(10) **PARTS PURCHASED OR MADE OUTSIDE OF TERRITORY.**—The manufacturer will refuse to consider claims for or accept for adjustment any parts not supplied by him.

Address.....

STANDARD SERVICE POLICY of the BLANK MOTOR CAR COMPANY

(Prepared by the N. A. C. C.)

The Blank Motor Car Company, through its dealers, aims to give all purchasers of Blank cars uniformly fair, courteous and businesslike treatment and to assist them in every reasonable way to keep their cars in good running condition.

The principles of this policy are:

First—To fulfill the obligations assumed under the manufacturer's warranty.

Second—To furnish repair parts as promptly as possible at our current prices.

Third—To maintain facilities for making repairs, adjustments, and do general overhauling in a prompt and competent manner at reasonable charges.

Fourth—To make inspections and adjustments, not necessitated by neglect or abuse, free of charge for one month following delivery of a new car to purchaser, and thereafter at our regular prices.

Fifth—To furnish printed instructions in the operation and care of our cars.

Sixth—Service to be rendered does not include furnishing repair parts or labor without charge, except as provided in the warranty and in the following specific clauses of this Service policy:

(a) Within ninety (90) days after delivery of a new car to purchaser the Blank Company will furnish free of charge at the factory, duplicate parts to replace any parts as covered by our warranty that are returned to the factory with shipping charges prepaid and which are determined by the company to have been defective in material or workmanship, or it will put such parts in condition as good as new without charge.

(b) Within ninety (90) days after delivery of a new car to the purchaser the dealer will install, free of labor charges, any parts that the factory furnishes free of cost to replace any parts determined by the factory to be defective, the purchaser to assume cost of parts and installation of same pending factory decision.

(c) The party returning the parts will be notified promptly of the decision of the factory regarding allowance of a claim for replacement or repair of parts returned.

(d) Cars brought to service stations maintained by factory, branch or dealer will be inspected and all necessary adjustments will be made as in paragraphs (e) and (f), without charge during the first month after delivery of a new car to purchaser, provided the car has not been tampered with nor injured by accident or neglect. After the first month adjustments will be made at the regular charges of the service station.

(e) Inspection includes examination and report of the condition of the car.

(f) Adjustment includes only such adjustments as inspection has found necessary to put the car in good operating condition.

(g) Every dealer is expected to give the same inspection and adjustment service on the cars made by this company without regard to the territory in which they were bought.

(h) All work not included in inspection and necessary adjustment during the first month, or installation of replacements under the warranty, will be charged for at regular rates.

(i) When any charge work is to be done and the cost can be estimated in advance, the owner, upon request, will be advised of the amount of the charges before the work is begun.

(j) When it is necessary, for the convenience of the owner, to render service at a distance from the service station, the time spent by employees going to and from the job will be charged for at the regular rates of the station, together with all proper expenses of making the trip, cost of shipping parts, if any, and other necessary incidental expense.

(k) Any overtime, holiday or Sunday work done upon the request of the owner will be charged for at the regular overtime rate.

(l) Instructions in printed form regarding the care and operation of the car and its accessories, and proper method of ordering and returning parts, will be given to the purchaser upon the delivery of the car.

(m) Personal instruction will be given in accordance with the agreement between dealer and customer at the time of purchase.

(n) For service and replacements on engine starters, batteries, magnetos, generators, lamps, carbureters, tires, rims and other trade accessories that are not made by the manufacturer of the car, application may be made direct to the nearest service station maintained by the maker of such accessory. Dealers will be provided with a list giving names and addresses of the manufacturers of said accessories.

(o) No promise of service, free repair work, inspection or adjustment, except as herein specified, given or made by the dealer, shall be binding on the manufacturer of the car.

(p) To help the dealer carry out the intent of this Service Policy, the owner is requested to furnish all information necessary to the prompt and proper filling of orders and issuing of credits and to observe the requirements regarding return of parts with claims for replacement.

(Signed)

THE BLANK MOTOR CAR COMPANY.

EAST

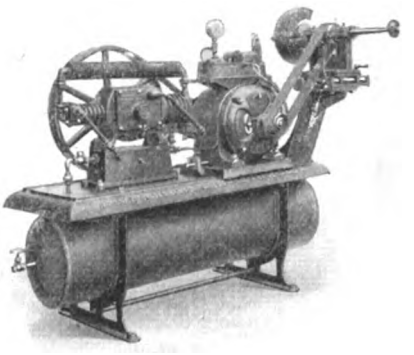
J. N. Pirong, 238 Herkimer Street, Brooklyn, maintaining a repair and service station for the Franklin and Marmon cars and Little Giant trucks, will move to more commodious quarters about July.

The Brooklyn Branch of the Chevrolet Motor Co. of New York will move from its present location at 1505 Bedford Avenue to Bedford Avenue and St. Marks Avenue, where a new building is almost completed. The entire first floor of the building has been taken on a 10-year lease, and a mezzanine balcony will provide office quarters. The removal will take place about July 1. The new service station at 1530 Atlantic Avenue was occupied early in April and has a floor space of 15,000 sq. ft. A full machine tool equipment will shortly be installed.

Blank & Rode, 1129 Bedford Avenue, Brooklyn, have opened a shop for repairing tires and tubes at this address, where they have the entire first floor. Mr. Rode was formerly with Thompson & Weeb of Brooklyn.

A. Jungkind, 1100 Bedford Avenue, Brooklyn, has purchased the entire interest in the tire repair business of Jungkind & Vogler with branches in New York and Brooklyn. The firm name has been changed to A. Jungkind.

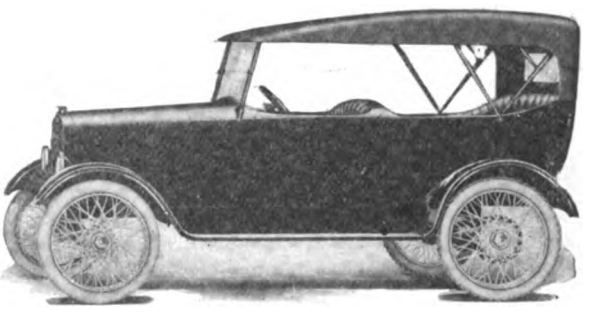
Burke & Disken have opened a garage at 48 Boerum Place, Brooklyn. Three additional buildings will be altered to eventually provide storage for 50 cars. A full line of accessories will be carried and equipment is being installed for vulcanizing. Repairing of all kinds will be done, but Ford cars will be the specialty.



Digitized by Google

Accessories

U. S. SAFETY LOCK FOR FORDS

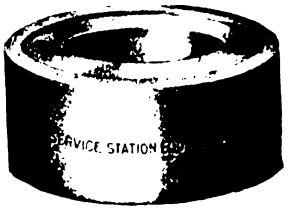


A steering wheel lock for Ford cars consisting of a wheel with a tumbler in one of the spokes which when locked in, fastens the wheel to the shaft, and when locked out, allows the wheel to turn without moving the shaft. A Yale lock is used, and two keys are provided. Can be installed in short time without machine work. Price $7.50.—U. S. Auto Lock Co., 3845 Wabash Avenue, Chicago.

U. S. COMPRESSOR AND BUFFING HEAD

A combined buffer or grinder head and two-stage automatic air compressor in one rigid unit so that either may be operated independently or both at once by the same ½ hp. motor which has a pulley at each end, one pulley belted to buffer and one to compressor. Motor is fully enclosed. Buffer will take two 8 in. wheels.—United States Air Compressor Co., Cleveland.

NATIONAL BODIES FOR FORDS



Bodies for Fords in two and five-passenger models, the bodies including windshield, one-man top, fenders, skirts, running-boards, instrument board, hood and new radiator 3 in. higher than the Ford radiator. Price $250.—National Body & Mfg. Co., Nashville, Tenn.

AD-EL-ITE ANTI-FRICTION OIL

An oil for preventing noises and squeaks in springs, generator, magneto, oil pump, shock absorber, etc. Put up in cans containing quarts for 85 cents, pints for 50 cents, half-pints with spout for 40 cents and quarter-pints with spout for 25 cents.—Adams & Elting Co., 716-726 Washington Boulevard, Chicago.

C-E-Z CELLULOID CLEANSER

A cleanser and renewer for celluloid that removes dirt, scratches and discolorations, preserves the celluloid and prevents the adhesion of moisture. Put up in double-ended cans with screw tops. Price 50 cents.—Adams & Elting Co., 716-726 Washington Boulevard, Chicago.

FORD TRANSMISSION DRUM SUPPORT

A Ford transmission drum support used to support the transmission drums on the bed of the arbor press when removing or pushing out the bushings. Has three different positions so that it can be used on all three drums. Price $2.—Service Station Equipment Co., 233 W. Schiller Street, Chicago.

JOHNSON'S HASTEE PATCH

Patching material and self-vulcanizing liquid, the material consisting of three layers, raw rubber, vulcanized rubber and khaki fabric. Claimed to make a permanent patch in three minutes. Small size contains 27 sq. in., to make 25 average patches, price 50 cents. Medium size contains 81 sq. in., or enough to make 75 average patches, $1. Large size, 324 sq. in., for 300 patches, $3.—S. C. Johnson & Son, Racine.

AVRIGID CURTAIN WINDOW

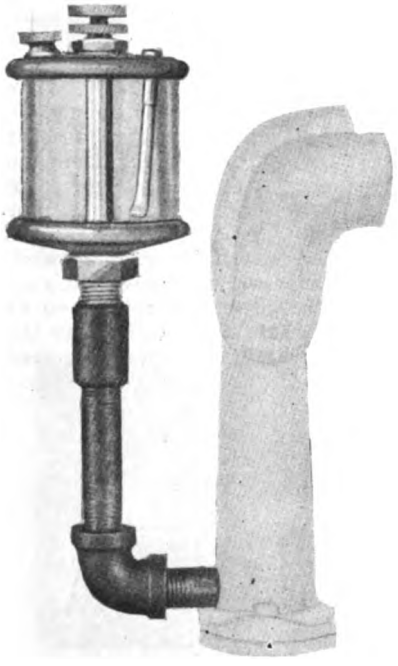


Plate glass window curtain having inside gripping ring and retaining ring, the former having resilient fingers and spurs to hold the curtain material which is folded over around it. These fingers also hold the glass tight. Made in several types for both single and double or lined curtains, and also in a flush or frameless style.—Ever-Rigid Auto Window Mfg. Co., 1017-1019 South Figueroa Street, Los Angeles, Cal.

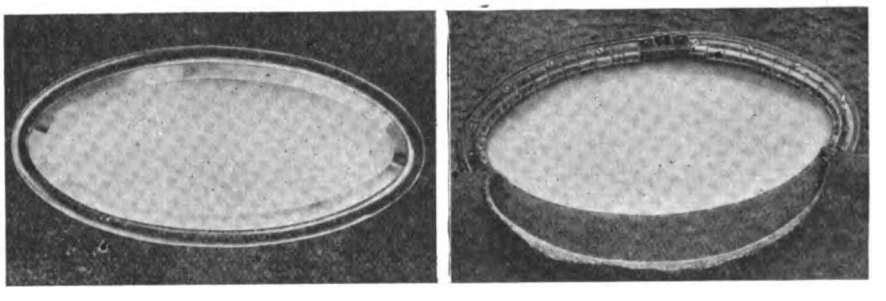
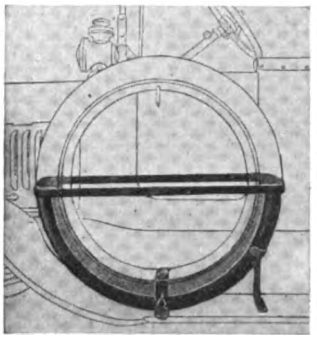
AD-EL-ITE LIQUID WAX

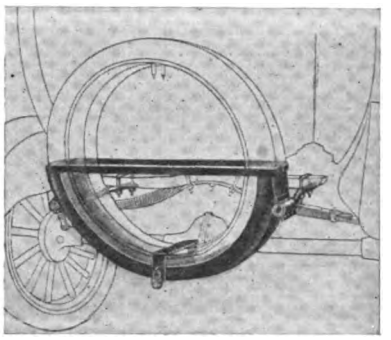
A liquid wax body polish which may either be sprayed on or rubbed on with a piece of cheesecloth. Half-pints 50 cents, pints 75 cents.—Adams & Elting Co., 716-726 Washington Boulevard, Chicago.



AD-EL-ITE LIQUID CLEANER

A liquid body cleaner and reviver to remove stains, road oil, water spots, mud splashes, dullness and blemishes. Contains no grit or acids and renews and revives the finish. Half-pints 50 cents. Pints 75 cents.—Adams & Elting Co., 716-726 Washington Boulevard, Chicago.

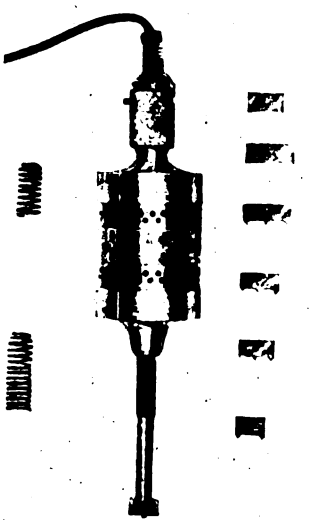




ACME AUTO CUP

A glass cup piped to the intake manifold to feed dry graphite to the cylinders while the engine is running. The frame of the cup is aluminum.—Arrow Specialty Co., 16-32 W. Sixty-first Street, New York.

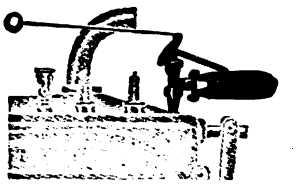
Digitized by Google



HUMBOLDT TIRE CARRIERS FOR FORDS

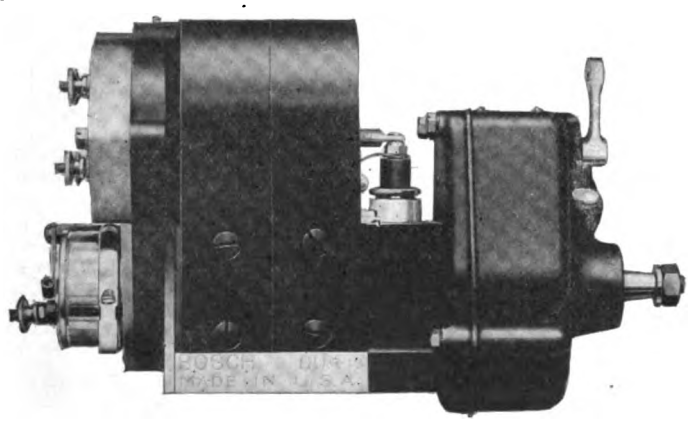
These are of semi-circular cradle type and will take 3 or 3½-in. tires with or without demountable rims. The cradle is one piece of sheet steel with component parts welded on. Finished in baked ebony enamel, packed in individual cartons, and supplied for one or two tires. The rear carrier is arranged to carry license and rear lamp, and will fit all Ford models. Prices are: Single side carrier, $4.50; double side carrier, $6; single rear carrier, $6.50; double rear carrier, $8.50. —Humboldt Machine & Stamping Co., Long Island City, N. Y.

WARNER WHEEL-TILT LOCK FOR FORDS



A combined tilting steering wheel and lock for Fords. When wheel is in tilted position, steering mechanism is securely locked. Ford steering wheel is utilized and device consists of three malleable castings with pin and tumbler lock. Can be easily installed without machine work. Price $7.—Warner Electric Co., Muncie, Ind.

ECLIPSE ELECTRIC VALVE GRINDER

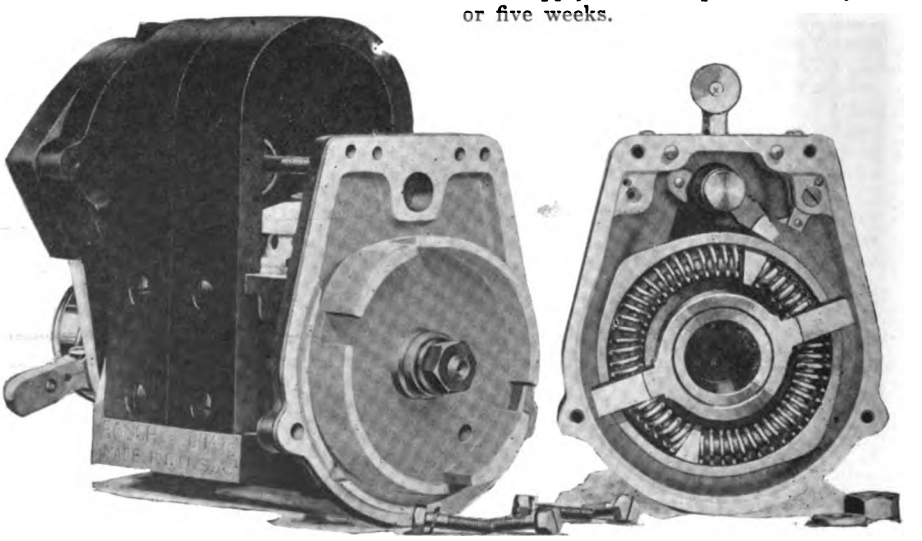


A portable electric valve grinder which gives a variable rotary oscillation to the valves at the rate of 2000 oscillations per minute. A vertical handle with plunger switch affords perfect control, while the weight of the device is such as to give proper pressure. Seven detachable bits for different style valve heads allows use on every valve made. Lifting spring for valves and 7 ft. of extension cord with swivel plug accompany each machine.—Eclipse Valve Grinder Co., Kansas City.

SERUM AUTO HORN

A horn or whistle which uses the compression of one cylinder. Attached by removing pet cock or priming cup and installing horn instead. Operated by pull ring on dash or any other place, connected by wire to horn. Price $3.50.—Charles H. Serum & Co., 3301 W. Chicago Avenue, Chicago.

Bosch Brings Out Impulse Starter



FOR motor truck and tractor ignition it is now customary to use a magneto without battery auxiliaries, and as the engines in general are so large that it is difficult to spin them, a so-called impulse starter aids greatly in starting, especially in cold weather.

A magneto with impulse starter incorporated has just been brought out by the Bosch Magneto Co., New York. The starter is of the type making use of coiled springs. It is located between the magneto armature and the driving shaft. When the engine is cranked the armature is held stationary by a pawl while energy is being stored up by the compression of the springs. After the driving shaft has been turned through a certain angle the pawl is released by a cam and the energy stored up in the springs imparts to the armature a quick rotary movement, resulting in the production of a hot spark.

When a speed of 120 r.p.m. is attained by the engine the impulse starter is automatically disengaged and the power is then transmitted through the springs of the starter to the magneto armature, the starter acting as a flexible coupling. The starter is of rugged design. All its working parts are steel, it is claimed to be well balanced and is completely enclosed in a dust-proof aluminum housing integral with the magneto itself. The heavier part of the starter is carried on its own sleeve bearing, hence there is no additional strain on the magneto bearings due to the starter.

In order to set the starter a lever mounted on a shaft projecting from the starter housing at the front is moved to the operative position, either directly or through suitable linkage. The starter is so constructed that if it should be accidentally engaged while the engine is running it will not go into operation and no damage will result either to it or to the magneto. The only attention required is to supply a few drops of oil every four or five weeks.

How to Lay Out a Building—6

THIS is the sixth of a series of articles which take up in detail the layout and arrangement of buildings for the dealer, garage and repairshop.

If you are thinking of building a garage, salesroom or service station, and are puzzled as to the proper lay-out of the building, send your plans to us. We shall be glad to help you. Include all necessary data and, if possible, a rough sketch.—EDITOR.

By Harold F. Blanchard

This is a perspective view of Plan No. 8, which is shown in Fig. 24 on the opposite page

Plan No. 6

FIG. 22 is as modest a layout for an accessory store and office as possible. There is a small store, small office, fair sized stockroom and toilets.

Any of the shop units shown on plans for corresponding width of plot may be used on this plan. Car arrangement in the garage may be similar to any of those shown on past plans of the same general shape as this one.

Only one accessory display is shown. It is strongly urged, however, that the full window frontage be used for display. This means that a sliding garage door cannot be used, or if one is used it must be placed back far enough to clear the window.

Plan No. 7

FIG. 23 is a much more desirable plan than that shown in Fig. 22, although it takes up slightly more space.

It is a preferable plan because the store is larger and there is a restroom for ladies, an important adjunct to the garageman who realizes the necessity of catering to women who drive or ride in machines.

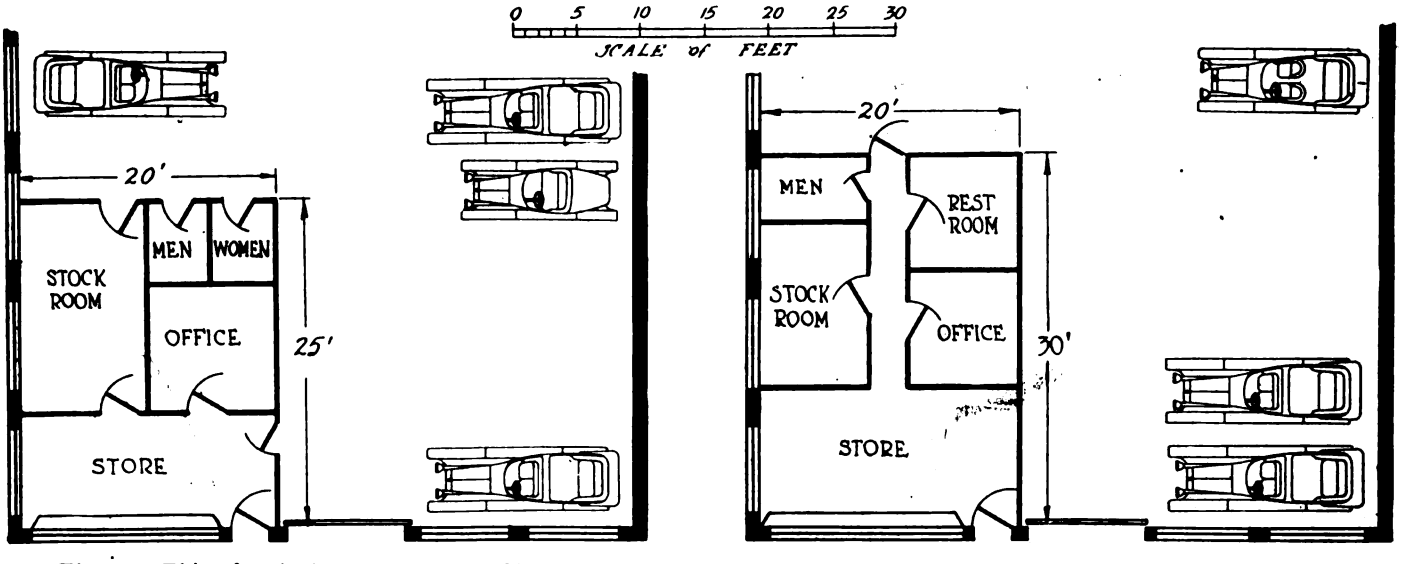
Plan No. 8

FIG. 24 is the sort of layout the aggressive garageman who believes in pushing accessory sales to the limit will want.

There is a commodious store, a stockroom of sufficient size but not too large, a restroom for ladies, a general office large enough for three or four desks, and a private office where the proprietor or manager can do his executive work undisturbed.

It seems needless to point out that any of these plans may be used on corner locations without any change, except perhaps in some cases it might be desirable to reverse the layout so as to have the office next to the side street window.

It may be possible for a garageman to adopt one of these plans bodily. They are very easily altered slightly, however, and it is thought that individuals can make such alterations to suit themselves.



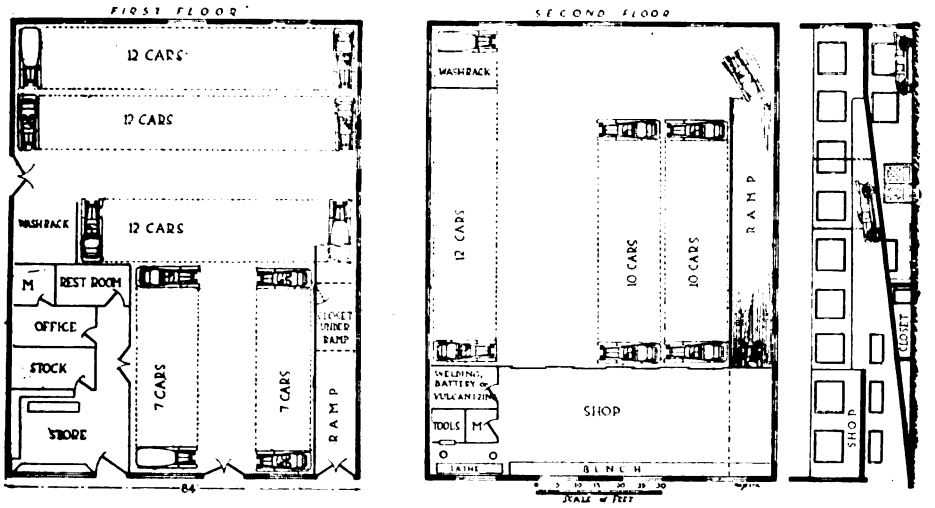


Fig. 22—This plan is for a modest establishment, though a better arrangement is shown in Fig. 23 at the right. This, however, requires a little more space

Digitized by Google

The plot of ground in this case is slightly too narrow to lay out a good garage arrangement, though the other departments should be satisfactory

stories, shop on the second floor with a ramp; no basement. I remember about a year ago the Motor World published a good many plans.

As we have a training camp here I sent all old numbers to the boys at camp. If you will kindly inform me where I could get such plans, will be very much obliged. —J. A. Roose, Majestic Garage, Rockford, Ill.

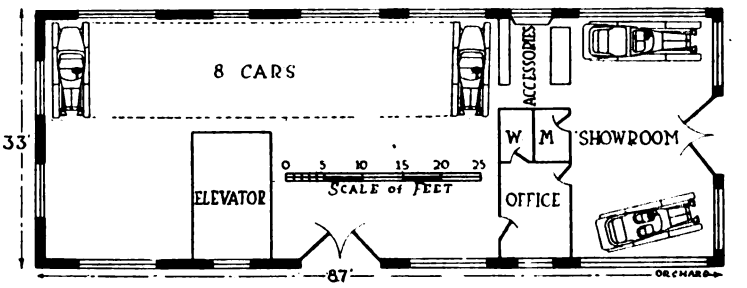
Herewith is a plan which has been very carefully worked out to meet your requirements.

You did not state which side the alley was on and therefore the plan may be the reverse of what you want.

If you sell cars it seems likely that you will want a showroom; however, there was nothing to indicate that you do sell cars; therefore this was left off.

The shop may be too large or too small but can be easily altered.

Using Window Space



Editor Motor World: We are enclosing plan of our building which we are now occupying but which must be remodeled or enlarged to take care of our requirements.

We must have a showroom and yet we don't feel like giving up storage space. We have four plate glass windows—two in the office and two in the garage—and should we extend our present office across the entire front of the building, it would make a very satisfactory showroom and office but it would necessitate making a new entrance.—The R. P. Orchard Supply Co., Belford, Ohio.

Your building is so narrow that, although it is possible to lay out a good showroom and office arrangement it is out of the question to produce a satisfactory layout for the garage.

It is better to use the whole width of the front for display purposes than to employ part of it for the office. The space at the side which we have chosen does just as well. There is provision for a small accessory store and stockroom combined, with a showcase along the front to partially separate this room from the showroom.

None of the rooms in the front of the building are any too large, but if more space were taken up by them the garage space would be just that much more crowded.

Suggested lay-out for a garage on a plot 100 x 84 ft.

Plan for Plot 110 x 84

Editor Motor World: We are contemplating building a garage on a plot 110 ft. long by 84 ft. wide. There is an alley running alongside. Building to be two

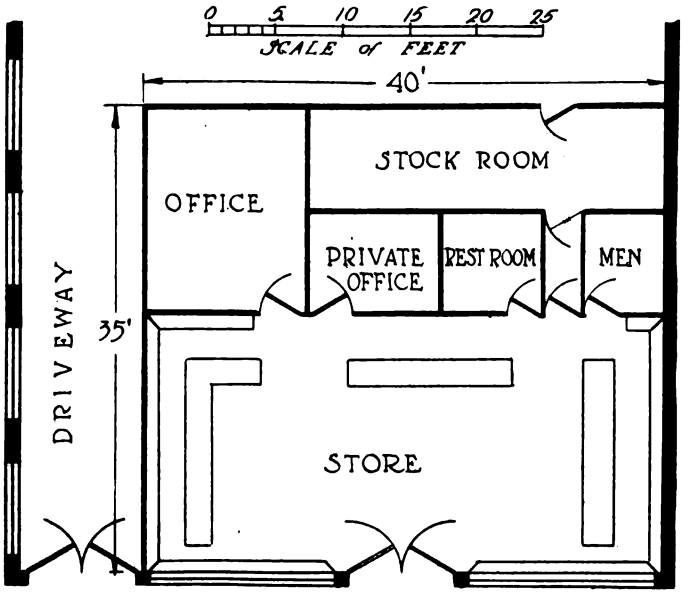


Fig. 24—The aggressive garageman will want a lay-out like this, where every opportunity has been grasped to take full advantage of the possibility of accessory sales. The plan is shown in perspective on the opposite page

Blind Heads Philadelphia Garages

PHILADELPHIA, May 17—The Philadelphia Garage Association at its annual meeting permanently changed its headquarters from O'Connell's Hall, 2156 North Broad Street, to the Adelphi Hotel, Chestnut Street, as being a more central location for the members. The following officers were elected:

President, George G. Blind, Mercury Garage, 2117 North Broad Street; vice-president, J. A. Dionne, Norris Garage, Twelfth and Norris Streets; secretary, John R. Fox, 650 Drexel Building, and treasurer, Harry Ebert, Ebert Bros.' Garage, 2429 North Broad Street. Trustees were elected as follows, forming an entirely new board: Frank Lussee, L. F. Pfeifer, Charles E. Mieswinkel, J. B. McGill and W. B. Jones.

The date for the motor car run to Atlantic City, which will be known as the "Atlantic City Sociability Run of the Philadelphia Garage Association," was fixed for June 25, and it was decided to invite the accessory and oil dealers to participate in the event, which it is intended to make an annual affair. After enjoying the hospitalities of Atlantic City over night, the return run will be made the following day, on the 26th. It is expected that a large number of cars will be in line.

More Money For Perfex

RACINE, May 20.—The Perfex Radiator Co. has increased its capital stock from $15,000 to $1,000,000 and already is carrying out an extension plan.

Digitized by Google

Drive-away Bureau

ASK FOR INFORMATION—AND—GIVE US INFORMATION

THIS department will be continued indefinitely. Its aim is to provide a clearing house for information as to routes, road conditions, hotel rates, garage rates, unfair conditions, new routes, etc. Motor World will make an effort to get any information you desire. In return, all dealers are requested to forward promptly any information they have regarding drive-aways. Send your information so it will reach New York not later than Monday of each week.

Watch Your Drive-aways

Editor Motor World: I know that you are one of the great and sincere friends of the drive-away and therefore have selected you as the target for some observations on that system as viewed first-hand right here on the firing line. I am forwarding them to you because you are indeed such a friend of the drive-away and would want to save it from faults that threaten to injure the proposition severely.

From your vantage point in Manhattan and the good words you heard in Cleveland last winter, it may be that the drive-away possesses in your estimate naught but virtues. Such is not the case, however, among those whose experience runs over many months and hundreds of cars, and those who have literally sat beside the road over which the greater proportion of the drive-away cars have been transported.

Some day, however, when you want to write a real critique of the drive-away and incorporate therein some friendly warnings, incorporate these two:

1—Cars are released from factories before they have been completely or properly inspected and tested.

2—Brand new cars are driven over the road in such a careless manner as to permanently injure them.

These two notions of the undersigned are the growth not only of observations from the side of the road but discussions among dealers in which I was fortunate enough to participate as listener. It will occur to you, I am sure, that both will act against the drive-away among the dealers and also pronouncedly among owners; and that both can be readily cured.

At the factories these days there are lines of dealers with their driving crews waiting for cars. They are anxious to take whatever they can get and drive home. Several specific instances were related of cars with important parts missing and otherwise deficient, the lack and faults not turning up until too late.

The second fault lies more largely with the dealer. Of course we appreciate that factories recognizing that no brand-new car should be driven at top speed, paste orders on the windshield to prevent the cars being operated faster than 25 miles an hour or some such speed. And yet last week when a party of us were driving in from Lima we were traveling about 40 miles an hour (no comments please) and a bunch of drive-aways went past us!

That was not exceptional or unusual, you can be assured by hundreds who have participated or watched some of the thousands of cars that have been driven over the roads leading into Cleveland. The damage to a new car is inevitable and is sure to injure the car with the owner.

Both of these facts to which I direct your attention may seem extremely simple; but the truth is they are growing, and no real, honest-to-goodness steps have been taken to eliminate them. The cases in which any but perfunctory action has been taken to remedy the situations are few.

I know of one in particular which might interest you. One dealer in Cleveland, who has been driving cars in for many months, enforces the rule that each driver must keep in sight the car behind him.

Don't set me down as against the drive-away, for either one of the following reasons: (1) Because of the foregoing observations, or (2) because I know you are for it. While the latter might influence my opinion in most matters, I assure you that I am for the drive-away in spite of your favoring it. Hoping you are the same, I am, Very truly yours, HERBERT BUCKMAN.

[Buckman, who writes the foregoing letter, is assistant secretary of all motoring and trade activities in Cleveland and northern Ohio, and is in close touch with all trade subjects.—ED.]

St Louis

ST. LOUIS, May 17—Chief drive-away dealers in St. Louis are the Overland, Weber Implement and Auto Co., Maxwell, Vesper-Buick Auto Co., Bleeck Automobile Co., Crow-Elkhart, Kardell Motor Car Co., Reo, Deluxe Automobile Co., Oldsmobile.

Routes to St. Louis

Detroit to St. Louis—Detroit to Toledo over the Government Truck Route—From Toledo through Defiance, Fort Wayne, Alexandria, Anderson, Indianapolis on Old Trails road to Terre Haute, to Effingham, to Vandalia, to Greenville, to Collinsville, to St. Louis.

Only detour in this route is south of Indianapolis for wet roads. Where Old Trails Route crosses the Ocean to Ocean road, the latter is taken through Rockville until Old Trails road is reached again. This is 18 miles additional, but worth it because of three sink holes on Old Trails route.

Except as above stated road very satisfactory.

No special hotels; all appear to be anxious for patronage and are inclined to give special rates to parties. Different firms patronize different hotels. Only trouble this year has been at Terre Haute where some hotels suffered somewhat from "rough necks" during earliest drive-aways and were inclined to turn down applicants. Guarantee of good conduct opened hotels again and things are reported satisfactory there now. Nearly all local firms in drive-aways visit service shops of their own cars en route.

No hotels or garages warned against as far as I could learn.

At Fort Wayne the police asked that cars be left at a market place near police station where police guard them over night. Indianapolis also provides parking sections and police detail. Only

Digitized by Google

trouble so far reported has been in small towns where over-zealous mayors have failed to grasp the drive-away idea and think that firms are evading freight rates and license charges. No St. Louis driver has been fined, although some have been threatened with arrest. An overland driver was arrested in Hicksville, Ind., but threatened to have the Interstate Commerce Commission take up the case and was released.—CLYDE JENNINGS, Motor World representative.

Louisville

LOUISVILLE, KY., May 16—The following dealers are driving cars from factories in great numbers:

Bluegrass Motor Sales Co., 630 South Third Street, Grant; DeHart-Turner-Wood Motors Co., 624 South Third Street, Elgin; Dr. J. T. Chawk, 713 South Seventh Street, International truck; Liberty Motor Car Co., 505 East Broadway, Maxwell; Leyman Motors Co., 501 East Broadway, Buick; Overland-Louisville Co., Floyd and Broadway, Overland; Southern Motors Co., 615 South Third Street, Packard, Hudson and Dodge; K. S. Stiles, 904 South Third Street, Premier; Studebaker Corp., 405 West Broadway, Studebaker; Yager Motor Car Co., 1600 South Second Street, Liberty.

Routes to Louisville

Detroit to Louisville (usual route followed)—Instead of going south direct to Toledo via Sibley, Trenton and Monroe, detour to Ypsilanti, Milan, Petersburg thence to Toledo. From this city the drivers follow the route of the Dixie Highway through Bowling Green, Findlay, Lima, Wapakoneta, Piqua, Troy, Dayton, Hamilton, Cincinnati, Covington, Williamstown to Georgetown Ky.

Here the Dixie Highway is left behind and, from Georgetown to Louisville, the road leads through Frankfort and Shelbyville. Macadam, stone and gravel road with many stretches of concrete between Toledo and Dayton. All the roads on the route through Kentucky are good and no detours are necessary.

Cleveland to Louisville—Elyria, Oberlin, Wellington, New London, Greenwich, New Haven, Shelby, Galion, Marion, Marysville, Springfield, Dayton, then follow Dixie Highway to Georgetown, Ky., and on to Louisville via Frankfort and Shelbyville. Roads good.

Akron to Louisville—Akron, Marion, Columbus, Springfield, Dayton, then follow Dixie Highway south to Georgetown and on to Louisville via Frankfort and Shelbyville. Metal roads good.

Flint, Mich., to Louisville—Ann Arbor, Ypsilanti, Milan to Toledo, then follow Dixie Highway south to Georgetown, Ky., and on to Louisville via Frankfort and Shelbyville. Roads good. Conditions noted in Detroit-Louisville route.

Kenosha, Wis., to Louisville—Waukegan, Ft. Sheridan, Evanston, Chicago and follow Jackson Highway to Louisville.

Chicago to Louisville—Jackson Highway.

There are several routes between Indianapolis and Louisville from which to make a selection. The Jackson Highway route is via Franklin, Edinburg, Columbus, Seymour, Brownstown, Salem and Louisville. Instead of advising drivers to take the direct road between Salem and New Albany, the Louisville Automobile Club suggests that they take the route via Fredericksburg, then on to New Albany over the Paoli pike. In good weather some of the drivers make the trip from Seymour, Ind., to New Albany and Louisville via Scottsburg, which is the most direct route.

All of the drive-away managers report that the garages charge a rate of 50 cents a night for each car. Hotel rates vary, according to the class of hotel. They range from $1 upwards, the average price, however, being $2. None of the hotels or garages has been reported unfair.

Unless roads are torn up there will be little change in the foregoing road information. Few of the local distributers make weekly drive-aways.—C. G. SWEARINGEN, Motor World representative.

Westcott Dealer Goes Drive-away One Better

Has Cars Brought from Ohio Factory on Armleder Drive-away Trucks

NEW YORK, May 20—The Westcott dealer in this city, the Westcott Motor Car Sales Co., is working the drive-away idea in a truly efficient manner. Manager Heck is keeping in touch with the Armleder truck factory in Cincinnati, which drives many trucks to the East. Whenever he needs cars he notifies the Armleder factory, which has its eastbound drive-away trucks stop at the Westcott factory and load on Westcott cars. These are delivered to the Westcott dealer here in much better condition than if they were driven overland. The charge is about $150 a car.

Kansas City

KANSAS CITY, May 18—No dealers are now driving cars in any quantity from factory. Several have been driving rather regularly, and a few have made one or two trips, with as high as fifty cars, up to a month or so ago; nearly all are getting the cars they need, by railroad, now.

Patersons are being driven now from Flint to Kansas City. G. W. Compton, district sales manager, engineers the drive-aways. Like all the others who have driven, he says he is not going to use again the route he took before. The route he is going to take on his next trip (with ten Patersons) is from Flint to Ann Arbor; thence parallel the Wabash to intersection with a trail—which he states is the White Line—leading south to Terre Haute; from Terre Haute over the National Old Trails road to Kansas City, ferrying at Glasgow. The intersection referred to of the Wabash with the trail is 12 miles west of Lafayette, Ind.

J. Frank Martin, Buick Motor Co. manager here, says they are getting cars by railroad satisfactorily now. He says that they have never recommended routes to dealers who go after cars, and many different routes have been used, the dealers apparently finding plenty of information on routes at Flint. One Buick dealer had a $2,000 loss from collisions on one trip, covered by insurance, but generally cars have come through in good shape.

G. W. Compton, Paterson's district manager, says hotels and garages have been fair and accessible, there being no necessity for designating objectives or day's run. He cautions that negro drivers can find no hotel or eating accommodations at Lafayette, Ind.

He recommends that at least one expert mechanic be taken along with each group of cars driven, not depending on local garages for service. On his next trip, with ten cars, he will separate into three groups, as three or four is all that should be in any group—the loss of time, at $10 per day for each car, being too great when a larger number are held up by accident to one car. He tried vaselining the cars one trip—the vaseline caught the dirt and dried, and he had to revarnish the cars. He figured cost of going after, driving and refinishing each car as $72.50, or about $20 more than freight would have been.

Grants and Briscoes have been driven through recently, but distributers say they will not do it again unless conditions get much worse on railroads. There seems little trouble now in getting freight cars, flat and even box, though the securing of them is irregular and in bunches.

Wisconsin Registers 170,000

MILWAUKEE, May 20—Approximately 170,000 licenses already have been issued to car owners by the State of Wisconsin and applications continue to be received at a rate that makes it appear that the 200,000-mark will be reached before June 30. The total registration of 1917 was 164,531, a mark which was passed on May 10, 1918. A year ago at this time the total issue amounted to 114,500.

Prest-O-Lite Discontinues Milwaukee Branch

MILWAUKEE, May 20—The Prest-O-Lite Co., Indianapolis, has discontinued its Milwaukee branch at 528-530 Milwaukee Street, erected about a year and a half ago, and the building now is occupied by the Wisconsin Magneto Co., distributer and service station of the Bijur, Westinghouse, Dyneto, Eisemann, Connecticut, Splitdorf, Swiss-Elkhart ignition, lighting and starting devices; Norma ball bearings and the Van Sicklen speedometer.

War Basis for All Dealers Urged by N. A. D. A.

Association's Directors and War Service Committee Plan to Release 30,000 Mechanics for War Work and to Effect War Efficiency for Whole Trade

ST. LOUIS, May 20—It is expected that 30,000 men will be released from retail automobile establishments for war service as the result of definite plans set under way at a two-day meeting of the board of directors of the National Automobile Dealers' Association held here Friday and Saturday.

This is in addition to the thousands of mechanical experts who have already entered various branches of the military service from automobile factories and service stations.

This action followed a request from the War Economy Board at Washington, of which A. W. Shaw is chairman, for the adoption of such measures by the automobile dealers and distributers of the country, as would release still more trained, all-round mechanics for military service where mechanical skill is required.

President F. W. A. Vesper of this city reported to the board of directors of the association that the War Economy Board had approved eight recommendations which had been previously drawn up by the War Service Committee, representing the Automobile Dealers of the United States, as told in Motor World April 24.

These recommendations cover the following points:

1—Elimination of unnecessary service, which, it is anticipated, would free many men.

2—The elimination of Sunday and night service except on cars used for commercial purposes.

3—The education of mechanics so that a greater number of men will be trained in the handling of combustion engines and motors.

4—The establishment of a cash basis to eliminate clerical help and office maintenance.

5—The education of automobile owners in making minor repairs and adjustments instead of depending on service stations for such minor work.

6—Economies in the use of fuel and lubricants and reduction in demonstrations and similar uses of cars which it has been necessary for the dealers themselves to maintain and keep out of necessary general use.

It is estimated by officers of the N. A. D. A. that an average of one man would be released from every retail automobile establishment in the country. This is stated by the officers to be an extremely conservative estimate. Six and seven men engaged in Sunday and night service is not an unusually large number under the old time arrangements, it is said. As there are nearly 30,000 automobile dealers in the country, the putting into effect of the approved war-time policies, it is anticipated, would immediately make about 30,000 men available for helping those who have already gone to take care of the American airplanes and motor trucks.

Representatives from several cities announced that steps had already been taken for the reduction of Sunday and night service, and that in those cities where the dealers had united in the elimination of unnecessary work, that central stations had been opened for performing necessary emergency work.

Dealers everywhere in the United States were called upon to enforce these regulations in a resolution adopted by the board of directors.

The sessions of the two-day meetings were occupied also with plans for increasing the general usefulness of the dealers' association. These were held at the Missouri Athletic Association. Dinner was tendered to out-of-town directors and representatives at the Sunset Hill Country Club, Friday evening, May 18, by the St. Louis Automobile Manufacturers and Dealers' Association.

Those in attendance at the meeting were: F. W. A. Vesper, St. Louis; Bart J. Ruddle, Milwaukee; P. E. Chamberlain, Denver; Geo. W. Browne, Milwaukee; Dean Schooler, Des Moines; A. E. Maltby, Philadelphia; J. H. Mac Alman, Boston; P. H. Greer, Los Angeles; Thos. J. Hay, Chicago; Prince Wells, Louisville; J. A. Graham, Minneapolis; Geo. D. McCutcheon, Atlanta; C. W. Hunt, Cleveland; Herbert Buckman, Cleveland; G. Elmo Holke, assistant secretary, St. Louis.

St. Louis Goes on War Service Basis

Votes to Cut Out Night and Sunday Service—Vesper Urges Full Co-operation

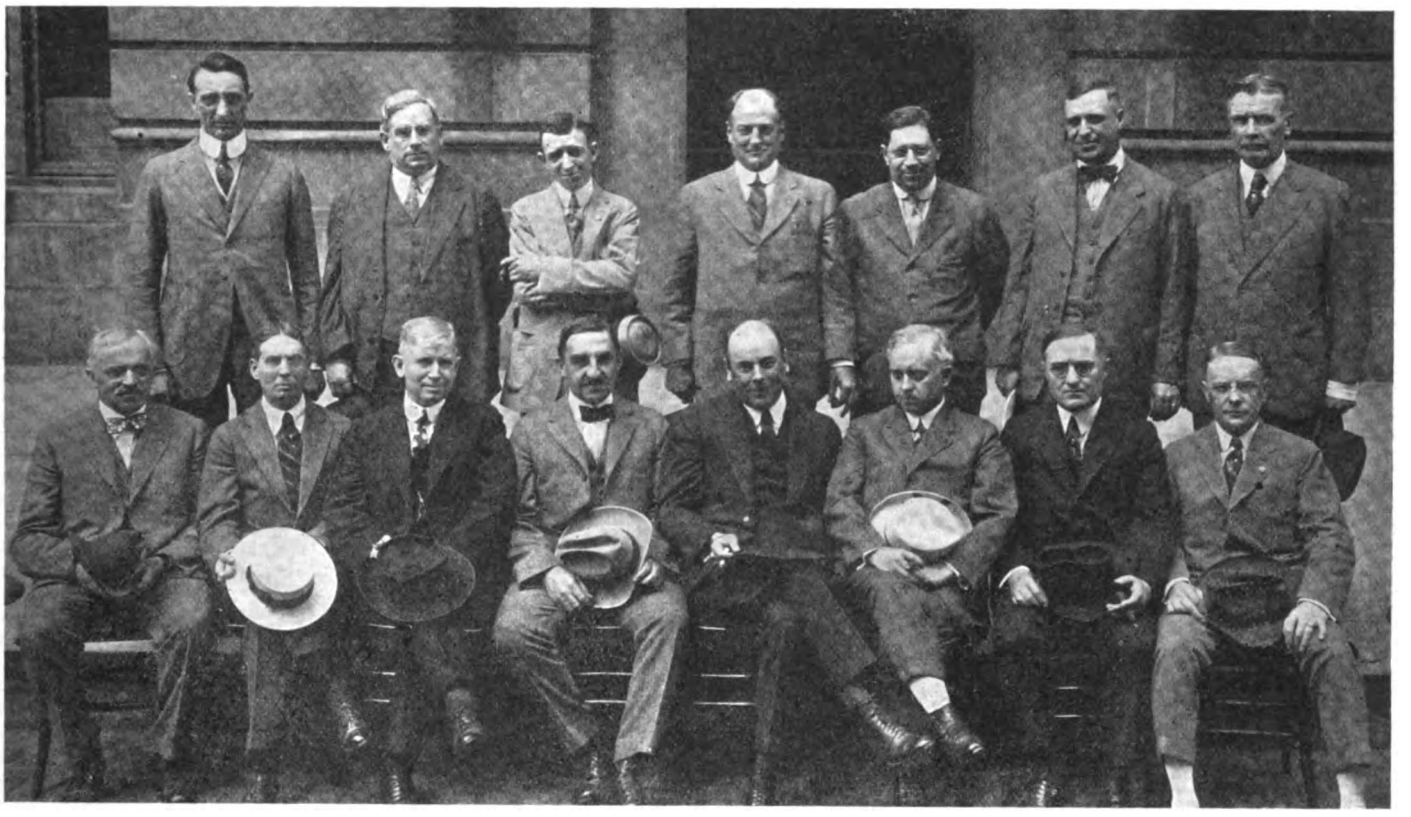
ST. LOUIS, May 20 — Automobile service in this community will go on a war basis June 1, on which date night and Sunday shifts in service stations will be eliminated. The date was fixed at a meeting of the St. Louis Automobile Manufacturers' and Dealers' Association Wednesday night. F. W. A. Vesper, president of the National Automobile Dealers' Association, was the speaker at the meeting, and he talked plainly to the dealers.

When one of them said, "I do not want to give up my Sunday and night service unless the other dealers do," he replied:

"There is nothing personal in my answer, but you have your choice of giving up this service this way or giving it up later because you are ordered to. If you are ordered to, you may give up more than your competitors. I can assure you that you will not suffer unfair competition as a volunteer very long."

Arrangements have been made with the Henry Motor Service Co. to establish four stations in the city where emergency service can be obtained by any owner, and reports will be made of such service to the regular service station at the opening of the next business day. The Henry company will not undertake to replace parts of cars or make extensive repairs, merely endeavoring to keep the car running, if possible, by emergency work.

Vesper covered his topic thoroughly before he submitted the question to the members present. He sketched briefly the wonderful growth of the industry to the point where the 4,000,000 cars now running have a greater seating capacity than the railroad passenger cars in use. He said that in this growth much of efficiency had been overlooked and that the motor car industry must now trim its sails for the test.



He made his appeal more forceful by announcing that the directors and the War Service Committee of the N. A. D. A. were to meet in St. Louis on Friday and Saturday, and he wanted to report to this body that St. Louis was fully aware of the condition of national affairs and was fully in line with the recommendations made by the War Service Committee to the Council of National Defense some weeks ago.

He told them that he had observed that most of the Sunday work was done for Sunday "chronics" who could just as well come some other day, and that only a small proportion of the night work really had to be done at night. "But the public must learn that mechanics must be conserved, and that they, as well as dealers, must put up with inconveniences," he asserted.

The resolution to adopt the emergency service plan was adopted without a dissenting vote.

Directors at War Service Meeting

Standing, Left to Right—P. H. Greer, Los Angeles; Bart J. Ruddle, Milwaukee, secretary; G. Elmo Holke, St. Louis, assistant secretary; Thomas J. Hay, Chicago, treasurer; Herbert Buckman, Cleveland; Dean Schooler, Des Moines; John H. MacAlman, Boston. Sitting, Left to Right—C. W. Hunt, Cleveland; A. E. Maltby, Philadelphia; Prince Wells, Louisville; F. W. A. Vesper, St. Louis, president; George W. Browne, Milwaukee; George D. McCutcheon, Atlanta; J. A. Graham, Minneapolis; P. E. Chamberlain, Denver

Starting the First Airplane Mail Service

The inauguration of America's first regularly-established airplane mail service was started May 15, a Curtiss model JN-48 equipped with a 150-hp. Hispano-Suiza engine leaving Belmont Park, L. I., for Washington. The trip was made in 200 minutes

W. L. Hausman laid before the association general plans for the "Junior Officers' Bureau," and the Velie Automobile Co., Hudson-Phillips Motor Car Co. and the De Luxe Automobile Co. were named a committee to designate "junior officers" to work out details. This bureau is expected to work out plans for further conservation of motor car energy, both in use of cars and from a dealers' standpoint thus assisting in carrying out the ideas of the association.

Farmers See Fordson Tractor Demonstration

Between 500 and 600 Assemble for Tests by Ohio Distributer—Women Drive

(*Pictures on page* 35)

DAYTON, May 17—Between 500 and 600 farmers witnessed a two-day demonstration of the Fordson tractor and Oliver plows held yesterday and to-day by the Bryant Tractor Co., Columbus, which is to handle the distribution of Fordsons for the State of Ohio. All the arrangements for the demonstration were handled by the Dayton & Trop Auto Co., local dealer. The field was on the farm of Rolla De Weese, a mile or so north of Dayton.

Not a hitch of any kind marred the event. Advertised to begin at noon, it was but a few minutes after that time when a Fordson, equipped with an Oliver No. 7 plow, turned the first furrow, and from then until the close of the demonstration late in the afternoon neither accident nor need for adjustment brought about delay. The tractors demonstrated their ability to pull two-bottom engine gangs, pulverizers, disc drills, road graders and trailers.

Nor were specially skilled operators or drivers relied upon to put the tractors through their paces. Drivers taken from the service station of the Dayton & Trop Auto Co., some of whom never before had driven a tractor, handled the machines. Visiting farmers also took a hand, also a boy or two, and even women showed their ability.

The driving of the women was particularly interesting and impressive. Miss Bessie Geiger, the daughter of a farmer in the neighborhood, took the lead and made her turns and plowed her furrows, handling both tractors and plows with the skill and ease of a veteran. She was followed on a second tractor by Mrs. G. B. Ehrmann of Cleveland, a city woman, who before this day never had driven a motor car even, yet she handled her Fordson with ease.

Upon earth it had turned itself, the Fordson pulled a pulverizer and a disc drill, demonstrating its tractive power and speed on plowed ground, while following along the headlands was another Fordson drawing a great dray trailer, heavily loaded with observers.

The enthusiasm of the crowd of five or six hundred farmers reached its highest pitch, however, when, in response to a request that someone demonstrate the speed of the Fordson, E. H. Bryant, unhitching one of the plowing machines from its plow, drove it around the fields, cleated wheels and all, at a speed in excess of 15 m.p.h., great clouds of dirt being thrown high into the air.

Arrangements for the event, which were in the hands of C. E. Emerick, of the Dayton & Trop Auto Co., and of Rolla De Weese, upon whose farm the demonstration was given, were above criticism. Free buses ran from the Miami Hotel to the demonstration grounds. Lunch was served by church women of the neighborhood in a marquee erected on the grounds, and the comfort of visitors was looked after in every way. All afternoon the crowds came and went.

It is impossible to say how many individuals saw the demonstration whole or in part, but the number must have run into the hundreds during the day. Farmers from the vicinity were in the majority, of course, but there were many dealers who had come, some of them from considerable distances, and, most significant of all, there were a number of bankers from small towns, men who had been asked to finance a car of tractors.

More Fordson Distributers

DETROIT, May 18—Henry Ford & Son have appointed the following distributers for the Fordson tractor:

	Territory
Hippodrome Motor Co., Nashville	Tennessee
Universal Motor Co., Richmond	Virginia
De Tamble Tractor Co., Winston-Salem	North Carolina
Duttee W. Flint, Providence	New England
S. F. Bell, Spartanburg	So. Carolina
Bryant Tractor Co., Columbus	Ohio

Reorganize Minneapolis Motor Reserve

MINNEAPOLIS, May 20—Major W. R. Stephens of the Pence Automobile Co. has been chosen to reconstruct the Minnesota Motor Reserve, recently formed, and the Minnesota Service No. 1, into one organization, under jurisdiction of Adjutant General W. F. Rhinow. The reserve members will be uniformed and the organization will transport members of the Home Guard when required as well as Government and State officials on official business in the various districts.

This reserve is largely a dealers' proposition, as the units are made up of eight cars of the same make. Eight cars make a squad, two squads a platoon, two platoons a company. Each company will have a captain, two lieutenants, two sergeants and eight corporals. Each company will be enough to take care of a Home Guard company.

In Minneapolis there are four Home Guard companies and four motor corps companies. The Motor Reserve men will be sworn into service and will have drills and regular duty on occasions.

Le Roy Eschner, president of the Automobile Trade Association, has been named captain of the St. Paul division. Major Stephens will tour the State and form at least a squad in every town. Hennepin County has 400 members of the old reserve and Ramsey County 150 members.

Republic Producing 2000 a Month

ALMA, MICH., May 20—The monthly output of the Republic Motor Truck Co., Alma, Mich., is now at the rate of 2000, with an additional ten trucks daily for the Government.

Dealers Will Get All Fordson Tractor Plows

Ford to Distribute Balance of Michigan Allotment—Dealers Get Equipment

DETROIT, May 20—The completion of the distribution of Fordson tractors, to make up the 1000 originally apportioned to Michigan, will be undertaken directly by Henry Ford & Son, and the medium employed will be the Ford agents in the state. Henry Ford & Son explain that this method has been adopted to the end that the company may become familiar with tractor merchandising.

The price on future deliveries of tractors will be $800, f.o.b. Dearborn, with the understanding that the Ford agent may add $15 to this amount to cover freight and service. This price is to continue until the full apportionment of 1000 tractors has been exhausted.

Plow Situation Uncertain

The plow situation in Michigan is uncertain. The Oliver Chilled Plow Works is making a price of $140, f.o.b. Columbus, to meet the distribution in Ohio, and has made a deal with the Bryant Tractor Co., Columbus, Ohio, which definitely takes the plow out of the hands of the implement trade in that state. No such arrangement has as yet been perfected in Michigan, although the Oliver people appear to be disinclined to continue the introductory price of $125 which was made there originally.

E. T. Bryant, Dearborn, Mich., is trying to obtain the Michigan state agency on the Oliver plow and on other implements which have been especially designed to use with the Fordson tractor. He says that a contract was made covering the agency for the special disc harrow, made by the Roderick Lean Mfg. Co., Mansfield, Ohio, and that he is negotiating with the Emerson-Brantingham Co., Rockford, Ill., for the E-B seeder. At last advices he had closed none but the Mansfield deal.

100 Tractors Produced Daily

Shipment of the English order for Fordson tractors will have been completed within a few days, probably within a week, according to the company. Production at the present time is in the neighborhood of 100 tractors daily, about 70 of which are for domestic use. The states having priority are Michigan, Ohio, Iowa, Wisconsin, Kentucky, Massachusetts, Tennessee, Virginia, Nebraska and South Dakota.

As soon as the English order is completed the entire production will be apportioned among these states.

Two hundred tractors a day is the production mark set by Henry Ford & Son after June 1. Sorenson, engineer of the company, says that if nothing untoward happens there will be 50,000 Fordson tractors in the hands of farmers by Jan. 1, 1919.

Noyes Takes Over the G. M. C. in New England

Also Gets Nova Scotia and New Brunswick—Will Continue to Distribute the Buick

BOSTON, May 20—On June 1 the Noyes-Buick Co. here will take over the G. M. C. truck branch. It is one of the largest deals ever put through here. It gives the Noyes-Buick Co. all New England, Nova Scotia and New Brunswick for the trucks. The company is the wholesale distributer of Buicks in New England, and because of the curtailment of cars the dealers were getting worried about meeting future conditions. M. E. Brackett, manager for the G. M. C. for the last few years, will direct the retail sales from the Commonwealth Avenue office owned by the branch, while Noyes will direct the wholesale from his headquarters on Lawton Street. The Buick organization is one of the biggest in New England.

29 Miles on K. B. C. Carbureter

CHICAGO, May 20—Twenty-one and a half miles on a gallon of gasoline and 29.05 miles on kerosene was the result obtained by a Ford car fitted with a K. B. C. carbureter in a test by the Chicago Automobile Club under sanction of the A. A. A. The car used was strictly a stock car during the gasoline tests, but used a hot-pin manifold in connection with the kerosene carbureter. Two Ford cylinder-head gaskets and a 3.32-in. steel gasket were used under the head when the kerosene tests were made, to lower the compression from 60 to about 53 lbs.

In the test for mileage on gasoline one full stop was made owing to traffic, the carbureter bowl finally running dry at 21.5. In tests for acceleration there was a difference of only 3.5 sec. in favor of gasoline. The trials were made from 5 to 30 m.p.h. In high gear the lowest car speed was about 6 m.p.h. for both gasoline and kerosene. In climbing the north end of Hubbard's hill, the K. B. C. carbureter showed a slight advantage over the stock Ford gasoline equipment, the time for the former being 33 sec. as compared with 34 for gasoline. On the south hill a slightly better performance was obtained on gasoline, but this was due mainly to ignition trouble which developed while the kerosene was being tested.

After the kerosene tests the engine head was removed, revealing practically a clean set of pistons, valves and plugs. The latter, especially, were in excellent shape. The kerosene carbureter was a stock model of the K. B. C. Carbureter Co., Detroit. The tests were in charge of E. A. Turner.

War Takes Tri-City Officers

DAVENPORT, IOWA, May 16—A new president and secretary of the Tri-City Automobile Trade Association have been made necessary because old officers have been called away by war duties. The new president is C. E. Alford, manager of the Overland Davenport Co. Former President H. J. Wolfer has been called to St. Paul to take charge of the business of his father, who is serving at Washington on the food administrator's staff. The former secretary, Lawrence L. Cook, has been called to the colors. Mr. Coughlin, proprietor of the Coughlin Sales Co., was made secretary.

Ross Sale Brought $37,500

DETROIT, May 18—The sale by auction of the equipment and material stocks of the Ross Automobile Co., held May 14, brought $37,500. The entire stock was sold in 630 separate parcels, no bids being offered when it was put up in bulk. There being parts sufficient to make ten complete cars they were arranged in car lots and offered in this manner. Each car brought $950; the regular price on the Ross eight at retail was $1,850. The entire stock was valued at approximately $80,000.

Overland Re-elects Officers and Directors

TOLEDO, May 20—At the annual stockholders' meeting of the Willys-Overland Co. the following directors and officers were re-elected respectively: John N. Willys, C. A. Earl, James E. Kepperley, Edwin B. Jackson, C. O. Miniger, Royal R. Scott, F. K. Dolbeer, Edward F. Swift and Rathbun Fuller; President, John N. Willys; first vice-president, C. A. Earl; vice-president in charge of sales, Edwin B. Jackson; vice-president in charge of production, C. O. Miniger; vice-president and counsel, James E. Kepperley; vice-president, Isaac Kinsey; secretary, Royal R. Scott; treasurer, F. K. Dolbeer.

U. of M. to Train U. S. Men

ANN ARBOR, MICH., May 17—The Government has accepted the University of Michigan's agreement to train 700 enlisted mechanics here in automobile repairing. The first 700 men will arrive June 15, and the training period will be 8 weeks. The second detachment of 700 will come Aug. 15, when the faculty hopes to have the new Union building available for both barracks and mess hall. A cantonment type of building will be erected immediately in which to train the mechanics in automobile chassis work.

General Electric Gets Bijur

NEW YORK, May 20—The General Electric Co. has purchased the Bijur Motor Lighting Co., and is, by the terms of purchase, paying $300,000 of new money into the company at once, and later will advance $200,000 additional whenever it is required. This total investment of $500,000 is to be represented by the first preferred stock. Joseph Bijur and his operating associates will continue with the new company. The manufacture of the Bijur line will be continued as heretofore, and enlarged to take care of new business.

Standardize Equipment For Fordson Tractors

Henry Ford & Son to Supervise Attachments for Belt-Power and Drawbar Work

COLUMBUS, OHIO, May 20—Henry Ford & Son will not directly market any of the farm equipment that goes with the Fordson tractor. Indirectly, however, the company will dictate what equipment the distributers of Fordson tractors shall handle.

It is of the utmost consequence to Henry Ford & Son that every tractor put out shall deliver maximum performance, both as respects quantity and quality of work. It is Ford's conviction that this can be assured only when specially designed machines are used with the Fordson and which shall have been given his personal approval. Every such machine built will be thoroughly tested out and only after it proves to meet every requirement will it receive official approval. Once that is conferred, however, that particular piece of equipment becomes standard Fordson equipment and every dealer who sells the Fordson tractor will sell that and no other.

Asked Others To Make Implements

Ford long ago requested certain manufacturers of farm operative equipment to design and build implements to be used exclusively with his tractor. Such was the reason behind the development of the No. 7 Oliver engine gang plow, designed and manufactured by the Oliver Chilled Plow Works, South Bend, Ind., and the engine double disc harrow, designed and built by the Roderick Lean Mfg. Co., Mansfield, Ohio. These machines already are being distributed by Fordson agents and other machines are to come. It is the expectation that within a reasonable time there will have been designed and put upon the market a complete assortment of drawbar and belt-power equipment for the Fordson tractor.

In turn it is understood that it shall be the policy of the manufacturers of such special equipment that it shall be sold exclusively through the Fordson dealers. This will operate to take the Fordson equipment out of the category of general farm implements and put it into a class by itself. Thus it will be sold as a specialized product and will not affect in any way the traditional policy of implement manufacturers toward their regular sales organization.

Inasmuch as Henry Ford & Son will have attained a productive capacity of 50,000 tractors a year by Jan. 1, 1919, and as the company expects to exceed even this production in the future, manufacturers of farm operative equipment see possibilities ahead of them, provided they can make something which will meet the approval of Ford. Already evidences of strenuous rivalry in this respect are apparent.

War Board and Steel Men Talk Things Over

Steel Men Say They Believe They Can Supply Both War and Non-War Industries

WASHINGTON, May 18—A joint committee was appointed yesterday, comprising steel manufacturers and government officials, to investigate the actual steel conditions and to determine if there is a shortage of steel.

Threats of drastic government action, including suggestions for control of steel on the part of the War Industries Board, were met by members of the steel industry with expressions of confidence in the ability of the industry to meet all government requirements during the next year.

There is a sharp conflict of views between the steel makers and the government officials. Bernard M. Baruch, chairman of the War Industries Board, and J. L. Replogle, director of steel products, claim that the government steel needs are so great that a material expansion of steel plants and curtailment of steel shipments to less vital industries are necessary to prevent a crisis.

Members of the steel industry are optimistic and inclined to the belief that they can provide the necessary steel for the government and still meet the usual industrial demands.

Differences of opinion arose in yesterday's meeting as to the actual steel needs of the government, the steel men insisting that they be given the exact facts as to war needs. They stated that if they were given an actual budget means could be found to meet the requirements.

The War Industries Board estimates that sufficient steel to construct 12,000,000 tons of new shipping must be produced for the Shipping Board alone during the next year. The War and Navy demands will be much heavier than was expected, according to the government officials.

Baruch, it is stated, will bring the matter to the attention of President Wilson at the next war cabinet meeting, Wednesday, May 22, where the problem will be thrashed out.

The joint committee appointed yesterday to agree on steps to increase steel production and restrict non-war consumption of steel includes: Representing the steel trade—J. A. Farrell, president of the United States Steel Corp.; Eugene G. Grace, president of the Bethlehem Steel Co.; H. D. Dalton, president of the Pickands-Mather Co.; J. A. Topping; E. A. S. Clarke, president of the Lackawanna Steel Co. Representing the government—Alexander Logge, J. L. Replogle and Brig. Gen. Hugh L. Johnson.

At this meeting it was learned that many of the smaller producers are unable to operate their plants at the present government price of $65 per ton for steel. The conference discussed incidentally the proposed curtailment of the automobile and piano industries. The official trend is for a heavy cut. The piano industry is said to have several hundred million dollars worth of notes outstanding which, if the industry were suddenly suspended, would result in considerable financial disturbance.

Replogle, although without a definite budget of government needs, was insistent that there is a critical shortage in steel and pig iron. Reports from the steel districts show that during the last week there has been a large increase in the steel and pig iron output.

Production in pig iron now is at the rate of 40,000,000 gross tons per year, the best rate in eleven months, and showing a substantial gain over the average of the past two years. Many steel companies are now operating their blast furnaces advantageously and further increases in total production is expected through the blowing in of furnaces that have been idle for many months.

In the last week the Carnegie company blew in two additional furnaces and is operating 53 out of its total of 59, as compared with the operation of 29 furnaces in April. The company's pig iron production is now at 94 per cent of capacity.

Semi-finished steel production is now running close to 3,000,000 tons per month, which quantity is expected to be greater than government demands for any considerable length of time, and it is expected by July 1 the non-war industries will be able to secure supplies of semi-finished steel in good quantities. Steel ingot production is now at the rate of more than 45,000,000 tons per year, a considerable increase over March.

The iron and steel industries both are said to have gone on a 100 per cent production for war materials during the past week, turning down orders from the non-war industries. It is expected that this plan followed for 60 to 90 days will result in a supply of steel sufficiently large to meet all government demands so that a percentage can again be diverted to the less vital industries.

Changes in Price

NEW YORK, May 20—The following changes in price have been made during the past week:

	New Price	Old Price
Chevrolet, 8-cylinder, 4-5-pass...	$1550	$1385
Halladay, Model S, 3-pass.....	1375	1185
5-pass.....	1375	1150
Model R, 2-5-pass.....	1530	1385
Moline-Knight, Model C, 4-5-pass.	1750	1650
Model G, 4-7-pass.....	2375	1935
Nash, Model 682, 7-pass.....	*1545	
Models 681, 683, 2-5-pass..	1395	1295
Models 684, 685, coupé and sedan	2085	1985
Westcott, Model S-18, 4-pass.....	1990	1890
5-pass.....	2290	1940
7-pass.....	2090	1940
coupé and sedan	2890	2790

*New model.

Columbia 2-Ton Truck Advances

PONTIAC, MICH., May 18—After June 1 the price of the Columbia 2-ton truck chassis will be $2,275. It is now $1,990.

Sales Conditions in Chicago Running Fair

Dealers Could Sell More Cars If They Could Get Them—Good Used Cars Are Higher

CHICAGO, May 18—A review of the trade situation in this city to-day reveals the following principal facts:

1—Dealers could sell many more cars if they could get them.

2—Transportation from factory to dealer not the serious problem that it was, because most of them can drive through if they can get the cars.

3—The fact that factories cannot turn out cars in sufficient quantities to supply the demand is the cause of the trouble.

4—Practically all standard cars are over-sold in this territory. Some of the dealers who have cars not so well known cannot sell them as rapidly as they can get them.

5—Used cars are high and are going higher. This applies only to such as have real road service in them. The junk is lower, and more of it is being junked than ever before.

6—The Liberty Loan drive had a distinct depressing effect, particularly during the campaign. Sales have recovered since with the coming of good weather.

7—Crop conditions in this territory were not particularly good last year, but crop prices were high, so that the final effect was about a stand-off.

8—As compared with last year the demand is less. In most instances, the figure given is around 75 per cent of last year's demand.

9—The demand for trucks is good, but not particularly good. This territory has not profited by war orders to the extent that eastern territory has.

10—The possibilities for tractor sales are practically unlimited. The amount of business done will depend wholly on the number of tractors which can be produced.

New Era Gets Parradee Bumper

GRAND RAPIDS, MICH., May 17—The New Era Spring & Specialty Co., of which Smalley Daniels is president, has recently purchased the plans, manufacturing rights, machinery and equipment of the Parradee Spring Auto Bumper, and has added this to its other manufacturing business. Edward Parradee, the bumper inventor, will superintend their construction.

Landon Airplane Production Head

WASHINGTON, May 20—Archer A. Landon of Buffalo was to-day appointed director of the Division of Production of the Aircraft Board, which is headed by John D. Ryan. Mr. Landon is vice-president of the American Radiator Co., and was assistant chairman of the Aircraft Board under Howard E. Coffin. "It is felt," stated Mr. Ryan to-day, "that Mr. Landon's wide experience and great ability will materially advance the production of aircraft."

Schofield Tractor to Be Made in Ten Zones

Parent Company Licensing Other Companies to Produce in Number of Territories

KANSAS CITY, May 22—The Automotive Tractor Corp., a $250,000 company owning the patent and heretofore manufacturing the Schofield tractor, is making contracts for rights in ten zones over the United States. Zone contractors will manufacture the machines and distribute in their territory. Each zone man, however, is required to put into his territory at various centers a prescribed number of demonstrators, the number being calculated by the home company on the basis of the number of farms in the zone. The zone companies are also under contract to manufacture up to a definite standard, and to distribute a certain number of machines each year. The home company takes the position that there should be a tractor on 160-acre farms.

Zone No. 1 has been contracted to the Automotive Tractor Co., and includes five states of the Atlantic Coast, with headquarters at Frederick, Md. Hesper E. Cline, a banker of Frederick, is president of the company; Dr. Geo. M. Smith, the treasurer, and Thomas E. Cling, secretary. This company has purchased a factory which heretofore has been engaged in hardware manufacturing at Frederick, and is adding to the buildings and equipment.

There are two acres of factory buildings and an additional 7½ acres for demonstrating. The first demonstration was made May 2, 1918, 2500 farmers witnessing it. This factory is already equipped to make the Schofield tractor, having one building two stories 200 x 60 ft., a foundry 60 x 75, and other minor shop and storage facilities. The company has material on hand to make 100 tractors, and can turn them out in large numbers this summer.

The home company has four zones in northern and eastern territory practically contracted for, where there are manufacturing facilities under control of zone people so that manufacturing can be started within the next month or so.

The Kansas City zone will probably be contracted within a few days; the company negotiating has 27 acres of ground, and has facilities with which 10,000 of the tractors can be made within the year. This Kansas City zone company probably will be delivering 1000 machines a month by August—and materially help the supply for the fall plowing in the wheat territory.

All the contracts provide that the distribution shall be through dealers; any sales made by demonstrators representing the zone contractors must be cleared through dealers.

The home company has a very definite notion as to the development of distribution of tractors. It is—developed of course in connection with its own device—that implement dealers, blacksmiths and automobile dealers ought to form a consolidated company, or ought to have working agreements with reference to certain articles which one or more handle. The company has already effected several consolidations, the implement man, the blacksmith and the automobile dealer, who has been interested in the Schofield tractor, forming a company.

A new plan of co-operation is being worked out, to be utilized in the distribution of the Schofield tractor, whereby the acquaintance of the implement man with the farmer and his problems, the equipment and ability of the blacksmith in making repairs on farm machinery, and in sharpening plows, and the financial ability of the automobile man in selling for cash, and the automobile man's facilities in getting, selling and giving service on his cars, will all be brought together.

The company is getting together a force of engineers and sales managers, who will act in an advisory capacity and as general directors of the zone contractors.

Eleven States Have Fordsons

DETROIT, May 20—Up to the end of the first week in May Fordson tractors have been shipped to the following states: North and South Dakota, Nebraska, Iowa, Tennessee, Wisconsin, Michigan. Ohio, Massachusetts, Kentucky and Virginia. State contract sales are now beginning to subordinate to the trade through the regular agents or agencies for the tractor, who find the farmers ready to buy on sight. There is no letting up in demand for the tractor.

Toledo Cartage Men Organize

TOLEDO, May 20—Cartage men of this city have formed what is to be known as the Toledo Cartage Men's Association. The purpose of the association is better co-operation among members in handling not only long-distance freight but in all matters pertaining to the cartage business in Toledo. The officers of the association are: President, James Manon; vice-president, W. C. Rathbun; secretary, C. M. Harrison; assistant secretary, James C. Fowler; treasurer, C. Gernheiser.

Grant Reopens Plant at Findlay

FINDLAY, OHIO. May 20—The Grant Motor Car Corp., Cleveland, will reoccupy its vacated plants in this city at once and begin the manufacture of munitions for the Government, contract for which has just been received. The plant will be placed in readiness as soon as possible, the machinery and equipment for same being en route now. It is expected that work will be started within a week. Eight hundred men will be employed at once.

Cars Indispensable to Mobilize Farm Labor

Missouri Farmers Could Not Get Along Without Them—Railroads Inadequate

KANSAS CITY, May 22—The necessity of motor cars for transporting farm labor this summer and fall is beginning to be realized in Kansas and other wheat states. A few weeks ago a mention of motor cars in connection with moving labor was scoffed at, the response being that railroads and the farmers themselves would take care of transportation.

Now, however, frantic efforts have mobilized the motor owners for definite help. The farmer will be too busy on actual production to send to the railroad station for workers, and there will be innumerable situations where labor can be transported across the country at a great saving in time by automobiles. The local Councils of Defense and local representatives of the State Farm Labor Direction are generally seeking now to organize motor volunteers for handling the labor. These volunteers will also be available for taking repair parts and supplying to the farms during the busy corn cultivating and harvest season.

Scores of small parties of three to six are being organized in cities, to spend their vacations of two weeks to a month or so in automobiles with camping outfits doing work on farms.

One of the hardest labor situations to handle is in certain districts of the West where house accommodations are inadequate, but where outside help has to be secured to care for crops.

Under the old conditions labor seemed willing to rough it, but it is considered inadvisable to send some of the city volunteer workers by railroad to these places. Such conditions can be met adequately by camping parties.

Plan Texas Show Oct. 14-27

DALLAS, May 20—The seventh annual Texas automobile show held in connection with the Texas State Fair will be held this year from Oct. 14 to 27 inclusive. These dates were announced this week. This year's show will be four days shorter than usual on account of the war. Automobile dealers who plan to exhibit their cars will meet soon to arrange for the exposition. The closed car salon which has been held each spring will not be held this year.

Frederick Remsen Hutton

NEW YORK, May 20—Frederick Remsen Hutton, Emeritus Professor of Mechanical Engineering in Columbia University and a prominent and active member of the Society of Automotive Engineers since 1908, died at his home, 257 West Eighty-sixth Street, in his 65th year, on Tuesday, May 14.

Prominent Tradesmen Assume New Duties

Resignations and Promotions Place Workers in New Places

Frank L. Grener, recently territorial representative for the Buick, Overland cars and Inland piston rings, has been named wholesale manager for the Oldsmobile distributer in St. Louis, the De Luxe Automobile Co.

Fred J. Miner has been appointed district representative of the Duplex Truck Co., Lansing. His territory consists of southeastern states.

W. C. Boulcott has been made advertising manager of the Dayton Engineering Laboratory Co., Dayton.

E. M. Mark, who has been associated with the Oakland North Pacific Co. for the past 4 years, has severed his connection with the Oakland concern to take over the distribution in the Northwest of the Elgin Six. He will head the Seattle Motor Car Corp. and branch offices will be opened in Portland, Spokane and San Francisco.

R. S. Higgins has given up his position as sales manager with John Millen & Son, Montreal, Canada, in order to enlist in the ranks of the Tank Battalion recruited in Montreal.

A. J. Brechell has succeeded Custer Ramsby as manager of the Studebaker Corp. branch house at Des Moines. He is from the South Bend office. Ramsby has gone to Detroit.

N. E. Wahlberg, chief engineer of the Nash Motors Co., Kenosha, on May 15 received notification of his appointment as a major in the quartermaster's department of the United States army and orders to report at once in Washington. It is expected that Maj. Wahlberg will go overseas within a fortnight on an important mission in behalf of the war department.

Bert M. Pettit, advertising manager of the J. I. Case Plow Works, Racine, has been elected secretary and a director of the Wallis Tractor Co., Racine, the stock of which is controlled by the owners of the plow company.

E. M. Ford, sales manager of the National Coil Co., Lansing, since the fall of 1915, has resigned to accept the same position with the Webster Electric Co., Racine, Wis., manufacturer of ignition devices for internal combustion engines.

R. F. Dyer, formerly assistant sales manager of the Aluminum Castings Co., Detroit, has resigned to become sales manager of the Parrish Mfg. Co. **Charles B. Bohm**, also formerly with the Aluminum Castings Co., has left the company to enter business for himself. His company is known as Charles B. Bohm Foundry Co. and will make aluminum and bronze castings.

Leopold E. Mosiman has been appointed production manager of the Traffic Motor Truck Corp., St. Louis. He was formerly superintendent of the Chevrolet branch plant in St. Louis.

A. W. Bolton has opened offices at 180 North Dearborn Street, Chicago, as manufacturers' representative. He has recently added the account of the Imperial Oil Co., St. Louis.

A. H. Davis, formerly of the Franklin Motor Car Co. of New York City, is now connected with the Franklin Motor Car Co. of Rochester, N. Y., as salesman.

Victor Clark Parker, former manager of the technical department of the Buick Motor Co., Flint, is now a major in charge of the industrial headquarters of the motor mechanics regiments of the Aviation Section of the Signal Corps at Camp Greene.

H. R. Russon, former branch manager of the Dayton branch of the Goodyear Tire & Rubber Co., Akron, has become a member of the manufacturers' sales organization of the company at the Detroit branch. He will specialize in airplane accessories.

George Beason has been appointed sales manager of the newly organized W. D. Block Motor Co., Oakland and Marmon distributer.

W. B. Kanis, former treasurer and general manager of the New Era Spring & Specialty Co., Grand Rapids, has been appointed sales representative of the Advance Automobile Accessories Corp., Chicago, and is handling cork inserts manufactured by this company in Michigan, Ohio and Indiana.

W. T. Scarritt, formerly White agent at Kansas City, has been made sales manager of the Western Trailer Co. and **John B. Cannon**, formerly with the Cadillac agency at Pittsburgh, Pa., is now traveling the territory as salesman.

A. H. Howard, formerly with the Interstate Sales Corp., Kansas City, has been made sales manager of the Standard Motors Corp., Cole and Empire distributers in Kansas City territory.

New Offices for Havoline Oil

NEW YORK, May 20—New offices have just been opened by the Indian Refining Co., manufacturers of Havoline oil, at 244 Madison Avenue. The company has taken three floors, comprising some 25,000 sq. ft. of space. The eighth floor is occupied by the general offices and sales forces and the seventh and ninth floors house the accounting and other departments.

Ables-Lally to Sell Power-Maker

NEW YORK, May 21—The Ables-Lally Light Corp., of this city, Newark, N. J., and Boston, will distribute the "Power Maker" a machine having rollers driven by the rear wheels of a car and in turn driving a pulley from which power is derived. This mechanism, which is manufactured by the Versal Products Mfg. Co., was formerly styled Versal Mobilpower converter. The list price will be $37.50 and will also be sold by dealers in agricultural implements and farm machinery as well as automobile distributers.

Trade in New York Is Running on Even Keel

No Great Boom and No Great Slump—Stock Market a Barometer—Freight Has Relaxed

NEW YORK, May 20—Trade in this city is running along about as it has been for several weeks. As a general rule it is not quite so good as last year, although some of the dealers in the popular-priced cars report sales far ahead of a year ago.

Deliveries, however, are not so good. Most of the dealers are driving cars overland, although there seems to be a pick-up in the freight situation. It is now possible to ship cars into the New York area. In some cases permits are necessary. And the time of shipment is fair. Cars are coming through from Ohio and the Central West in two weeks by regular freight.

During the Liberty Loan there was a noticeable slump, and the present Red Cross drive is expected to have an effect. The New York trade is said by the old-timers to be especially susceptible to psychologic conditions. When the stock market runs up million-share days car sales pick up, and when the market lags car sales lag. Also, big drives on the Western front have a similarly depressing effect.

The used-car market is in good condition. Few dealers figure to make any profit on their used cars, although most of them say they are breaking even. Cleaner sales of new cars are reported with the greater demand for used cars. Cutting-Larson carried 385 new and 100 used cars throughout the winter, and has its entire stock just about cleaned out. Its used-car stock is lower than it has been in four years.

All along the row the demand is said to be ahead of deliveries. Labor shortage is a great handicap.

License All Makers, Dealers and Jobbers of Farm Equipment

Presidential Proclamation to Conserve Food Supplies Includes Tractors and Attachments

WASHINGTON, May 20—Manufacturers, jobbers and dealers of tractors, trucks and trailers and all other farm implements and machinery will be required to work under license after June 20, 1918. The license will be issued by the United States Food Administration. The plan is to prevent undue control of prices both of food and of food-producing machinery. It is further aimed to prevent German influence from controlling the prices or quantities of food in this country. President Wilson has issued a proclamation instructing the Department of Agriculture to place the importation, manufacture, storage or distribution of farm equipment under license.

An act of Congress approved by the President Aug. 10, 1917, for encouragement of production, conservation of supply and control of distribution of food products grants the President the power to license the importation, manufacture, storage, mining or distribution of farm implements, etc., and authorizes him to place these businesses under license or other regulations as he sees fit.

The proclamation states that all individuals, partnerships, associations and corporations engaged in the business of importing, manufacturing, storing or distributing farm equipment are required to secure licenses on or before June 20, 1918. The Secretary of Agriculture will carry into effect the provisions of the act and proclamation. Applications for licenses must be made to the Law Department, License Division, United States Food Administration, Washington, D. C.

The plan is designed to prevent scarcity of food, monopolization, hoarding, injurious speculation, manipulation and private control of the food supplies during the war.

The general regulations governing the licenses as outlined by President Wilson include the following:

The term "farm equipment," wherever mentioned in these regulations, shall be deemed to mean certain necessaries, including attachments and repair parts thereof, required for farm use in the actual production of foods and feeds, as follows: Binders, boilers, brooders, bunchers, carriers, carts, cleaners, covers, crushers, cultivators, diggers, distributors, drills, elevators, evaporators, fencing, forges, forks, fountains, gates, grades, grinders, grindstones, harrows, harvesters, headers, hillers, hitches, hullers, huskers, incubators, jacks, listers, loaders, markers, milkers, mills, mowers, pens, pickers, planters, plows, powers, presses, pullers, pulleys, pulverizers, pumps, racks, rakes, rollers, scales, seeders, separators, shellers, shredders, silos, sleds, slings, sorters, sowers, sprayers, spreaders, stalls, stanchions, tanks, tedders, testers, threshers, towers, tractors, trailers, troughs, trucks, wagons, weeders, weighers, windmills and all other tools, utensils, implements and machinery required for farm use in the actual production of foods and feeds.

Licenses required, pursuant to the proclamation of the President of May 14, 1918, to engage in or carry on any business of importation, manufacture, storage, or distribution of any farm equipment, shall be prepared by the Law Department, License Division, United States Food Administration shall have the signature of the Secretary of Agriculture affixed, and shall not be transferable.

Each licensee shall give to any representative designated for the purpose by the Secretary of Agriculture, whenever the said representative shall so require, any information concerning the business of the licensee. Such information shall be in writing or otherwise, and with or without oath or affirmation, as the said representative may require. Written report, when requested by said representative, shall be made on blanks furnished by the Department of Agriculture, giving complete information regarding or affecting transactions in any farm equipment, which is imported, manufactured, packed, purchased, contracted for, received, sold, stored, shipped, or otherwise handled, distributed, or dealt with, by the licensee, or which is on hand, in the possession, or under the control, of the licensee, and any other information concerning the business of the licensee that such representative may require from time to time.

Each licensee shall, during ordinary business hours, permit any representative of the Secretary of Agriculture, designated by him for the purpose, to enter the place of business of such licensee, and inspect any and all property stored or held in possession or under the control of the licensee and all records of the licensee. All necessary facilities for such inspection shall be extended to the said representative by the licensee and his agents and servants. Said representative shall be the President's duly authorized agent for the purpose of this regulation.

Each licensee shall keep such records of his business as shall make practicable the verification of all information given by him under these regulations.

No agent or employee of the United States shall without the consent of the licensee concerned divulge or make known in any manner, while he is such agent or employee or thereafter, except to such other agents or employees of the United States as may be required to have such knowledge in the regular course of their official duties, or except in so far as he may be directed by the Secretary of Agriculture or by a court of competent jurisdiction, any facts or information regarding the business of any licensee which may come to the knowledge of such agent or employee through any examination or inspection of the business or accounts of the licensee, or through any information by the licensee pursuant to these regulations.

A licensee shall not import, manufacture, store, distribute, sell or otherwise handle any farm equipment on any unjust, exorbitant, unreasonable or discriminatory and unfair commission, profit, or storage charge.

A licensee shall not resell any farm equipment, within the same trade, without reasonable justification. Any such resale without reasonable justification, especially if tending to result in a higher market price to the retailer or consumer, will be deemed to be a wasteful practice.

A licensee shall not buy, contract for, sell, store, or otherwise handle or deal in any farm equipment for the purpose of unreasonably increasing the price or restricting the supply of any such commodity, or of monopolizing, or attempting to monopolize, either locally or generally, any such commodity.

A licensee shall not knowingly commit waste or willfully permit preventable deterioration in connection with the production, importation, manufacture, storage, distribution, or sale of any farm equipment.

Each licensee shall report in writing to the Secretary of Agriculture, within ten days thereafter, any change of address, or any change in the management, control, ownership, or character of the business of the licensee.

A licensee shall not, without the express sanction of the Secretary of Agriculture, sell any farm equipment to any person engaged in the business of selling or utilizing such commodity or any derivative therefrom, if the licensee has knowledge that such person, after this regulation has become effective, has violated the provisions of the aforesaid Act of Congress, approved August 10, 1917, by making an unjust or unreasonable rate or charge in selling or otherwise handling or dealing in such commodity or by holding, contracting for, or arranging for a quantity thereof in excess of the reasonable requirements of his business for use or sale by him for a reasonable time.

A licensee shall not make any misleading representation which tends to enhance the price of any farm equipment. The issuing or making public of market quotations, or any statement to any person regarding the price at which any farm equipment is being sold, which quotations or statement cannot be verified either from the records of such licensee or from the records of other licensees, shall be considered as making such a misleading representation.

The words used in these regulations shall be construed to import the singular or the plural, as the case demands. The word "person," wherever used in these regulations, shall include individuals, partnerships, associations and corporations.

The general rules and regulations as to food commodities, effective November 1, 1917, as amended, under the Food Control Act, shall not apply to farm equipment.

In accordance with my proclamation of May 14, 1918, and pursuant to the authority conferred on me by the Act of Congress, approved August 10, 1917, entitled "An Act to provide further for the national security and defense by encouraging the production, conserving the supply, and controlling the distribution of food products and fuel" the foregoing regulations are hereby prescribed and promulgated to govern persons licensed to engage in and carry on any business of importation, manufacture, storage, or distribution of farm equipment.

Done in the District of Columbia this 14th day of May, 1918.

(Signed) WOODROW WILSON,
President.

United to Acquire Perlman Assets

NEW YORK, May 20—The United Motors Corp., which already controls the Perlman Rim Corp. through stock ownership, is to acquire the assets and properties of the company, which will be made a United Motors division. Action authorizing the transfer of the assets and property was taken at a meeting of the Perlman Rim Corp. on May 13. The change presages no alteration in the conduct or productions of the company and is in line with a similar change which was made several months ago, when the Hyatt Roller Bearing Co.'s assets and property were transferred to the United.

Schools for Army Mechanics

KANSAS CITY, May 18—The two big automobile and tractor training schools in this city, the Sweeney and the Rahe, are to be used by the Government in training 5000 men from the selected army this summer as motor mechanics. The men will come in groups of 1500 and be divided between the two schools. The course will take two months. The first contingent is already going through the school. Most of them are from Iowa.

Five More in M. A. M. A.

NEW YORK, May 20—Five new members were admitted to the Motor and Accessory Manufacturers' Association at the meeting which was held last week. These are:

Indiana Lamp Co.....Connersville, Ind.
Teetor-Hartley Motor Corp.Hagerstown, Md.
Mayo Radiator Co.....New York City
John W. Brown Mfg. Co.....Columbus, O.
G. & O. Mfg. Co.....New Haven, Conn.

Detroit Dealers Say Car Demand Is Steady

Expect Increasing Interest as Weather Improves—Truck Sales Better

DETROIT, May 18—The demand for cars in this territory is apparently good and most dealers feel quite optimistic about the future. They believe the demand will naturally increase as the weather improves, but due to the shortage of cars they feel that they will not be able to obtain sufficient cars to supply their requirements.

Used cars are in greater demand than ever before and higher prices are being secured for them. The increased demand, however, is expected throughout the cities rather than in the rural districts. The wheat acreage this year being much below normal is somewhat discouraging. This, with the fact that many farmers' sons, on whom the farmers have depended to drive their cars, have departed for military service, reduces the field of sales possibilities in the rural communities.

As compared with last year, motor truck and delivery wagon sales are 25 per cent less but are steadily picking up. Passenger car sales, however, are 25 per cent better than last year's figures. During May, 1917, the Overland distributer sold $61,000 worth of cars. This year to date the company has already done $60,000 worth of business, pointing to a remarkable increase for this month.

Outgoing freight from the factories is moving more freely. Most of the plants state they are obtaining a great percentage of the cars they need. Less than 25 per cent of the production of Paige is driven away; part of this goes by water. Shipments from the Packard plant to the East are sent to Buffalo by boat, and there the cars are unloaded and called for by distributers, who drive them to Pittsburgh and New York. Cadillac sends 18 per cent of its production by water; only 2 per cent is entirely overland.

Lozier Reorganizes Service

DETROIT, May 20—The Lozier Motor Co. has made a number of changes in its service organization and has formed an advisory division in charge of W. S. Grant, to assist owners in the proper maintenance of their cars. B. B. Denyes has been placed in charge of the overhaul department.

Fickling Enameling Reorganized

LONG ISLAND CITY, N. Y., May 21—The Fickling Enameling Co. has passed out of existence and has been succeeded by the Enameling & Stamping Corp., organized with a capital of $200,000. W. Irvine Fickling will be president of the new company and H. F. Holbrook, formerly associated with the Holbrook Co., manufacturer of bodies, will be secretary and treasurer.

Chicago to Conserve "Service"

CHICAGO, May 20—The Chicago Automobile Trade Association is contemplating taking steps toward lessening unnecessary service to owners, as urged by the National Automobile Dealers' Association at St. Louis last week. It is probable that a meeting of dealers will be held within a few days to adopt a formal program. Meanwhile individual dealers are asked to urge owners to perform such operations as greasing and oiling, etc., that do not require expert services.

Kaufmann-Morris Reorganized

NEW YORK, May 21—The Kaufmann-Morris Co., New York distributer of Nash cars and trucks, Premier and F. I. A. T. cars, has been reorganized, following the resignation of George R. Morris from the company. Mr. Kaufmann continues as president and F. C. Stowers general manager.

Lewis Resigns from Timken Axle

DETROIT, May 16—Eugene W. Lewis, who has been vice-president and a director of the Timken-Detroit Axle Co., has resigned in order to devote his entire time to government war activities. As a result of his resignation the following changes in personnel of the company have taken place: A. R. Domery, vice-president, is now also general manager; Frederick C. Gilbert, secretary, has been made vice-president in charge of sales and advertising; C. W. Dickerson, who is treasurer, has been given the added responsibility of secretary of the company.

Peace?

(*Continued from page* 28)

one took them seriously until the butchering army set forth across Belgium on its career of "Weltmacht." No one ever thought it would happen. It was unbelievable. And when it happened it was too late to teach the world what the war meant. But we MUST teach these things else we do not know what we are fighting for—and if we don't know what we're fighting for *we may be tempted by the coming German-made talk of "peace."*

The only peace we can have is the one whose terms you know. Those terms can be secured only when the German army is crushed, and this crushing will take millions of men and possibly years of time.

We have said for ourselves: "World peace or ruin," and by that we mean we shall fight until the German ideals of power and world domination are crushed into the dust—across the Rhine.

So, when you hear men to-day blather and simper about peace, fairly shriek at them to get sense into their heads, for our only way to world peace is to GET ON WITH THE WAR.

Another Slight Rise In Prices of Tires

Goodrich and Fisk Add 2½ to 10% But Are Alone—Expect Cotton Shortage

NEW YORK, May 20—Another slight increase in tire prices has been made by the B. F. Goodrich Co. and the Fisk Rubber Co.; Goodrich has increased the price of fabric tires of all sizes from 2 to 3 per cent, and Fisk has made increases varying from 2½ per cent to 10 per cent, according to size. Although it is freely predicted that other companies will make further increases, none of them has, as yet, done so. Kelly-Springfield, which did not increase at the time other companies did so, about the third week in April, has raised its lists 10 per cent, effective at once.

The increases are ascribed largely to a shortage of the proper grade of cotton for fabric and to the rising cost of labor. It is stated that whereas the tire manufacturers generally require 80,000 bales of Sea Island cotton for a normal year's output, insect pests and other causes have reduced this year's possible supply to about 60,000 bales. Of this the Government has requisitioned probably 50,000 bales, leaving only a very small amount for tire manufacturers. The exact effect on the industry cannot be estimated, though the suggestion is offered from some quarters that this may bring about the production of unguaranteed tires. Some factories are at present working from day to day on the cotton they can receive, though some of the others are fairly well stocked.

The rubber situation is not causing any apprehension. Imports have been coming in freely during the last few weeks, and all the rubber that was afloat on May 8 will be admitted without restriction. In view of reduced automobile production, it is thought that there will be no shortage of rubber for tires.

Continental Truck to Start

SUPERIOR, WIS., May 20—The Continental Motor Truck Co., Superior, Wis., which has been inactive for nearly a year, has completed arrangements for the final equipment of its new shop building and expects to be engaged in a regular production of commercial cars within 60 days. The company was organized in 1913 by Dr. J. G. Barnesdale, designer of the truck, and occupied leased quarters pending the erection of a new factory. For the present the company will devote its attention to a 3-ton type.

More Room for Lavine

MILWAUKEE, May 20—The Lavine Gear Co., Racine, has acquired a large tract of land near the north limits of Milwaukee, and intends to erect a complete manufacturing group costing about $400,000.

Mulford in Frontenac Winner at Uniontown

Takes Liberty Sweepstakes Final at 97 M. P. H.— Oldfield Wins Match Race

UNIONTOWN, May 16—Ralph Mulford, driving a Frontenac, won the feature event at the speedway here to-day, winning his heat in the Liberty Sweepstakes at 95.3 m.p.h. and the final at 97 m.p.h. Eddie Hearne, in another Frontenac, was second, and Tommy Milton in a Duesenberg third. The race was run in five heats of 27 miles each. Barney Oldfield, driving his "Submarine," won a match of 5 laps, or 5⅝ miles, from Louis Chevrolet in a Frontenac in 3:18.51, which is at the rate of 102 m.p.h. Approximately 18,000 people saw the races, the attendance being considerably better than at the last meet on Thanksgiving Day in 1916.

Oldfield and Mulford shared honors in the day's racing. Mulford, by winning the final heat, gets his name inscribed on the $3,000 Universal Trophy cup, which becomes the permanent property of the driver who wins it three times. Billy Taylor, Louis Chevrolet and Ralph Mulford so far have won each one leg of the cup, which is competed for but once a year.

The match race between Oldfield and Chevrolet went five laps. Oldfield piloted his "Golden Submarine," but the shining armor had been removed as well as the tail.

The Liberty Sweepstakes was split into five heats, the winner of each of the first four heats entering the final. Each heat was 24 laps, or 27 miles, the Uniontown track being a mile and an eighth.

The "death curve" on the southwest turn figured in two super-thrilling accidents, in one of which two flagmen were injured.

Ira Vail was coming out of the turn at a tremendous speed in the second heat of the Sweepstakes when an upper front wheel spindle broke. The wheel hung by a thread but dropped at an angle of 45 deg., the upper portion of the wheel falling over against the hood of the Hudson. The car swerved to the upper guard rail, with the plucky driver displaying consummate nerve and skill in handling his mount. The field of cars was well bunched and the Hudson started down toward the bottom of the track in what appeared to be an inevitable piling up of some half dozen cars running at not more than a car length apart. Vail, however, got his mount under control and brought it into his pits. Neither he nor his mechanician was hurt with the exception of slight scratches.

In almost the same spot in which Vail's accident occurred Red Fetterman, driving a Peerless, blew a tire. Here again the cars were pretty well bunched. The Peerless smashed into the upper guard rail, but Fetterman regained control of his machine and kept the car hugging the guard rail along the sharp turn. He brought it to a stop and against the guard rail and held it there until the heat was over. Ray Coldren of Uniontown and J. W. Barnes of Pittsburgh, flagmen, were struck by the Peerless, however, and each sustained broken arms. Barnes may have been internally injured.

The summaries:

MATCH RACE
(5 laps, 5⅝ miles)

Driver and Car	Time	M.P.H.
Barney Oldfield, Submarine...	3:18.51	102
Louis Chevrolet, Frontenac...	3:18.72	101.9

TERMS STRICTLY CASH

Effective May First, 1918

As recommended and endorsed by the War Service Committee of the Automobile Dealers' Association of the United States and unanimously adopted by the Tri-City Automobile Trade Association.

The Tri-City Automobile Trade Association recommends the following schedule of minimum charges:

LABOR RATES

Mechanics' labor per hour	$ 1.00
Overtime and holidays per hour	1.50

STORAGE will be charged on cars left in our garage 24 hours after owner has been notified that work is completed.

STORAGE

Storage 1 to 3 hours	.35
Storage 3 to 6 hours	.50
Storage 6 to 12 hours	.75
Storage 12 to 24 hours	1.00
Storage by the week, if paid in advance	4.00
Storage by month, if paid in advance, summer (April to Sept.)	8.00
Storage by month, if paid in advance, winter (Oct. to April)	12.00

TIRE AND TUBE REPAIRS

3½ inch tire section, one cure	4.00
4 inch tire section, one cure	4.75
4½ inch tire section, one cure	5.00
5 inch tire section, one cure	6.00
Tube, single puncture (25c for each additional puncture)	.50
Blow outs	.75
Tube section	1.25

All service charges, for mounting and demounting, etc., based on time consumed.

WASHING CARS

Open cars up to 135 inch wheel base	1.50
Open cars over 125 inch wheel base	2.00
Closed cars up to 125 inch wheel base	2.00
Closed cars over 125 inch wheel base	2.50
Extra for wire wheels	.50
Extra for polish on open car	.50
Extra for polish on closed car	1.00
Use of wash rack	.50

BATTERY CHARGES

Battery recharging, 6 volt	1.00
Battery recharging, 12 volt	1.25
Battery recharging, 18 volt and over	1.50
Battery rental, per day	.20

Tri-City Automobile Trade Association

321 Masonic Temple Phone Dav. 7203

The dealers in Davenport, Iowa; Rock Island, Ill., and Moline, Ill., have taken a good step in putting their businesses on a war basis. They have standardized rates on a profit-making basis and propose to operate actively to get business and eliminate waste. The rates above were run in a newspaper advertisement

Muskegon 2-Ton Truck at $2145

A TWO-TON truck made up in great part of well-known components is being manufactured by the Muskegon Engine Co., Muskegon, Mich. The chassis price is $2145, including lazyback seat. Fitted with cab, windshield and standard stake body the price is $2360.

The engine is a Model C-4, four-cylinder Continental, 4⅛ x 5¼ in., with three bearing crankshaft; all bearings are in the upper half of the crankcase. Crankcase and oil pan are aluminum and all moving parts are accessible. Lubrication is by a plunger pump maintaining a constant level. The cooling system has a centrifugal pump, a large fan and an armored type cellular radiator with separable cores to permit of quick repairs. An Eisemann magneto with fixed spark furnishes ignition. A 1¼ in. Stewart carbureter is fed from a 16 gal. welded tank under the seat, feed being by the Stewart vacuum system. The Pierce governor is operated by engine speed.

Transmission

A three-speed selective gearset, multiple disk clutch, tubular drive shaft and Torbensen Type C rear axle comprise the transmission members. The gearset has gears and shafts of nickel steel, gears ⅞ in. face, and annular ball bearings throughout. The clutch has fourteen saw steel plates with Raybestos friction surfaces. Drive shaft is 2¼ in. diameter, with 5/32 in. wall, and is provided with grease and dustproof joints of substantial construction. An M & S differential is incorporated in the internal gear drive rear axle.

Gear ratios are 28:1 on reverse, 23.2:1 in first, 13.6:1 on second and 8:1 on high. There are two sets of Thermoid-lined brakes, the service set external contracting, 18 x 2½ in., and the emergency set internal expanding, 17½ x 2¼ in.

Chrome-vanadium steel, heat-treated and oil-tempered, is used for the springs, which are 40 x 2¼ in., with nine leaves in front and 56 x 3 in., with eleven leaves in the rear. The spring bolts are 20 carbon steel, hardened and ground and fitted with grease cups of large capacity. Under load the rear springs are almost horizontal. The artillery type wheels have fourteen square spokes, 2 in. in front, 2¼ in. in rear, revolving on Bower bearings, and are fitted with Firestone tires 36 x 4 in. in front, 36 x 6 in. rear. The wheelbase is 144 in., but 120 and 165 in. can be furnished on order at an extra price.

The frame is pressed steel channel section, 34 in. wide, inswept to 30½ in. between the front wheels. Sections are 5⅝ in. deep at the center, 3⅝ in. wide and ¼ in. thick. The entire frame is riveted, well braced and gusseted. A 20 in. steering wheel is mounted on an inclined column and has doubled threaded screw and half nut with only one adjustment.

Standard equipment includes front fenders, running board, three oil lamps, tool kit, tool box and horn. The weight of the chassis is 4080 lb.

Each purchaser of a Muskegon truck receives a coupon book, the coupons to be presented to any Muskegon service station in payment for inspection and lubrication service. Each coupon is stamped with the month and year in which it must be used and the number of the truck on which it applies.

Rochester-Buffalo Truck Routes

ROCHESTER, May 20—The trend toward motor haulage is being realized in this city by the establishment of motor truck express lines. Two such lines now connect Rochester with Buffalo, and the Empire State Transportation Service has recently extended its lines as far east as Utica.

Although the plan was enthusiastically received by the Buffalo business men, the first few trips to Buffalo were made with little or no freight. As soon as Rochester manufacturers began to realize that the plan was a success, however, they were quick to take advantage of the opportunity, and now the Empire State Service has secured the entire business of several large Rochester manufacturers.

The service of both the Empire State and the Erie Transportation companies now consists of one truck each way each day between Rochester and Buffalo. The trucks leave both cities at night and arrive and deliver the goods early the next morning, changing drivers in Batavia. If the demand is sufficient day loads will be established.

Standardize Rural Truck Expresses

SYRACUSE, May 20—The Motor Truck Transport Association of the State of New York was organized here recently. This association was formed for the purpose of standardizing the motor truck express service throughout the State and for the purpose of facilitating longer shipments. It links up the most important motor truck lines in central and western New York. The business of the association is to be handled by an executive committee of which Ben Wiles, a Syracuse attorney, is chairman.

Columbia Adds to Organization

PONTIAC, May 20—The Columbia Motor Truck & Trailer Co. has made several appointments in its sales organization. E. H. Habersham, Baltimore, will represent the southern territory east of the Mississippi. H. W. English, Spokane, will represent the Pacific-Northwest. Both these men were connected with the Republic Motor Co., Alma, Mich. A. H. Pearsall, formerly branch manager of the Studebaker Co. of Chicago, becomes representative for the Western States, with headquarters at Chicago.

A Correction

NEW YORK, May 20—Below a picture of the show window of the McCoy Motor Supply Co., Los Angeles, appearing in a recent issue of Motor World, it was erroneously stated that the merchandise displayed was Advance Felt Specialties. This should have been Advance Cort Insert Brake Lining.

A Sales Bulletin Of Tire Trade Conditions

A thorough knowledge of trade conditions—the work of investigating experts, to be sent to Miller Dealers each week.

Supplementing the big "Miller Uniform Tire Book," acknowledged by experts to include the most comprehensive trade investigation ever made by a private concern, we will mail regularly to every Miller Dealer a bulletin bringing out some new and important angle in tire conditions.

Each bulletin will contain a chart based on actual figures and data secured during our nation-wide investigation, together with a complete explanation.

Miller Dealers, as well as others, all agree that the Miller Uniform Tire Book is the most valuable book ever given to the tire trade.

These bulletins will bring out many equally interesting facts that found no place in this book or have been secured since it was published.

When it is considered that this investigation covered practically every state in the Union, that the answers from 25,349 dealers, distributors and owners have been checked, compiled and charted and that the investigation is the work of nationally known experts, the value of this book and these bulletins cannot be overestimated.

Any tire dealer, whether he handles Miller Tires or not, will be mailed free the wonderful Miller Book and sample charts upon request. If you are interested, send in your name today.

THE UTILITY SURE-GRIP PEDAL

For Fords Is Now Ready

Every Ford driver knows the danger of accident or collision when his foot slips off the pedal—and his foot **often** slips off because the pedal is small and smooth.

The Utility Sure-Grip Pedal permits a firm grip on the pedal—the foot absolutely cannot slip. The heavy rubber pad and the flanges at the side prevent all possibility of a slip, even in rainy weather when the shoes are wet.

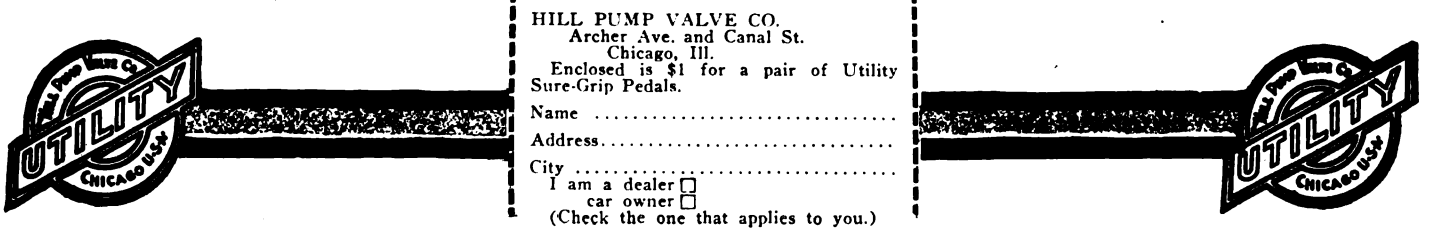
Utility Sure-Grip Pedals also serve to distinguish the brake and clutch pedals from the reverse when the light is uncertain.

The Utility Sure-Grip Pedal converts the small, smooth Brake and Clutch Levers into standard size, safe, comfortable pedals. Without question one of the most needed articles for a Ford car. And the price—$1 per pair—makes Utility Sure-Grip Pedals the best buy on the market.

ONE DOLLAR PREVENTS DAMAGE SUITS and ARGUMENTS

By installing Utility Sure-Grip Pedals on Fords, drivers can absolutely prevent accidents due to the foot slipping off the pedal. In crowded traffic a slip of the foot may mean jamming into the car ahead, which will inevitably mean an argument and later on perhaps a lawsuit. Is it worth taking chances when a pair of Utility Sure-Grip Pedals can be purchased for one dollar?

A car is lucky if it comes out of the slightest collision with a damaged fender—and a damaged fender means a repair bill of more than one dollar, the price of Utility Sure-Grip Pedals. Utility Sure-Grip Pedals are made of high-grade pressed steel beautifully finished in black baked enamel and equipped with a heavy pad of highest grade rubber edged with metal. They can be attached instantly—no holes to drill—no special tools required—one nut to tighten and the job is done. Once they are installed they absolutely cannot slip off.



The highest grade material is used in their construction. There is nothing to work loose and drop off—nothing to get out of order—they will last as long as the car runs.

Like all other Utility products manufactured by this concern, Utility Sure-Grip Pedals carry an unqualified guarantee of satisfaction. Send the coupon now.

DEALERS—ATTENTION!

LOOK OVER THIS PROPOSITION AND YOU WILL SEE THAT UTILITY SURE-GRIP PEDALS FOR FORDS ARE SLATED FOR A TREMENDOUS SUCCESS. ORDER YOUR SAMPLE PAIR NOW AND WRITE FOR OUR ATTRACTIVE PROPOSITION.

SPECIAL NOTICE—Utility Sure-Grip Pedals are covered by U. S. Patents granted Jan. 1, 1918; other patents pending.

It Costs No More to Have Accuracy

NO motorist who wishes to make the most of his car will attempt to get along without a speedometer, and as long as he is to have a recording instrument at all he should demand the one that assures him of the utmost accuracy and durability.

He will find these essential qualities combined to the highest degree in the

CORBIN-BROWN SPEEDOMETER

Corbin-Brown reliability begins with the strong, perfectly-meshing drive gears, extends through the sturdy, almost frictionless link cable and finishes in the instrument itself. Every part is simple and amply heavy for the work it has to do.

The centrifugal principle on which the Corbin-Brown operates keeps it free from the troubles found in more complicated systems. It is not affected by extreme temperatures or electrical influences. Long usage and hard road shocks do not interfere with its accuracy.

When ordering the Corbin-Brown do not fail to specify the Maximum Speed Hand, an extra feature which registers the highest speed attained and remains at that point until reset to zero. You don't have to watch the speedometer—the speed record remains as long as you want it.

The Corbin-Brown catalog illustrates the various models and describes the features which make this speedometer your logical "buy."

Trade Mark

"It Starts your Ford and Lights It Too"

EVEN if you cannot obtain as many Ford cars as you require you can make money selling Genemotors to *present* Ford owners.

The live dealer in every city should sell Genemotors. If there is no agency in your city write today and we will tell you how you can make additional profits.

Built by the General Electric Company

Price $90 f. o. b. Lynn, Mass.
Sold Everywhere

Prest-O-Lite Batteries Standard Equipment

Send for the GENEMOTOR Catalogue

A. J. PICARD & CO., Inc.
General Distributor
61st Street at Broadway, New York

The "GENEMOTOR" is a circular unit 10" long and 6¼" in diameter. It weighs exactly 37 lbs., being by far the lightest single unit Ford starter ever manufactured. This unique motor generator is mounted on a suitable one-piece bracket by means of two large cap screws, located at the front of the unit. The chain can be easily tightened by raising the "GENEMOTOR" by an adjusting screw turned by an ordinary monkey wrench. This the car owner can easily perform himself without so much as soiling his or her hands.

The bracket is attached to the engine by utilizing the holes for the two forward crank case bolts. These are replaced by two longer bolts furnished, which secure the "GENEMOTOR" bracket in place. The front of the bracket is firmly held by the regular front water coupling bolts, a new water coupling being cast integral with the bracket.

A Link Belt chain is furnished already assembled, which has been especially manufactured for the "GENEMOTOR." After mounting the large sprocket on the crank shaft, the chain can be easily slipped around it without the necessity of opening one of the links. No special effort to secure chain alignment is necessary, for when the "GENEMOTOR" is bolted into place the chain must line up.

The battery is the standard 12-volt, 45-ampere hour type.

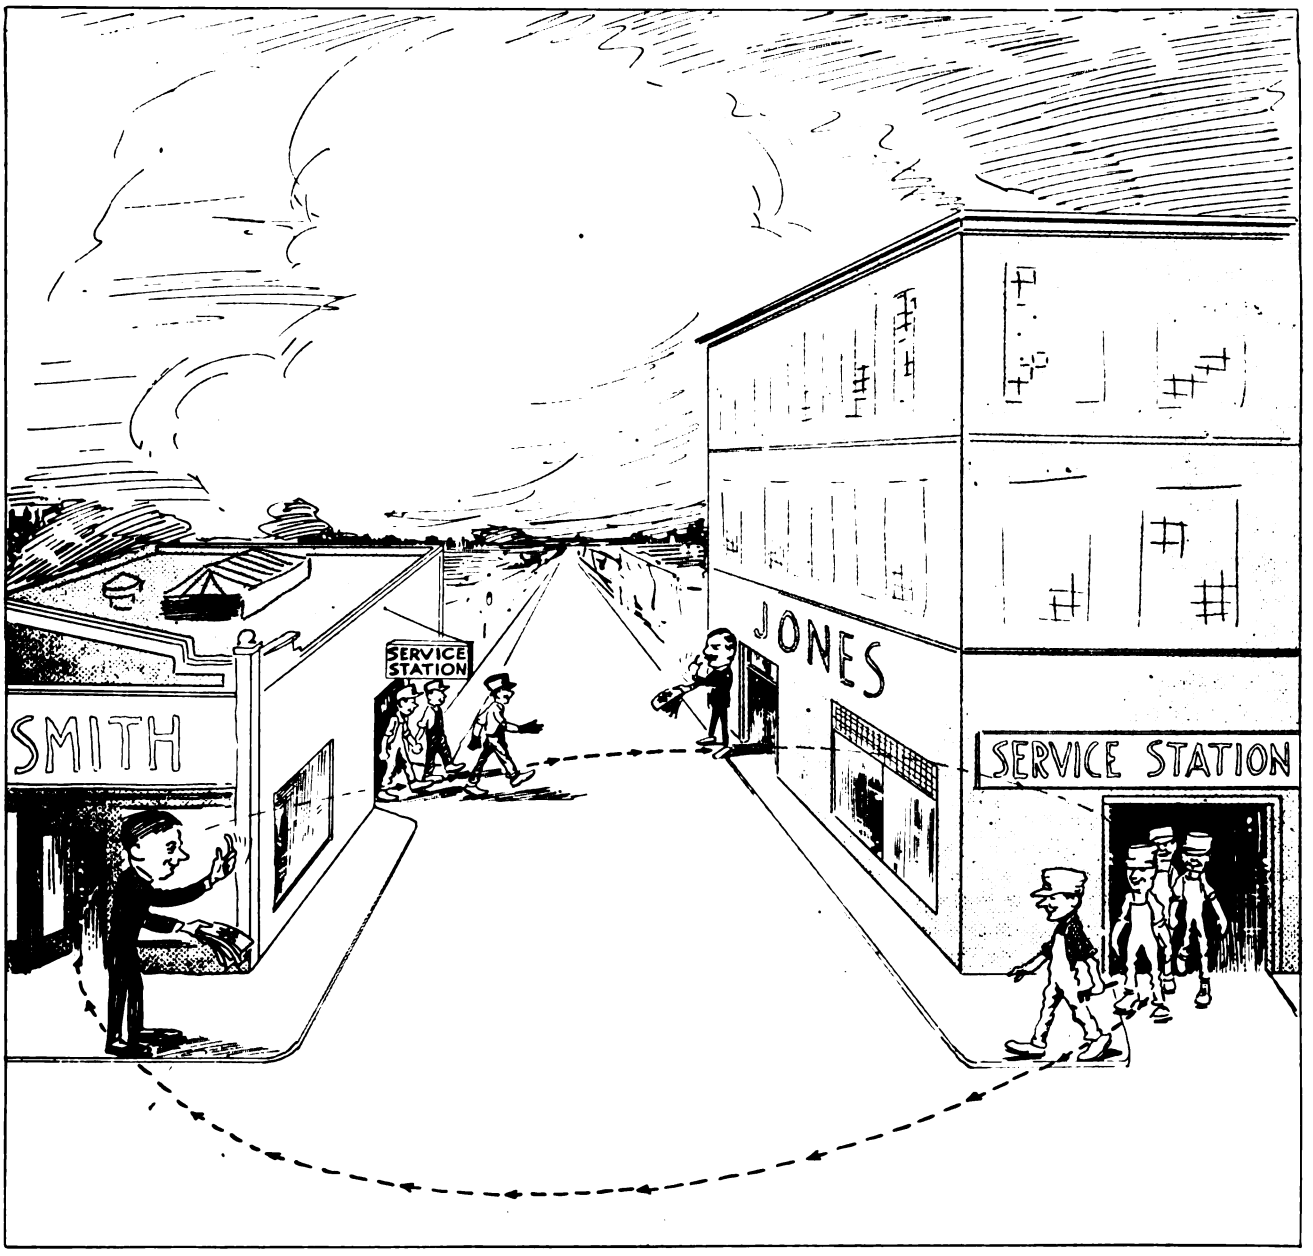
Heavy one-eighth inch plates are used exclusively. The storage battery is guaranteed by the manufacturer for twelve months.

The battery support consists of an angle iron cradle, which is securely clamped to the frame of the car. This feature distributes the weight evenly, and keeps the running boards clear.

The starting switch is substantially made for a quick "make and break" and is of ample capacity to carry the current. It is fastened by two bolts to the permanent floor or heel-board. A slight pressure of the heel closes the contact tightly until released.

The lighting switch is a standard two-gang, of the Cutler-Hammer type. A resistance coil is shunted across one of the units, so that one button turns on Head and Tail lights full, while the other dims them for city driving. The whole mechanism is mounted in a small black-enameled case, which clamps on the steering post. This makes the control of the lights most convenient and a simple matter to dim headlights when passing other cars.

The wiring is furnished completely assembled with terminals, etc., making the installation very simple and minimizing chances of making improper connections.



The Lamp Equipment consists merely of an Electric Tail Light, which is furnished. The Standard Ford Headlamps are used, but it is necessary to replace the bulbs with 12-14 volt type.

The Lenses That Worked

and

The Laws That Failed

Reasons why the lens business has become sluggish and things that may be done to help the situation

ONE of the finest examples of "all dressed up and no place to go" is found in the lens situation as it stands to-day.

The stockrooms of many jobbers and dealers contain lenses which were designed to eliminate headlight glare, and the lenses have become an over-stock because the merchandisers have been unable to move the goods.

This has slowed up the stream of production. With these lenses moving slowly, the manufacturers have been unable to continue manufacturing in former quantities.

The lens business started off with a big push, and—like some of the well-known Hindenburg pushes on the Western front—it went only a little ways and then the rush stopped.

Since then the makers and distributers of lenses have been wondering what happened and what could be done to relieve the situation. There are thousands of dollars invested in lenses, and there are several million car owners running around the United States who ought to have them, but as the situation stands to-day there is little probability that the car owners will come and get these lenses unless some action is taken by the people who are back of the merchandising of the product.

Let us concede at the beginning that there is a need for lenses. It was this need which started the whole affair. Realizing that there was a need for lenses to eliminate the dangerous and ungentlemanly headlight glare on the highways of different states laws were introduced in a great many different legislatures until to-day practically every state has a headlight law of some kind.

With all these laws being put on the statute books everyone, car owner, dealer and manufacturer, was quick to see that here was a field which would require a device of some kind in order that car owners might conform with the law.

Wherefore manufacturers began turning out lenses. It was easy to figure how many would be needed. All a manufacturer had to do was jot down on a sheet of paper the number of cars running in a certain state, divide that by the percentage of business he thought he could get, and manufacture accordingly.

But something slipped.

The headlight laws and the manufacture of lenses started about the same time, and if everything had gone through on schedule lenses would to-day be on the headlights of all automobiles.

Laws Not Enforced

But the one weak link in the whole chain was that headlight laws were not enforced, whereas everyone expected that every owner of a car which was not equipped with a lens or a dimming device of some kind would be speedily brought to terms by the police and made to equip his car with a dimming device. Very little ever was done about this, and the result was that the law was looked upon with disrespect by car owners and thousands of them never put on any dimming devices at all.

Wherefore to-day there are many car owners that are conducting themselves on the highways in an ungentlemanly and dangerous manner. The glare is not only annoying to other motorists but it is likely to cause the driver of the approaching car to run into a ditch, damaging his own or the other car. What may happen in a case of excessive glare is an old story that is familiar to everyone, and little need be said about it here.

When the authorities failed to enforce the law, and motorists failed to see any particular necessity for equipping their cars with lenses, the lens business lagged. The stocks that had started on their way from factories hesitated, and most of the hesitating was done on the shelves of jobbers and dealers, who still have lenses and would be only too glad to get rid of them.

The lens business is a legitimate business. There is a need for a device of some kind like this to eliminate headlight glare. Inasmuch as this need exists, and inasmuch as this device is a legitimate device, the problem then becomes one of *what is going to be done to move these lenses and make them a more salable article.*

Must Recreate the Need

The whole situation may be covered by the one statement that the necessity is to *recreate the need for the lens.*

Or, we might say in other words, *make this need a necessity.*

How is this need going to be made a necessity?

It can be done in two ways.

1—*It can be done by the enforcement of headlight laws.*

2—*Or, it can be done by an ethical appeal to the motorist.*

Procedure number one means compelling the car owner to equip his car with a lens. The other appeal is the one of persuasion, and is comparable to the old Æsop fable of the Sun and the Wind in their famous contest to make the man take off his coat.

The Wind blew and blustered and tried and tried, but he couldn't make the man take off the overcoat. It only stuck the tighter, but when the Sun got a chance at the man's overcoat we all know what happened, and what happened in that case is comparable to what may happen if an ethical appeal is made to the motorist and he is advertised into seeing that he is not a gentleman of the road unless his car conducts itself in a gentlemanly manner.

Educate Owners

There are roadhogs and all kind of road nuisances, and a campaign of education to eliminate these elements could

Digitized by Google

be well linked up with an educational campaign to make the motorist see the necessity for having his car equipped with lenses.

But let us first take up the question of compelling the use of lenses by the enforcement of law. The reason laws have been unsatisfactory to car owners and to the public in general is that no two states have laws that are alike. It has come about, however, that in most states the standard requirements for headlights and headlight lenses are the same. These briefly are: *The rays of a lamp shall not rise above 42 in. at a distance of 75 ft. in front of the car.*

The illumination shall fall 10 ft. to the sides of the car, at a distance of 10 ft. in front of the car.

On unlighted streets, and on country roads, the lamps shall make objects visible at a distance of 250 ft. ahead.

There are other requirements relating to trucks, but they are merely modifications of the above regulations. Practically all the headlight laws of different states are built upon the above basis.

Should Have Uniform Laws

One of the great needs in order to have a proper distribution of lenses is that the laws in all states be made more or less the same. A uniform headlight law would be a fine thing, and it might be put into effect through the machinery of the National Automobile Dealers' Association if the members in that organization are sufficiently interested in the merchandising of lenses.

Another piece of machinery that might be used to put the law over is the National Association of Automobile Accessory Jobbers, which naturally is more interested in the sale of lenses than are car dealers. It is the jobbers—and the dealers who buy from jobbers—who have these great stocks of lenses piled up on their shelves.

Having secured headlight laws that would be satisfactory in all states, one of the next essentials would be a Bureau of Inspection that would permit the manufacturer or seller of lenses to take his product to some state department and have the state tell him whether it met the requirements of the statute in that state.

This has been done in the State of New York, which has recently passed a law providing for an inspection department of this kind. There is a fee attached, but it is not such as to make the law burdensome. This legislation covering inspection follows:

New York's New Law

"Any person may submit to the Secretary of State a device for controlling the front lights of motor vehicles so that they shall comply with the provisions of this section while the vehicle is proceeding, together with an application that such device be tested as prescribed by this section. Such applicant shall pay to the Secretary of State a fee of fifty dollars. Thereupon the Secretary of State may submit such device to a qualified technical expert or experts from the physical laboratory of a university or technical school within the State of New York, under the jurisdiction of the University of the State of New York, with a request that it be tested as to its compliance with the provisions of this section. Upon notice from such technical expert or experts that such test has been made, and that such device complies with the provisions of this section, the Secretary of State may issue a certificate to the applicant describing the device and certifying that such test has been made and that the device complies with the provisions of this section. The expense of such test by such technical expert or experts shall be paid from the fee collected from the applicants, and the balance of such fee, if any, shall be paid into the State treasury."

New Jersey's Law

In New Jersey the method of enforcing the automobile law requires that a car owner when applying for a new license or a renewal of his old one must drive his car up to the inspection division for the purpose of having his brakes, mirrorscope, warning signal and headlights inspected. Each of these must be satisfactory before a license is granted, and every car must have on its headlamps either a headlight lens or a glare-dimming device which has been tested, approved and certificated by the state commission.

Having gotten the machinery all ready, a campaign might then be undertaken for the enforcement of these headlight laws. There doubtless would be opposition from some clubs and automobile owners, and just what would happen in that case is problematical.

Some clubs have opposed some headlight laws on the grounds that they were unnecessary and drastic, but it is hard to see how any gentlemanly car owner could object to a law whose only purpose was to compel all motorists to operate their headlights in such a manner that they were not a danger and annoyance to the drivers of other vehicles. Almost any man is willing to admit the justice and sensibleness of this contention.

This enforcement of law could be taken up by trade associations, or could be brought about in various other ways.

Appeal to Fair Play

We now come to the question of an ethical appeal to the motorist, which we compare to the sun making the man take his overcoat off. While it might require time to get uniform laws in all states and bring about their enforcement an ethical campaign for the use of lenses could be started at any time.

Furthermore, an ethical campaign of this kind might be conducted in conjunction with whatever advertising was run referring to headlight laws, because the whole thing in its final analysis is founded upon gentlemanly conduct and safety to the drivers of cars.

In case the problem were approached from this standpoint of ethical appeal, manufacturers would have to revamp their advertising. Some of them have already advertised along these lines, *but others have simply stated that their lenses complied with the law, and would save the owner prosecution. When the prosecution part fell down the advertising went flat.*

In reality, it amounts to the adoption of a new selling idea by the lens people. It means new advertising based upon a new appeal. It means approaching the car owner from a different standpoint, *and it means educating jobbers and dealers to sell the lenses upon an entirely different basis.*

It would then follow that the dealer and the jobber in their advertising would have to work along the new lines, and whenever the dealer approached a customer he would have to make an appeal to his gentlemanly instincts *rather than to tell him that he was likely to be arrested if he didn't have lenses on his car.*

This latter argument, however, could well be used in case there was any foundation for its use, but it hardly seems probable that a proposition of this kind could be put over by the use of threats against car owners. They are not even frightened on the question of license tags. Most of them have them, but now and then a car owner—and even a dealer—takes liberties on the license tag question, and there are cars that are run from year to year, in some of the more remote sections, on licenses that are so old that the paint has become mildewed, and the state is robbed of hundreds of dollars.

Law Not Respected

It is well known that the ordinary American citizen hasn't all the respect that he ought to have for the laws that his own representatives have made. He is often prone to figure that the law is something that is set up to test his skill and ingenuity, and if he can avoid it he considers himself a very clever man.

The thing that is going to have the greatest influence in the marketing of lenses is going to be merchandising, regardless of whether there are headlight laws or not.

It has been said that a salesman can sell anything to anybody at any time, and, while that is somewhat fanciful and exaggerated, it is nevertheless true that *these lenses could be moved if sufficient merchandising efforts were put behind them.*

The merchandising effort has been responsible for those that have moved in the past. The salesman of the manufacturer has sold them to the jobber, the salesman of the jobber has sold them to the dealer, but the dealer hasn't been sufficiently sold on the idea or skilled in salesmanship to move them on to the consumer.

The Auto Equipment Co. of Denver states that a big advertising campaign caused it to believe big sales would continue, but that in the case of the particular lens stocked the advertising campaign was dropped, and this left it with a big stock. In this particular case perhaps some of the blame for the jobbers' overstock should be laid to the blame of the manufacturer who discontinued his advertising and failed to support the dealer at a time when support was needed.

J. E. Faeth, of the Motor & Machinist Supply Co., Kansas City, says he believes the inability to move the lenses is occasioned by the failure of the state to enforce the laws. He says: "We had

Digitized by Google

occasion to note the difference in the attitude of our customers in the two states of Kansas and Missouri when the dimming laws went into effect.

Kansas Law Went Flat

"Kansas is a state that usually makes an attempt to enforce state laws, and our customers provided for this, getting a considerable stock of lenses preparatory to supplying the trade when this law would become effective, but it seems this is one law that the State of Kansas has not been able to enforce. At least not to the extent most of the state laws are enforced.

"When the Missouri state law became effective we could not help but note the wonderful difference in the demand for lenses. We believe the people as a rule in the State of Missouri do not take a state law as seriously as do the Kansas people. At least this is our view from the demand we have had from the different two states on this item.

Suggest Law Enforcement

"We might suggest that, if you could write some articles on the protection and enforcement of the different state laws with reference to speed laws as well as lens laws and the various other state laws, some of the dealers and jobbers would possibly be able to reap some benefit from your effort."

F. K. Levy, sales manager of the Inter-State Electric Co., New Orleans, says he will not be able to move his lenses until the Louisiana laws are enforced. H. William, of the Motor Car Supply Co., Chicago, attributes the overstock of lenses to the failure of the state to enforce its laws. He says:

Illinois Is Lax

"The first of this year there was a law passed that every car should have lenses, but the trouble is that our laws of this state are not rigid. When our state law went into effect we felt that there was going to be a great demand for these lenses, but as the months were going by we found to our disappointment that our state was the poorest of any in selling lenses. As we have salesmen traveling in the different states we find that these men traveling outside of Illinois bring in more business than the men traveling in our own home state. We, ourselves, are not overstocked on lenses, and are not worrying about our stock at this time."

C. D. Pettingill, manager of the G. Norman Baughman Co., Tampa, Fla., says his company stocked heavily when the Florida dimming law went into effect Jan. 1. Quite a few lenses were sold before the law went into effect, but after it became effective and the public saw there was nothing to it they lost interest in the lens question. The law did not require the use of lenses, but merely required that motorists should dim their lights when approaching other cars. He says:

"It is going to be a difficult matter to sell lenses through legislation in our opinion. They should be used, however, and could be sold more or less through the appeals to the gentlemanly side of the driver or from the courtesy standpoint. It might be well, and undoubtedly would be, to start a campaign appealing to the decency of the motorist in advocating the use of lenses.

"There are a few motorists who can be classed as road hogs—those who have absolutely no regard for the other man's rights or privileges, who do not know what the word privilege means, but take a sort of pride in riding roughshod over the rights of others. There are some few motorists that when in town refuse to dim their lights, but on the other hand equip their cars with the brightest headlights possible and who do not think it necessary to dim and who will not do so.

"The motorist who might be inclined to be courteous, and who would be inclined to obey the law, if he finds that, after dimming his lights, the other man will not do so, then wants some protection, and hence is driven to adopt the same measures as the other ones—that is, use bright headlights, so that in the event he meets someone who will not grant him the courtesy of dimming, he can in turn leave his headlights on to discomfort the other driver as much as possible."

Theo. Bass, of the National Electric & Auto. Supply Co., Peoria, says it seems that a lens salesman calls on him every day with a new lens. He says, however, that he has kept away from all but the advertised and popular lenses and because of that fact has had no trouble in his territory.

The fact that some jobbers and dealers may have stocked up with lenses that weren't sufficiently advertised may have been one reason why their goods failed to move. In a field such as the lens field, where there has been quite a number of products in keen competition, it is hardly possible that any goods at all could be moved unless they were brought before the public by proper advertising.

T. M. Brooks, of The Auto. Supply Co., Chicago, says his difficulty with lenses is doubtless due to the fact that the laws are not enforced, and that the owners won't buy unless they have to.

Canadian Situation Better

A word from Canada may be interesting. It is from A. M. Bottcher, buyer for Hyslop Bros., Ltd., Toronto, one of Canada's largest jobbers. He says: "We are not overstocked with lenses, as we have found them to be good sellers. Our main difficulty has been in securing shipments in ample quantities to take care of current requirements.

"We have gone into this matter with other jobbers here in Canada, and the impression gained is that when any overstocking occurs, it is due to the jobber handling several lines. It is necessary to stock a variety of sizes in order to take care of the different size headlights. We are concentrating on one lens and are having good success with it."

Ohio Laws Are Dead

H. M. Dine, of the Dine DeWees Co., Canton, Ohio, says his difficulty is due to the failure of the state to enforce its laws. He says all Ohio jobbers are overstocked on lenses. He says it would help if there were an agitation to have all states agree on lens specifications, and enforce a uniform law.

Didn't Buy Many

E. A. Bowman, of the E. A. Bowman Co., Detroit, says he is not overstocked with lenses because he didn't buy many. Bowman has always been a cautious buyer of goods, so he states. He says that when the lens salesmen approached him and told him that because of the coming law and the prospective advertising of the manufacturer there was going to be a big sale of lenses he put in a small stock.

He says that this is his practice with any accessory. He puts in a small stock, paying a higher price for it. Then if the goods move he orders more, but in case the goods do not move he is not stuck with a large stock. That was his experience in the lens situation.

No Pennsylvania Law

George B. Shearer, of The Gaul, Derr & Shearer Co., Philadelphia, is another who is overstocked on lenses. He says: "The early part of last summer there was quite a large demand for lenses, stimulated by the laws that had just recently been passed in Delaware and Maryland, and we ordered rather heavily to meet this demand. Unfortunately in Pennsylvania we have no law requiring the use of lenses, and there is no hope of getting such a law until the legislature meets the early part of next year. Dealers generally seem rather reluctant to stock up on headlight lenses for the reason that so many different sizes are necessary to have a stock to meet all requirements."

From these experiences of jobbers it is not difficult to see that much of the present situation was occasioned by the reliance that was placed on the effect of headlight laws. *It was a situation no one could foresee. There was every reason to expect that laws would be enforced if legislatures were going to the trouble of having them passed. Just why they were not enforced no one seems to know, and perhaps it would be difficult to find out.*

Need for Action

However, the situation exists. The jobbers and dealers are stocked with lenses, the laws are not being enforced, the goods must be moved, there should be a sale for them in the future. The question is how to do it.

The headlight glare question probably will always be with us. There will consequently always be a market for headlight devices or lenses which regulate glare. But the sales appeal may have to change even though the goods be always the same.

One thing is certain: Laws may sell lenses. Merchandising will sell them. Both law and merchandising would be a powerful force, and in the temporary absence of laws the solution of the problem seems to lie in greater sales effort and a new merchandising appeal.

Recouping War Losses

WITH THE FARM TRACTOR

The story of how two Ohio dealers tagged opportunity six weeks ago and have made strides in the Buckeye tractor field

COLUMBUS, OHIO, May 27—When G. B. Erhman and E. H. Bryant, composing the Bryant Automobile Co., Cleveland, had a talk some two months or more ago about the outlook in the automobile business, which didn't look any too good at that time, and when Erhman advised Bryant to go to Detroit and get a job, opportunity was standing just outside the door knocking for entrance.

Both had been watching the development of the tractor industry and both were wondering if it were not possible to take on the tractor and thus re-animate a business which promised to be seriously hurt by the war.

The problem was to get into it in such a way that success and permanency might be assured. The project to appeal to the patriotism of Ohio farmers for a distribution of tractors to assist in agriculture already was broached, and Erhman's suggestion to Bryant had certain possibilities in view.

Seeking Opportunity

So Bryant went to Detroit, bought a suit of overalls and applied for work in the tractor factory of Henry Ford & Son. He thought he might be able to do such work as would attract attention to him and mark him as a man competent to do bigger things than run a lathe. Then, too, he argued with himself, opportunity may wander through the factory and I may be able to reach out and tag her.

How satisfactory a workman Bryant proved to be in the factory it is impossible to say, but when it became apparent that the Fordson tractor would be considered seriously for the projected Ohio distribution, he walked into the office, greasy overalls and all, told who he was and suggested that he might be of some service. Whether because of the record he had made in the factory or whether the powers that be were impressed by the assurance of the man, whatever the reason, he was given the chance to show what he could do. *He had tagged opportunity. This was on April 9.*

The following day he was given a letter by Henry Ford & Son, addressed to Governor Cox of Ohio, specifying just what the Ford company could and would do to put 1000 Fordson tractors into the State of Ohio. Bryant took the train for Columbus, called on the governor, presented his letter, assured the governor that his company was ready to relieve the state of all responsibility in the matter of distribution of the tractors, that the deal probably would finance itself and that all he needed was the governor's sanction to get on the job.

By April 16 the deal was closed. On April 17 the Bryant Tractor Co., Columbus, came into tentative existence, an office was opened temporarily at 128 East Gay street, the announcement of the contemplated distribution was made through the papers of the state, and the first car of seven Fordson tractors was shipped from the factory at Dearborn to the Bryant Tractor Co., Cleveland, on April 24.

Since that date better than an average of three cars of tractors has left the factory every day for points of distribution in Ohio. To-day over half the 1000 tractors destined for Ohio have been shipped and for the most part have been delivered to the farmers.

The wonderful thing about this is that it has been accomplished without capital, without profit and without pull or intrigue.

A paragraph is made of the foregoing statement purposely, for the reason that it is a categorical denial of many stories which have gained circulation.

No Pull at All

A similarity of name in the case of E. H. Bryant, of Cleveland, Ohio, and E. R. Bryant, of Dearborn, Mich., has given rise to the story that nepotism was responsible for the success which has come to the Ohio company. E. R. Bryant of Michigan, who has tried to secure control of the tractors and equipment for Michigan, is a relative of Henry Ford; E. H. Bryant of Cleveland claims no such distinction, and does not even know Bryant of Michigan personally. The coup he has achieved is due entirely to the fact that he saw the chance and got on the job, and not at all because he had a pull, either family or political.

Nor is there any profit for the Bryant Tractor Co., nor for anyone else, in the Ohio deal. The tractors are sold to the farmers at $750, f.o.b. Dearborn, Mich.—just what they cost. As a matter of fact the money paid for the tractors is not even handled by the Bryant Tractor Co. Every check in prepayment for a Fordson tractor, whether it comes direct from the farmer himself or whether it is a check from some local agent who is financing a carload, is made payable to the Central National Bank of Columbus, is deposited there and held in escrow until the tractor or tractors have been delivered, whereupon it is forwarded to Henry Ford & Son.

The only present connection which the Bryant Tractor Co. has with the deal is through a contract which gives the company the state agency for the Oliver No. 7 gang plow, which is being sold only because of the sanction of Ford.

Sells Plows

This plow is sold to the farmer at $140, f.o.b. Cleveland or Columbus, and is paid for in advance just as is the tractor. This price on the plow, which is being charged the Ohio farmers, is likely to be established as the price which will pertain universally on the special Oliver No. 7 plow.

The Bryant Tractor Co., of course, has assumed general direction of the distribution in the state and has dictated how, when and where tractors should be shipped. As was inevitable, the orders which poured in for tractors came in overwhelming numbers from individuals. The Bryant Tractor Co. saw at once that individual shipments and deliveries would cost money and time, so a circular letter was sent to every automobile dealer who had manifested any interest in the matter, requesting that the dealer get after the prospects at once.

As a result of this policy practically every car of tractors which has been shipped into the state, excepting two or three of the first installment, has gone to an automobile dealer who has financed the deal and who has distributed the machines.

In order that the dealers who have assumed the responsibility of doing this may be protected in a service way the Bryant Tractor Co. has given each of them an agreement.

Erhman, of the Bryant Tractor Co., says that it would have been impossible to have put the distribution across so quickly and successfully had there not been a body of men who were accustomed

Digitized by Google

to stocking in quantity, paying sight drafts attached to bills of lading and taking a chance, namely, *the live, energetic, progressive automobile dealers of the state.*

This is the more remarkable too because they responded to the appeal, business and patriotic, without hope or expectation of profit.

"We are going over the top," says Bryant. "If on this first distribution we put only 1001 tractors into the state we shall not care, for we will have gone over the top. It's the future we are looking to. Not only shall we have put the Fordson tractor on the map as far as Ohio is concerned, but we shall have convinced the automobile trade that there are wonderful possibilities in the tractor business and that the automobile dealer is the one man to handle it. It would have been impossible to have done what we have without the assistance and co-operation of the automobile dealers, and now that they have demonstrated what it is possible to do most of them will stay in the tractor business.

"We shall handle only such power farm equipment as receives the approval of Henry Ford," says Erhman.

"Implement manufacturers are designing implements to be used exclusively with the Fordson tractors, at the request of Ford, and when they shall have received his approval they will be handled by the distributers of the Fordson tractors. Without such sanction they will not be available. There is no doubt that ultimately there will be a complete equipment, both of draw bar and belt machines, built especially for this tractor which shall have received the approval of the company, and this equipment the Fordson agents will sell.

"Furthermore, it will be sold just as the tractor is sold, sight draft attached to bill of lading, and as a consequence business methods will have been introduced into the farm operative equipment business, as far as tractor implements are concerned."

Motor Car Dealer Best for Selling Tractor

Tractor Maker, After Survey of Field, Pins Hopes on Automobile Men

"THE tractor business of the future will be handled by automobile distributers and dealers who have a special department for tractor and truck sales and service."

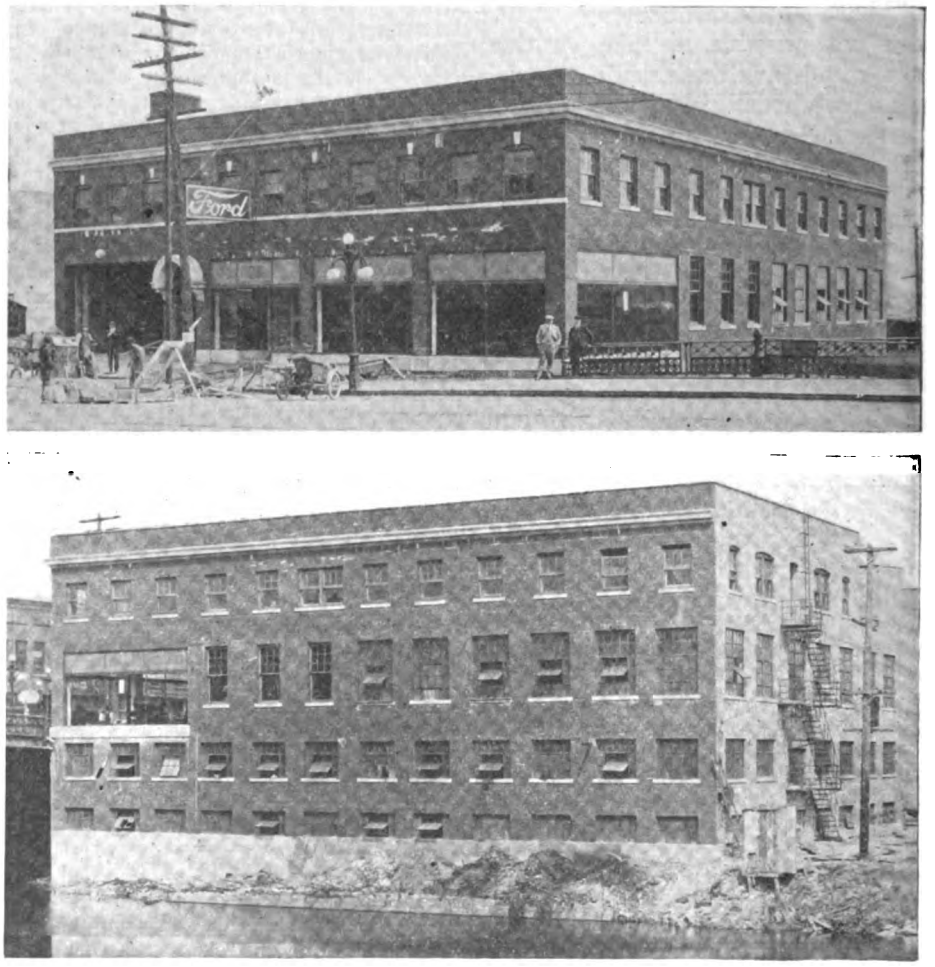
This is the conclusion of G. M. Matson, vice-president and general sales manager of the John Lauson Mfg. Co., manufacturers of the Lauson kerosene tractor, at New Holstein, Wis. Matson has just returned from a two months' business trip throughout the West and Southwest.

"The general tendency on the part of automobile dealers," said Matson, "is to take on a good truck and a good tractor as they have been quick to realize the heavy future demand.

"The same principle of sales that has been successful in passenger cars must apply to both tractors and trucks.

"Farmers have been and still are the biggest buyers of passenger cars. In fact, statistics show that practically 70 per cent of all the automobiles sold in the United States in 1917 went to farmers.

"The big feature that appeals to the automobile dealer is his opportunity of selling tractors on virtually the same overhead that covers the sale of passenger cars and trucks. Seldom will he need any more salesmen, and it is unlikely that an addition will be necessary to his service force. By handling these three lines now, he has a continuous business the year around with insured profits.



"Then, too, the automobile dealer has a service station in connection with his salesroom. This will serve tractor as well as passenger car and truck. It must be expected that the farmer purchaser will need occasional service in the way of adjustments or replacements. Hence this service feature of the automobile dealer is most attractive.

"The wise tractor manufacturer has adopted the principles that have proved successful in twenty years of manufacture and sale of automobiles. The automobile dealer is used to taking up shipments with bills-of-lading attached. **The automobile dealer is a cash buyer and a cash seller. It is necessary, to make the tractor industry successful, to embody these same sound business methods that have worked out so long in the automobile industry.**

"I have no criticism to make of implement dealers, but those who expect to remain in the tractor field have got to apply the experience that has proved profitable in the automobile industry and create a good tractor service department.

"The time is not far distant when all farm machinery will be sold on a cash basis and the farmer will profit by lower prices through the elimination of heavy collection expenses to manufacturers and distributers. **The manufacturer of tractors must do a cash business and so too must the tractor dealer.**

Builds New Home to Handle Tractors

Two views of the establishment of F. J. Blanding & Co., Lansing, Mich., which is going into the distribution of the Fordson tractor after official distribution proved not very satisfactory

Mark 'Em Up!

THE DAY OF THE GIVE-AWAY HAS GONE IN SELLING USED CARS

"LET the dealer mark up his used cars over old-time figures to a point anywhere from $30 on a small car to $100 on a large car and he will make rapid sales if the cars are really worth it."—W. K. ARMSTRONG, HURLEY MOTOR CO., PHILADELPHIA.

By K. H. Lansing

MERCHANTS of all kinds in this period of watching leaks and keeping down overhead expenses are learning to avoid markdowns and frown away the discount beggar. To be intrenched in these strenuous war days one must make retrenchments, and there is no retrenchment just now in *underselling*, as many have discovered. The necessity for not falling below the list price on merchandise has become so marked a factor in the present business of some motor car dealers that they are emulating the man about whom we have all heard, who stood up so straight that he leaned backward.

There are plenty of reasons why the motor car dealer should stick to the list prices on new cars and wave away the grafting type of person who always is ready with an excuse for not wanting to pay the full figure for an automobile, or a truck, but now it has begun to strike home to some members of the trade that, while tariffs for living expenses, from necessities to luxuries, are being revised upward, there is more profit in *selling even used cars for what they can get for them than in taking what the prospect will grudgingly give.*

Sell Better Marked Up

It is the demonstration of a simple principle of psychology that a person will set a higher value on something he thinks somebody else wants and which soon will be gone from the market and his chances of getting it lost than on something he thinks will linger in the market indefinitely and which he can obtain for the mere reaching out and taking. Like most simple things of the kind, it is so very patent and evident that it is lost sight of as a principle by many, when it could be used to advantage.

Some dealers are arguing: Why grind prices on used cars down to make a few quick sales, especially, if, as is hinted, there may be a shortage in passenger cars owing to government limits on output of new cars? This is a period of transportation straits, and passenger cars for business purposes must be used, and if there is even a comparative scarcity of new cars, then the logical result will be an increased demand for used cars.

Demand Strong

This increased demand for used cars already has arrived in Philadelphia. A trip up and down "Automobile Row" recently adduced the evidence that the used car business of dealers in the leading makes of motor cars has been, in most cases, by far the larger part of their trade since winter and that April and thus far May have proved the best months in some time. Some dealers say that their turnover of used cars has been more rapid than at any previous time, and as for the "gyp—"

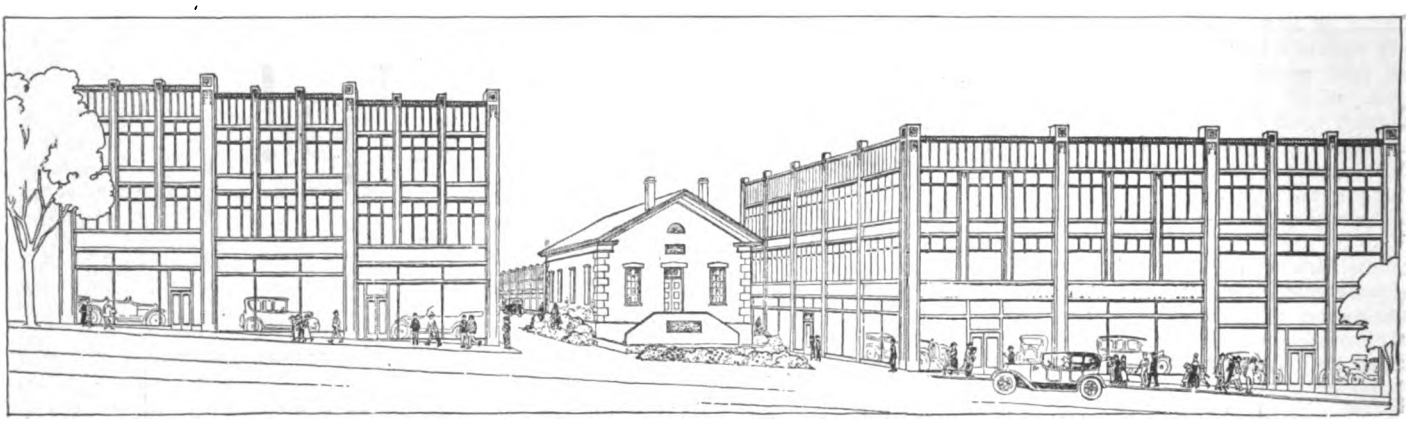
Well, there are always enough "old blisters" and "crocks" fit only for the jitney traffic to keep him going, but this year he is reaping a harvest in some really good cars that he snapped up before it was realized that there was no necessity for sacrificing them to him in order to get floor space for better ones, but this time is passing, if not already gone.

A dealer in Philadelphia who has learned the value of not only sticking to list price on new cars, but of actually *marking up prices on used cars*—that is putting thereon the value that he really thinks the purchaser should pay, instead of sacrificing for a quick turnover—for turnovers in used cars now are quick anyway—is Samuel Earley, of the Samuel Earley Motor Co., who handles the Mercer and National.

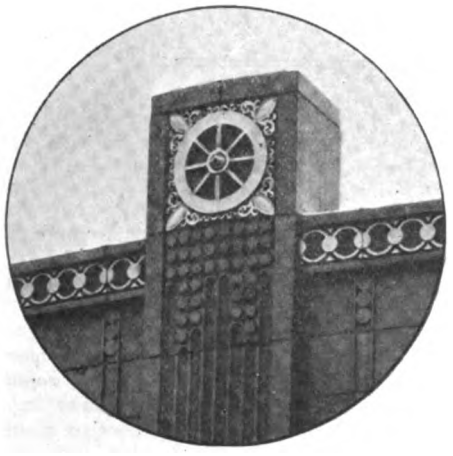
"Early in May, last year," said Earley to a representative of Motor World, "I had thirty used cars in stock. To-day I have not one and I sell them as fast as I get them. There are positively no obstacles to the dealer in the used car end of the business if he handles used cars for which he can vouch, particularly used cars of the make he deals in.

"The turnover is remarkable. *There is no need to fall below what a used car actually is worth in price to make room for others,* for they don't occupy my floor space long. *I mark prices on used cars up, compared with what we had been selling them for previously, and I SELL THEM TWICE AS FAST AT THE HIGHER PRICE.*"

In similar vein spoke W. K. Armstrong, sales manager for the Hurley Motor Co., handling the Jeffery and Nash.



Psychology of Buying



"By putting the price on our used cars higher than formerly," said Armstrong, *"I dispose of them much easier.* Somehow people seem to want them more at the higher prices than at the old figures for which we used to let them go. And it is a most noteworthy fact at this period of the business customers would rather have a rebuilt high-grade car than a cheaper make, brand new.

"The motor car purchaser has tried them out and, like the buyers of typewriters and other machines, has found that there is more value in a 'factory rebuilt' machine of workmanship than in a new machine of skimped manufacture made to sell cheaply. At least that has been my experience of late. The purchaser seems to realize that he is getting value when a dealer won't let a used car go mainly to get rid of it. I believe now that a purchaser would have his suspicions, since this new plan is in effect, that if he got a car for as low a figure as used to be allowed him, the dealer was working off a 'blister.'

"Let the dealer, for instance, mark up, over old-time figures for used cars, the price to a point anywhere from $30 on a small machine to $100 on a large one and he will make rapid sales if the cars really are worth it," added Armstrong. "The day of the give-away has gone."

MILLION DOLLAR ROW
in Salt Lake City

THE million-dollar motor row shown on this page is being built in Salt Lake City by the Mormon Church, whose old Social Hall stands in the center of the upper picture. The small round picture shows a detail of the decorations. The photographs below show an exterior and the interior of a salesroom and a service floor. Note the heavy arches which make posts unnecessary. It is intended that the row shall be exquisite in appearance and provide quarters for a number of dealers

STATISTICS INDICATE

The Passenger Car Dealer

Is Best Truck Dealer

¶ Exclusively truck dealers are few and there are many advantages in favor of the man who has learned the business of selling cars.

THE dealer who contemplates the truck sales field may wonder whether he is eligible as a truck dealer. He may wonder what the conditions are and how truck sales were handled in the past.

The manufacturer may similarly ponder. He may wonder whether it is best to place his agency with an existing passenger car dealer or whether he should create an exclusively truck agency. He may ponder on the subject of branches and whether they are profitable financially or from a development standpoint.

Setting aside all theories and opinions, a study of the truck field today throws some light on this subject. The figures indicate:

1. *The most logical truck dealer is the passenger car man who already has his sales and service organization and knows the automotive field.*

2. *Exclusive agencies exist almost entirely in the big cities—when there are any such agencies.*

3. *Only the biggest and financially strongest manufacturers have gone after exclusive agencies.*

Tabulated statistics regarding truck dealers are shown in tables in connection with this story. There are in the United States 5524 truck dealers, which includes branches and all other truck selling organizations.

Taking the country as a whole, there are 5¾ passenger car dealers handling trucks to 1 exclusive truck dealer and, as we go from the larger cities to the smaller, this ratio becomes larger.

In cities over 17,000 population the ratio is only 3 to 1, but in cities between 5000 and 17,000 it is 11½ to 1, and as we go into the towns below 5000 population we find that there are 16½ passenger car truck dealers to 1 exclusive truck dealer.

There are 823 exclusive truck dealers and 4701 passenger car truck dealers; of this 823 we find that 258, or 31 per cent, are in 24 principal cities; 362, or 44 per cent, are in 293 smaller cities, while 203 dealers, or 25 per cent, are in the small towns of the rest of the country.

In only eight cities of the United States the exclusively truck dealers outnumber the passenger car truck dealers. These cities are shown in the following table:

Cities	Population	Combination	Exclusive
New York (Manhattan)	2,682,977	16	31
Baltimore	558,485	9	13
St. Louis	687,029	13	14
San Francisco	416,912	17	19
Birmingham	132,685	5	6

Rochester	218,149	11	12

In the larger cities where life is so rounded as to include manufacturing, large retailing, transportation, baggage, express and marketing businesses, practically every large truck company has made an effort to secure representation.

This representation is divided. Where a small delivery car is concerned an effort is made to pair up with a dealer who handles a heavier truck successfully, and the dealer concentrates on the two non-competitive trucks—or sometimes three. This gives the dealer a line to supply all needs and permits him to expand his volume of business, increase his profit and become a more successful and desirable dealer for all of those whom he represents.

Rare in Small Towns

In the larger cities exclusive representation for a single truck is a rarity. The exclusively truck dealer will have three lines more often than one, and the preference for two over one is overwhelming, unless where a heavily financed institution, such as International, Vim or Republic, feels it necessary to put in branches and sub-dealers in order to make sure that adequate representation will be secured.

In studying the 823 exclusive dealers in comparison with the larger number of passenger car dealers, we find that 10 of the larger of these companies—there are 210 altogether—have 55 per cent of the exclusive agencies. They follow:

Names	Number
International	131
Republic	90
Vim	50
G.M.C.	43
Kelly	36
Federal	29
Garford	25
Autocar	20
Little Giant	20
G.V.C.	13
Total	457

These figures seem to indicate that even in the larger cities truck manufacturers seek passenger car connections where such dealers can demonstrate their ability to sell trucks and give service in a proper manner. It is only where the passenger car effort would overshadow and dwarf the truck selling effort that the large truck manufacturer, even when he can pick and choose, seeks an exclusive dealer.

Very often the manufacturer establishes and finances his own branch or aids financially some established dealer, extending to him also the advertising co-operation and selling aid that is positively necessary to keep him in business.

When it is considered that in only eight cities of the United States do the exclusive dealers outnumber the passenger car and truck dealers, the following deduction seems logical:

Only the very large cities can support substantial exclusive truck agencies.

The larger manufacturers—the only ones who can support nation-wide, independent representation—favor combining the passenger car and the truck representation when it can be secured under favorable circumstances. In these larger cities the figures show an overwhelming preference for combined representation where the truck dealer is exclusive, two, three and sometimes four truck lines being represented in one organization.

A reason for the preponderance of combination dealers over exclusively truck dealers seems to be that in the case of the passenger car dealer the

Digitized by Google

manufacturer finds an already existing organization. It is established and therefore generally financially sound. It has sold cars, given service on them and has undoubtedly installed the necessary equipment and labor for further service.

It is known in its community. It has sold passenger cars to business men, who are the only buyers capable of purchasing delivery cars or trucks. It has been compelled to learn merchandising and advertising methods and, if successful, has proved itself capable in salesmanship—a faculty more vitally necessary in handling motor trucks than in selling passenger cars.

No Truck Dealers Exclusively

To cite a few examples, there are no exclusively truck dealers in such towns as:

Cities	Population
Mobile, Ala.	51,520
Colorado Springs, Col.	29,078
Pueblo, Col.	47,295
Bristol, Conn.	9,527
Danbury, Conn.	20,234
New Britain, Conn.	43,916
Augusta, Ga.	41,040
Boise, Idaho	17,358
Moline, Ill.	24,199
Burlington, Iowa	24,324
Bangor, Me.	24,803
Brockton, Mass.	56,878
Lansing, Mich.	31,229
Duluth, Minn.	78,466
Albuquerque, N. M.	11,020
Binghamton, N. Y.	53,082
Troy, N. Y.	77,738
Watertown, N. Y.	29,384
Lancaster, Pa.	47,227
Newport, R. I.	27,149
Sioux Falls, S. D.	14,094
Galveston, Tex.	36,981
Waco, Tex.	26,425
San Antonio, Tex.	96,614
Charleston, W. Va.	22,996
Cheyenne, Wyo.	11,320

In Ohio, taking 10 cities with population in the neighborhood of 20,000 in alphabetical order, beginning with East Liverpool and ending with Steubenville, there are 34 passenger car truck dealers and *not one exclusively truck dealer.*

In the State of Massachusetts, beginning at Reading, and also in Michigan, taking towns between 5000 and 17,000 and going alphabetically down through the list, we find 39 towns containing 64 combination dealers and only one exclusive dealer. The latter is located in Owosso, Mich., a town of 10,000 population.

Exclusive Dealers Few

A similar situation in this class of cities is found in Minnesota, Mississippi and Missouri. There are 59 combination dealers to three exclusive. In Ohio, in a class of cities between 5000 and 17,000 population, taking 25 in alphabetical order, beginning with Cuyahoga Falls and concluding with Van Wort, there are 42 combination agencies and not one exclusive truck agency.

Taking states and cities alphabetically and beginning with Bolton, Tex., and going alphabetically down through to Brattleboro, Vt., there are 20 cities which have no exclusive truck dealer, though trucks are sold in 29 passenger car salesrooms.

Population of cities	Cities having truck dealers	Car-truck dealers	Exclusively truck	Ratio
17,000 and over	320	1771	620	3 to 1
5,000–17,000	578	1036	89	11.5 to 1
5,000 and less		1894	114	16.5 to 1
Total		4701	823	5.75 to 1

However, in Montpelier, Vt., there is one exclusive dealer and, continuing on down through the list and through Virginia, there are 12 cities with 22 combination dealers and no exclusive dealers.

Again there is an interruption in this sequence by Hoquiam, Wash., a 10,000 population town, which has one combination dealer and one exclusive dealer.

Continuing down through the list of 26 cities from Bluefields, W. Va., through Wisconsin and Wyoming, there are 46 combination dealers and *no exclusive truck dealers.*

Michigan, the greatest motor car manufacturing state, has 29 cities in the 5000 to 17,000 class in which trucks are sold, *and there is no exclusive truck dealer.* There are in these 29 cities 50 combination dealers, the only city sheltering an exclusive dealer being Owosso, previously referred to.

Old Beliefs Discarded

In years past, exclusively truck dealers were by some considered a necessity because it was believed that in order to sell a truck an organization had to be composed of transportation engineers, statisticians and salesmen of a peculiar breed.

While a different factor is necessary in the ordinary selling organization, this great variance is not necessary, according to the statistics that have been cited. With the large number of combination dealers in existence, it does not seem probable that all of them, or even a small per cent of them, have any greater array of transportation engineers and statisticians.

The more the dealer can go into this transportation engineer and statistician proposition the greater becames his sales possibility, because it enables him to analyze the field and to open up lines of selling that are not obtainable through less aggressive methods.

The same thing, however, might be said of selling passenger cars or any other commodities. The more science there is applied to the selling the greater will be the results. The only handicap comes when the science becomes an enormous overhead and eats up the profits that are derived from the sales it makes.

Overdoing Science

There have been dealers who have gone so far into modern merchandising and the science of business selling that their activity has centered largely around the scientific side and they have paid so little attention to watching leaks and taking care of the profits that their earnings have not been sufficient to pay the expense of the organization.

Sometimes in those cases the observer will state that the old hard-headed business methods are best. Old hard-headed business methods are good, but they are much better when tempered with science, and vice versa; science is good when tempered with old hard-headed business methods; neither one can best stand alone.

There is, however, a great deal in the old hard-headed business methods that is scientific but it is not so recognized because of the atmosphere in which it is found.

Distribution the Problem

It does not necessarily follow that the men who are selling upholstery on Broadway and Michigan avenue can be truck salesmen, but it is a certainty that any man who is well founded in the fundamentals of selling should be able to merchandise any product once he is given a chance to acquaint himself with it.

The motor truck industry's problem is distribution. The sales manager of a truck company must first secure enough distributers to take enough trucks to underwrite his estimated annual production. In case he works only through large distributers, the distributer's problem is then to secure dealers to whom he can pass out the product.

Distribution must be nation-wide or else the vehicles in operation through their self-advertising will localize the manufacturer's distribution, and in acquiring national distribution up and down the country in towns of all sizes *the only logical dealer seems to be the passenger car man.*

He is there, he is organized, he is equipped, he needs additional volume, and he is waiting for the product.

Should Investigate Truck Field

The passenger car dealer who has not investigated the truck situation is passing up a good thing.

Right now every dealer is in need of additional volume to help carry his overhead and increase his profits. If he can see how he can get it out of passenger cars that is probably the easiest thing for him to do, but if he can't get this necessary volume out of passenger cars, he must take it out of something else, and a truck is the product which is most closely allied with that merchandise upon which he has built his business and out of which he has made his profits during past years.

He should shake off old thoughts, old methods, and take on new goods. He should become a combination dealer—AN AUTOMOTIVE MERCHANDISER.

THE LONG DISCOUNT TRUCK

The Will-o'-the-Wisp

It is all right if rightly used and if it is justified, but—

By Ray W. Sherman

"THE Sayanna truck is a fine truck, Mr. Reilly," warbled the road man for the Highman two-tonner, "but we have a truck that is just as good and——" the Highman lad went strong on the "and"—"we can give you much better discount terms than you are getting.

"A lot of former Sayanna dealers have taken on the Highman. The Sayanna is a good truck, BUT you dealers are in business to make money, and if you can get a discount of 40 or 45 per cent isn't it more profitable to you than selling at almost half that profit? What about it?"

"You have a fine argument," replied Reilly, who had recently added the Sayanna truck to his Sennett car agency, "but what I'm interested in is my profits two or three years from now. Whatever agencies I take and whatever plans I make must be based upon what they will do for me in the future. If I build for this year only I am running on a short-term lease of life—and am liable to quit any minute that Old Landlord Time calls the turn on me."

May Lead, But—

"That's just what I contend, Mr. Reilly," shot back the Highman representative. "We have a truck that is going to be one of the leaders in the country. It——"

"It isn't a leader to-day."

"I know it may not be, but it is going to be!"

"You don't advertise very much," declared Reilly.

"I know we don't—but we're going to."

"When?"

"Well—ah—you see, I'm not handling the advertising end, but I happen to know that the company has big plans under consideration."

"Your price is high."

"Surely it is! But the truck is good and the discount is big. The price is justified. It also gives you a chance to make good trades——"

"I don't want to make good trades!" Reilly snapped out the words. "I'm in business. I'm not running a lottery. People can find out what my prices are by looking on the price tags. And they can find what I'll give for a used car by going out and letting my used car man make an estimate on what it's WORTH!"

"But wouldn't you like to know that in case you made a poor guess you wouldn't lose money?"

"We quit guessing a long time ago," laughed Reilly. "And, furthermore, we don't try to kid ourselves. We have a bookkeeper and cost man who won't let us. He makes us feel ashamed of ourselves sometimes because of the things we try to do. He surely keeps us in the straight and narrow path."

"But—Mr. Reilly! On this truck you can make twice as much every time you make a sale as you can on the Sayanna. The discount is bigger and the price from which this discount is taken is higher, which makes the profit bigger. The truck is a good seller, it is made of good stuff, and you would have a fine business——"

"I know all about that!" Reilly retorted. "You people have been in business just as long as the Sayanna people have, but you haven't made the same progress. You haven't advertised and put your truck over. It hasn't the same standing throughout the trade and the business world. You have always thought progress could be made by an excessive price and long discounts. You have merely demoralized business and tried to knock the bottom out of everything. You have not a strong line of dealers. You have kidded a lot of dealers into your agencies through this big discount argument, and then you have failed to support them with advertising and intelligent sales work, and the result has been that most of them haven't stayed with you very many years.

"You have hurt the truck business more than you have helped it!"

Must Look to Future

The Highman man started to say something but Reilly got started first—and a start is half the conversation: "In selling trucks or cars a dealer must consider his future. And he must not forget this, that the harder a thing is to sell the more it costs to sell it, and the fewer the sales are the more the overhead eats into the profit on each individual sale.

"I have the Sayanna truck. It has done a lot of work to put itself on the market. It is well known. There are lots of them running around. Business men know they are good. It is easy to sell them. The repeat business—a mighty important factor—is just like finding money. They are good and don't require a maximum of service. Their parts prices are reasonable. The price is low. I know the discount isn't as big as it is on some other trucks—yours, for instance—but I turn my money over rapidly and I'm making a good profit.

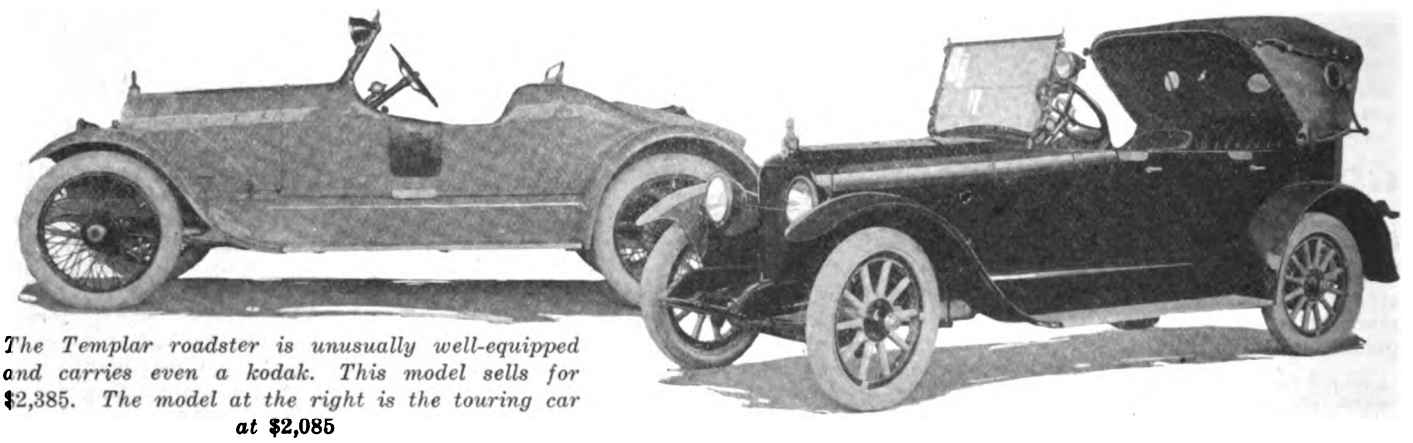
"Furthermore, I am building for the future. I do some advertising myself, and it merely adds to the sales lubrication that has been provided by the company's advertising and reputation. If I take on a truck, such as yours, that is not well known and well advertised, I might be able to put it across through my own reputation, but I would have to do it by spending my own money for advertising and promotion work. A small town man couldn't do it. I might be able to, but *it would be a hard job—and in the end I might find I had been working on the wrong track.*

Price Excessive

"Of course, if two trucks were of equal merit and the discount on one were higher than the discount on the other, the one with the higher discount would naturally be a better proposition. But in order to make your discount long you have made your price high, and this makes selling difficult. Furthermore, your price is so excessively high that it makes it possible for a discerning buyer to compare the money value in it with such a truck as the Sayanna.

"It is much the same thing as the passenger car industry has gone through. In the old days there were all kinds of discounts. They used to run up toward 50 per cent. But when buyers began to get wise to car value it was necessary for the manufacturers to pare their prices down, and the result was that one of the big cuts came in the dealers' discounts.

"With those old-time long discounts dealers used to make foolish trades, and that is one of the things that put the used-car business in the deplorable condition it is in to-day. And then when the discounts came down the dealers didn't know enough to revise their trading and so we have lost millions of dollars as a trade.



"The same thing happened in tires.

High Efficiency and Low Maintenance Aim of Templar Four

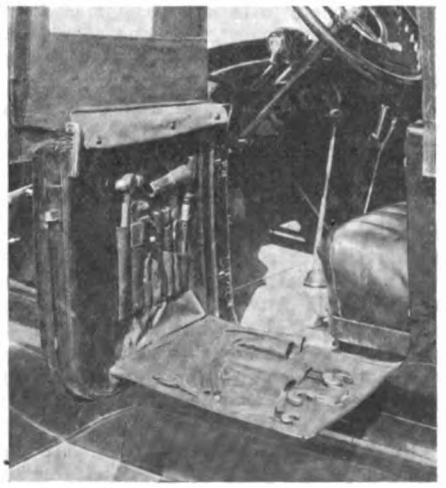
Four Body Styles and One Chassis in the Line

The Templar roadster is unusually well-equipped and carries even a kodak. This model sells for $2,385. The model at the right is the touring car at $2,085

WITH low maintenance cost and high efficiency in view, the Templar Motors Corp., Cleveland, is concentrating on what may be termed a foreign type of small-bore, long-stroke four-cylinder car. The chassis was first revealed at the last New York show and the company is now accelerating production.

Four types of body are standard, the five-passenger touring selling at $2,085, the four-passenger sportette at the same price, four-passenger victoria, $2,285; and two-passenger touring roadster, $2,385. The chassis alone sells for $1,850. The bodies are finished with twenty-seven painting processes and a number of standard color options are provided. On the touring roadster an aluminum body is used. The windshields are sloping rain vision types equipped with cleaver. The upholstering and trimming are in hand-buffed leather. The doors have nickel plated double handles, straight bar outside and curved lever inside. They are mounted in invisible hinges and equipped with pockets and leather hand pads.

One of the features of the Templar car is its complete equipment. This even includes a compass and a folding pocket kodak. A list of the equipment provided on the different cars is given herewith.



Five-passenger Touring and Four-passenger Sportette

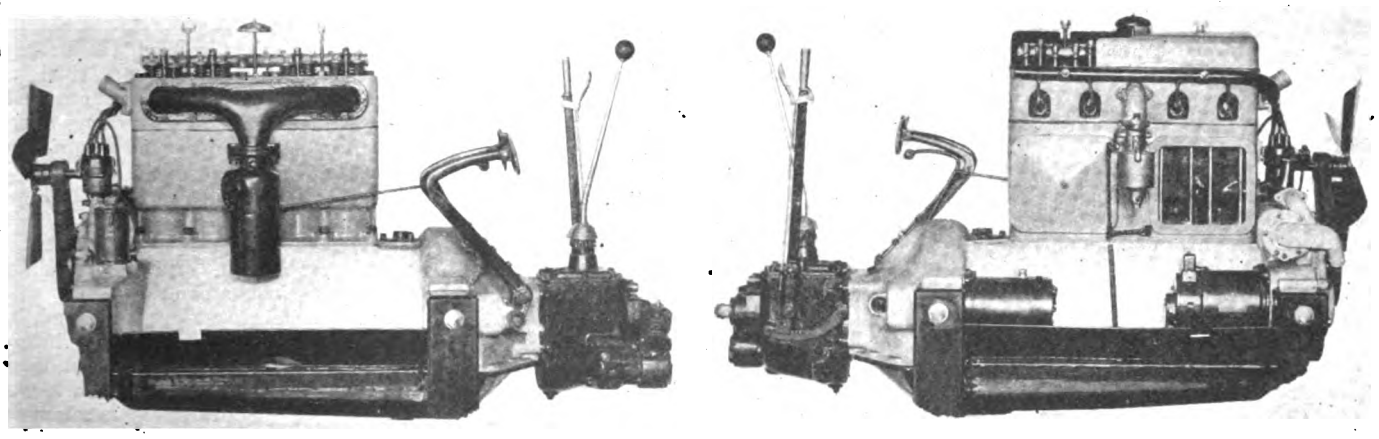
- One-man "Never-Leek" top.
- Door-opening curtains.
- Johnson plate glass rear window.
- Macbeth-Liberty lenses.
- Electric horn.
- Kellogg tire pump.
- Tire gage.
- Windshield cleaner.
- Motometer.
- Petry muffler cutout.
- Warner Auto-Meter.
- Keyless clock.
- Spotlight.
- Inspection lamp.
- Ammeter.
- Clum switch and lock.
- Oil gage.
- Copley primer.
- Tool kit.
- Four cord tires and tubes.
- Natural wood wheels.
- Five Parker rims.
- Wire wheels $100 extra net.

Two-passenger Touring Roadster.

- Detachable top.
- Warner Auto-Meter.
- Electric horn.
- Motometer.
- Keyless clock.
- Kellogg tire.
- Tire gage.
- Petry muffler cutout.
- Windshield cleaner.
- Spotlight.
- Inspection lamp.
- Ammeter.
- Copley primer.
- Macbeth lenses.
- Johnson plate glass rear window.
- Stanwood safety step-pads.
- Tool kit.
- Clinometer.
- Compass.
- Folding kodak
- Six Houk wire wheels.
- Six cord tires and tubes.

Standard color options on the touring and sportette are Valentine's Tiffany Bronze, light Wine or Allegheny Blue. Fenders, chassis and splash guards are black enamel. Wheels are natural wood finish. Striping is done only when color, size and location are definitely specified. Monograms or initials are put on when requests are accompanied by scale drawings.

Tools are carried in a pocket inside the front door



Standard color options on the touring roadster are Valentine's Rich Cream, Khaki Gray, Light Wine or Allegheny Blue. The fenders, chassis and splash guards are painted the same color as the body. The upholstery on the touring roadster may be either red or black leather. The wire wheels on the touring roadster may be either red, white or black. Black furnished unless otherwise specified. Other colors than standard are $50 extra net.

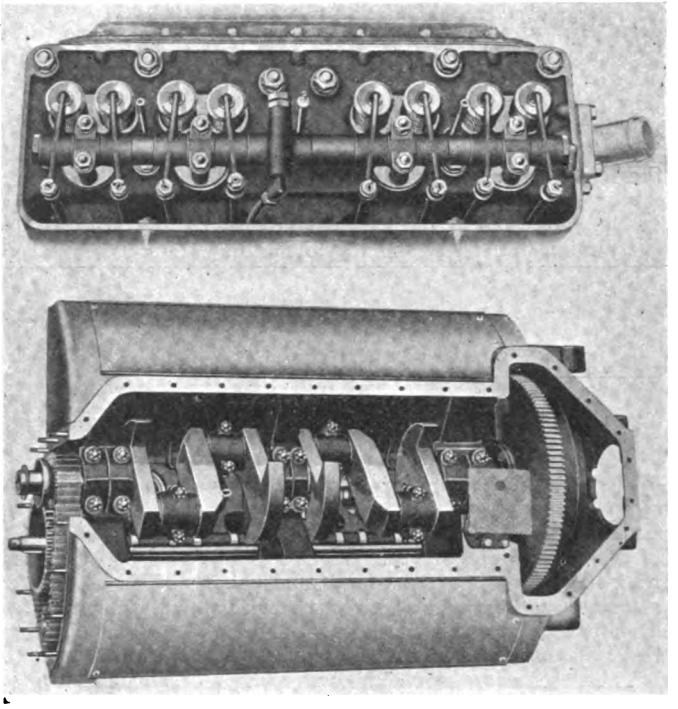
Mounted on a wheelbase of 118 in., the actual body length is 88 in., showing a relatively short length of powerplant which is in line with the purpose of the car to give economy and at the same time flexibility. The engine is built in the Templar shops and represents an up-to-date adaptation of overhead valve practice. Lightness in the powerplant has been sought by the extensive use of aluminum for the stationary parts and alloy steel for a large percentage of the moving parts.

The 3⅜ x 5½ cylinders are cast in a block, the head casting being separate, and the crankcase together with the flywheel and clutch housing cast separately in aluminum. The oil pan is pressed steel, galvanized, the cylinder block and cylinder head of close grain cast iron, and the head cover plate housing the rocker arm action is sheet aluminum. One of the unique arrangements of these castings is the direct communication of the crankcase with the valve mechanism on top of the cylinder head, thus permitting the crankcase oil spray to circulate around the rocker arms.

An unusual feature which results from this communication is the placing

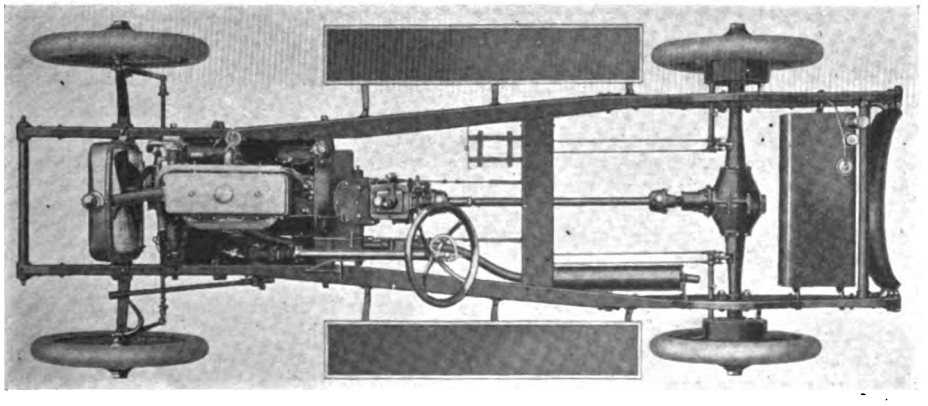
Digitized by Google

Both sides of the Templar engine, showing the neat design and accessibility of parts. Note the unusually large hot air stove for the carbureter



of a breather and oil filler at the top of the valve cover plate.

Cast iron pistons weighing 26 oz. are employed, the pistons being fitted with wrist pin bearings, bushed with Non-Gran bronze. The pistons are designed to prevent oil entering the combustion chamber, this being effected by the use of three concentric rings above the piston pin and one below. The lower ring is supplemented by a groove turned in the piston with holes drilled through the piston wall to give an efficient wiping device. A unique feature in the piston is the placing of the second and third rings in one groove. All four of the rings are 3/16 in. and are all hand peened by the Wasson process.



Nickel steel connecting rods are used, machined all over, with a sectional width of ⅝ in. and a depth of 1 in. The stock is 3/32 in. The I-beam section is uniform from top to bottom, the lower end having an inserted bronze backed bushing, 2½ x 1⅞ in. diameter. The caps are held in place with 2 7/16 nickel steel bolts.

Other than the opening between the crankcase and valve rocker arm mechanism, the valve drive is in accordance with usual overhead valve practice. The camshaft is machined from a solid forging and is driven by a Morse silent chain running in oil. The same chain drives the generator, giving a triangular drive with the generator so mounted that it may be moved to adjust the chain. Keyed to the camshaft is a helical bronze gear which drives a cross shaft, having on one side an aluminum centrifugal water pump and on the other, the ignition distributor. The valve action is transmitted from the camshaft in the usual manner by vertical push rods at the right side of the engine, and it is in the space surrounding these push rods that a clear way is provided through to the head.

Counter-balance weights are used on the crankshaft, these counter-balances being forged integrally with the shaft, which is a .40 carbon steel unit, balanced separately and afterwards in connection with the flywheel. These counterweights permit a relatively high engine speed, the output being 43 b.hp. at 2100 r.p.m., and the maximum engine speed being in excess of 2500 r.p.m.

The overhead valve mechanism of the Templar is a simplified design, the push rods being adjustable when the engine is running. A carefully counter-balanced crankshaft permits high rotative speeds without vibration. Below is a top view of the chassis, showing the clean lay-out

Lubrication is by pressure feed, the oil being circulated by gear pump to the valve rocker shaft, which is hollow, to the timing gears and thence to the engine bearings through the drilled crankshaft. Thus the lubrication of the overhead valve action is taken care of in two ways: First, by the pressure system in which the oil is fed through the hollow shaft into the valve rocker bearing and then by the oil vapor which comes up the side of the engine from the crankcase. The oil which passes through the hollow rocker shaft is carried to the front end of the motor flowing over the chain drive, sprockets and spiral gears, thence returning to the oil reservoir.

With the overhead valve mechanism

Digitized by Google

operating in a bath of oil, quietness is assured. The valve adjustment is also readily maintained by means of a small hexagonal wrench which fits into the end of the adjusting screw on the end of the rocker arm, allowing any adjustment to be made while the engine is running.

The valves are tungsten steel, 1¾ in. diameter in the clear, interchangeable and equipped with double springs. No cages are used, the valves acting directly in the head, thus permitting of waterjacketed stem guides. The push rods are tubular steel, having ball and socket contact with the rockers, and roller contact with the camshaft.

A complete vaporizing system has been laid out to take care of present fuel condition. The air is preheated by passing through a stove surrounding the exhaust pipe, directly through a passage cast in the cylinder block and thence to the Zenith carbureter. The mixture is carried to the cylinders through the manifold cast integrally in the detachable head and entirely surrounded by the waterjacket and also absorbing some of the exhaust heat before reaching the cylinders. An air adjustment and starting primer is mounted on the steering column, and in addition there is an auxiliary primer of the Copley type for cold weather starting.

Ignition, starting and lighting are by the Remy two-unit system, both the generator and starting motor being mounted on the right side of the engine. The coil is mounted in close proximity to the distributor at the forward end of the engine, thus reducing to a minimum the loss of potential in the high tension circuit. Combined automatic and manual spark advance is provided.

Cooling is by centrifugal water pump in connection with a Fedders honeycomb radiator of 3½ gal. capacity. One of the features of the engine is the distribution of the waterjacket space, particularly around the valves. The plugs are also cooled due to the fact that they are mounted directly in the side of the head, passing through the waterjacket space in such a manner that the cooling liquid surrounds them practically entirely. The cooling jacket is also worked over the head in such a way as to give free circulation above the top of the combustion chamber.

A feature of the car is its easy acting Borg & Beck clutch. It is provided with a ball bearing release collar, and since it is of the single plate type requiring only a minimum of motion to secure complete disengagement, it has been possible to work out an exceptionally soft pedal action. The gearbox is a three-speed selective, Templar design unit, built with the engine. The gears are 5 per cent nickel steel with ¾ in. facing, and the gear shafts operate on annular ball bearings.

A Kellogg single-cylinder tire pump is mounted on the gearbox with hose connection coiled under the driver's seat. The pump is meshed by raising a button on the front floorboard. The tire pump and speedometer gears are housed within the gearbox, being thus protected and lubricated.

Hotchkiss drive is used, the propeller shaft being a .440 carbon steel unit equipped with two Schwitzer universals. The springs are Perfection, chrome vanadium, semi-elliptics, 36 x 2 in. front, and 54 x 2½ in. underslung rear. The spring shackle bolts are bushed with Nigrum oilless bearings, thus reducing the number of grease cups on the car, which total eleven. The spring shackle bolts are ⅞ in. diameter.

Side-by-side brakes are employed, both service and hand brakes being internal expanding. The drums are 14 in. diameter, and the service brake 2 in. wide. Adjustment of the brakes is accomplished by turning the wing nuts on the rods beneath the front floor board. Artillery type wheels having ten spokes in front and twelve in rear are used. These are provided with Parker demountable rims, one extra rim being provided as stock equipment. The tires are 32 x 4 in., straight side cord with rib tread front and non-skid rear.

The fittings throughout the car are in accordance with current practice, the fenders being full crowned. The muffler is a Maxim silencer with Petry cut-out valve. The steering gear is a semi-irreversible screw and nut type with the spark and throttle quadrant and horn button mounted above the steering wheel. The auxiliary air adjustment and the electrical switch equipped with thief-proof lock is mounted on the column just below the steering wheel.

Do You Hold Sales Meetings?

THE Buxton-Phillips Motor Corp., Kansas City, L. A. Buxton, retail sales manager, holds daily and weekly meetings of the sales forces for both Chalmers and Maxwell. Every morning at 8.30 all the salesmen gather, going over the work of each on the previous day and outlining the calls for the current day.

These morning meetings are strictly on current business, the salesmen getting the help of their fellow salesmen on the prospects which they are immediately concerned with. The company is eager to have the Chalmers salesmen know all the points on selling the Maxwell and vice versa; and there is a distinct advantage to the two forces in hearing each other's arguments for their own cars and hearing the manner in which objections are met.

The company has retail sales contests each month; any salesman missing any of these daily meetings without a good excuse is eliminated from the prize contest. The company also holds weekly sales meetings when the general problems of salesmanship are discussed.

A feature of the weekly meeting is the occasional examination of salesmen on various topics—on the policies of the company, on the parts of the car, on local affairs, and on general information. Prizes are given to the salesmen who come out of these examinations with the highest scores.

Buxton has a few very definite ideas on the qualities of the most successful salesman; and on salesmanship of automobiles. One of these is that perfect salesmanship gets results without appearing to imposing the commodity on the customer.

This involves not only such perfect familiarity with the car that even the most technical information can be given in a casual way, but also such accurate general information that casual conversation on other topics than automobiles need not impress the customer with the thought that the salesman knows nothing else except cars.

In all the meetings the idea is emphasized that the man whose mind is alert is the one who can take quickest advantage of every opportunity in the sale negotiations, and that alertness involves the fullest exercise of the mental faculties at all times.

The daily and weekly meetings are also aiming at the standardization of sales talks, even to such minor matters as to what Maxwell and Chalmers cars have done in Kansas City and vicinity. One definite point, for instance, is that each of the salesmen should mention the same mileage on gasoline, which might vary slightly for Kansas City as against some other community, and which is much more effective as an argument when it is specified as Kansas City mileage.

Mention has more than once been made in the meetings as to the advantage of reading business papers for keeping up with the news of the industry, and the reading of weekly review magazines as a means of keeping up with general information.

The half dozen general magazines which have a large circulation seem to stand equally well among business men; if a customer happens to refer to a point of view on the war given by the Independent the salesman's response with something he saw in the Literary Digest provides an immediate harmonious contrast. The effect on the customer is far better than if the salesman refers merely to a dispatch which he saw in the newspapers.

At each of the weekly meetings some article is usually presented, either being read or a digest being given, bearing on salesmanship or on general conditions which the salesman is likely to be called upon to discuss.

THE LAW

By George F. Kaiser

As It Applies to
Dealers
Repairmen
Garagemen

Alien Can Be Barred

THAT a town has a right to provide by ordinance that no license will be granted to a motor car used for the transportation of passengers for hire except to a citizen of the United States was decided in a late New Jersey case.

A Russian owner of a jitney bus was convicted of violating an ordinance providing that motor cars for hire should not be operated by persons who were not citizens.

He appealed, claiming that the town had no constitutional right to limit the operation of motor vehicles.

The court decided against him, however, although he had a state motor vehicle driver's license, and held that he had no right to drive a car for hire in view of the ordinance. It further held that the town had the right to deny the privilege of using the public streets and places to aliens just as it had the right to prevent them from engaging in practising law, the laundry business, the liquor business, or any other business it might see fit.—Morin vs. Nunan, 103 Atl. (New Jersey) 379.

Bars Price Contracts

THE Federal Trade Commission recently handed down a decision on price fixing along the lines of the opinion of the United States Supreme Court in the Gramophone case. The commission's order was issued in a case involving the manufacturer of certain proprietary medicines.

The manufacturer was forbidden to indicate to dealers the prices at which its merchandise should be re-sold, from obtaining agreements from dealers to keep to such prices, from refusing to sell to dealers who failed to keep up prices upon the same terms as dealers who kept up prices and from furnishing advantages of any kind to the dealers who agreed to keep up prices.

The following statement was made by the Federal Trade Commission in connection with the case:

"Some of the most distinguished lawyers in the United States have appeared before the commission to argue this question, as well as many of the leading business concerns of the country, some of whom have insisted that the maintenance of resale prices was proper, and others who have contended that it was not. Almost all of the large department stores of the country have been heard in opposition to it.

"After full consideration the Federal Trade Commission has decided to issue complaints against all business concerns who refuse to sell unless the purchasers will agree to maintain a resale price fixed by the seller. The case just decided is the first formal finding by the commission to that effect.

"When once an article has passed from the maker to a purchaser he owns it, and the owner of such article may sell it at any price that he chooses, provided he does not himself sell it at such price as to be below cost, and thus thereby enter into unfair competition with other retailers selling the same article.

"This decision is going to be open to considerable controversy in relation to the subject matter thereof, and the matter will probably have to be settled by an act of Congress in the manner suggested by Justice Brandeis in his concurring opinion in the Supreme Court of the United States, in the case of the American Graphophone Co.

"The Stephens bill, which is now in Congress, is in relation to that matter, but in the estimation of many business men and others it is thought to be broader than it should be. It may be that resale prices can be so regulated by placing the power somewhere protecting against unfair prices as to make it work equitably, and be a fair method of competition in commerce, but that question will undoubtedly have to be settled by Congressional action."

Sunday Contracts Illegal

THE fact that Sunday contracts are invalid is persistently ignored by some dealers. When these dealers finally understand that the courts will not afford them any relief in illegal transactions they will stop making illegal contracts.

In a case decided some time ago, an owner of an automobile made a contract with a dealer to exchange his car. The agreement was made that the old car should be taken in as part payment and that $1,000 in cash in addition should be paid on the new car. The contract was made and completed on a Sunday and the check was delivered to the dealer on that day.

The customer notified the dealer some time later that he was not satisfied with the new car and that he wanted to return it and get his old car back. The dealer replied that the old car had been sold, whereupon the customer turned around and stopped payment on his check and sold the new car.

The matter finally came to court and it was decided that the transactions were illegal because they were made on a Sunday and that neither party could have any relief from the court against the other.

Of course, the sale of gasoline and accessories is permitted on Sunday in many states because of express statutes which have been enacted, such as the one in New York State. Where there are no statutes, however, even these sales are usually illegal under some of the old "Blue laws."

Tipping Is Illegal

AN illegal practice persisted in by dealers is the tipping of chauffeurs, although a great number of states now have statutes making it improper to pay commissions or bonuses to chauffeurs.

Persisting in this practice in the face of these anti-tipping laws often leads to unlooked for results.

In one New York case it was held that the employer of a person receiving a bonus need not even pay the dealer or garageman what was justly due him if the latter had violated the New York act by paying a bonus. In addition to losing some considerable amount, which he may be justly entitled to, a garageman frequently leaves himself open to being convicted of a misdemeanor if he pays a bonus in a state where any anti-tipping law is in effect.

Good Demand in Canada

WINNIPEG, May 27—When figures on automobile production show that the output is considerably decreased from last season, it is rather startling to find that all over the country the demand, instead of decreasing in proportion has actually increased. A western distributer of the Reo reports that since January he has taken orders and received the money for more cars than he had sold in the same period of either last year or the year before, his two banner years. The results showed practically a 20 per cent increase in demand. When this figure is considered in relation to approximately a 30 per cent reduction in motor car output, the country would seem to be on the verge of an extreme car shortage.

How to Lay Out a Building—7

THIS is the seventh of a series of articles which take up in detail the layout and arrangement of buildings for the dealer, garage and repairshop.

If you are thinking of building a garage, salesroom or service station, and are puzzled as to the proper lay-out of the building, send your plans to us. We shall be glad to help you. Include all necessary data and, if possible, a rough sketch.—EDITOR.

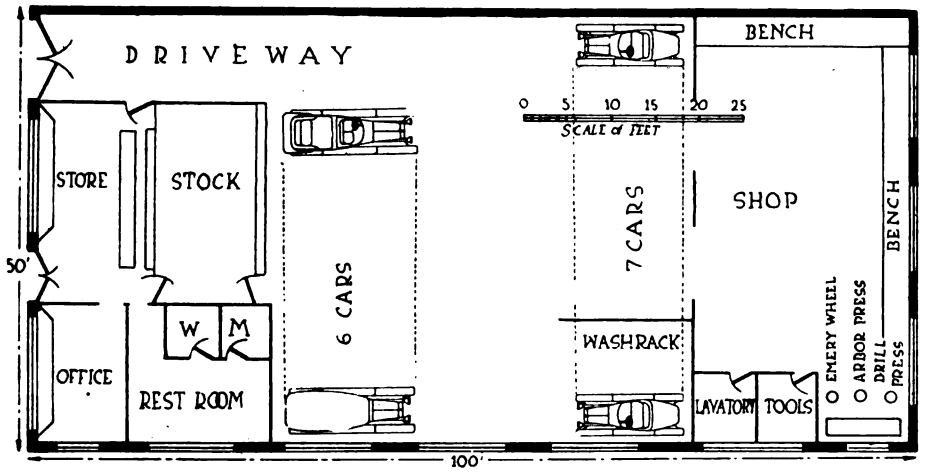

Fig. 25—In this plan the two large windows across the front are used for an accessory display

Plan No. 9

THIS plan, Fig. 25, answers the same purpose as that shown in Fig. 24. Two large windows across the front are provided for accessory display. An advantage of this plan is that the office is situated at the front, where light is good, although, of course, the advantage is paid for by reduced store width. The office is convenient to the accessory store, yet is distinct from it, so that it is possible to transact business in the office without distracting the attention of customers in the store.

Although the office is on the opposite side of the building from the driveway it is nevertheless very easy, by looking through the front window, to check cars as they come and go.

The plan has been arranged so that anyone desiring to go to the office, waiting room, or lavatories must pass through the accessory store. Naturally, the more traffic there is through the store the more business will be done in it.

Plan No. 10

IT is plain that the showroom, the shop and the garage units illustrated in the various plans cover the majority of designs that are required. That is to say, among the showroom plans almost any dealer should be able to find a showroom to suit him, and the same holds true regarding shops. Therefore when a plot of irregular shape is encountered, one which does not lend itself readily to the adaptation of one of the standard plans, a suitable standard showroom and shop unit should be chosen and so located on the plot that the cars in the garage may be efficiently placed. Fig. 26 is an example. Here is a plot 75 x 80 ft., to which it is hard to fit any of the plans given. We will assume that the showroom and shop unit, Fig. 10, is satisfactory. Since the lot is on a corner, the showroom unit is placed on the corner. The space between the showroom and the rear of the building is about the right length for the shop unit, the light is good along this wall and the sliding doors across the rear make it easy to run cars in and out. It seem like an ideal place for the shop; therefore the shop unit is placed there.

A moment's inspection shows that the only car arrangement possible in the garage is the one chosen. Part of the garage aisle has cars on only one side. This is not an efficient use of the space.

From the standpoint of garage layout the plan, Fig. 27, would be much better. The light and access to the shop are not quite so good (unless skylights are used), but twenty-two cars may be stored in the garage instead of seventeen.

Plan for Lot 34 x 300

Editor Motor World: We have a lot with a 34-ft. front and 300 ft. deep. The lot is situated on Main Street, has a back entrance from a side street, has a gradual slope to the rear. We would like to have an accessory shop and a showroom for cars in the front, but we do not want to crowd our showroom. We will build one or two stories whichever we can arrange more conveniently.

We are dealers for Buick and Franklin cars and for Republic and Little Giant

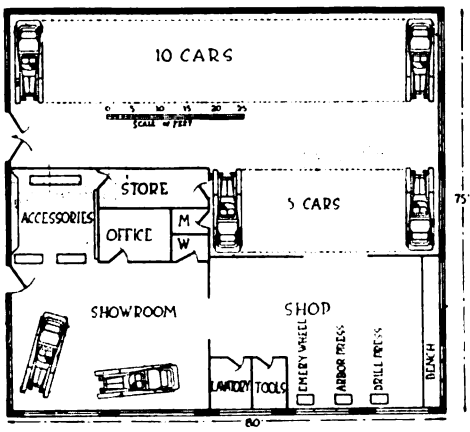

Fig. 26—A rather hard sized plot to which to fit a standardized plan

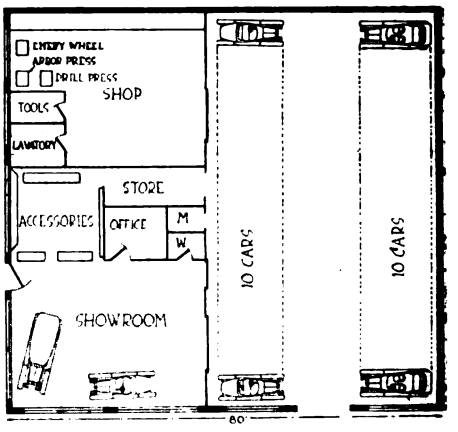

Fig. 27—This is a better arrangement than the one shown in Fig. 26

Digitized by Google

trucks. We will need storage room for an average of 10 cars.—Crum Brothers, Orangeburg, S. C.

Herewith is a plan drawn to meet your specifications. Before going ahead with this building we should like to advise you that you will not be satisfied with a building on such a narrow plot. Forty feet is the minimum width, and even that is rather narrow; 45 ft. is much better and where large cars are to be stored 50 ft. is standard.

The difficulties with a narrow plot are in the layout of garage and shop. You have not stated whether the garage section is for public use or merely to store your own cars. In the latter case a systematic arrangement of machines is not so necessary.

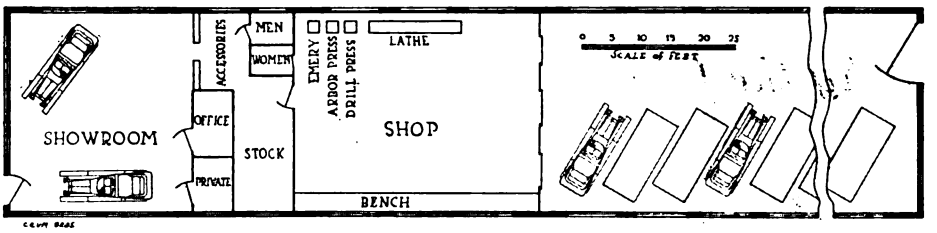
In other words with a width of 34 ft. if you try to obtain an orderly arrangement the best you can do is place a row along one wall and even then it will be necessary to stagger the machines so as allow sufficient aisle space.

Obviously very few machines can be stored with this arrangement and a more efficient way to use the space is to pack them in lengthwise, leaving no aisle. It is hardly possible to do this, however, unless the machines are not moved frequently, which would be the case if they were ones you were holding to sell and were not on active storage. Thus it should be plain that a 34-ft. plot is out of the question for garage purposes.

Likewise the only possible arrangement in the shop is to place the bench along one wall. Difficulty will be experienced in getting the cars in and out.

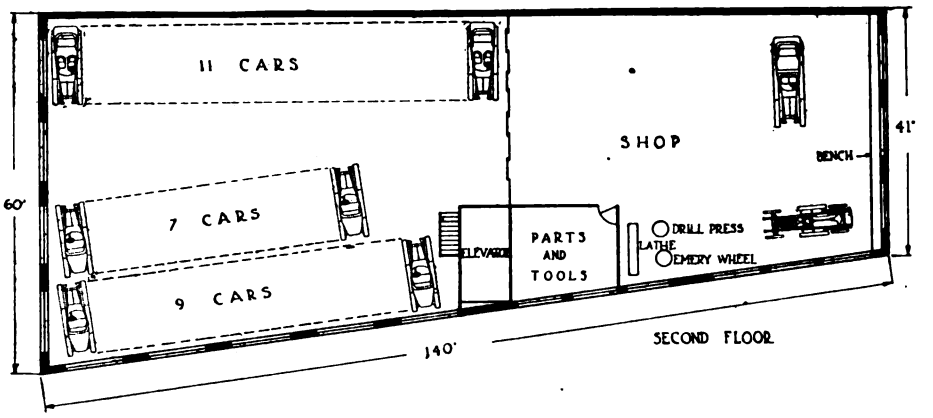
A front entrance to garage and shop is almost out of the question since it would leave a very narrow showroom and a window space only large enough for one car.

The customary location for the shop, which is at the rear, where light is best, cannot be used, because if this were done the only means for reaching the garage, which would then be between shop and showroom, would be by a front entrance, and as already pointed out this is almost out of the question because it would make the showroom too narrow.

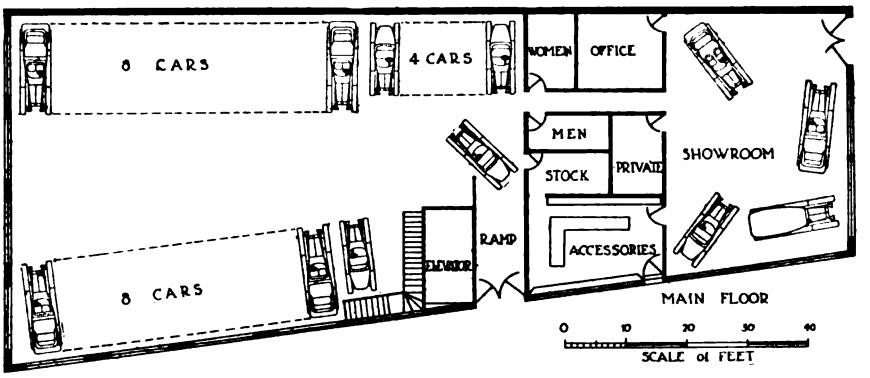


If you follow the plan submitted the shop will have to be lighted by skylights, but there is no great objection to this.

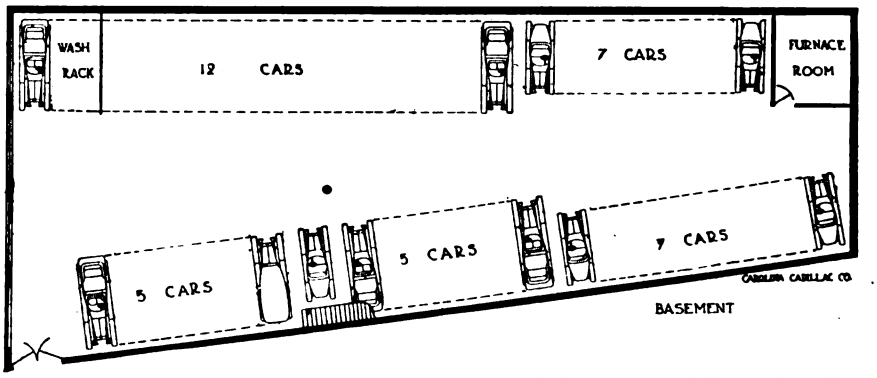
To sum up, we strongly advise you to select a plot 45 ft. or more wide.



Has Lot 41 x 40 x 60



Editor Motor World: We have a lot 41 x 40 x 60 on which we are contemplating building a modern and up-to-date paint and trimming shop, with some space for storage purposes. The lot is situated on two streets as per diagram and the 60 ft. end of the lot is 16 ft. lower than the 40 ft. end.



The building contemplated is to be three stories high. Your suggestions in the past have always been helpful and it is with this in mind that we are asking your assistance in building and locating our equipment. —C. E. Enfield, Carolina Cadillac Co., Winston-Salem, N. C.

Why the Old Implement Man

Can Never "Sell" Tractors

OWOSSO, MICH., May 27—If additional evidence were needed to establish the fact of the superiority of the automobile dealer over the old style retail implement dealer in the final distribution of tractors, it might be found wherever the two types of dealers are essaying the tractor business, side by side.

A typical instance exists here. On nearby locations are The Auto Sales Co., distributer of the Buick and Dodge, and —let's call him Smith—old-time retail implement dealer and distributer of the Oakland.

Both handle tractors. Both began seriously in the tractor business something like two months ago. Both bought an opening stock of six tractors. The Auto Sales Co. machine is a 10-20, while the Smith machine is an 8-16. The one will pull three bottoms habitually, the other will take three bottoms only where the conditions are exceptionally favorable.

When it is said that Dealer Smith carries tractors the term is used advisedly. He does carry them. Of his original six he still has five on hand. Of the six with which The Auto Sales Co. began business there remains but one unsold.

Two Types

The different degrees of success attained by The Auto Sales Co. and Dealer Smith are due primarily to a fundamental difference in sales policy, a policy in each case which is in harmony with the traditions of the business each was engaged in previously, and which emphasizes the one over the other.

Smith, convinced by the inclination of retail implement dealer organizations to discourage canvassing, has waited for tractor trade to come to him. He has been resting in the—to him—comforting assurance that everybody knew he was in the implement business; therefore, naturally, if anyone wanted a tractor he would come to him for it.

The Auto Sales Co., on the contrary, was in a trade which had no such limiting traditions, so a more aggressive policy was adopted. Immediately upon securing a tractor agency a man was started out into the country to canvass actively for prospects. The advantages of power farming methods were explained from an economic point of view; the equipment and the ability of The Auto Sales Co. to give adequate service were emphasized; the particular mechanical features of the tractor the company sells were illustrated, described and explained.

> He may be able to act as an agent, but the great essential is the go-out-and-sell-'em methods of the motor car dealer.

The result was inevitable; hence the fact that The Auto Sales Co. has sold five out of its six tractors and has left a number of live prospects, while Smith has sold but one of his machines. That he cannot enthuse over the future of the tractor demand is not to be wondered at. It merely is typical and significant.

Eleven Fordson tractors also have been delivered in the immediate neighborhood of Owosso through the recent state campaign. The effect upon The Auto Sales Co. and upon Dealer Smith is characteristic also. The former says: "The more the merrier. There's room for all of us. Every Fordson tractor which does good work is a boost for power farming and will excite a desire for a tractor in the minds of farmers who never yet have seriously considered one as a possibility. The more tractors there may be in this neighborhood in successful service the more we shall sell ultimately."

In contrast Dealer Smith takes the view that 11 Fordson tractors about cover the immediate trade possibilities and that he will wait and see what the result will be before he makes any very active efforts to get additional trade.

10-20 Best Seller

Again The Auto Sales Co. more nearly divined the size and type of tractor which meets the preferences of the farmers in that vicinity. This may have been chance or it may have been good judgment, but the 10-20 seems to sell more readily than does the 8-16. A higher light, too, is thrown upon this contrast when it is understood that both tractors are made by the same concern, the ——— Co., the one being the ——— and the other the ———.

G. A. Stanton, of The Auto Sales Co., has charge of the tractor department. "In addition to keeping a man constantly in the country," he says, "whose duty it is to run down every tractor tip we get or hear of, it is our purpose to give service to the extent of seeing that every tractor we sell works continuously and satisfactorily.

"Serious difficulty, should such be met, we shall look to the factory to take care of, of course, and service rendered after that necessary to get the tractor into satisfactory running order will be charged for. Service costs money, and it would be easy to eat up our profits in this way very soon. This we do not intend to allow. But we will give service up to the point where our customer is satisfied. Beyond that he must pay for it.

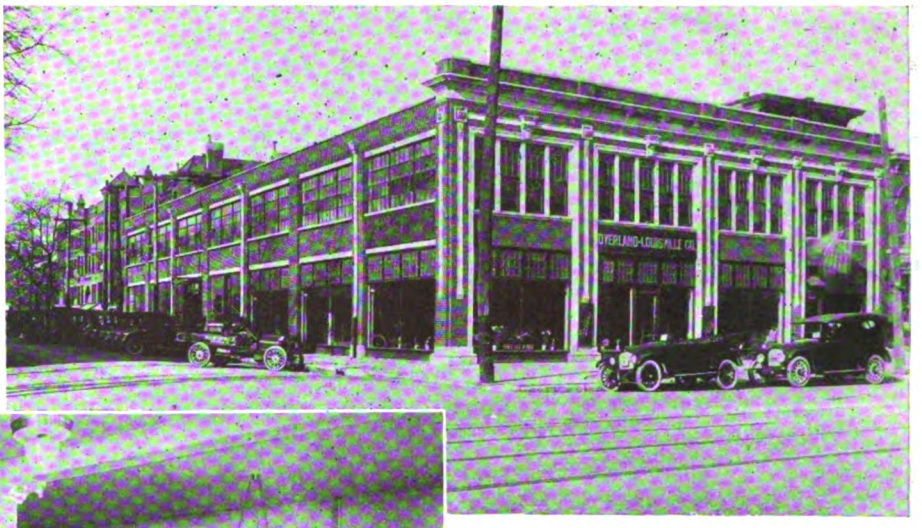
"We are thoroughly equipped to render service, and our experience to date in the tractor business confirms our prior conviction that our training in the automobile business would prove to be an efficient preparation for meeting the demands of the tractor business. We think we have demonstrated this fact, and we are looking ahead to realizing handsomely in the tractor business.

Pushing Ahead

"For the present we shall not carry any tractor implements, although we have sold some from catalogs. What the developments of the future may be in this direction we cannot see now, but it is certain that we are disposed to do everything necessary to make our tractor trade worth while, and if we find that this involves the stocking of power farm equipment, *we shall not hesitate to do so.*"

There is still another retail implement firm in Owosso—the Stowe Implement Co. This concern has been in business for 35 years, during nearly all of that time having represented the Oliver line of goods. Therefore, when the 11 Fordson tractors were delivered recently to the Stowe Implement Co., without any effort on its part, came the distribution of the 11 Oliver No. 7 plows which went with them. Yet the Stowe Implement Co. never has taken any interest in the automobile business, despite the fact that the automobile has cut an annual trade on buggies from about 100 to a paltry half dozen a year, nor has the concern seriously considered the tractor.

"The tractor is not far enough along yet to warrant us in taking it up," says Stowe; "we'll wait a little while and see."



In the meantime The Auto Sales Co. is not waiting but is making tractor profits and at the same time establishing itself as the tractor authority in its section.

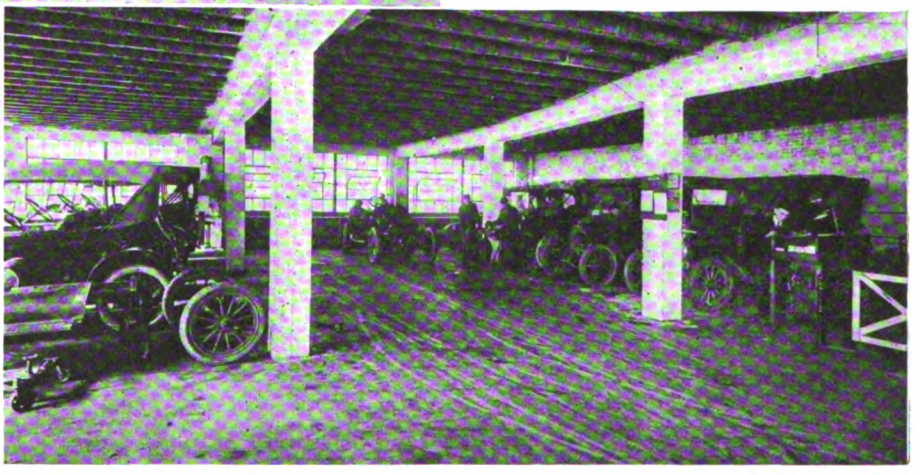
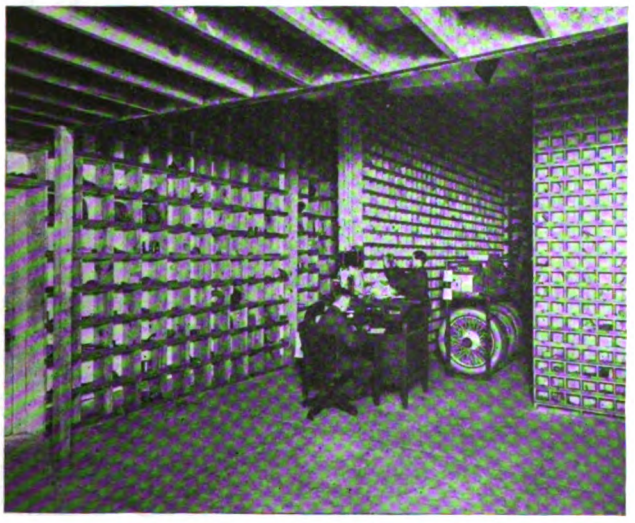
DRESS-UP

Makes the Sales Come Faster



Overland-Louisville Co., Louisville, Ky., Believes in Atmosphere and Neatness

Top—The front of the Overland-Louisville Co.'s building carries an air of stability and business aggression. It looks substantial



Left—The salesroom has a spacious floor which is not crowded with cars, although there are plenty of cars that might be crowded in. Flowers are used to carry the atmosphere

Right—This shop picture was taken without flashlights, because the building is so well lighted. Cleanliness is considered a factor in efficiency

Lower Left—There are 2600 wood bins for stock. Tires are stored on the overhead balcony. Carl Hurst, stockman, is at the desk

Lower Right—The garage is one of the cleanest parts of the building. A big hydraulic elevator is one of the garage assets

Simple Methods of Repairing Cracked Waterjackets

A Temporary Job and a Permanent One

WHEN a waterjacket cracks, the standard method is to have it welded. This makes an absolutely permanent repair, but it has several serious objections:

1—It is relatively expensive.

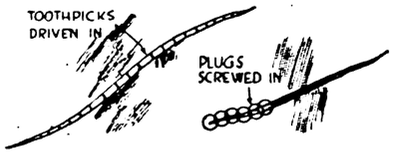
2—There is the cost of removing and replacing the cylinders.

3—It requires time, not so much for the welding itself as for the removal and replacement of the cylinders.

4—There is always a possibility of warping the cylinders so that they will have to be rebored.

Inasmuch as many owners object to the expense and also to the time the car is laid up it is often desirable to use a simpler method which is just about as satisfactory.

In most cases a good radiator compound will do the work, care being taken to select one which will not clog the radiator nor otherwise injure it.



This method has the advantage that the repair can be effected in a very short space of time and if properly done it should be permanent.

Using Healing Compound

If the crack is a small one, say less than 1/32 in. width, the liquid will close it up quite readily. It is desirable to have the cooling water warm before the liquid is poured in.

In order to prevent undue leakage in warming the engine up it is best to run the engine without water until it is warm, then fill the cooling system with boiling water and then pour in the liquid.

Soon the thin sheet of water issuing from the crack will break up into a number of small streams and these will grow smaller and disappear one by one until the fissure is sealed. The engine should, of course, be kept running in order to keep the water warm.

Wooden toothpicks forced into a small crack will stop the leak temporarily. A permanent job can be done by screwing in a series of brass plugs

When the car is taken out on the road it may be found that the vibration of the engine will open the crack slightly, but little leakage will take place and before long it will be tight permanently.

If the crack is wider than 1/32 in. the leakage from it may be so great that it will be found advisable to pack it with lead wool.

Tamp in Lead Foil

This material is nothing more than strips of thin lead foil about ⅛ in. wide and should be obtainable in any large hardware store. The material is tamped into the crack much after the manner of a dentist filling a cavity with gold. Its function is simply to impede the flow of water so that leakage will be cut down. The wool and the compound amalgamate so that the result is a tight joint the same as in the case of the smaller crack.

To prevent leakage at any future time it is desirable to keep some of the compound in the system. If the radiator is drained a small amount of new compound, depending on the maker's instructions, should be added when the fresh water is put in.

Another good method, which, however, cannot always be applied without removing the cylinders, is to start at one end of the crack and drill a ⅛-in. hole, tap it, insert a brass screw and cut it off close to the surface. Then a hole is drilled on the edge of the brass screw, tapped and another screw inserted. Then a third is put in place on the edge of this, and so on until the crack is filled.

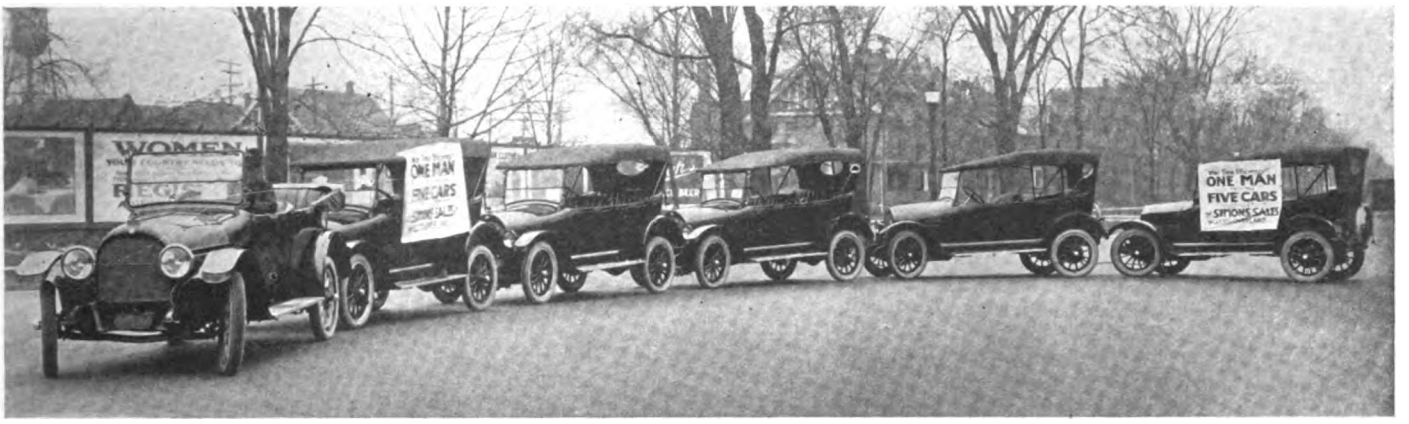
The screws, of course, should be tight fitting and should be coated with white lead before inserting.

A makeshift repair which is cheap and quick, although not applicable to very narrow cracks consists in forcing toothpicks into the opening and breaking them off close.

If the crack is very small and allows only a little seepage it may be closed by adding some sal-ammoniac to the water. This chemical rusts the crack and the rest of the cylinder casting as well.

It is important, as soon as the leak stops, to flush out the system and put in clean water.

Palmer Heads Collier Truck



BELLEVUE, OHIO, May 27—H. A. Palmer, organizer and director of business policies of the Cartercar Co. from 1895 to 1912, has been elected president of the Collier Motor Truck Co. Associated with Palmer is John F. Cool, formerly general manager of the Rapid Motor Vehicle Co., Pontiac, and Edwin S. Lewis, who is directing the sales of securities. The Collier company was formerly located at Sandusky, Ohio, but recently moved to Bellevue, where it will continue the manufacture of ¾-ton trucks. The plant is to be enlarged shortly.

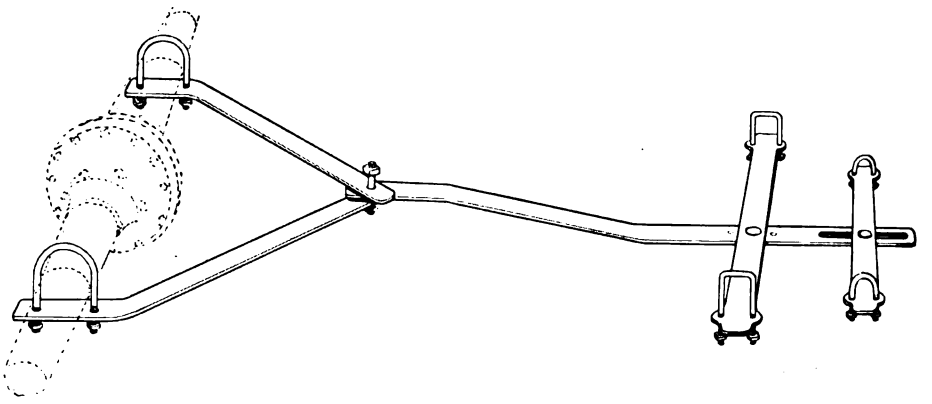
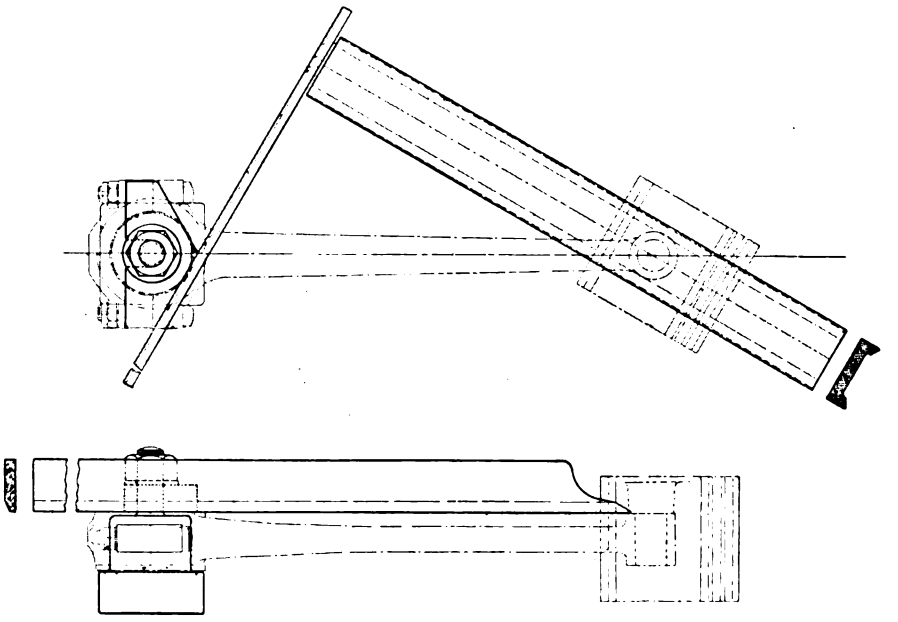
Trailing Bar Facilitates Drive-aways



THE Simons Sales Co., Overland distributer, has tried out a new trailing device furnished by the Willys-Overland Co., which has proved very successful. By means of this trailing bar it is possible to drive six cars, and perhaps more, with one driver. This makes for economy. The trial drive was made from the factory a short time ago and when the cars arrived in Detroit they were taken over the boulevards and through the more congested traffic sections of the city with no difficulty. This was made possible because all the cars tracked perfectly.

It is possible with the assistance of this device to turn a train of six cars around an ordinary city corner with as much ease as the first car alone. An advantage lies in the use of the trailing bar in that the train of cars can be pushed equally as well. If the first car is unable to pull the train out of a hole, the driver can do so from the last one.



Above—One driver trailing five Overland cars by means of a steel draw bar. This train drove over the boulevards of Detroit and through the congested parts of the city without difficulty. Provided a heavy car is used for pulling it is possible to attach more than six cars in this fashion and successfully draw them

Right—The trailing bar. The loops at the left side are attached to the rear axle of the first car. The middle cross bar is fastened with a pivot and the ends are securely screwed to the front axle of the second car. The cross bar at the extreme right hooks securely to the tie-rod; the slot in the draw bar permits it to slide back and forth as necessitated when turning. By means of this bar the cars track perfectly

Piston and Connecting Rod Aligning

PROPER alignment of the piston and connecting rod is essential to correct operation and this may be effected by means of a special device. There are three distinct disalignments possible. The first an offset in the direction of the crankshaft; the second a bend to the right or left in the direction of the crankshaft; and the third, a twist in the connecting rod. A special device used in the test comprises a block attached to the crankshaft bearing and two gages used in checking the alignment. One is attached to the piston by means of rubber bands and the other used to gage the resulting alignment.—Packard Motor Car Co., Detroit.

Repairshop Shortcuts

From Motor World Mechanics

No. 1682—HOOK FOR PISTON RINGS

A hook to hang piston rings on is made of ⅜ in. round steel, about 12 in. long, and with the end bent around to form a hook so that the rings will not slide off.—R. A. M. Machine Shop, Brooklyn.

No. 1683—BATTERY TRUCK

A truck for hauling starting and lighting batteries from cars at the curb to the shop is made of a board 14 in. wide, 24 in. long and 2 in. thick. A batten is screwed across each end of the board on the bottom and large castors are fastened to each corner. A piece of ⅜ in. cotton rope serves to pull the truck.—White Co., New York.

No. 1684—STORAGE BATTERY CLAMP

A tie rod to prevent the clamps that hold the storage battery on the car from splitting the outer case of the batteries. Made of two ⅜ in. steel rods with right and left threads and a piece of hexagon stock drilled and tapped to form a turnbuckle. Can be applied and taken off quickly.—T. D. Schaftchenko, National Carbon Co., Cleveland.

No. 1685—AIR COMPRESSOR

An air compressor is made by welding an old brake drum to the driving pulley of a motorcycle engine, this serving as a belt pulley to drive it from a ¼ hp. electric motor. The exhaust valve is rendered inoperative by cutting a piece off the stem so that it is not raised when the cam raises the valve lifter. A stock check valve is placed in the air pipe line which leads from the spark plug hole to the tank. Engine, motor and tank may be placed on one board.—R. A. M. Machine Shop, Brooklyn.

No. 1686—WHEEL ALIGNMENT GAGE

A wheel alignment gage is made by bending a piece of iron pipe up at the ends at right angles. Flat pieces of metal are attached to the pipe to keep it in an upright position. Pieces of steel rod are held in the ends of the pipe by set screws so that they can be raised or lowered according to the size of wheel. Screws are threaded through the upper ends of these rods, the points to touch the inside of the rim or tire.—C. C. Leong, Hakalau, Hawaii.

No. 1687—BENCH SUPPORT FOR CASINGS

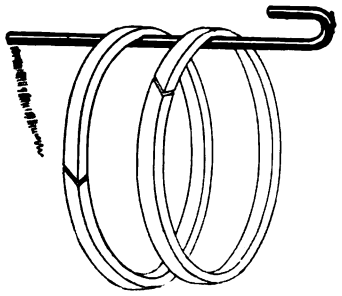
A support to hold a casing in position while cleaning and rebuilding it preparatory to vulcanizing is made by fastening a light chain to the ceiling, the lower end extending to within 18 in. of the bench. A hook in the end enables the chain to be hooked around the casing and can be adjusted so that the casing is upright or lies over at an angle. Two wooden pieces with rounded corners extend from under the bench below the chain to hold the lower part.—A. Jungkind, Brooklyn.

No. 1688—WAGON WHEEL FOR TUBE RACK

A rack for holding tubes to be repaired is made from a wagon wheel by removing the rim and tire, leaving the spokes for tube racks. The wheel is held to a wooden upright by a lag screw and washer. The wheel can be turned, so that the workman does not have to do any walking to get tubes.—A. F. Rollin, Germania Rubber Wks., Brooklyn.

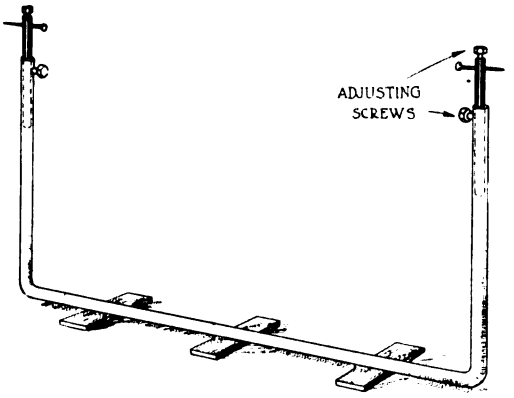
No. 1689—SUPPORT FOR RADIATORS

A soda fountain stool makes a good support for radiators while soldering or repairing them. The stool is placed near the bench, and the radiator is thus brought to about the height of the bench and within easy reach of tools, blowpipe, etc.—Western Radiator, Lamp & Fender Wks., Brooklyn.



No. 1690—METAL CAN TO REPLACE FUNNEL

A metal polish or other screw top can is soldered to a piece of copper tubing, the lower end of which goes into the crankcase of an air compressor. This does away with using a funnel when oiling the base. The screw top keeps out the dust and prevents oil being forced out by the compression in the base.—R. A. M. Machine Shop, Brooklyn.



$1 a Helpful Kink

HOW often have you been compelled to rack your brain to overcome some difficulty? But when you did find a solution—what a satisfaction it was! Well, here's a chance for you to dig some of those life-savers out of their hiding places and put them to work for your fellow-craftsmen. Send them to Motor World. We will pay you a dollar for every one accepted for publication. The only requirements are these: 1—*Describe the short-cut briefly but clearly, in few words.* 2—*Send a sketch, in pencil or pen, no matter how rough; our artists will finish the job.* 3—*Write on ONE side of the paper only.* 4—*Sign your name and initials, the name of the company you are with, and the town. Write plainly. If your name is unusual, print it in capital letters.*

Editorial Observation

Two Thoughts on Labor

Thought No. 1

LABOR is scarce these days and service station and repairshop operators are finding it more and more difficult to get enough skilled men to run the shops at maximum capacity.

Of course, in securing men there is the question of "diluting labor," as has been done in England and elsewhere, but that is another story. The fact is that many dealers are making it hard for themselves and the trade in general by stealing men.

For instance: A man shows up at the shop of Dealer A and says he wants a job. He says he has been working in a factory or out of town or some other place, and the dealer hires the mechanic.

Not until later do both Dealer A and Dealer B discover that what has happened is that Dealer A has hired one of B's men. Dealer B is short a man, so what does he do? He sends an emissary around and hires a man out of A's shop.

What is the result? Very simple. Both A and B have just as many men as they had before, the men are just as good—and no better—but each is paying several cents an hour more for the same work. Each has shot his overhead up from one to five or six dollars a week and nothing has been gained.

One evening the association in an eastern city had a meeting and the members, who were airing their wartime troubles, began to make assertions about this stealing of men. In a few minutes a lot of dark colored cards were on the table. Some admitted having knowingly stolen men. Others said it had been done by service managers without the knowledge of the dealer.

By the time these dealers got through comparing facts and figures they found that each man had just about as many men as he had before, was doing about the same work as before, but that each was carrying a dangerously increased overhead. All were agreed that fair wages must be paid to the men—because the cost of living is high and skilled men should be adequately compensated.

This stealing of men is an exceedingly short-sighted practice. In England the hiring of workmen is regulated by the government. In local circles in the motor trade the only governing necessary should be *common sense and co-operation.*

Thought No. 2

IN recent issues of Motor World have appeared letters from mechanics, or men who have been speaking from the mechanic's side of the question, setting up as a state of unfairness to the men the fact that dealers charge much more per hour for labor than they pay to the mechanics.

One such letter states that before the war mechanics were paid 40 cents and customers were charged 60 cents. It is also stated that now the dealers are charging $1 an hour and are paying mechanics 50 cents.

This is an increase of 25 per cent in the wage of the mechanic and 66 2/3 per cent in the price to the customer. This, one letter states, is not a fair proportion. It almost sounds like an accusation of profiteering on the part of the dealer.

But let us look the situation over. Let us concede that 50 cents isn't a high wage for a good mechanic. It is, however, a big wage for many who endeavor to pass as mechanics. This is not to be considered a reflection on mechanics as a class. This trade has some mighty fine ones, and because the trade has that reputation some mighty poor ones try to get in and enjoy the benefit that comes from association with a good industry.

But as to the discrepancy in the figures: It hardly seems that any other than a man experienced in business figuring could be competent to say what profit is derived from any difference between labor wage and charge.

During past years the trade has been notorious for the fact that its service stations and repairshops did not make money. How to make the repairshop pay has been one of the problems. One of the methods of arriving at a charge for labor has been to add a certain amount to the wage paid the mechanic and let that constitute the labor charge to the customer—which is obviously wrong. Known costs are needed.

In figuring repairshop costs there comes first the wage of the mechanic, and if he works 1 hour for the shop and 8 hours for customers this extra hour for the shop must be charged to the customers in some form. All costs have gone up. The employer must not operate at a loss. If he can only stay in business and pay his workers he is doing well. What is required is a little more *common sense and co-operation.*

Letters from Readers

THIS page is for the use of MOTOR WORLD readers with something to say. Letters on subjects of interest to dealers, garagemen, repairmen and jobbers are always welcome.—EDITOR.

From Australia

Editor Motor World: I am enclosing herewith some photos of our business. You will notice notes on the back of them, which may interest some of your readers.

We are also enclosing two views of our garage, one exterior and one interior.

The town of Mudgee, which is our place of business, has a population of approximately 5000, and is supported by farming, sheep raising, grazing and mining.

We are agent for Buick cars and G. M. C. lorries. We also handle various makes of tires and carry out high-class repairs, including oxy-acetylene welding, casting, machining, etc.

You will notice we also enclose a photograph of portion of our workshop.

Last year we sold in the vicinity of 27 Buicks, but as the price of cars in Australia is very high, it makes a limited amount of sales, as only the well-to-do people can afford to purchase.

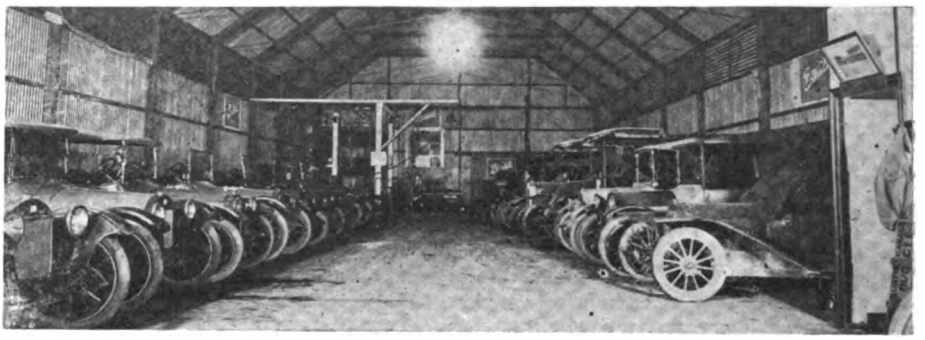
The price of the Buick, 6-cyl. car in Mudgee would cost the purchaser $2,625. Petrol retails here at $10 a gallon, and I am enclosing a retail copy of the Goodyear Rubber Co.'s price list for this country, so you will see, comparing it with your prices for everything connected with our business, we are at a big disadvantage, but the writer is looking forward to a time when we will be able to manufacture our own rubber goods and petrol in sufficient quantities to be able to reduce the running cost here to something like the ruling prices in your country.

You will notice outside our garage the Red Sentry Bowser pump, and we find this a splendid service to motorists, but again the cost is very high. The installing of this system fitted up ready for use cost us $1,000 with the 650 gal. reservoir.—Jack Austin, Austin's "Buick" Garage, Mudgee, New South Wales.

Is He Right?

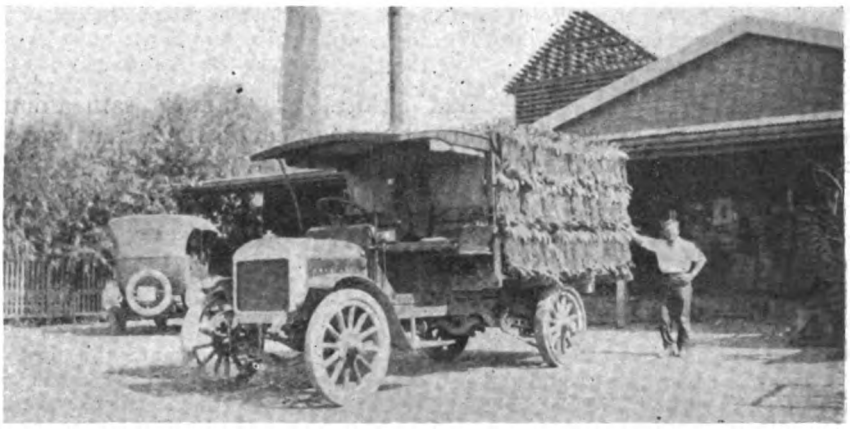
Editor Motor World: I have read the article by Mr. Richards of Toledo regarding the scarcity of mechanics. To my mind he is absolutely right. Repair work is hard, dirty and greasy and one must have brains as well as brawn to be an A-1 mechanic—and, where for all this a garage owner will offer $20 to $25 a week, the scarcity of good mechanics is plain. Furthermore the garageman expects and gets from 90 cents to one dollar an hour for the work done in his shop, pays from 20 cents to 40 cents an hour for his help and then kicks because he can't get help.

He could get and keep all the help he wanted if he paid the right wages, made helpers do helpers' work, let mechanics do mechanical work and charged accordingly. But no, *he charges the same for work done by helpers as for work done by an A-1 mechanic* and many a car owner can testify to the truth of this statement.



After nine years' experience in the repair end of the automobile business, I claim that a man should serve a regular apprenticeship the same as printers, etc. But no! bluff, a kit of tools and a cheap garage owner and he's a mechanic.

The trouble with too many garages is that a bookkeeper is trying to run the repairshop. The pay is too small for the work to be done on expensive cars and there is no incentive for a good mechanic. One must "know" hard, dirty work. Maybe some other "grease monkey," as I call mechanics, will correct me.—A. L. Bennett, foreman, Bryan & Gillette, Charlotte, Mich.



Se'ls Sedans to Farmers

Editor Motor World: Some months or so ago I noticed in the Motor World that you want pictures of farmers who have bought sedans. You stated that some one had remarked that a sedan could not be sold to a farmer, and if any one

They show Austin's Buick Garage in Mudgee, New South Wales, Australia. Look it up and see how far away it is. When it's noon here it's 3 o'clock to-morrow morning in Mudgee. The views show the inside, outside and a G. M. C. "lorry"—which is what the British call a truck—loaded with 1205 pairs of rabbits, in front of the refrigerating plant, whence they will go overseas and maybe you'll purchase some of them at your own home-town butcher shop

Digitized by Google

had sold one you would like to have his picture, also how it was done.

I will state to you that I have sold seven sedans last winter, and six of these were to farmers. The only way to sell a sedan to a farmer is to have Ford sedans. They sell themselves.

I have told you that I had sold six sedans to farmers but I will change this and tell you that the farmers came in and bought six. The way to sell a sedan to a farmer is to have a sedan in your showroom, and let the farmer come in and see it.

I am enclosing you a picture of this farmer, in his sedan. He is Mr. R. P. Sentell. He is a prosperous cotton planter of this county. He raises everything that is required to make his farm self-sustaining, and then makes all the cotton that he can to sell at a high price. Would be pleased to see this published in Motor World. Yours truly, J. M. Whitehead, Vienna, Ga.

Here is the picture that J. M. Whitehead sent us. It shows a contented farmer in a sedan—a sedan that Whitehead sold to him. Motor World would like more pictures like this. Send them along.

What Money Cannot Buy

Editor Motor World: Your letter in regard to our resolution to close up all the shops in town and harvest wheat came yesterday. In behalf of our association and myself, we appreciate your interest in the matter. I am enclosing you a copy of the resolution.

Several weeks ago while in Kansas I was amazed at the prospective wheat crop. At our next local garage dealers' meeting we adopted the idea, and every member loyally supported the motion. At a regular meeting of the shop men a paper was signed: "To lend our services in the saving of wheat as the harvest demands."

This paper was signed by every garage employee in our little city, which totaled about fifty men. Forty per cent of these men are capable of running thrashing rigs, thereby filling a place that common labor could not fill.

Our plan is to leave our business houses open and our shops closed with the exception of two men left in "one" garage to take care of cars belonging to physicians and United States mail routes. We are leaving our supplies, gasoline and oil open for sale, together with storage by men and women who are not able bodied to do harvest work.

Our local papers are advertising our shops to be closed at that time, and the general automobile trade is loyally supporting the movement. We in turn shall harvest our own crop, "not wheat," in the fall if it becomes necessary, but the wheat, even though the fields are several hundred miles from us, must be harvested at the proper time to save the crop. We are at war, wheat will win the fight, and we cannot take chances on losing a bushel.

I might state that other dealers' associations are interested, and I am certain that a great many of them will adopt the idea. If our own Rocky Mountain Auto Trades Association, consisting of 600 garage dealers, should adopt this proposition, even in a modified form, the industry in this section alone could release 5000 men.

No other business could release men so efficient in this work. No other business could close up their shops and have the work when they returned as we can have. The average shop is not a "money maker but a grief taker," and wherever garages can consolidate as an association the business will not be ruined or the labor be lost by six weeks of our time in the harvest fields.

In our section we feel that the dealers will have no loss and feel that the shop employees will be well satisfied for a month's change of work as well as the wages they receive. At least we will have done our part—*a part that money cannot buy*—a service that our country needs, and the first duty that we owe to the boys "over there."—Most sincerely yours, Clayton Garage Dealers' Assn., J. Allen Wikoff, President.

Try This Idea

Editor Motor World: I see in Motor World from time to time helps to the larger dealer, and we have worked out an idea which has helped us greatly the past year.

In former years we have sent out salesmen and worked territory at a great expense. This year we picked out a number of small garages and repair-shops in the adjacent counties, and where we found that the owner was reliable, would sign an agreement with him to represent the cars we handled in his locality, never giving more territory than he could keep closely in touch with.

Our plan was to furnish the car for him to keep on his floor and sell. We finance the transaction and he sells the car and looks after the customer. We would give him 8 per cent for his work.

Formerly we had to pay a salesman 5 per cent on all sales and furnish the car and pay his expenses. When he sold a car in a district fifty miles from home, it was up to us to take care of the owner. We did not have the good-will of the local man and there were times that the extra expense would eat up our profits, but now our local men sell the cars and make the deliveries and we get our proportion of the profit without worry. Of course we have to pick our men, but we have been fortunate the first year we have tried this, and have had absolutely no trouble. In case there were time payments we had our local man handle this with his bank and pay us in full for our car.

Perhaps a number of other dealers are using this plan, but those who have not tried it will find that it is a good idea, especially now that there is such a shortage of salesmen. With best wishes for Motor World, we are, yours truly, W. D. MacMillan, Jr., per B. W. Cameron, Wilmington, N. C.

When the War Will End

Editor Motor World: I have just found out when the war is going to end and am sending the information on to you.—Will S. Strine, 1315 McGee Street, Kansas City.

(The following poem is printed on the back of one of Strine's business cards, which he enclosed with his letter. It is a most accurate statement as to when the war will end.)

Absolute knowledge I have none,
But my aunt's washer-woman's sister's son
Heard a policeman on his beat
Say to a laborer on the street
That he had a letter just last week
Written in the finest of Greek
From a Chinese coolie in Timbuctoo,
Who said that the negroes in Cuba knew
A colored man in a Texas town
Who got it straight from a circus clown
That a man in the Klondike heard the news
From a gang of South American Jews
About somebody in Borneo
Who knew a man who claims to know
Of a swell society female fake
Whose mother-in-law will undertake
To prove that her seventh husband's sister's niece
Has stated in a printed piece
That she had a son who had a friend
Who knows when the war is going to end.

Fruehauf Showing Increases

DETROIT, May 27—The Fruehauf Trailer Co. has enlarged its dealer organization and now has representatives in all states. It reports that business is increasing rapidly. Last February was the biggest month the company has ever had, but it doubled that business in March, when it secured $48,000 worth of business. The company is now manufacturing twelve different styles of trailers for various lines of business.

Accessories

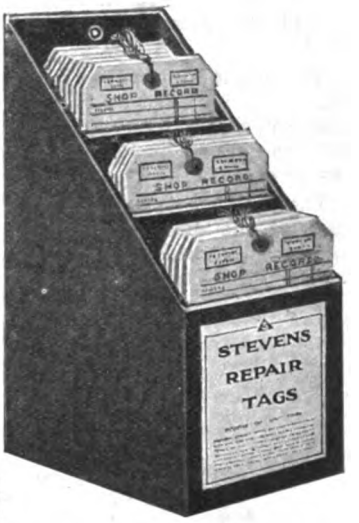
DIXIE ASSEMBLY AND REPAIR STAND

A stand for overhauling and repairing front system, rear axle and engine of Ford car. Has two vises, one on a swivel and the other to tip sideways. Extension telescopes and is long enough to support universal end of propeller shaft and radius rods. Has oil and grease catch pan and pan for holding tools and parts. Weight 175 lb., price $50. With two clamps for engine overhauling, $90; with upright clamp, $75; with flat clamp, $65. — Service Station Equipment Co., 233 West Schiller Street, Chicago.

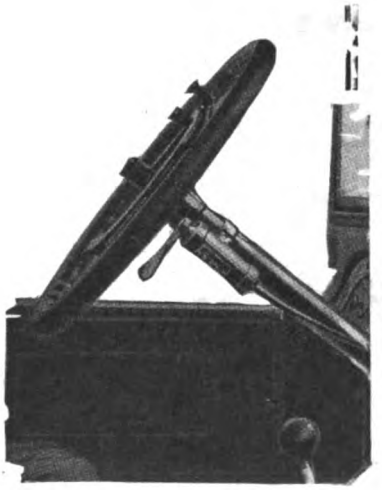
FISH & PERRY HOT-SPOT

It is now possible for every car owner to have a hot-spot on his engine to assist in the proper carburetion of his fuel. The hot-spot made by Fish & Perry, 1906-08 Wabash Avenue, Chicago, is designed to fit between the flanges of the carbureter and intake manifold and provides heat from the exhaust to the incoming gas. It is not a hot-spot manifold, nor does it pre-heat the ingoing air. Its working principle is to make the fuel leave the air at its turning point and land it on a hot surface, where it is thoroughly dried out. The hot-spot is made to fit standard manifold and carbureter flanges and the outlet and inlet for the exhaust gases can be arranged to suit any installation. Installation requires drilling a hole in the exhaust pipe and tapping the latter for a pipe nipple and elbow. From this a flexible pipe carries the burnt gas through the device.

SIMPLEX TUBE VULCANIZER



This is a small clamp type tube vulcanizer using solid fuel for generating heat and vulcanizing ordinary punctures in 5 minutes. Complete outfit, including clamp and 12 patches, $2. Additional patches, $1 a dozen.—Simplex Auto Devices Co., 311 West Fifty-ninth Street, New York.

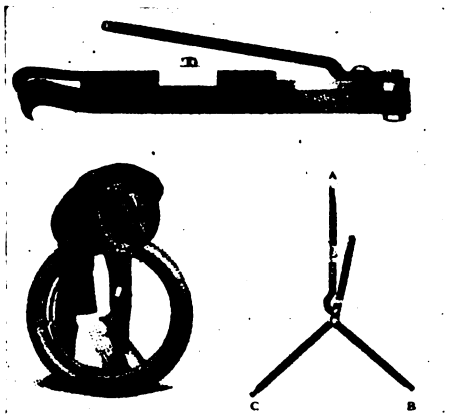


ROSE LATIGO FAN BELT FOR FORDS

Fan belts for Fords with riveted splice and heavy waxed lock stitch, reinforced metal sewed or full latigo metal sewed. Price 50 cents each. — J. H. Haney & Co., Hastings, Neb.

STEVENS TAG FILE

As an aid to repairshop bookkeeping, a Simplified Account File has been designed. It is to be used with Stevens repair tags and has three divisions, one for tags on jobs which have been delivered and paid for, another for tags on work delivered but charged, and a third for a supply of new tags. The tags give complete information concerning repair instructions, material used and time consumed. The file is given free with each order for 1000 repair tags, which sell for $4 per 1000.—Stevens & Co., 375 Broadway, New York.



ECO LIGHT CONTROLLER

This is a miniature rheostat contained in a cylindrical box clamped to the steering column, just below the wheel. A lever governs the amount of current flowing through the headlamps and thus regulates the amount of light given by them. Clamps are made for all sized posts. The controller is made in three sizes, No. 1 for Fords, No. 2 for cars using 2- and 2½-amp. lamps, and No. 3 for cars using larger lamps. The controller weighs 22 oz., is nickel plated, and sells for $7.50. —Western Mfg. Co., Oskaloosa, Iowa.

LAWCO RIM TOOL

The Lawco rim tool is a four-piece steel device which can be used to open any transversely split demountable rim. It is attached at three places to the rim and it is possible to obtain sufficient leverage to break even badly rusted latches. The tool can also be used to expand rims in place inside a shoe. The tool weighs 5½ lb. and can be collapsed into very small space. Price $3.50.—F. H. Lawson Co., Cincinnati.

NEW OAKES FAN DESIGN

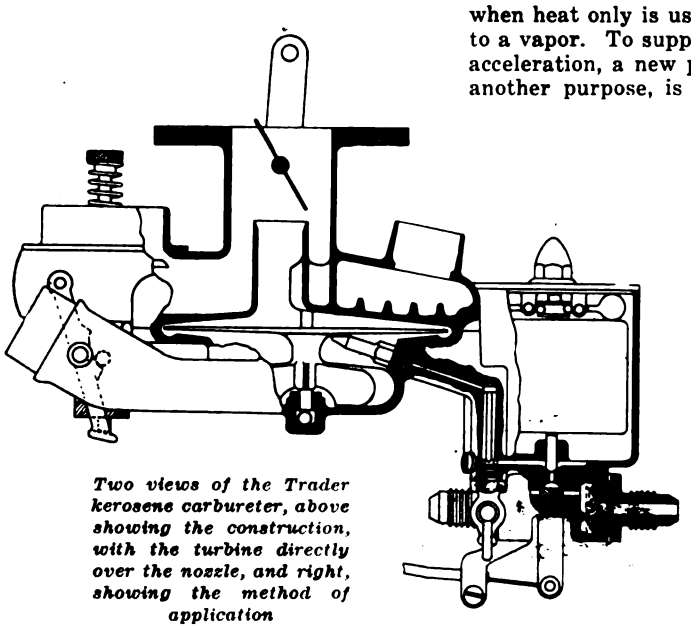
The accompanying illustration shows the latest Oakes radiator fan. This design has been under development for 5 years and pressed steel construction throughout. It has enclosed bearings, which exclude foreign matter and enable the lubricant to be retained for a long period. Modifications in design can be made to accommodate either a flat or V-belt or to suit the fan for either right-hand or left-hand rotation. The fan can also be made of any diameter. The Oakes Co., Indianapolis.

Turbine Principle in Trader Kerosene Carbureter

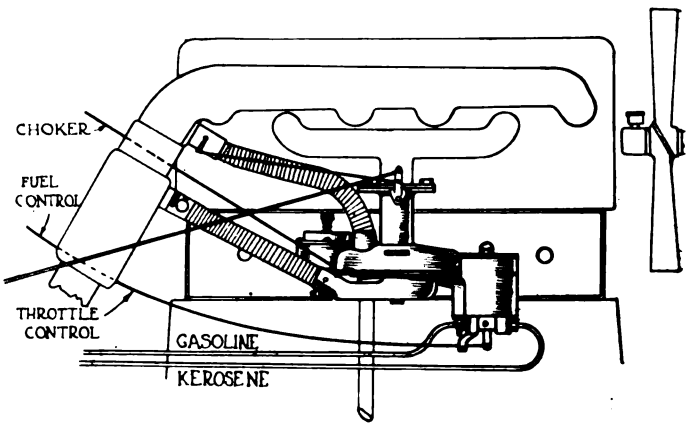
THE Trader turbine carbureter has been designed for vaporizing low grade fuels such as kerosene, and in order to do this successfully, several radical features of construction have been adopted.

The main air supply is taken from a stove on the exhaust pipe into the throat of a small turbine which directs it against the blades of the turbine rotor, revolving it and the attached disc on the same shaft.

This warm air revolving in the turbine housing is in direct contact with the disc and evaporates by centrifugal force the fuel spread thereon from a jet at the center of the disc.



The fuel passes around the circumference of the disc, over the circular exhaust-heated wall of the disc casing at such a high velocity as not to heat the vapor, but should any drops of fuel try to pass around the edge of the disc, the sudden change of direction would impinge them against this hot wall, where they would readily vaporize and pass along with the vapor from the disc, entering the throttle passageway through a throat directed so that the air from the auxiliary air valve at high speeds will surround the gas in its passage through the manifold.



At normal engine speeds the Trader carbureter is claimed to vaporize the fuel completely, it being drawn from the jet and spread over 56 sq. ft. of revolving surface, from which it is evaporated by the revolving air. The addition of cold air from the auxiliary air valve reduces the mixture to the proper temperature.

This method of low-grade fuel vaporization does not require such a high degree of heat, hence there is not the volumetric loss of efficiency which prevails when heat only is used to reduce the fuel to a vapor. To supply a rich mixture for acceleration, a new principle, performing another purpose, is used. Upon sudden opening of the throttle, a higher vacuum is produced in the disc chamber, giving additional fuel for acceleration until the turbine speed equals that of the air flow. Likewise at sudden closing of the throttle, the flywheel action of the turbine rotor and disc creates a pressure in the disc chamber diminishing the fuel flow from the nozzle. Bearing lubrication is from the fuel itself, or by an oil reservoir to one bearing and through the drilled shaft to the other bearing.

The float chamber construction is something new, using a single float for alternate operation of the two grades of fuel, with the float always floating in the lighter grade of fuel, and permitting the reversal of fuel supply to the engine almost instantly with the change of the three-way valve.

Other models of the Trader carbureter will shortly be placed on the market which will burn still heavier fuels, and having an automatic fuel change from the lighter to the heavier fuel when starting. The carbureter is made by R. V. Trader & Co., McKeesport, Pa.

Two views of the Trader kerosene carbureter, above showing the construction, with the turbine directly over the nozzle, and right, showing the method of application

Show Parts to Farmer Truck Buyer

He Wants to Know About Your Service, Says McDaniel

WHEN the farmer buys a truck the first thing he wants to know about is service and the parts stock.

The first thing the dealer should think about is teaching the farmer what he can and can't do with the truck.

These, says J. A. McDaniel, representative of the Wichita truck in Dallas, Tex., are the big thoughts in selling trucks to farmers to-day, which field, he states, is a comer.

"When a farmer considers buying a truck the first question he asks is, 'What kind of service do I get?'" said McDaniel. "Let me see your parts. It is not a question of what the truck is worth in dollars to the farmer when he buys it, but what it will be worth to him after he has bought it. The average farmer who has never used a truck doesn't even know what the word service means. On the other hand, that is the first thing a man who has used a truck thinks of asking and that not only applies to the farmer, but to the business houses that are using trucks.

Must Educate Farmer

"There are many ways a farmer may use a truck on his farm and that is just what we must do, educate the farmers in the use of these trucks. Up to this time the farmer has thought the only use he has for a truck is to carry his produce to market. That is not true. He can use the truck to haul his hay from the meadow to the barn. He can use it to haul his grain from the thresher to his bins or granaries. He can haul his wood from the woods to the house, but in most cases he must have hard ground over which to run his machine or it will not be of the advantage to him it should be.

"The farmer cannot do everything with a truck and he ought to be shown that from the very start. It's all bunk to try to teach him or to try to tell him he can. He must be taught just what he can do and what he cannot do. When a dealer tries to teach the farmer to do things which cannot be done then the dealer is hurting his own business. The average farmer in the Southwest particularly doesn't expect anything very much from his truck because he doesn't know anything about them.

"Unless a farmer buys his trucks where he can readily get his parts he is soon discouraged in the use of trucks. This hurts our business, too, because if a farmer has a breakdown and has to wait two or three weeks to get his parts from the factory his truck is idle and he is discouraged in its use. He also discourages others from buying. Few farmers in this section of the country, however, have bought trucks unless they can get the service and the parts. That is the all important question now in selling trucks to farmers."

J. A. McDANIEL

Representative of the Wichita truck in Dallas, Tex.

Would License Gasoline Sellers

PROVIDENCE, R. I., May 27—The licensing of all garages, dealers and other persons holding and disposing of gasoline is proposed in an ordinance pending before the City Council. The fire commissioners appeared before the ordinance committee to-day and urged its adoption. It is claimed that this ordinance would greatly reduce the fire hazard and bring the city a revenue of $1,500 this year and much more next year. The licenses are to be issued by the fire commission, and it is proposed to have the battalion chiefs see that the ordinance is enforced. The license fee proposed follows: Five to 250 gal., $1; 250 to 500 gal., $2; 500 to 1000 gal., $3; 1000 to 5000 gal., $5; 5000 to 10,000 gal., $10; 10,000 to 25,000 gal., $25; 25,000 gal. or more, $50; portable tanks, $5; tank wagons, $10.

Open Des Moines Ford Plant June 1

DES MOINES, May 27—The new million dollar plant of the Ford company in Des Moines will be put in operation June 1. Taking over of the Ford plant at Omaha for Government supply purposes will cause the local plant to be rushed to its final completion, and P. F. Minnock, general manager, will move from the temporary plant not later than June 1. At the start the plant will employ 400 to 500 men and turn out 200 cars a day, but it is expected that within three months 1000 men will be employed and the output increased to 400 cars a day. Manufacture of Ford cars for the States of Iowa, Nebraska, part of Kansas and part of South Dakota will be handled at the Des Moines plant.

Shortage of Washers in Hartford

HARTFORD, May 27—One of the largest car selling agencies in this city has given up washing cars and in future will do very little of this, for the reason that good washers are scare and such as can be secured have to be paid high wages. Furthermore, it has been definitely determined that a profit cannot be realized on this sort of work. Washers in Hartford are now paid $21 a week or better and are hard to get at that.

Test Class A, AA and B Trucks

WASHINGTON, May 27—Rigorous tests have been made by army officers for the past week of the class A, AA and B standardized war trucks and of the other trucks of the various army divisions, including the Quartermaster, Signal and Ordnance Corps. These tests are the result of intercession on the part of those favoring the standardized truck program with Secretary of War Newton D. Baker.

Shows Truck in Small Town Public Square

RUSSEL P. TABER, Hartford, Reo and Republic truck distributer, does not think it worth while or sound business to wait for prospects to walk into the salesroom and buy trucks. At this season of the year farmers especially have very little time to spend in looking over motor trucks. The weather is fine and they are making the most of it in setting out their plants and all that sort of thing.

"But," reasoned Taber, "if the farmers cannot come to me what is to prevent me from going to the farmers? Nothing, of course," and so Taber has gone to the farmers.

One afternoon he had a 8000-lb. Reo truck on display in the vicinity of the town hall in Collinsville, a thriving manufacturing and farming village some distance northwest of Hartford. And the fact that the truck was to be there was duly advertised in the daily papers, five columns wide and 12 in. deep. The advertisements were printed on the same page with the Collinsville news. In addition to the newspaper publicity Taber sent out invitations to the farmers informing them of the presence of the car and men to tell all about it. This sort of thing will be done every Saturday afternoon for the next few weeks, and the important farming communities in Hartford County will be thus favored.

Is It Unpatriotic

To Spend Money for Advertising At This Time?

What do YOU think about it? The story that follows is a paper prepared for the recent World's Salesmanship Congress in Detroit by W. O. Rutherford, sales manager of the B. F. Goodrich Co., Akron, whose company has to do with the spending of thousands of advertising dollars annually. He says failure to advertise is disastrous, even though the product be all sold. Read why. It applies to the business of every dealer, jobber, garageman and manufacturer.

THE United States Government has not established any statute declaring it illegal to solicit advertising. Therefore to the question, "Is It Illegal and Unpatriotic to Solicit Advertising and Stimulate Sales at This Time?" I answer "No."

Yet in time of war the unexpected is always happening. Everything is volcanic. Thus it is within the bounds of probability that some legislator might misconceive the function or the cost of advertising and propose a law similar to that indicated by my subject.

If such an enactment as this were made it would imperil the general business interests of the country, consequently it is proper that we should to-day weigh the several considerations involved in the case. I shall consider it my present mission to demonstrate that advertising and advertising effort—that sales and sales effort, are just as much a part of our economic fabric as it is to grow wheat or potatoes, or to manufacture articles of daily use.

Benefit by Experience

This nation has been spared some of the terribly costly moves experienced by our allies in the early stages of the war. Again and again we must recite these lessons so that we may know them by heart. What happened in England is peculiarly instructive. August, 1914, was characterized by the worst trade panic England ever saw.

Advertising in the London dailies dropped to less than half the July figures. The public stopped buying and began to hoard money. People wore their shoes to shreds. It was expected that there would be unemployment on the widest scale and a huge "Prince of Wales" fund was collected to feed the poor. This fund was never needed.

What did England do? *She called together her advertising men and made plain that the industries had to be kept alive. This gospel brought advertising back to its pre-war level.*

"That which keeps our business going to-day," said Selfridge, London's biggest merchant, "is the fourteen and a half million pounds a week of our national payroll. It comes out of the bank on Friday, goes over the retailer's counter on Saturday and back into the banks on Monday.

Spending an Essential

"If advertisers wouldn't advertise, people wouldn't spend, and this would mean that this great sum would be impeded, business would slacken and national prosperity would suffer."

This was England's answer to the problem and though I do not apprehend that our government will take any step adverse to our national merchandising interests still it is well to define clearly some of the fundamental principles involved in the transaction of daily mercantile affairs, commonly called business.

A clear declaration of principles is a wonderful force for harmonizing men's minds and welding everyone into the universal thought. Our Chief Executive has made free and general use of this policy. Through his state papers he has swayed the nations of earth. *I presume one of the greatest documents ever written is President Wilson's recently issued international message setting forth "Fourteen Considerations in the Program for World Peace."*

It is in behalf of those fourteen considerations that the Allied Armies are now fighting the Central Powers. It is in such declarations that we find truth in the statement, "The pen is mightier than the sword."

Nine Reasons Why

In a more humble fashion we may well search out the fundamental considerations involved in our business life and after making a thorough study of the economics of the situation I submit the following nine declarations as being fundamental to our business life:

1—Since only one cent out of every trade dollar is spent in advertising, our entire national advertising budget *cannot, even of itself, be considered an extravagance.*

2—Advertising speeds up production and reduces the selling expense, thereby making the cost to the user less than would otherwise be the case.

3—*The quickest way to help Germany win the war is to close up shop; fail to provide labor, and restrict the circulation of money.*

4—We have recently learned the value of the expression, "In time of peace prepare for war." We have yet to learn that advertising during the war prepares for the commercial war after the military activities are over.

5—America's industrial greatness is due largely to advertising, and *failure to advertise, even for a temporary period, will drag our institutions downward.*

6—Advertising gives us national unity and oneness of purpose. It institutionalizes America. *Without it we lost the value of the world's greatest trade-mark —"U. S. A."*

7—Unless we support the press by our advertising, newspapers and magazines will suspend publication and *our national life will soon flow as stagnantly as it does in the veins of a Mongolian peasant.*

8—The man who under fire abandons his trade-mark or allows his business to shift for itself *is a business slacker who is helping the enemy to win.*

9—Just as we need the farmer to grow grain, the engineer to make airplanes, the chemist to make ammunition, so we need the advertising man and the salesman to *keep the wheels of our industries turning faster than those of any other nation.*

Digitized by Google

You will observe that it is my contention that a vigorous industrial condition is necessary to win the war. This seems self-evident, but occasionally I see signs which tend to make me believe that the entire body politic is not in harmony on this point; but it is fortunate for us that our national leaders are keen, far-sighted men, and I was strongly impressed recently with a statement made by our Secretary of Commerce, William C. Redfield. He said:

"The problem at hand is to win this war. It is not to be won by assuming that we shall win it or by anything less than putting our whole force into it.

"What does it mean to put our whole force into it? The phrase cuts deep. For example, if we spend for our selfish pleasure that which we could otherwise put into Liberty Bonds, we are not putting our whole force into it. If we have land which we fail to cultivate, if we have work to do which we are not doing, we are not putting our whole force into the war."

He goes on to say: "We are free American citizens now but if business fails to do its part the Kaiser will win the war and we shall be subject to the will of Germany. The right of Americans to think for themselves, to speak for themselves, and to act for themselves, is at stake. Then let each of us find out what he is not doing and get at the doing of it."

Do More, Not Less

You see Secretary Redfield does not tell us what we must not do but he tells us to do more things and to put our whole force into it. This is good gospel in my judgment.

Sometimes we assume that the war has changed the fundamental principles of economics. It has not. For instance, you were long since taught that the equation which governs business is

Supply = Demand

War has not changed that principle. The only thing that war has done is:

First—To increase the demand.

Second—To change the channels of consumption.

Our problem, then, is how to increase our goods in the face of a heavy shortage of labor due to army conscription. It also involves a readjustment to the degree that we shall produce MORE of certain lines of goods coming under the head of war necessities and LESS of the things which minister to our love of ease and luxury.

Regulation Automatic

The underlying elements are not so complicated after all, but, gentlemen, *we cannot achieve one step upward in the curve of our national economic well-being by pulling down anything.* That which is not essential will slough off as naturally as a snake's skin in the spring. We need no legislation against it.

Thus if advertising needs to be diminished or speeded up, it is self-governing, and I sincerely hope that no bars or restrictions will be placed in the way of the free sway of honest advertising and that no impediment will be placed in front of our newspapers and magazines.

Few of us realize the tremendous power of the press. It molds public opinion, guides the impulses of the masses. Exalts or debases the minds of the people. It sways the destiny of nations. Did you ever stop to consider how long Germany could hold out if the German Government did not exercise rigid supervision and censorship over the press?

In this country, as in France and England, the press has been an invaluable aid not alone in stimulating enthusiasm, strengthening courage and disseminating information, but in assisting to float our war bonds as well.

Liberty bonds require advertising. Every other movement or article connected with our national development also requires advertising.

It is just as important that our people at home be educated in the determination to win the war as it is that our soldiers and sailors be trained to fight properly in the trenches of France or on the high seas. It is our sublime purpose to defeat the enemy by force of arms, but how much more glorious will the victory be if the advent of peace find America united, vigorous, virile—and with a determined smile facing the reconstruction problems.

Gentlemen, through the generations we have been freemen; let us stand on our feet and be freemen still. We are in harmony with the principle that the way to win is to strike with all our force. We must not choke business.

We must not muzzle the press even on its advertising pages.

A few weeks ago there appeared in a certain magazine a story bearing the title, "The Thunder of Silence." The theme was the suppression of a notorious pacifist, always conspicuous in the news columns, by applying a "silence treatment." No newspaper mentioned his name again; *he passed into oblivion—forgotten.*

"Thunder of Silence" and America's Mills

This demonstrates in a forceful way that the trade-mark which is not brought before the public eye in constant repetition, that the product or firm name that is not persistently advertised—*one and all pass quickly into dry-as-dust oblivion.*

We cannot afford to apply "The Thunder of Silence" to the products of America's mills and factories, but let us rather take the skill and talent of every man and woman and apply it where the most good will result, so that the words of Thomas Jefferson, "We are a united people, brave to front any attack" may still ring true and clear in our ears.

Why I Bought That Car

I went down to Milwaukee one Saturday night last fall, just before the roads broke up, to look over a number of new cars to which my choice had simmered down. I reached the salesroom at 461-465 Broadway early Sunday morning. A salesman was assigned to me and gave me a fine demonstration. I told the manager that the car looked good to me and I would come down again next Saturday to drive it home, the distance being about 350 miles.

The salesman evidently saw me slipping through his fingers and he said: "Take the car now and drive it home." I answered that it would be impossible, as I was not dressed for such a trip and, what was more, it would take a couple of days to transfer the funds to cover payment for the car—something like $1,385. The salesman urged, "Date your check ahead a couple of days and take the car."

I had never seen the young man before and said, "Aren't you taking chances with a perfect stranger to offer that?" Quick as a flash, he said, "I am not afraid to trust a man who wears the button you do," referring to my Shriner's lapel emblem. My answer was flatfooted. "I am not trying to do business on that button." He said, "And I wouldn't on mine, if I was lucky enough to be privileged to wear one. Yet the fact that you belong to that order fully warrants me to make the offer."

I drove the car home the same day, feeling as one who has just left church and heard a good sermon that has touched the better side of the inner man. It made me feel that the other fellow's glass showed the same reflection as my own.—Simon Clough, lumberman, Marshfield, Wis.

Daily Sales Conference

There is one thing that stands out more than anything else in the writer's mind as far as our organization is concerned for the benefit of sales promotion, and that is that we have a conference every Monday morning of all the salesmen, superintendent, stock clerk, and in fact the heads of all departments. This conference is held at seven o'clock in the morning during the heated term, and eight o'clock during the winter months. There is no business important enough for any man to miss this conference.

Everything is gone over personally with each man with the others present, and if there is any ill feeling or friction among the salesmen it comes out there.

Sales lost to competitors are gone over carefully, and if we are successful in obtaining business in an odd way from a competitor that is credited to the man.

There are two large blackboards in the conference room, showing the sales made last year by each man, by weeks, and one showing the corresponding sales for the present year. It is very interesting to note what keen competition there is among the salesmen to better their records, and it is also astonishing to note the amount of interest they have in outdoing their last year's record.—Edward J. Otis, Utica Motor Car Co., Utica, N. Y.

"The Liberty engine is as good as, if not better than, any engine that has ever been created . . . . It is being produced in quantities—"*

CHARLES F. KETTERING
President, Society Automotive Engineers

OUR country has produced several articles that I believe have become classic. I believe that none of us doubts the success, the fundamental success, of the recent Government standard designs of automotive apparatus. Any of you who have been around the plants where the articles are being built must be impressed, regardless of bias, with the fact that the product is fundamentally correct.

We have produced the so-called Liberty engine. I found to my surprise the other day that many people did not know that one of these had ever been completed. The lack of appreciation by many people of what real manufacturing is, of what is necessary to produce things so essential as these Government standard designs, has caused a waste of much printer's ink and paper. National issues have developed out of the length of a bolt and the depth of a radiator to an extent that I did not believe possible.

Some Cooling Problems

In ordinary manufacture if a radiator did not cool an engine under certain conditions, we would make it a little bigger. Coming to the question of what cooling really is, to-day we have fairly nice weather in New York; yet in 15 min. from the time you leave the ground here you could reach conditions of a temperature of zero or below.

The question is, do you want the radiator so large that you can cool the engine perfectly at wide-open throttle going up the first 10,000 ft., or do you want the radiator so proportioned that it will cool the engine properly or keep it warmed properly up in the business district? Nobody cares anything about this port of entry down here. Up there is where you are doing your work. There are a few problems regarding the matter of cooling that are more a matter of opinion than of mechanism. We know enough about the subject of radiation to provide the particular type of cooling needed without making it a national issue.

They say we are having all kinds of difficulty with the engine; that we are having trouble with the oiling. I have seen a good many engines of all sorts, and I believe that we have not had more trouble with the Liberty engine than is usual in engine manufacture. As a matter of fact in every new model of engine produced there is always a certain amount of difficulty in the design of the lubricating system.

I am going to give you a very simple account of an incident in Dayton the other day. Two gentlemen from Chicago came there to see me regarding some business matters. Each of them had two sons in the Aviation Corps. They looked worried, and I said to them:

Letting In the Light

"What is wrong with you fellows?"

One said: "If you had two sons in the Aviation Corps you certainly would be worried. We have no engines, airplanes or anything else. This confounded Liberty motor is a failure, a great joke perpetrated on the American public. I am going to Washington."

I said: "There is a train at 3 and another at 8; just skip the 3 and take the 8 o'clock train."

We went to an airplane factory in Dayton and came to one lone Liberty engine. He said:

"My God! Have they got one done? Have you had this in a plane?"

I said: "No, never had this in a plane."

He said: "Why don't you put it in a plane?"

He walked about and finally into an aisle and saw about 75 Liberty engines in a row.

He asked: "What are they?"

I said: "Liberty engines."

"Where did you get them?"

I said: "The name-plates on them tell where they are from, some from the Packard company, some from the Lincoln Motor Co."

He asked: "How long have you been getting them?"

"Right along."

"How many have you had?"

"Two hundred and fifty or three hundred."

He said: "I was told in Chicago the other day they never made one of them."

I said: "We can't control what you are told in Chicago; we can only take the engines as they ship them in."

He went about and saw one of the airplanes and that we had actually built a machine.

He said: "You can't get the engines off the ground."

I said: "Partially true; you can't get them off the ground unless you run them."

He asked: "How fast do they go?"

I said: "That is a question. Would you like to ride behind one of these engines. I can't show you by conversation anything about it."

He said: "I have never been up."

I said: "You had better take your initiation right now. Here is a stop-watch. Just as you leave the ground press that and when you pass 10,000 ft. press it again, and when you come back tell us."

We sent him up and he came back. Talk about a transformation. He was not the same fellow that went up at all. He had forgotten everything about being scared and being 10,000 ft. in the air.

He said: "My God, we got up 10,000 ft. in a little over 7 min."

We said: "If you would like to take another ride, we want to show you how fast we can go."

He said: "No, I don't care to go again, but my friend will go on this trip."

The friend went up and we ran him over a measured course and showed him we were getting better than 135 miles an hour.

Those men went back to Chicago contented with their experience. They said: "Wait till we get back there; we want to see some of those fellows who have been telling us that we have no engines or airplanes? They had some facts they had gotten first-hand.

A Simple Fact

There are a few very important facts and here is a very simple one that perhaps you have not thought of. The Liberty engine cannot read; it has no ears; therefore it does not know anything about the criticism that is going on about it. Otherwise I do not know whether some of them would get off the ground. I think they would be too discouraged to try. But knowing nothing of the situation, they are doing admirably, and the engine to-day, as near as I have been able to analyze it, knowing something of aviation engines, is as good as if not better than has ever been created.

It is being produced in quantities. They shipped the thousandth engine several days ago, only two companies having been in production. One of these has been in production for about 60 days.

**Paper read before the Metropolitan Section of the Society of Automotive Engineers.*

Digitized by Google

The Ford Motor Co. has tested its first engine and put it through the official 50-hour test. The same thing is true of the Cadillac Motor Car Co. and of the Buick Motor Co. The Marmon company is, I believe, putting its engine through the test now.

It has not been a year since the first one of these engines was put together experimentally. It is a new product, a new order of things, which people are not familiar with. It is perhaps because we do not analyze these conditions that so much criticism and gloom have spread over the country. There is only one thing that will answer the criticisms, and that is the engine itself. But I think it will be very gratifying for you to know some of the simple facts. We can show you things in Dayton that would gladden your hearts and brighten your eyes. And Dayton is only one place of activity in this matter.

When I was coming down from Chicago the other night two fellows were talking in the smoking compartment. One said:

"I understand this plane they are making in Dayton can't get off the ground; a friend of mine was down there the first day they tried it."

I said: "That is right, I was there."

He asked: "Have they ever been able to get it off the ground?"

I said: "Yes, getting an airplane off the ground is like the case of the fellow who bought the barrel of apples from an Irishman and said, 'No, sir, I don't intend to buy any more apples from you, because the other barrel you sold me had a few good apples on the top and the rest were worthless.' The Irishman said, 'My friend, it is not my fault; you opened the barrel at the wrong end.'"

The momentous occasion which was mentioned, and of which an account was published, happened in this way: A manufacturer desired to try out some propellers. He sent four experimental ones. His letter read something like this:

"I am sending you four experimental propellers. I don't believe the number one propeller will fly the machine, but it is very important that, if you get into the air, you record the revolutions per minute at which the engine is turning. I think the number four propeller will be perfectly satisfactory, but in order to get the data I need I am sending all four."

Now the men who unloaded the propeller boxes did not know anything about the letter; they unloaded them out on the field where they were going to make the test, and the boys opened the one nearest the machine, which happened to contain the number one propeller. This propeller was tried on a plane, marked no good and put back into its box. It had not run at a sufficient number of revolutions to make a flight worth while. The next propeller which happened to be lying there was number four, and a very nice flight was made with it.

This was the basis of all the comment. It was purely a matter of chance which box was opened first; like in the case of the barrel of apples. In any other industry you could have tried fifty propellers and nobody would have taken any notice of it, but here was a national issue.

There is one thing we ought to get into our heads that I think we have not appreciated entirely, and that is the fact that if not a single mistake had been made in any one of the Government proceedings we would have been delayed from three to four months in obtaining the amount of tools needed because of the congestion in transportation, in addition to the extraordinary demand.

Some months ago I asked a leading automotive manufacturer connected with the aircraft production whether he expected to be able to get the tools he had to have.

He said: "In the last 10 years I have put over $25,000,000 into machine tools, and there is not a manufacturer who is not going to give me what I want." He ordered his gear cutters and lathes and milling machines and what-not.

When I saw him a few weeks later he said, "Look at this sheet. Those are my delivery dates. Now don't you think I can get the stuff? I am an old hand at this game." That was all right until the Priority Board said, "These tools are needed more elsewhere." He got only a small percentage of the tools he expected within the specified dates. He endeavored to get thread gages and other articles, and the same thing happened. I saw him a few weeks ago and he had not received all his tools yet. There is universal delay in such things and it is always interpreted against the particular thing that the particular critic wishes to criticise.

The airplane products are coming along fast. There has been some delay on account of our inability to decide finally on machine gun equipment and types of bombing devices. While waiting until final decisions were received from the other side (the difficulty has not been all on this side; there has been a change of mind on the other side not infrequently), many a thing which was started has been stopped and then started again.

We have had confusion on account of changes in specifications made here. There have been put into the great Governmental and industrial organizations thousands of people who have been unfamiliar with manufacturing methods. We have had that to contend with.

That sort of thing is wearing away. It is becoming more appreciated that people who have spent all their lives in the shop really know something about it, and that those who have been able to make things before are able to produce for the Government.

We have cleared away a great lot of this preface to our book. It has had a lot of fly-leaves in it; but I believe we are right up to the reading matter now.

Last week we shipped from the factory with which I am connected forty-two of the fighting machines with 75 per cent spares. When you ship four machines you really ship seven; so that if you ship forty machines, that is really equal to seventy machines. That production is coming right along.

We have done in our method of manufacture what all of our American aircraft people have done; it is possible to build aircraft to-day by the interchangeable method just as it is possible to make anything else, and that is being done.

Automotives at Dairy Show

NEW YORK, May 25.—The National Milk and Dairy Farm Exposition, held the week of May 20-25 at Grand Central Palace, included in its exhibits five tractors, one tractor attachment, one truck and two farm lighting and power plants. The E-B tractor was shown by Edward Ehrbar, Inc., distributer for New York State, the Sandsky by C. B. Cook of Newark, N. J., the Monarch and Staude Mak-A-Tractor by the Farmers' Bureau, Inc., the Cleveland tractor by the J. S. Woodhouse Co., and the Happy Farmer tractor jointly by the M. Maloney Co., Syracuse, and the Hartz Machinery Co., Philadelphia. An autocar truck was in charge of the New York Autocar branch and the Delco-Light and Lalley Light farm lighting and power plants were shown in operation lighting lights and driving various dairy machinery. These automotive exhibits attracted considerable attention and showed the extent to which the manufacturers are interested in all forms of farm work.

Handbook for Truck Salesmen

Charles E. Stone, an engineer of Detroit, Mich., is issuing a motor truck hand-book for salesmen, which sells for 25 cents. It is a small pamphlet-size booklet that can be carried in the pocket, and contains a geat deal of statistical information that is of service to salesmen, including such things as metric conversion tables, angles of incline, gradients in percentages and degrees, road resistance, capability of horses, weights of ale and beer, and other commodities that trucks often carry, such as building materials, coal, coke, cotton and other products.

Charges Against Pump Makers

WASHINGTON, May 24 — Eleven companies manufacturing and selling pumps and tanks for storing and handling gasoline and oil are charged with unfair trade competition by the Federal Trade Commission. Seven of the companies are also charged with discrimination in price in violation of the Clayton Act.

The concerns named are: Wayne Oil Tank & Pump Co., Ft. Wayne, Ind.; Gilbert & Barker Mfg. Co., Springfield, Mass.; Atlantic Refining Co. of Philadelphia; Standard Oil Co., Ohio; Standard Oil Co. of Indiana; Standard Oil Co. of New York; Standard Oil Co. of Louisiana; American Tank & Pump Co., Cincinnati; Milwaukee Tank Co., Milwaukee; Tokheim Mfg. Co., Cedar Rapids; The Guarantee Liquid Measure Co., Pittsburgh, Pa.

It Takes the "Wild West" to Sell War Stamps

Oklahoma City Thought the Old Days Had Come Back When the Automobile Men Held a W. S. S. Day

OKLAHOMA CITY, May 27—To the motor car dealers of Oklahoma City belongs the credit for having sold more War Savings Stamps in one day than any of the many other clubs and organizations of this city.

Dick Carhart, county chairman for the War Savings Stamp Committee, struck upon the idea of a friendly contest between the various clubs of the city. On the first day the bank was turned over to the Knights of Pythias, who sold $2,203 worth of stamps. On the next day the Advertising Club sold $2,466 worth; on the third day the Shriners sold $2,591 worth; on the next day the Lions Club sold $5,243 worth; on the next day the Rotary Club sold $7,613 worth. The motor car dealers on the next day sold $22,455 worth and, on the last day of the week's contest, the Kiwanis Club sold $11,000 worth.

This contest was staged during the week ending May 11. If there is an automobile in Oklahoma City that does not bear a "Stamp out the Hun" sticker it probably is because the car did not leave the garage Friday, May 10.

The car dealers worked under the direction of the Oklahoma City Motor Car Dealers Association and before the day ended the town knew Carhart and the rest of his Indians had been on the job. They tagged every car, and a thrift stamp and sometimes a flock of them went with each sticker.

Hundreds of people who possibly never heard of thrift stamps until that day now have a nucleus for a collection as a result of the unique methods used by the car dealers.

Ropes were stretched across Broadway and Main Streets, traffic cops were pushed aside and a "Strong Arm" squad refused to allow cars to pass that did not bear a sticker in token of a thrift stamp sold.

The workers began with a supply of 5000 stickers. When these gave out 2000 more were printed and when evening came the supply was again exhausted. At least one thrift stamp went with every sticker.

Fifty Boy Scouts, fifty girls from the business college and fifty dealers composing a "Strong Arm" squad broke all records for the War Savings Stamps and resulted in more sales than any daily drive by the other organizations.

They began work at seven o'clock in the morning and did not stop until eleven o'clock that night. It was estimated that the girls sold $4,000 in stamps. Most of the girls carried service flags, one having a flag containing three stars.

Novel methods were used in stopping motorists who tried to plow through them without buying stamps. Three or four men would jump on the running board of the car and if the driver would not stop one of them would pull out the key or turn off the gas. When other methods failed, a small board was placed under the rear wheel which pulled the wheel from the ground and stopped further progress. Frequent complaints were made to the police by those who were stopped, but officers said they were helpless and told the complainers to buy stamps and be cheerful about it.

Exhibition of "The man who was killed

These are some of the wild and woolly automobile men in front of the W. S. S. Bank looking for customers. What chance would a man have against such a bunch of husky salesmen as these?

because he would not buy a thrift stamp" netted nearly $1,000 in stamp sales. R. H. Walker, Glen Price and W. L. Freeman devised this scheme. Dale Allen, one of Walker's mechanics "played dead," took his place in a coffin, and was hauled through the streets. He was viewed by hundreds who bought a thrift stamp for a look at him.

The day's work was topped off with an auction at the War Savings Bank that night of articles confiscated during the day. Cigars, candy, pies and dogs were sold. Several articles taken from obdurate automobile owners who refused to buy stamps were placed in the War Savings Bank until they were redeemed by the owners buying stamps. These articles included ten gallons of buttermilk, two girls' hats, a window sash weight, two dozen bottles of mustard and a pet dog.

All during the day the motorists in trucks which were decorated with flags and banners paraded up and down the main streets.

Expand Airplane Mail

WASHINGTON, May 27—The Postoffice Department has planned extensions of the airplane mail service. Mail-carrying airplanes will operate between New York and Boston next fall. A third route will later be established between Chicago and St. Louis. The planes have already been purchased for the New York-Boston route. Weather conditions in New England are being studied. Schedules will be operated between New York and Boston in conjunction with the Washington-New York route and will effect a saving of 4 hours in mail delivery as compared with railroads.

Owing to the unfavorable weather conditions, which have delayed airplane mail service, the machines will be equipped with instruments for calculating wind, velocity, driftage, etc. Landing fields will be sprinkled over the entire routes so that fliers can sail along close to the ground if necessary.

Postoffice officials are confident that the aerial service will be self-sustaining. Under the present arrangement the War Department furnishes the fliers and machines and pays the cost of upkeep. The Postoffice suplies the landing fields and gasoline. To date an average of 600 letters have been carried northbound between Washington and New York, bringing in $150 a day. The southbound receipts are slightly less.

Rickenbacker Made Life Member of A. A. A.

ATLANTIC CITY, May 24—Eddie Rickenbacker, the racing driver, was honored to-day at the annual meeting of the A. A. A. when he was elected a life member because of the excellent patriotic and war spirit he has shown by first going to France and serving as a driver for General Pershing and then taking the aviation course, which has brought him so successfully up to the present with two, or perhaps three, German planes to his credit. Not only was a cable sent to Rickenbacker to-day advising him of the honor, but the signatures of all delegates attending the convention were sent to him.

Urge Better Highways For Motor Truck Use

American Automobile Association Adopts Resolutions Suggesting Road Improvement

ATLANTIC CITY, May 24—The attitude of the American Automobile Association with regard to improving highways for increasing motor truck transportation was clarified at the annual meeting of the association here to-day, when a definite program for highway building and maintenance during the war was adopted. It embraced wider highways so as to accommodate the increasing motor truck transportation in addition to passenger car transportation. It called for heavier bridges, heavier road foundations and sign-boarding of commercial roads for truck traffic.

The resolutions with regard to roads which were adopted are as follows:

1. Because highways are an essential part of our transportation system the War Industries Board should be urged to place road building material and road building machinery on the priorities list.

2. That the several committees of the War Industries Board having jurisdiction over the issue of new securities and approval of bond issues for improving main highways approve without delay all of such matters.

3. That as properly constructed and maintained highways are vital to our national needs that the following road building is deemed best.

a—Roads and bridges should be so built and maintained that they will withstand the constantly increasing heavy motor truck traffic.

b—Roads and bridges should be built wider than they have been in the past so that they can accommodate both the slow-moving freight traffic and the faster-moving passenger traffic.

c—Moneys received under the Federal Aid Road Act, as well as moneys received from state and rural sources, should be first applied to connecting the larger centers of population by main truck highways.

d—These main trunk highways should be continued to state boundary lines so as to link up with adjoining states for interstate traffic.

e—The policy of snow removal should be encouraged.

f—The greater share of the nation's transportation being placed upon the highways calls for greater federal, states and county appropriations.

4. Intercity highways for commercial traffic should be well sign boarded.

5. The patrol system of road maintenance be universally adopted.

6. Because of the shortage of motor mechanics the motoring public drive its own cars as much as possible. The motor clubs should take up the work of training motor mechanics.

7. All motorists should give soldiers and sailors a lift wherever possible.

Milwaukee After Rumor Mongers

MILWAUKEE, May 27—The circulation of an unfounded and baseless report in Milwaukee that the Government has ordered twenty "motorless Sundays," beginning June 2, to effect a conservation of fuel, has led the Milwaukee Automobile Dealers' Association to take under consideration the proposition of offering a reward of $1000 for information that will lead to the arrest and conviction of distributers of propaganda regarding the shortage of gasoline and the possible prohibition of the use of motor cars because of such shortage. The report was that on the twenty Sundays no passenger car could be used excepting strictly on business, such as those of physicians.

Submit Lens for Test

ALBANY, N. Y., May 27—A dozen or more manufacturers of headlight devices have submitted their product to Secretary of State Hugo as the first step in compliance with the new headlight law of New York State. Several manufacturers have submitted blue prints or drawings of their devices for testing, which Secretary Hugo has returned with a statement that a sample of the device must be sent for examination by experts of the National Bureau of Standards. Following a report of the tests a list of manufacturers complying with the law will be made public.

Nantucket Lets Down the Bars

BOSTON, May 25—After 12 years of agitation, court cases and verbal clashes motor cars are allowed to travel on Nantucket Island, the sole place in New England where they were excluded. A vote was taken on the measure the other day with the result that those favoring the cars won, the figures being 336 for and 296 against.

Allies Get Gas for 21 Cents

WASHINGTON, May 25—The price of gasoline to the Allies was fixed yesterday by the Fuel Administration as follows: Fo.b. Gulf ports, 21 cents per gallon; f.o.b. Atlantic seaboard, 23½ cents per gallon. United States Navy specification apply in both instances.

FLAG DAY

June 14 will be Flag Day all over the United States.

No Motorless Sundays, Says Federal Officer

And Reward of $1000 Is Offered for Man Who Spreads "Fuel Shortage" Propaganda

ST. LOUIS, May 26—Assistant Secretary Holke of the N. A. D. A. has been busy the past week answering questions of dealers and automobile clubs as to the "seven motorless Sundays" beginning June 1. He has replied to all inquiries that there is no official backing for such a plan. The association received the following information from Washington:

"Restrictions on the consumption of gasoline by the general public are not yet considered necessary by the Fuel Administration. H. L. Requa, oil administrator, says the situation is being studied with a view of future action but until the Government requirements of gas for aviation and military transport expand materially, no regulations will be enforced to obstruct ordinary use. The Administration does not believe that the situation will be changed within the next few months."

The Milwaukee Automobile Dealers' Association has notified the N. A. D. A. that it has offered $1,000 reward for the arrest and conviction of persons who are disseminating the information as to the restrictions on the use of gasoline.

N. A. D. A. Indorses Theft Law

ST. LOUIS, May 28—The directors of the N. A. D. A. in the meeting here a week ago indorsed the anti-theft law drafted by J. T. Botkin, secretary of State of Kansas, acting as a committee for the American Association of Secretaries of State. The National pledged its support in endeavors to get this bill passed by the various states.

This law requires that whenever a motor vehicle is sold the sale shall not be legal until the seller transfers a certificate of title and license, issued by a secretary of state. Also it makes the requirements for licensing all cars the same in all states except as to fee.

The N. A. D. A. Directors also indorsed several proposed bills to protect cars in driveaways.

N. A. D. A. Adds to Membership

ST. LOUIS, May 26—Recent reports to the N. A. D. A. headquarters here bring into the National the following local dealer associations with full membership: Toledo, Seattle, Cincinnati, Indianapolis, Memphis, St. Paul and Sioux Falls.

Detroit S. A. E. Nominating Committee Elected

DETROIT, May 25—At a meeting of the Detroit Section of the Society of Automotive Engineers held last night, J. Edward Schipper, Technical Editor of Class Journal Co., was elected chairman; A. C. Hamilton, Chief Engineer of the Oakland Motor Car Co., vice-chairman; Chas. Van Sicklen of the Van Sicklen Speedometer Co., secretary; Don T. Hastings, Chief Engineer of the Holly Carburetor Co., treasurer, and R. E. Wells, Engineer Hyatt Roller Bearing Co., member of the national nominating committee to nominate officers for the national association at the coming summer meeting in Dayton. The membership of the Detroit Section is now 1200 and although a number of the members have been absent from the city due to connections with the government at Washington and other points, the meetings have been well attended. At the meeting held last night, Lee Anderson, vice-president of the Hupp Motor Car Corp., delivered an address on the problems of the sales and engineering departments during the war, and afterwards.

Dodge District Managers Meet

DETROIT, May 25—The annual convention of the district managers of Dodge Brothers was held in Detroit this week. Good reports issued from these managers indicating a good business in every section of the country.

Sixteen Entries For Sheepshead

NEW YORK, May 27—The card for the Decoration Day meet at Sheepshead Bay Speedway has not yet been definitely settled though it is certain that there will be two events and perhaps more. The principal feature will be the 100-mile Harkness Trophy Handicap for which 16 entries already have been made. The other event will be a 10-mile handicap which is to be run in two heats and a final. Entries formally close at noon, May 28. Both races are for nonstock cars of 300 cu. in. piston displacement or less. The entries to date are:

Driver	Car	Handicap
Louis Chevrolet	Frontenac	Scratch
Ralph De Palma	Packard	1:01
Dario Resta	Resta Special	2:02
Ralph Mulford	Frontenac	2:05
Barney Oldfield	Golden Submarine	2:10
Ed. Hearne	Duesenberg	2:12
Tom Milton	Duesenberg	2:15
Ira Vail	Hudson	2:21
Omar Toft	Miller special	2:35
———	Delage	2:50
———	Delage	3:00
Denny Hickey	Hotchkiss	3:10
I. P. Fetterman	Peerless	4:00
Percy Ford	———	5:00
Rudolph Wehr	Wehr special	6:00
Wm. Votere	Duesenberg	6:00

The car which Resta will drive is a combination of the Peugeot chassis which he has previously driven fitted with an engine which he is understood to have built himself. For the 10-mile handicap De Palma and Resta will be on scratch.

Accessory Show Hit by Chicago Dealers

Declare That Any Member Taking Part in It May Be Expelled from the Association

CHICAGO, May 24—The Automotive and Accessories Exhibition, which is planned for the Municipal Pier in September, is not to have clear sailing, as seemed would be its lot a few weeks ago. While it has received the endorsement of the Chicago Association of Commerce, the Chicago Automobile Trade Association appears to have come out strongly against it. In a letter sent out to its membership the latter organization makes the statement that unsanctioned motor vehicle and accessory shows are being promoted in Chicago and that any member who takes part directly or indirectly in such an exhibition will be liable to expulsion. At the headquarters of the association, it is stated that it was the Automotive and Accessories Exhibition which called forth the letter.

Open Top Cars For Road Material

WASHINGTON, May 27—The Railroad War Board has ruled that open-top freight cars may be used for the transportation of sand, gravel and other road material, thus acting in line with the policy adopted by the United States Chamber of Commerce at its annual meeting in April.

The ruling, which has been prepared by the Car Service Section of the Railroad Board, provides that available open-top cars not suitable for the transportation of coal, coke or ore, may be furnished for the transportation of stone, sand and gravel and when so furnished shall be used preferentially for the transportation of highway maintenance material. It is further ruled that cars used for coal, coke and ore may be used for the transportation of road materials on their return trips to the mines, and that every endeavor should be made to furnish shippers of stone, sand and gravel with a minimum of 40 per cent of the minimum weekly transportation requirements.

Peerless Studies Drive-Aways

CLEVELAND, May 27—A combination of circumstances permits an economical handling of trucks and passenger cars for the Peerless Motor Car Co. even to far distant points.

This consists in the delivery of truck chassis and passenger cars in one trip. This has been accomplished during the severest weather at a good average express shipment time and at practically freight cost. Passenger cars are crated and secured to the truck chassis.

In delivering passenger cars overland where trucks are not included in the order, the finish is preserved by a protective coating of oil which, when removed at the point of destination, leaves the finish as good as when the car left the factory.

Farm Implements Don't Include Light Trucks

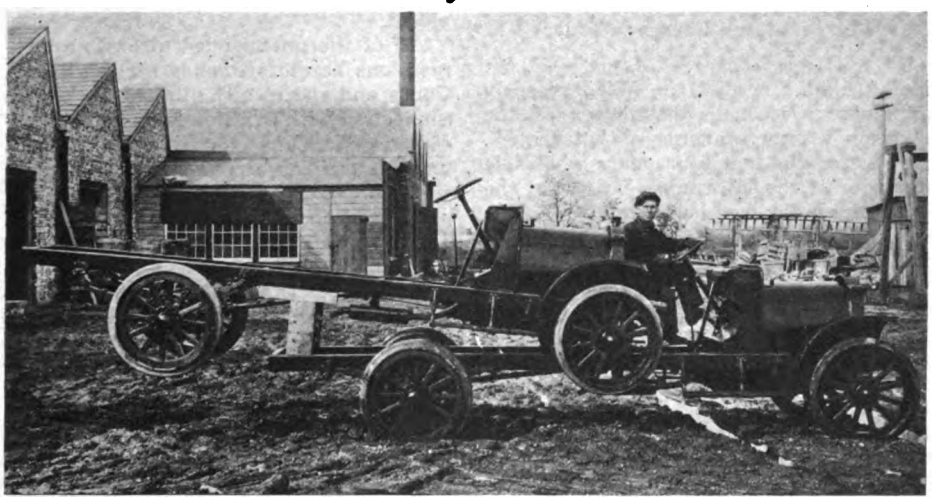
Food Conservation License Plan Not Intended to Apply to Any Such Vehicles

NEW YORK, May 25—President Wilson's proclamation requiring that manufacturers, dealers and jobbers of farm implements and equipment obtain licenses will not apply to manufacturers, dealers and jobbers of motor trucks. The National Automobile Chamber of Commerce has issued a statement to the effect that Washington officials state that the word "trucks" in the proclamation is intended to relate only to small trucks used on farms, "and will not affect motor truck manufacturers for the present, although later, in the case of companies which sell a major portion of their trucks to farmers, a ruling might be made requiring such companies to take licenses."

It was the intent of the proclamation to eliminate profiteering in the handling of food supplies and to prevent injurious speculation and manipulation in the manufacture, sale and distribution of farm equipment used in the production of food. The proclamation specifically includes tractors, trailers and trucks.

Does Not Include Retailers

Retailers of farm equipment, including trucks, trailers and tractors, will not be required to obtain licenses under the recent presidential proclamation. Retailers are defined as "a person, copartnership, firm, corporation or association not doing wholesale business, and with gross sales not exceeding $100,000 per annum."



However, under provisions of the proclamation steps will be taken to prevent profiteering by retailers. They will not be allowed to make unjust charges, unreasonable rates or contract for more equipment than is demanded by the reasonable requirements of the business. Further explanations of this licensing order will be made public by the Food Administration in the near future.

Inch Size Tires for Export

NEW YORK, May 27—Commencing July 1, 1918, manufacturers of passenger automobiles will use inch sizes in equipping cars for export instead of the usual metric sizes. Following the promulgation of a list of standard sizes by the Commercial Economy Board of the Council of National Defense and its formal approval by the tire makers and the car producers, the tire makers met with the Export Committee of the National Automobile Chamber of Commerce last week and agreed to substitute the inch sizes for metric sizes.

The tire manufacturers have agreed to carry in stock in all countries sufficient stocks of tires to fill requirements. Car makers are to supply the tire people with estimates of the number of cars likely to be exported to the various countries during the year beginning July 1. The tire makers in turn will prepare lists of foreign branches and dealers where stocks of standard size tires will be maintained.

It Takes One Fulton to Carry Another

TRANSPORTATION difficulties have brought into existence many ingenious devices for transporting cars and trucks these days. An interesting method is employed by the Fulton Motor Truck Co., Farmingdale, L. I., in which one chassis is mounted on the other, blocked in such a way that the carried chassis will not move about or fall off. The front end of the carried chassis is laid on a board which is made fast to the frame of the lower chassis, while two braces with cross pieces supporting them are placed on the rear of the lower chassis from which point they support the central part of the frame of the carried chassis. It is stated that the trucks have ridden very satisfactorily, arranged in this manner and deliveries have been made to points 400 miles distant and less without damage. Greater distances are to be covered in the immediate future.

Los Angeles Dealers Make Greer President

Stoner Heads Motor Truck Division —Much Good Work Done by Association

LOS ANGELES, May 27—In recognition of the activity he has shown for many years in the welfare of the organization Perry H. Greer was chosen president of the Los Angeles Motor Car Dealers' Association at a recent meeting. Ralph C. Hamlin was continued as treasurer. For the first time the motor truck branch of the trade was recognized by the election of J. A. Stoner to the office of vice-president. L. V. Starr was named secretary, and in addition to these four the board of directors will be composed of Donald Smith, H. W. Tuttle and Spencer Kennelly, the last named representing the authorized Ford dealers of the city.

There are 72 dealer-members and practically every one belongs to the National Automobile Dealers' Association, Greer, the new president, being a vice-president of that body. Recognizing legislation is important and always has two sides, the local association has retained Dave Smith, an attorney, as legal adviser and assistant secretary upon a salary.

Harold L. Arnold, retiring president, made a report, in which he called attention to the accomplishments of the dealers during the last year. He called attention to the growth of the association in two years from a membership of 16 to 74 and from a condition of finances which necessitated the levying of a $25 assessment to pay the more pressing debts in 1915 to workable assets of $4,000 cash in bank and an investment of $10,000 in Liberty bonds of the third loan. Its stable financial condition has resulted from the association conducting and managing the two last motor vehicle shows held, committee members donating their time and energies, making unnecessary the employment of a professional promoter.

At the last session of the California legislature the association succeeded in blocking the enactment of an extremely drastic garage lien law and in its place had substituted a bill that goes a long way toward protecting the dealer who sells a car under lease contract by making it a felony for the purchaser to attempt to dispose of a car bought in this way before it is fully paid for.

St. Louis Produces 70 Fords a Day

ST. LOUIS, May 26—The Ford assembly plant here has been turning out 70 cars a day for some time, according to W. C. Anderson, manager. Each of these cars leaves the plant under its own power, as rail shipments are not considered. The home trip in this territory is as far as 300 miles.

Motor Truck Exchange Plan for Philadelphia

Cut Out Dead Mileage and Increase Efficiency—Propose Highway System

PHILADELPHIA, May 27—To increase the efficiency of operators engaged in long distance motor truck transportation, the Board of Trade, through its committee on inland transportation, is seeking to form a motor truck exchange in this city. It is planned to consolidate and stabilize the operation of motor trucks through organization, which would guarantee the responsibility of all members in such a body. Long distance trucking concerns are springing into being in Philadelphia almost weekly. Motor truck men have expressed the view that thoroughly competent operators are a necessity, especially now that the United States government is making a survey with a view of establishing a federal department of highways, that, under a chief like Mr. McAdoo, would have jurisdiction over the building and control of roads.

Tentative plans of a proposed system of motor truck highways in southeastern Pennsylvania have been submitted to Joseph W. Hunter, acting State highway commissioner. The project was indorsed recently by the city comprehensive plans committee and financial aid from the State will be required to put it into effect. The highways are planned so as to connect industrial centers within a radius of 60 miles of Philadelphia, obviating the necessity of having much of this traffic pass through the city.

Horning Resigns from Automotive Products Section

WASHINGTON, D. C., May 27—H. L. Horning, director of the Automotive Products Section of the War Industries Board, Council of National Defense, has resigned. His resignation has been accepted for the War Industries Board by George M. Peek, Director of Finished Products. Mr. Horning is secretary of the Waukesha Motor Co., Waukesha, Wis., which has increased its business from $375,000 in 1914 to $7,500,000 in 1918, and this has caused imperative need for his services at home. He has been urged for some time to resign and give his entire time to his personal business affairs.

Mr. Horning came to Washington in May, 1917, as a member of the Production Automobile Committee of the Council. He has been actively interested in the design and production of standardized war trucks against which serious opposition developed through objection to this program on the part of certain interests.

In July, 1917, he was made chairman of the Automotive Committee, and has held that position ever since. His duties have been the final supervision of purchases by the Allies and the United States Government of all automotive products, including passenger cars, motorcycles, motorcycle side-cars, motor ambulances, trucks, truck bodies, truck trailers, armored cars, military tractors, military tanks, airplane engines, gas engines, stationary gas engines and automotive accessories.

It is reported that Mr. Horning is working on a new discovery to aid in winning the war, and that much of his time will be given to that work in the Waukesha laboratories.

Ohio Has 2000 Tractors

COLUMBUS, OHIO, May 27—Ohio's tractor drive to increase food production is succeeding beyond expectation. There are now at least 2000 tractors in use in the state. The original goal was 1500. According to L. H. Lightcap, chairman of the farm production committee of tractor manufacturers organized to boost the movement, at the suggestion of Governor Cox and the state defense council, tractor sales have increased 30 per cent in Ohio this year.

Manufacturers have co-operated by arranging special terms to Ohio farmers, by setting aside definite parts of their output for this state and by securing the widest possible distribution, endeavoring to place their sales throughout the state in every possible county in which the use of a tractor is practicable.

The second lap of the tractor drive is now on. It is an attempt by companies to train farm owners to get maximum efficiency out of their machines in every district where tractors have been sold.

The state has rendered great assistance in making it possible for farmers to buy the machines. By direction of the governor, State Bank Superintendent Berg has asked all state banks to aid farmers in financing tractor purchases.

Big Plant for Fordson Dealer

FON DU LAC, WIS., May 27—T. W. Meiklejohn, Fon du Lac, Wis., recently appointed Wisconsin distributer of the Fordson tractor, announces that Ira W. Mabie, for the last four years wholesale manager of the Milwaukee branch of the Ford Motor Co., has been appointed manager of the distribution headquarters of the new tractor at Fon du Lac. A large warehouse will be erected at once at Main Street and the Chicago & North-Western tracks, on a site, 500 x 800 ft., provided by the railroad. Meiklejohn has resigned as president and manager of the Service Motor Co., Fon du Lac, district Ford distributer, to devote his entire time to the Fordson tractor work in Wisconsin. He is succeeded by W. A. Meiklejohn. The Service company will act as official service station on the Fordson tractor in central Wisconsin.

Frank Hopewell

Frank Hopewell, head of the firm of L. C. Chase & Co., Boston, died April 25, 1918, after a short illness at Pasadena, Cal., where he was spending a few weeks with his wife and daughter.

President Reorganizes All Aircraft Activities

Signal Corps Completely Divorced and Various Heads Are Given Real Power

WASHINGTON, May 23—As soon as President Wilson signed the Overman Bill on May 20, it was possible for him to proceed with the reorganization of the aircraft activities, and this has been carried out in accordance with plans announced some weeks ago.

The main thought in the reorganization is that those in charge are given power as compared with Howard E. Coffin, former chairman, who had an advisory position only. Under the reorganization, the Signal Corps has been robbed of every vestige of power relating to aviation and aircraft matters. Major-General Geo. O. Squier, who as Chief Signal Officer of the army was the head of aviation activities, has now nothing whatever to do with the work.

In the reorganization there are two divisions of aircraft activity: The Bureau of Aircraft Production, which is headed by John D. Ryan, the copper operator, and who is the successor to Howard E. Coffin. The other department is the Bureau of Military Aeronautics, which has to do with the complete training of men for the service and is under Brig.-Gen. William L. Kenly. His duties include the operation and also the maintenance of military aircraft.

Ryan, as head of the Bureau of Production, has complete jurisdiction over the production of airplanes, airplane engines, and all equipment necessary. By this division of the field, Chairman Ryan has charge of manufacturing and Gen. Kenly takes charge after they are completed.

All of the unexpended aircraft appropriations heretofore made for the Signal Corps and specifically allotted for use in connection with aviation have been transferred. The funds for the operation and maintenance of airplanes go under the jurisdiction of Gen. Kenly and those for production come under the control of John D. Ryan.

It is quite likely that in addition to these two aircraft divisions, the one controlling production, the other controlling operation and maintenance, there will in the near future be established the third joint division comprising the best engineers in both sections for the purpose of securing the most competent designing and engineering advices.

The completion of the one thousandth Liberty aviation engine on May 17 comes as good evidence of what had previously been accomplished under the poorly organized Aircraft Production Board and this production figure adds much credit to those who have had the work in charge.

At this writing, Packard and the Lincoln Motors are in production. Cadillac and Buick are practically getting into production. Marmon has been com-

Digitized by Google

pleting the final test of this engine before starting in production. The exact status of the Ford factory is not known, but it is reported that Henry Ford has organized a force of 1200 toolmakers in order to hasten production.

Not only is the former Aircraft Production Board deserving of credit for the actual production of Liberty engines, but the work of the Board is well evidenced by plane production. The Dayton-Wright Airplane Co. had shipped a few days ago 104 complete De Haviland battleplanes fitted with Liberty engines. These planes carry a pilot and gunner. They are fitted with two machine guns. For these 104 planes shipped, there are spares for seventy-one additional so that the shipment of 104 battleplanes is equivalent to 175.

This factory is by far the farthest advanced in plane production, but its production has been held up for months because of delays on the equipment for the planes which had to come through the Signal Corps and over which the factory had no control. It has been held up for months waiting for machine-gun mountings. Last week it was held up because the Signal Corps had failed to order certain types of radiators that were supposed to have been ordered. These planes are now being shipped without air-speed indicators or bombing attachments. There has been very much delay in connection with the development of the many equipments which go with the planes.

This factory last week produced forty-five of these De Haviland battleplanes which with the necessary spares equalled an output of 75 complete planes. The week previous, production was thirty-two planes, to which must be added spares; and the week previous to that twenty-seven, which with spares would make fifty-four. The production to-day is approximately twelve planes per day which with spares is equal to twenty planes.

Changes in Price

NEW YORK, May 27—The following changes in price have been made during the past week:

	New Price	Old Price
Mercer, Series 4, 4-and 6-pass.	$3850	$3500
Mitchell, D-40, 2-pass*	1350	1250
5-pass.	1350	1250
Coupe	1900	1850
Sedan	2000	1950
C-42, 3-pass.	1565	1490
5-pass.	1625	1560
7-pass.	1625	1525
Coupe	2210	2135
Sedan	2375	2275
Roamer, C-6-54, 4-pass.	2375	2250

*Effective June 1.

Signs for Curtis Compressor Owners

ST. LOUIS, May 27—The Curtis Pneumatic Machinery Co. is furnishing a 10 x 14-in. steel baked color sign with every Curtis air compressor. A similar sign will also be sent to all owners of the compressor.

Philadelphia Supply Men Add 12 Members

Automobile Accessories Business Association Growing—Plan Annual Outing

PHILADELPHIA, May 24—Twelve new members were admitted to the Automobile Accessories Business Association at its monthly meeting and it was decided to hold the yearly outing on June 15, at Kugler's on the Delaware River, jointly with the Motor Truck Association and the Camden Automobile Trade Association. Sixty members attended the meeting.

Samples of the new association stamp, or "sticker" issued in the city colors, blue and yellow, for use on all stationery of the members and the association, for patriotic purposes, were exhibited.

On a call for volunteers for the War Chest drive, the following responded and formed themselves into teams to collect the subscriptions for the accessory men: Malcolm Robertson, S. D. Winchell, V. S. Fry, Walter Bisworth, Frank Ash, Jr., James J. Bradburn, Charles G. Frowert, D. D. F. Yard, William E. Hoover and Albert Stellwag.

The principal speakers at the meeting were: Lee J. Eastman, Capt. C. Ross, of the First Canadian Battalion; Mayor Schimpf of Ventnor, N. J.; William B. Levis, whose brief war talk raised a collection of $131 on the spot, and Walter Willard, president of the City Club. The meeting had a decided war-and-patriotism flavor throughout the session, business topics being subordinated.

THE WILL-O'-THE-WISP

(*Continued from page* 15)

Discounts used to be long—and the dealers gave them away. So the manufacturers cut the discounts.

"With accessories its different. On those you don't get exclusive distribution and the overhead is higher. Discounts have to be bigger.

"Car discounts have been shaved and shaved until some of them are pretty short—but you'll find the popular cars with the shorter discounts are the ones with the most prosperous dealers. If their discounts were stretched a little it would make the dealers still more prosperous, for most of them have been squeezed into learning good business methods.

"If I take on your long-discount truck some day I'll lose the long discount. It is not something I can bank on in the future. As competition becomes keener you'll have to come down in price—and your cut will come largely out of the discount. If you had a proposition anywhere nearly equal to the Sayanna I'd grab it. But you haven't. If I couldn't get the Sayanna or one like it I'd take yours. But as long as I've got the Sayanna and am making money at it I'm not going to go chasing any long discount will-o'-the-wisp that will lead me no one knows where. I'm on my way and I know where I'm going."

"And so do I," said the Highman man, as he donned his gay new straw lid and steered his way toward the next best prospective dealer in Callawassa.

Truck Freight Line for Des Moines

DES MOINES, May 27—Iowa's first motor truck transportation company has been formed. Council Bluffs citizens have filed articles of incorporation for the Cross Country Transportation Co., with a capital stock of $25,000. T. A. Minardi is president of the company. Regular routes are now being planned and motor trains will operate on regular schedules. Freight will be received and discharged at all stations.

Order 8000 Standardized Trucks

WASHINGTON, May 25.—Orders for 8000 Class B 3-ton standardized motor trucks have been placed by the Motor Transport Service. They will be distributed through the various branches of the army as required. Each company awarded a contract will do assembly work, the parts having been ordered from other concerns, and will receive an assembly price of $567 per truck. Deliveries are to be completed between Aug. 1 and Dec. 1. Sixteen companies are expected to share the order, of which 15 have already signed contracts. They are:

Gramm-Bernstein Motor Truck Co....Lima
Kelly-Springfield Motor Truck Co..Springfield
Indiana Truck Corp.....Marion, Ind.
Service Motor Truck Co.....Wabash, Ind.
Republic Motor Truck Co.....Alma, Mich.
Selden Truck Corp.....Rochester
Bethlehem Motor Corp.....Allentown, Pa.
Diamond-T Motor Co.....Chicago
United States Motor Truck Co....Cincinnati
Brockway Motor Truck Co.....Cortland
Healy Motor Corp.....Moline
Sterling Motor Truck Co.....Milwaukee
Garford Motor Truck Co.....Lima
Packard Motor Truck Co.....Detroit
Hulburt Motor Truck Co.....New York

Ten thousand of the Class B trucks have already been ordered, of which more than 2500 have been delivered and 75 are being produced daily. The assembly price of $567 per truck is approximately $200 lower than the assembly price of between $700 and $800 which was reported for the first contract of 10,000 trucks.

Bankers Help Tractor Sales

KANSAS CITY, May 27—Bankers of Kansas City territory are far readier this summer than last to finance farmers who wish to buy tractors. Heretofore the farmer's credit in tractor purchase has been based entirely on the farmer's character, the bankers considering that they were taking a chance. Many bankers this spring are actually encouraging farmers to buy tractors, so production can be fairly well guaranteed on the farmer's investment. Bankers in districts where average farms are a quarter section welcome the two- and three-plow tractors for such farms.

Prominent Tradesmen Assume New Duties

Resignations and Promotions Place Workers in New Places

Leopold E. Mosiman has been appointed production manager of the Traffic Motor Corp., St. Louis. He was formerly superintendent of the Chevrolet branch plant in St. Louis.

A. C. Burch has resigned as president of the Signal Motor Truck Co. and has been elected vice-president in charge of sales and director of the Clyde Cars Corp., Clyde, Ohio.

C. A. Erickson, formerly chief engineer of the Scripps-Booth Corp., Detroit, has been made general manager of the Standard Radiator Co., Springville, N. Y.

J. D. Wilson has been appointed chief engineer of the carriage division of the Packard Motor Car Co., Detroit, succeeding G. H. Brodie, who was recently transferred to the aircraft engineering staff. Formerly Mr. Wilson was assistant carriage chassis engineer.

T. P. Chase, formerly chief engineer of the King Motor Car Co., Detroit, has been made chief engineer of the Young High Velocity Carbureter Co., Detroit. His work will have to do with the technical details involved in the manufacturing of the Young carbureter.

J. W. Fitzgerald, former president of the Detroit Starter Co., who later became president of the Versal Products Co., Detroit, has been appointed consulting and experimental engineer for the L. A. Young Industries, Inc., Detroit.

C. V. Thomas has been promoted from assistant sales manager of the F. B. Stearns Co., Cleveland, to general sales manager of the company.

C. C. Thomas has been appointed sales engineer of the Denby Motor Truck Co., Detroit, with which he has been associated for the past 3 years, first as experimental engineer then as service manager.

W. A. Clare, general sales manager of the Atterbury Motor Car Co., Buffalo, N. Y., for the last 2 years, has been appointed assistant secretary of the company. He will retain his supervision over sales in addition to his new duties.

Fred J. Miner has been appointed district representative of the Duplex Truck Co., Lansing. His territory consists of southeastern states. He was formerly connected with the Olds Motor Works, Lansing, and the Cadillac Motor Car Co., Detroit.

Frank B. Kearn, who for 6 years held different positions with the Willys-Overland Co., Toledo, for some time acting as Australian representative, has been appointed office manager of the General Motors Export Co., New York.

Louis W. Cossey, formerly of the Albany branch office of the International Motor Co., has accepted a position with the Lane Motor Truck Co., Kalamazoo, Mich., as sales representative for New York State and western Massachusetts.

Frederick H. Chrisler, for the past 2 years with the Saxon Distributing Co., Albany, has accepted a position as sales manager for Chalmers cars with the Berkshire Motor Co., Albany.

Harry W. Graves has just been appointed sales and advertising manager of the Stanley Motor Carriage Co., Newton, Mass.

Charles H. Goss, formerly assistant to the general manager of the Bergougnan Tire Co., New York City, has entered the army and is at Camp Joseph E. Johnston, Jacksonville, Fla.

Norman G. Wilson, who associated himself with the Philadelphia Stanley branch last February, has been promoted to the position of manager of the branch.

HOWARD NATTRASS

Of the Nattrass & Harris Motor Co., Ltd., Wellington, New Zealand, who drove 40 Oaklands from Pontiac to New York in order to "make" a boat that was about to sail, the first ship for New Zealand in three months

E. J. McMullen, formerly in the technical department of the Olds Motor Works, has been appointed First Lieutenant in the Quartermaster Corps of National Army and has been ordered to report for duty at once. He was chassis lecturer for the Olds during show seasons and has given technical lectures from coast to coast.

D. C. MacDonald, formerly manager of the Akron Branch of the Mason Tire & Rubber Co., has joined the colors and is at Camp Meade, Md.

William King, who has been sales manager for the Brandle Motors Co., St. Louis, for a year, has returned to the service of the Missouri State Life Insurance Co., which has created a special department for him.

A. D. Beach, formerly manager of the Hood Rubber & Tire Co., St. Louis, has been made territorial representative of the Cadillac Automobile Co., St. Louis.

Large Rubber Stock On Hand at Present

According to Rubber Association, Tire Makers Have Plenty For a Time

NEW YORK, May 27—Assurances that there is sufficient rubber on hand and in transit to care for normal requirements for some time into the future were given at a luncheon held by the Rubber Assn. of America for the War Service Committee of the Rubber Industry of the U. S. A. on May 10, the details of which have just been made public. On March 31 there was a total of 87,572 tons in the hands of importers and manufacturers and afloat. On Dec. 31, 1917, the total tonnage afloat and in stock amounted to 67,536 tons, so that stores increased 20,000 tons in the 3-month period. Following are the statistics:

	Tons
Crude rubber in importers' stores	11,224
On docks and in transit overland	20,754
Afloat for American ports	14,832
Crude rubber in manufacturers' stock	18,512
In transit within the U. S.	15,033
In transit, imported direct	7,215
Total	87,572

All of this is what is termed "free rubber," that is, it is not subject to the restrictive measures under which the importation of crude is limited to 25,000 tons during the current 3-month period. Only rubber which was shipped subsequent to May 8 is covered by this measure.

Correction

BLOOMFIELD, N. J., May 27—Joseph P. Hall, general manager of the Combination Rubber Mfg. Co., was formerly treasurer-director of the Globe Rubber Tire Mfg. Co., and not of the Combination company as stated in a recent issue of Motor World.

Best Repairmen Used for Training Soldiers

Special Education of Drafted Men Progressing Well—Outline of Course

WASHINGTON, May 27—Special education of drafted men by universities and colleges is working successfully. The Committee on Education and Special Training of the War Department in a report shows that the University of Pittsburgh is training 650 men for service as gas engine and automobile mechanics in the army. When this plan was announced in March the University of Pittsburgh discussed provisions of training and housing the 100 men. Less than a month later 326 men were taking instruction. To-day there are 650 men. It is anticipated that there will be 2000 by Aug. 1, and the university is preparing to enlarge its facilities even beyond that point.

The work at this particular university was confined to the training of gas engine and automobile men, first, because there were a number of members of the faculty who were specialists in gas engines; second, because there were in the city many automobile repairshops from which practical men could be taken to give instruction, and, third, because the city offered an opportunity for obtaining without transportation a large variety of worn and broken automobiles, an essential in conducting the practical course which was planned. Both the equipment of the university and its location made possible an effective co-ordination of instruction, material and housing necessary for the work.

The problem of instruction has been met by collecting about 45 of the best automobile repairmen in the city, who under the leadership and coaching of faculty members have proved successful teachers. They were men without academic experience, but with experience in the kind of concrete practical teaching demanded. It is continually impressed upon the instructors that the work they are doing is very important, that if only one-fourth of the men they train prove to be poor mechanics it is just as serious or probably more serious than if only one-fourth of the shells made in a munitions plant should fail to explode.

The material for use in the course comes from three sources: New Trucks and engines from the government, old and dilapidated cars which have been purchased outright by the university, and cars and trucks in need of repairs which are obtained from firms and individual owners. Owners of cars pay for new material, but no charge is made for labor. The owner is allowed to choose whether he will have his car put in "first class," "fair" or "running" condition with a corresponding range in the expense for new material. The university has provided shop equipment and individual tool kits for each student.

The university first met the housing problem by making use of the gymnasiums and other buildings which could be temporarily adapted for sleeping purposes and for the feeding of men. Barracks are now being built which by Aug. 1 will accommodate 2000 men. Shops have been built for 580 men. These are being extended. A mess hall seating 1200 will be completed by June 15.

The whole character of the instruction is practical. No more theory is given than is absolutely necessary.

It has been found possible to maintain the most intimate connection between the military and mechanical aspects of the work. According to their officers, the men learn the routine of drill nearly as fast as they would if they gave their whole time to it. Their excellent morale and fine spirit show alike in the energy with which they attack the problem of diagnosing the complaints of a broken down automobile and in the zest with which they go through the maneuvers of their military drill. The men are not allowed to feel that there is any distinction between their mechanical work and their military instruction. They are responsible to their captain for doing their duty in both.

Glover Heads Motor Transport

WASHINGTON, May 27—Major F. Glover, of the Ordnance Department, who has been in charge of tractor work, has been promoted to a Colonelcy in the Quartermaster Department, and appointed by Brig. Gen. Wood, acting Quartermaster General, as Chief of the Motor Transport Service. He will have supervision of the purchase and procurement of all motor propelled vehicles except tanks, creeper-type tractors and other artillery tractors for all of the various divisions of the United States Army in this country and abroad.

Detailed duties of Colonel Glover include technical supervision over maintainence and repair, organization, supply, operation and inspection of motor-driven vehicles, motor repairshops and garages, and a department for supplying spare parts, gasoline, lubricants and miscellaneous supplies. He will also confer with the Ordnance Department, which will have charge of purchases of tanks, creeper-type and artillery tractors, in regard to these vehicles.

Colonel Glover prior to entering the military service was the general manager of the Emerson-Brantingham Co., tractor manufacturer, Rockford, Ill.

New Mail Records with Liberty Engines

WASHINGTON, May 24—Liberty engine-equipped airplanes used yesterday for the first time in the mail air service established new flying records. Mail which left Washington at 11.30 a. m. arrived in New York at 2.10 p. m., bettering previous records by 40 min. The journey from New York to Philadelphia was accomplished in 52 min., bettering previous records by 23 min. The journey from Washington to Philadelphia was made in 1 hr. and 48 min.

Taking Snarls Out of Car Taxation Tangle

Branch and Dealer to Be on Same Footing—How Should Chassis Be Taxed?

NEW YORK, May 25—Automobile taxation matters, about which the National Automobile Chamber of Commerce conferred with treasury officials yesterday, are gradually clearing up, and though no definite ruling is expected for at least two weeks, the situation is promising.

Under the original ruling a manufacturer's branch was held to be separate, and as such was required to pay a tax of 3 per cent on the retail value of cars sold, whereas a manufacturer selling a car to a dealer who in turn sold it at retail was required to pay 3 per cent only on the price to the dealer. It is expected that this will be straightened out and that the manufacturer's branch selling at retail will be placed on the same footing as a dealer.

Another matter which was discussed was the tax on a tax. Under the original ruling a manufacturer who sold a car to a dealer at wholesale for $800, for example—the dealer's tax in this case being 3 per cent, or $24—was required to make a return to the government on both the price of the car to the dealer—$800—and the $24 tax. In other words, his return was on $824. It has been pointed out that this is manifestly unfair and the ruling probably will be changed.

Under the original ruling a manufacturer who sold a chassis direct to a user was required to pay a 3 per cent tax, whereas if he sold the chassis to a dealer the dealer was required to pay a 3 per cent tax on the chassis and also on the value of any body applied to it. It is considered likely that this ruling will be changed so that a manufacturer will pay a tax of 3 per cent on the chassis, regardless of the person to whom it is sold; the dealer probably will pay 3 per cent only on the value of the body applied to the chassis.

When parts of automobiles were exported and assembled abroad no tax was levied on the cost of the parts, under the old ruling. Under a recent decision of the supreme court, however, this ruling has been suspended temporarily pending a review of the situation. It may be that exporters of disassembled automobiles will be required to pay a 3 per cent tax.

Detroit Electric Factory Enlarged

DETROIT, May 27—A new building for the Anderson Electric Car Co. is now in course of construction. It will be two stories high and 200 x 400, giving, when completed, 160,000 additional square feet of floor space. The addition was necessitated to enable the company to keep pace with the demand.

Don't Grab Bonds as Payment to Make Sale

It Is Not Patriotic, Says Joe Schlecht to Go Into the Bond Bartering Business

ST. LOUIS, May 27—The buying of Liberty Bonds was only the primary test for patriotism of money, according to Joseph A. Schlecht, president of the St. Louis Automobile Manufacturers' and Dealers' Association. He illustrates his meaning in this way:

"A few days ago a banker from North Blank, Ill., came into my salesroom and looked over the cars. He picked an Allen car and offered to buy it if I would accept $1,000 Liberty Bonds on the purchase price.

"I happened to know something about West Blank. I knew that when the Liberty Bond drive was made this banker headed the list and accepted full praise for his patriotism and was quite the town pride. I told him:

"'I happen to know how you bought those bonds and of the credit that was given to you. It does not strike me as being at all patriotic for you to want to sell them at the first opportunity. I will not sell the car on those terms.'

"I suppose," continued Schlecht, "that he bought a car some place on his terms, but I am glad to say that I was not a party to the sale. I do not mind some bonds on a car from persons who need the car and who have been saving to buy one. But I consider it my patriotic duty to decline to accept practically all bonds from persons who can hold them for themselves. I have found most dealers here of the same opinion and I believe the dealers of the country should take this stand."

Distribution Plan for Fordson Tractor Plows

SOUTH BEND, IND., May 27—In distributing the No. 7 tractor plows which are made especially for the Ford tractors, the Oliver Chilled Plow Works sells them either to the people who distribute the Ford tractors, who in turn sell them to retail dealers to be resold to the farmers, or in cases where distributing connections have not been made, the company disposes of the plows to retail dealers to be sold to farmers. In every instance the retail dealer is protected and assured of a reasonable profit. This makes it possible for the retail dealer to give the farmers such service as they may require. No plows are sold direct to the farmers by the company.

Two More Monarch Tractors

WATERTOWN, WIS., May 27—Plans for extensions to the plant of the Monarch Tractor Co. were approved at the annual meeting of the corporation, and arrangements completed for increasing the weekly output to thirty tractors a week. As soon as practicable, two new sizes will be added, giving a line of three types. Work on a large machine-shop addition has been undertaken and the foundry will be enlarged when the shop is completed. The company is capitalized at $500,000 and recently organized a Canadian company under similar name, to build a plant in Toronto, to handle increasing Canadian requirements, now filled from Watertown. Officers were elected as follows at the annual meeting: President, W. N. Smith; vice-president, Albert F. Leopold, Chicago; second vice-president, J. S. Sebree, North Dakota; third vice-president, F. L. Thomas, Watertown; secretary-treasurer, Walter H. Stiemke, Watertown; directors, Max Rohr, Watertown; H. O. Pond, New York; E. M. Sverdloff, Moscow, Russia; H. Garfield Taylor, Chicago.

Independent Harvester Elects

MILWAUKEE, WIS., May 27—The Independent Harvester Co., Ltd., organized by Milwaukee capital as successor to the Independent Harvester Co., Plano, Ill., has elected these officers: President, Lawrence Fitch, president Western Malleables Co., Beaver Dam, Wis., and treasurer Globe Seamless Steel Tubes Co., Milwaukee; vice-president, A. J. Earling, president board of directors, Chicago, Milwaukee & St. Paul Railway Co.; secretary, A. W. Wilbrand, secretary Western Malleables Co.; treasurer, Grand Fitch, vice-president National Exchange Bank, Milwaukee. The capital stock of the new company is $3,500,000. It has taken over the plant in Plano, which has been in the hands of a receiver since last December, and will continue production on an increased scale, engaging in the manufacture of tractors in addition to farm machinery.

Des Moines Discusses Roads

DES MOINES, May 27—Motor Trades Bureau of the Chamber of Commerce gave its May meeting over to the good roads question. Representatives of the three principal marked highways which go through Des Moines, the Jefferson Highway, the Great Whiteway and the River to River Road, were present at the meeting, as were members of the Des Moines City Council and the Polk County supervisors. Thomas H. McDonald, head of the Iowa State Highway Commission of Ames, made the principal address. A considerable program for the coming summer was outlined by city and council officials. Major Charles A. Watrous of the Supply Train at Camp Dodge, who drove out the fleet of twelve Liberty trucks recently, paid his "respects" to the Iowa dirt roads.

Osmond Gets Winton

MILWAUKEE, WIS., May 27 — The Winton Co., Cleveland, O., has discontinued its Milwaukee branch at 503-507 Broadway, and the Winton line henceforth will be distributed by the Osmond Motor Car Co., state distributer also of the Chamlers. The Osmond company has moved into the former Winton branch house quarters from 215 Wisconsin Street.

St. Louis Accessory Men Choose Sheford

Picked to Head Association a Second Term—First to Get Re-election Honor

ST. LOUIS, May 27—John F. Sheford, wholesale manager for the Bittel-Leftwich Co., was elected president of the Motor Accessory Trade Association at the May meeting. Sheford has served one previous term as president and is the first to be elected for a second term. Other officers elected were: Vice-president, W. L. Ferrier, Fred Campbell Auto Supply Co.; Secretary, R. E. Lee, incumbent; Treasurer, A. R. Baxter, Shurnuff Mfg. Co.; Directors: L. E. Allman, Missouri Auto Specialty Co.; W. L. Patterson, Henry Motor Co.; W. A. F. Ulenhaut, Ulenhaut Wagon Co.; T. Frank Wood, Shapleigh Hardware Co.; E. S. Marvin (retiring president), Imperial Oil Co.; sergeant-at-arms, William D. Clark, Vehicle Top and Supply Co.

Attention of the dealers was called to the accessories and parts for farm tractors in an address by Douglas R. A. Drummond, field editor of Power Farming and Power Farming Dealer. He said that this was a big and growing field and that it was necessary that such accessories be generally sold. He also told of the field of service in connection with household lighting systems and starting appliances for tractors.

Minneapolis After Tire Abuses

MINNEAPOLIS, May 27—The Minneapolis Tire Dealers Association has planned a campaign of uplift of the business. It has written letters to all jobbers, branches, manufacturers and retailers in the tire business to help. The association first cleaned its own skirts of business abuses and now wants all outsiders to join in. A meeting was called for May 23 at the Odin Club, a regular meeting night of the association, to talk it over. One abuse to be righted is selling tires at less than retail prices to consumers. Unwarranted adjustments have reached a bad stage in the city and the tire men want to get rid of this. They do not want to put on branch-sold tires in their service stations free of cost. The association is going after other distributers hammer and tongs and expects close co-operation.

Hartford-Buick Out For Cash

HARTFORD, May 27—The tendency to cut out credit business in garages in this section is emphasized by the policy of the Hartford Buick Co. This concern recently erected a big white sign with red letters to the effect that "Owing to the number of Buick car owners in this vicinity it would be impossible to open accounts for parts and repairs. Therefore all Buick parts and repairs cash."

Here's Some Business for the Truck Dealer

Government to Boost Rural Express Route Idea—Will Mean Sale of Lots of Trucks

WASHINGTON, May 27—The Highways Transport Committee of the Council of National Defense has outlined a plan for concerted action to facilitate the establishment of Rural Express Routes in practically every state in the union. Since conditions under which such routes would have to be formed differ in all states, because of geographical conditions, etc., it is proposed to carry on the work through the various State Councils of Defense and ultimately through similar public and semi-public organizations in the large cities.

A start in the organization of such routes already has been made in the vicinity of Washington. There are twenty-two Rural Express Routes now operating in Maryland; fifteen operate out of Baltimore; five out of Washington, and one out of Cumberland. Thirty trucks, having a combined capacity of 73½ tons, cover 1574 miles daily on these routes. They afford a possible daily service of 115,690 ton-miles or 35,000,000 ton-miles a year. They can haul more than 100,000 tons of farm produce into Baltimore and Washington every day and carry an equal amount of merchandise back to the farmers and country merchants.

The shortest route is 10 miles from Baltimore to Ellicott city, and the longest is 47 miles from Baltimore to Frederick. Recently, daily service has been started between Philadelphia, Baltimore and Washington by a trucking company that has had a fleet of trucks in operation between New York and Philadelphia —104 miles—since last September.

Every kind of produce raised on farms, all sorts of goods raised by farmers, and various products of factories are handled by the trucks. The list includes vegetables, fruit, corn, wheat, milk, butter, eggs, chickens, live calves, cows and pigs, fertilizer, wood, coal, farm machinery and repair parts, groceries, drugs, clothing, shoes, hardware house furnishings, fixtures, musical instruments jewelry and newspapers. The market price of produce in Baltimore at present averages 20 per cent lower than in Washington and this is ascribed to the Rural Express Routes which feed Baltimore from outlying agriculture areas.

The Council of National Defense is suggesting that local councils prepare maps showing improved roads within a radius of 50 miles or so of population centers which are surrounded by agricultural areas from which food may be brought. With these maps in hand, the next step is to ascertain where it would be advantageous to establish routes, after which it is suggested that negotiations be carried on with farmers along such routes with a view to interesting them in the use of existing trucks for carrying their own produce to market and that of other farmers along the route.

The Highways Transport Committee has sent out a questionnaire to farmers in the vicinity of Washington along these lines and has received very encouraging replies. These replies will be used as a basis in assisting in the organization of additional routes between Washington and nearby farming centers.

President Takes Ride in a Tank

PRESIDENT WILSON, who is always doing some ordinary every-day thing, lived up to his reputation recently when the British tank Britannia was rambling around Washington. He enjoyed his ride just as much as the rest of the novelty seekers. He also did something we all should imitate—smile

Velie Men Band Together

BOSTON, May 27—The New England Velie Co. has formed the Velie Social Club among its employees, men and women, and Amos J. Shorey has been chosen president. Since the company has taken on the Kissel line, allowing a large number of other employees to join, the club will change its name to the Velie-Kissel Club. At its monthly meeting a few nights ago President Shorey gave the members a talk on what was being done at Washington, where he had been spending some time. James T. Sullivan, automobile editor of the Boston Globe, gave a talk on motor legislation. The club voted to consider the advisability of forming a marching club to take part in patriotic parades in the future.

Chandler Men Form Organization

BOSTON, May 27—The employees of the Chandler Motors Co. of New England have banded together for social purposes, and they have formed an orchestra to entertain themselves. The officials of the company presented the club with a piano, and the employees enjoy the use of the used car department for dances and entertainments.

Boston Picks Orphan Outing Day

BOSTON, May 27—Secretary Chester I. Campbell of the Boston Automobile Dealers' Association has picked out Wednesday, June 5, as the day for the annual outing of the crippled and orphaned children in the different homes in and about Boston. It is planned to get some 700 cars for this purpose, and take the children to Nantasket Beach.

Use Trucks to Haul Grain to Elevators

Practise Growing in Southwest—New System May Be Established—Means Truck Sales

WICHITA, KAN., May 27—The coming summer will doubtless see a radical change in tendency in the movement of grain from farm to elevator and mills. The effort to relieve congestion of railroads will undoubtedly result in the development of motor transportation of grain.

For instance, grain which formerly was hauled three or four miles to railroad and then carried six or eight miles by railroad to an elevator, is going to be hauled the entire distance to the elevator from the farm by motor truck or tractor with trailer.

It is likely that within the next year many millers and elevator companies will build new elevators—not on railroads but on highways over which they may run their own truck and tractor lines. The subject is being seriously considered by at least one Kansas miller who is seeking to avoid the double handling of the grain and the delays due to waiting for freight cars.

It is interesting to note that this miller is not worrying over the condition of the roads while planning his project. Most of the roads in the wheat district have tractors running over them during the harvest season, the tractor operators being accustomed to laying planks over culverts and bridges that are not normally able to carry the heavy loads.

An incidental advantage to the miller who is establishing his own truck line and elevators on highways is that he need not worry over rates from origin to destination. He need consider only one freight rate, that from his own elevator or mill to the station of the purchaser of his wheat or his product.

The Secret of Safety in 1918

"THE secret of business safety during the coming season lies in anticipation of needs and conservation of resources," in the opinion of B. O. Leftwich, treasurer and general manager of the Bittel-Leftwich Co., jobber, of this city, who has seen the business over which he presides grow from a newly established tire service company to a wholesale and retail tire and accessory business doing a business of considerably more than $1,000,000 a year.

"The safety valve of the present is in the trade acceptance, the best single piece of business aid this country has seen, and in intelligent accounting," according to Leftwich, who has been elected president of a bank during his short business career and is quite active in that work.

"There are some firms that are going about the present work entirely wrong. I personally know of some firms who are making inventories by crediting their stock with every advance in price, regardless of cost or the peace time value of the article. If the war were to end suddenly, or for any reason the ban on material for making these accessories were lifted, these firms would be bankrupt over night. *No bank can take a chance on an inventory like that.*

"The two great elements in the present situation are labor and the war. I consider the labor situation foremost at present. The unrest, the demands that must be met because of scarcity of labor, the ability of manufacturers to keep on turning out goods that we merchants must have if we live, our ability to get labor to handle these goods and give the service that we have established; all of these things enter into the situation.

"In times like these a man cannot play too safe. Every firm ought to lay aside a fund as a guarantee against the later turn of merchandise and to keep strict account of all expenses to know exactly what expenses mean.

"Bookkeeping showed us where we had been keeping our service cars on the road just double the profitable time for running such cars. It cost us $5,000 to keep those old cars going before we learned where the limit was. Now we charge off depreciation on each car monthly, so that when the end of the profitable running of a car is reached whatever that car brings as a used car is profit.

"That is the problem that every man must solve in his own business.

Tire Business Should Be Watched

"The tire service is a business that will bear watching carefully. Every successful tire service man in this city has worked for me. A good many tire service concerns have come and gone while we have been building up our business. Nearly all of them thought they could give cheaper service than we could. We knew that they could not and merely waited. Perhaps we could have broken some of them sooner by cutting prices against them, but *we believe that we must make a profit on every transaction or not make the trade.* The other man will learn sooner or later where the limit lies. *Most learn too late.*

"This is not a period for experiments either in expenses or in running on small stock or carrying too large a stock. A man must measure his prospects carefully and then act accordingly. I have been urging upon our customers the necessity of this action and have been endeavoring to show them how the trade acceptance makes this possible on a cash basis. Our last appeal to our customers was the letter that follows:

Trade Acceptance Letter

"For some time past we have been giving a lot of thought and investigation to the two following matters, which are of vital importance to our company and your good selves:

"FIRST—The ability of the manufacturers whom we represent to fill our orders, and

"SECOND—The ability and willingness of the railroad company to deliver to us the products of these manufacturers, and our ability to re-ship them to you.

"We find conditions from every standpoint exceedingly unsatisfactory. In cases where we are able to find manufacturers with sufficient stock on hand to supply us, we find the embargoes, etc., are such that the goods cannot be shipped to us.

"We further find it is a very hard proposition at certain periods to even make local shipments from our St. Louis warehouse to you; hence this letter and the following suggestions:

"Every indication points to a hot summer, which means the maximum amount of automobile driving and the necessity of having tires and accessories on hand to fill your orders.

"It is our suggestion that you go over your stock immediately, and mail us your order for at least a ninety-day turn-over. We will be glad to sell these goods to you on the basis of a ninety-day trade acceptance, that is a trade acceptance for the amount of your invoice, dated 90 days from the date of shipment, which will give you ample time to dispose of the stock in the majority of cases, before the acceptance falls due.

"Our Government is highly recommending the use of this sort of trade paper and we feel it is a patriotic duty for all of us to use this method of payment.

"We are issuing such paper to all of our manufacturers. Should there be any information that we can give you as to the use of these acceptances our accounting department will be very pleased to explain fully to you their advantage.

"The writer desires to take this opportunity to thank you for your patronage in the past and trusts that our pleasant relations will continue in the future. Yours respectfully, BITTEL-LEFTWICH."

Catalog Sizes Standardized

CHICAGO, May 27—The Catalog Conference of the National Assn. of Purchasing Agents passed a resolution yesterday recommending 3 sizes for manufacturers' catalogs. These are 6 x 9 in., 7½ x 10⅝ and 8 x 11. The stock recommended was 40, 45, 50, 60, 70 and 80 lbs. on a 75 x 38 sheet basis. These weights give printers a chance to use accumulated stock. The colors recommended are white and natural.

The recommendations have already been accepted by representatives of the National Gas Enginemen's Assn., the American Institute of Architects and others. Makers of filing cabinets say they will make their products to fit the catalogs, if necessary.

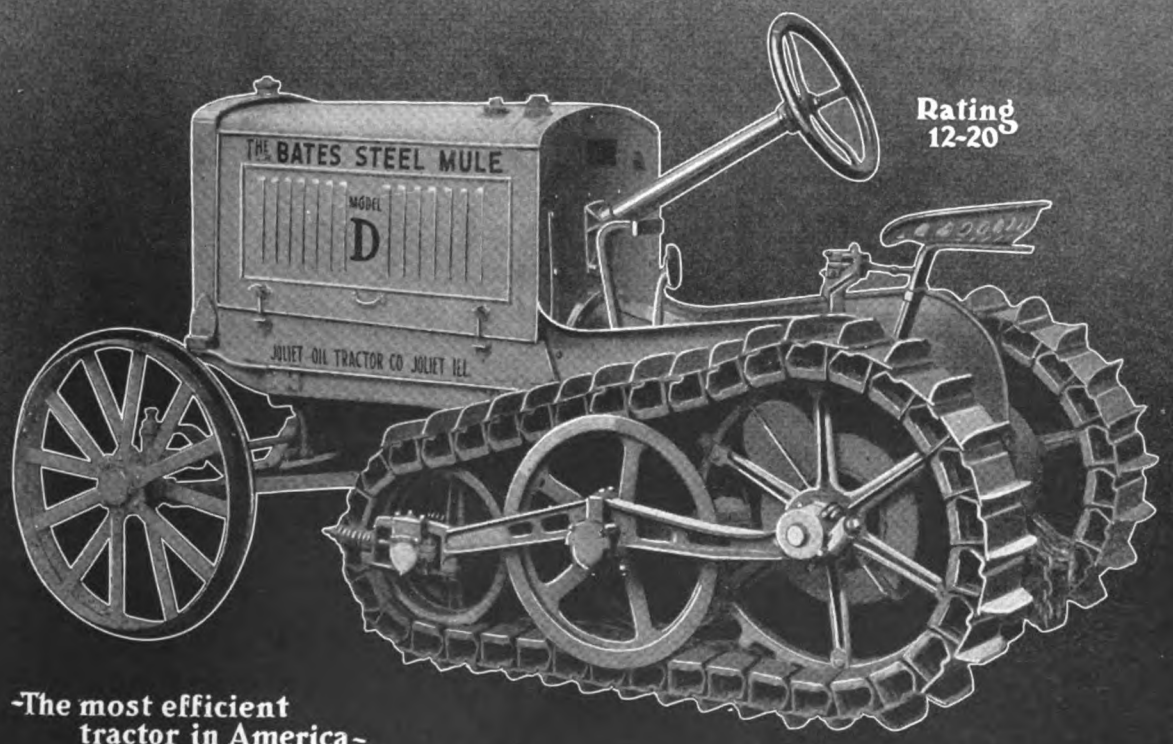
Proved Crawler Durability



Correct mechanical principles combined with the proper alloy steels, specially heat treated for this hard service, make the BATES STEEL MULE Crawler Shoes endure the life-time of the tractor. The knowledge of what these materials must be and how they must be heat-treated has become known to its builders only through the experience gained during the past six years with thousands of tractors in the field.

No less important than its Crawlers are the Mule's valve-in-head, heavy duty kerosene motor; its hardened cut steel transmission gears; its Timken Roller Bearings; and its enclosed working parts.

Write for complete illustrated descriptive literature.

"NORMA"
PRECISION
BALL BEARINGS
(PATENTED)

Today—whether in men or in machines—the measure of value is the capacity for service. Not so much "what is the price" but "what will it do" is the decisive question. To be saleable today a thing must above all be serviceable. And serviceability commands a ready market and a good price.

"NORMA" Precision Bearings are the standard bearings in high-grade ignition apparatus and lighting generators because the test of time has proved their pre-eminent service capacity. Their maximum-service qualities contribute mightily to the service qualities of those better cars, trucks and tractors that carry "NORMA" equipped accessories.

Be *Sure*—See That Your Electrical Accessories Are "NORMA" Equipped

HUBBELL-OAKES MOTOR COMPANY
DISTRIBUTORS
SOUTH ALABAMA
GEORGIA 1513 CANDLER BUILDING FLORIDA
ATLANTA, GA.,
April 16, 1918

Selden Truck Sales Co.,
Rochester,
N. Y.

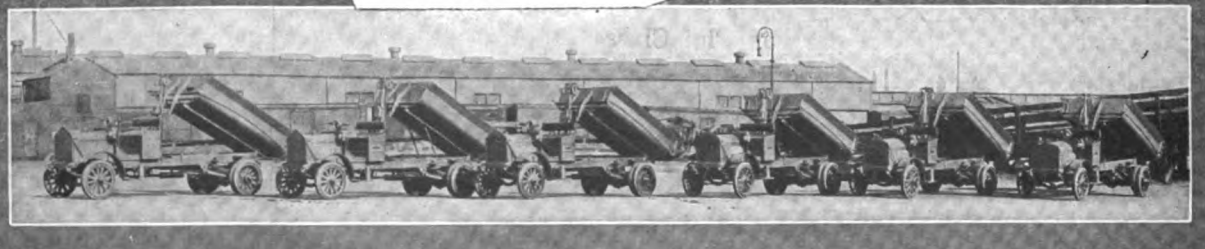
Gentlemen:

It is with great pleasure that we review our connection with your organization during the past twelve months. We are exceedingly sorry that we did not make this connection many years ago, as it is a great pleasure to do business with such men as are at the head of your organization.

We are desirous of expressing our sincere appreciation of the fine way in which you have taken care of us during the recent chaotic conditions of railroad embargoes, et cetera; more particularly as we are so far away from the factory and might very easily have been lost in the shuffle.

Had it not been for the clean business methods with which you people do business - this might have been the case.

It is with great pleasure we note the increased production which you are going into and the specifications of the new models look better than ever. We can assure you that we do not have any trouble in selling SELDEN TRUCKS. Our main trouble is getting sufficient trucks to supply the demand and at the present time we have three buyers for every one we can get.



We want to again express our thanks to you for the courteous treatment we have received from you at all times, and extend to you a hearty greeting with an invitation to visit us in the South and give us a chance to show you how popular the great number of SELDEN TRUCKS we have running in our territory are.

With very kindest regards,

Sincerely yours,
HUBBELL-OAKES MOTOR CO.

The Horseless Age

The Oldest Automobile Paper in the English Language

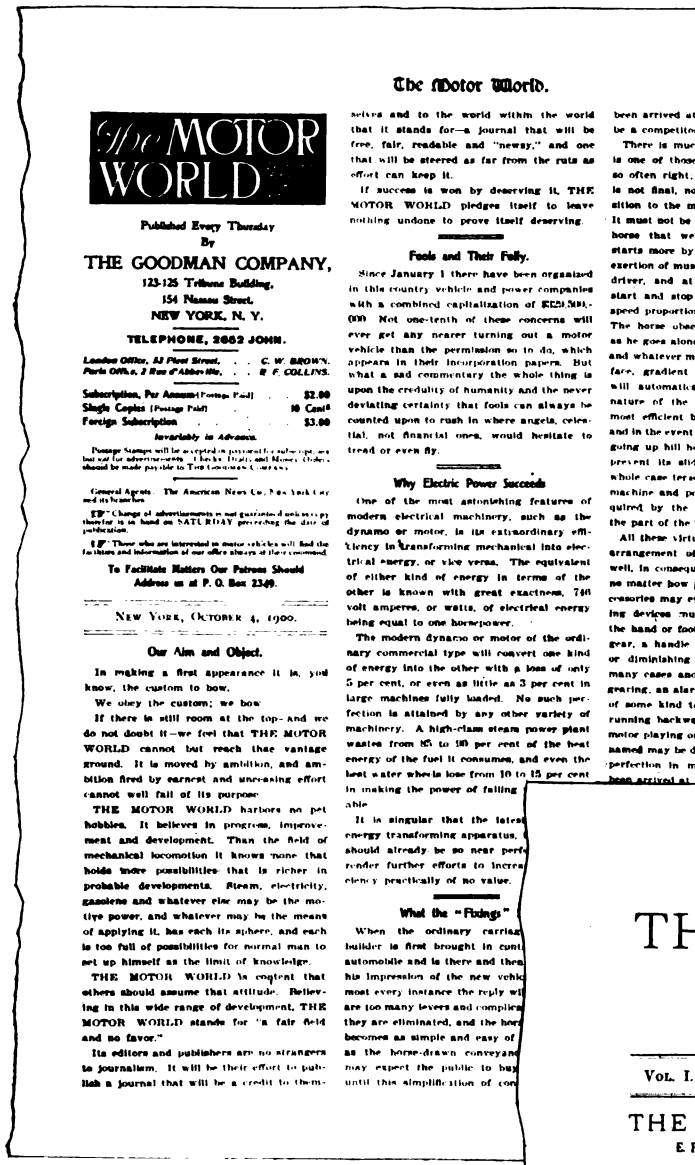
Has Been Merged With

MOTOR WORLD

And Other Class Journal Publications

THE merger brings about a combination of strong trade influences which will continue in a more intensified manner the merchandising and trade betterment work that has won such commendation from readers during past years.

THE Horseless Age, the oldest automobile journal in the English language, has been purchased by The Class Journal Co.



It is, with this issue, made a part of The Class Journal publications, and many of the editorial features of this pioneer motor trade journal have been merged with those of Motor World. Also, a big percentage of the dealers, jobbers, garagemen and salesmen who have been reading The Horseless Age will find that service continued henceforth in Motor World, which they will now receive.

The last issue of The Horseless Age was dated May 15. This acquisition builds still more strongly The Class Journal Co., which like The Horseless Age and Motor World, is a pioneer in the automobile field and has become one of the important factors in the automotive industry's progress. It is one of the large publishing houses of the United States, and is the largest in the automotive field.

By this merger there has been welded into one dynamic unit a wealth of romance and tradition. Strong forces, which for years have been seeking to achieve constructive aims in the industry and trade, have been combined under one leadership, where these forces will co-operate more intensively toward the same ends.

And, too, this extends Class Journal history back into the earliest days of automobile history. It sends

To Facilitate Matters Our Patrons Should Address us at P. O. Box 2349.

NEW YORK, OCTOBER 4, 1900.

Our Aim and Object.

In making a first appearance it is, you know, the custom to bow.

We obey the custom; we bow.

If there is still room at the top—and we do not doubt it—we feel that THE MOTOR WORLD cannot but reach that vantage ground. It is moved by ambition, and ambition fired by earnest and unceasing effort cannot well fail of its purpose.

THE MOTOR WORLD harbors no pet hobbies. It believes in progress, improvement and development. Than the field of mechanical locomotion it knows none that holds more possibilities that is richer in probable developments. Steam, electricity, gasolene and whatever else may be the motive power, and whatever may be the means of applying it, has each its sphere, and each is too full of possibilities for normal man to set up himself as the limit of knowledge.

THE MOTOR WORLD is cognizant that others should assume that attitude. Believing in this wide range of development, THE MOTOR WORLD stands for "a fair field and no favor."

Its editors and publishers are no strangers to journalism. It will be their effort to publish a journal that will be a credit to themselves and to the world within the world that it stands for—a journal that will be free, fair, readable and "newsy," and one that will be steered as far from the ruts as effort can keep it.

If success is won by deserving it, THE MOTOR WORLD pledges itself to leave nothing undone to prove itself deserving.

Fools and Their Folly.

Since January 1 there have been organized in this country vehicle and power companies with a combined capitalization of $259,500,000. Not one-tenth of these concerns will ever get any nearer turning out a motor vehicle than the permission so to do, which appears in their incorporation papers. But what a sad commentary the whole thing is upon the credulity of humanity and the never deviating certainty that fools can always be counted upon to rush in where angels, celestial, not financial ones, would hesitate to tread or even fly.

Why Electric Power Succeeds

One of the most astonishing features of modern electrical machinery, such as the dynamo or motor, is its extraordinary efficiency in transforming mechanical into electrical energy, or vice versa. The equivalent of either kind of energy in terms of the other is known with great exactness, 746 volt amperes, or watts, of electrical energy being equal to one horsepower.

The modern dynamo or motor of the ordinary commercial type will convert one kind of energy into the other with a loss of only 5 per cent, or even as little as 3 per cent in large machines fully loaded. No such perfection is attained by any other variety of machinery. A high-class steam power plant wastes from 85 to 90 per cent of the heat energy of the fuel it consumes, and even the best water wheels lose from 10 to 15 per cent in making the power of falling able.

It is singular that the latest energy transforming apparatus, should already be so near perf render further efforts to increa ciency practically of no value.

What the "Fixings"

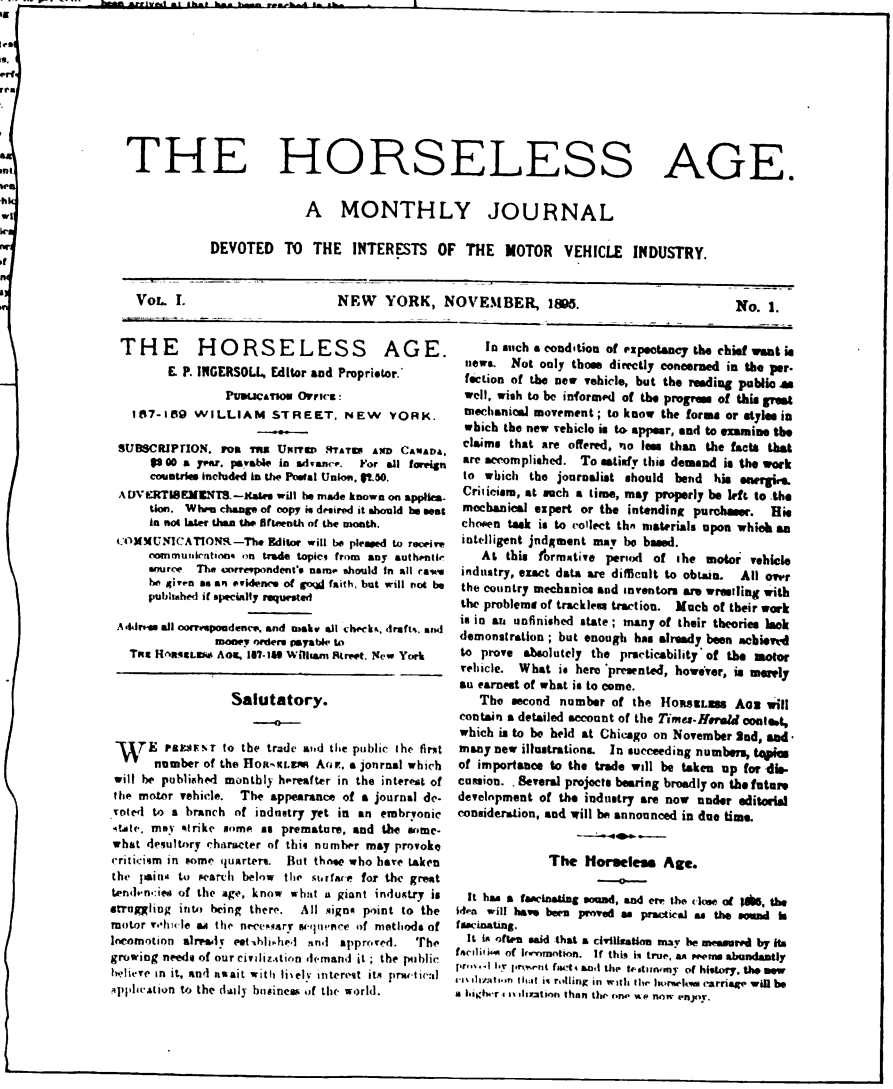
When the ordinary carriag builder is first brought in cont automobile and is there and then his impression of the new vehic most every instance the reply wi are too many levers and complica they are eliminated, and the hor becomes as simple and easy of as the horse-drawn conveyanc may expect the public to buy until this simplification of con been arrived at will the new vehicle actually be a competitor of the old one."

There is much that is true in all this. It is one of those first impressions which are so often right, but, even so, the conclusion is not final, nor is it absolute in its opposition to the mechanically propelled vehicle. It must not be forgotten that when driving a horse that well-trained animal stops and starts more by word of mouth than by the exertion of muscular force on the part of the driver, and at other times the horse will start and stop automatically and go at a speed proportionate to the obstacles in front. The horse observes the nature of the road as he goes along, if hard, if muddy, if rough, and whatever may be the condition of its surface, gradient or construction, the animal will automatically adapt his work to the nature of the case. Again, he acts as a most efficient brake when going down hill; and in the event of the carriage stopping when going up hill he is to be ever relied upon to prevent its sliding backward. To put the whole case tersely, the horse is an automatic machine and performs nearly all that is required by the driver without an effort on the part of the latter.

All these virtues can never be found in an arrangement of machinery. It is just as well, in consequence, to at once admit that, no matter how perfect the motor and its accessories may eventually become, the following devices must always be present under the hand or foot of the driver: The steering gear, a handle of some kind for increasing or diminishing the motive power, and in many cases another handle for altering the gearing, an alarm, a brake and another catch of some kind to prevent the machine from running backward on a hill in event of the motor playing out from any cause. The last-named may be dispensed with when the same perfection in mechanical road vehicles has been arrived at that has been reached in the

Above is shown the editorial page from the first issue of MOTOR WORLD, *Oct.* 4, 1900

the roots of the Class Journal organization back to the beginning of the gasoline age and adds a final touch to the great structure which the Class Journal founders built—and are still building—over a period of more than twenty years.



Throughout this entire score of years the aims of The Class Journal Co. have been the same. It years ago staked its fortunes upon the "class paper" idea. It believes that the classes within an industry require separate papers, that no one paper can serve any great industry like a blanket. It does not believe that dealers, jobbers, garagemen, manufacturers, engineers, factory managers and car owners can all be served by one publication.

Therefore it to-day operates papers for three classes: Motor World for the merchandisers—the dealers, jobbers, accessory men, garagemen and salesmen; Motor Age as a great maintenance paper—for dealers, garagemen, accessory men, car owners, etc.; Automotive Industries for the engineering and producing class. How essential this division is the readers of these respective papers know too well to require any explanation. In an age of intensification and specialization no other policy can succeed.

Years ago there was no merchandising paper. When the industry first had its beginnings the mere fact that vehicles ran without horses was sufficient to corral the attention of the whole world. Every interest tended toward developing the power plant, refining the bodies and "finishing" the car itself. Selling was something to which little real attention was given.

Therefore, until recent years but two classes in the industry were served—the maintenance, and the engineering and producing.

Horseless Age began as a monthly in November, 1895, at a time when people had not yet decided even what they should call this new vehicle. The chaotic condition is indicated in the very name of the publication. The idea of the world was negative rather than positive. It thought in

THE HORSELESS AGE.

A MONTHLY JOURNAL

DEVOTED TO THE INTERESTS OF THE MOTOR VEHICLE INDUSTRY.

VOL. I. NEW YORK, NOVEMBER, 1895. No. 1.

THE HORSELESS AGE.
E. P. INGERSOLL, Editor and Proprietor.
PUBLICATION OFFICE:
167-169 WILLIAM STREET, NEW YORK.

SUBSCRIPTION, FOR THE UNITED STATES AND CANADA, $3.00 a year, payable in advance. For all foreign countries included in the Postal Union, $4.50.

ADVERTISEMENTS.—Rates will be made known on application. When change of copy is desired it should be sent in not later than the fifteenth of the month.

COMMUNICATIONS.—The Editor will be pleased to receive communications on trade topics from any authentic source. The correspondent's name should in all cases be given as an evidence of good faith, but will not be published if specially requested.

Address all correspondence, and make all checks, drafts, and money orders payable to
THE HORSELESS AGE, 167-169 William Street, New York.

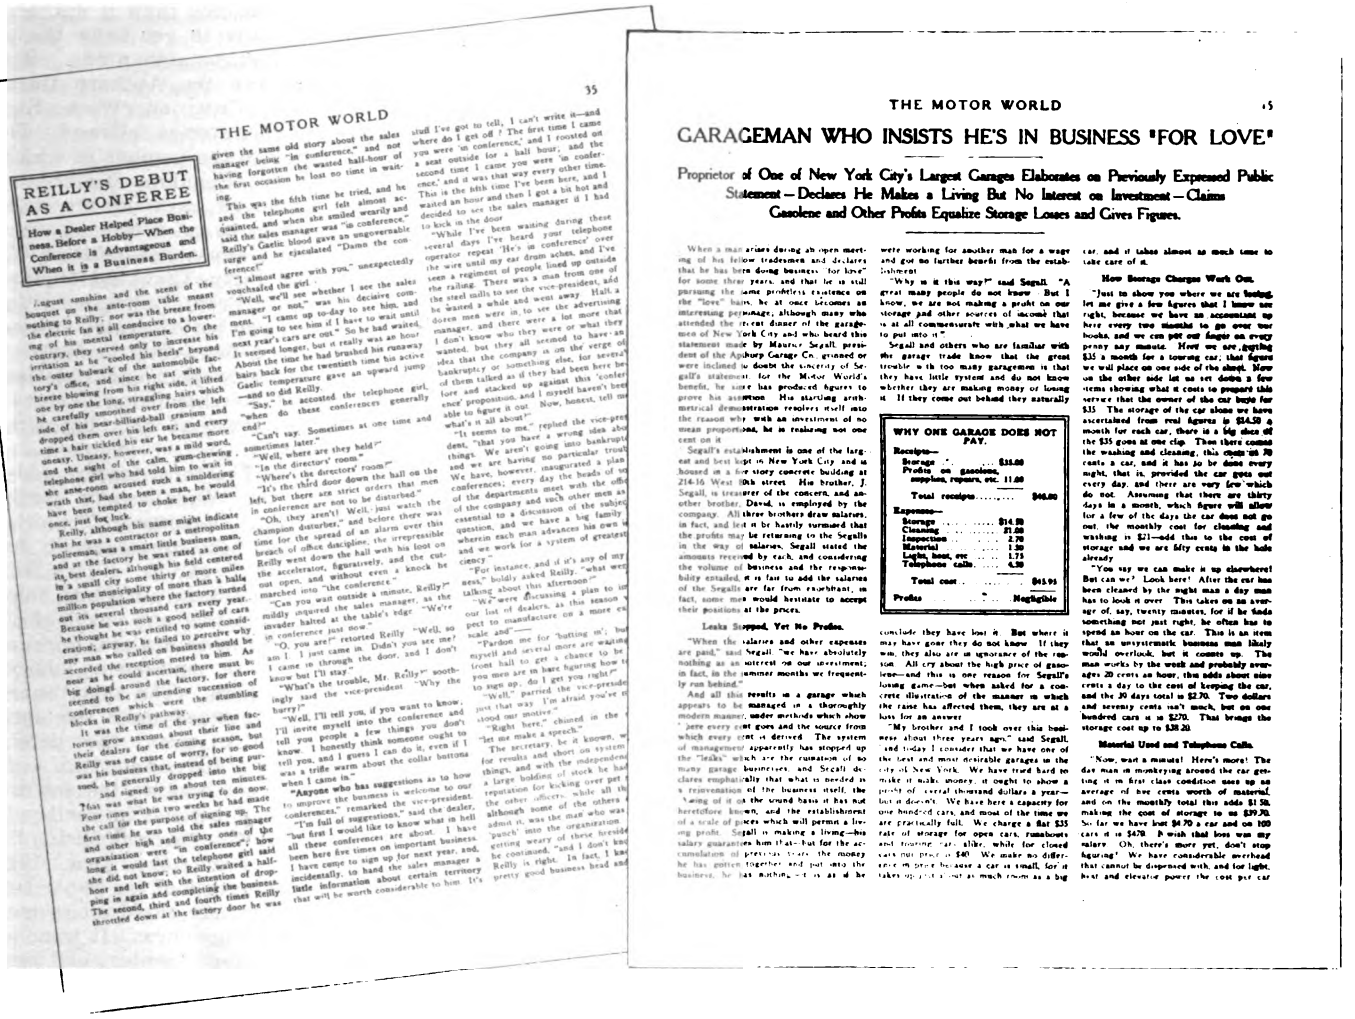
Salutatory.

WE PRESENT to the trade and the public the first number of the HORSELESS AGE, a journal which will be published monthly hereafter in the interest of the motor vehicle. The appearance of a journal devoted to a branch of industry yet in an embryonic state, may strike some as premature, and the somewhat desultory character of this number may provoke criticism in some quarters. But those who have taken the pains to search below the surface for the great tendencies of the age, know what a giant industry is struggling into being there. All signs point to the motor vehicle as the necessary sequence of methods of locomotion already established and approved. The growing needs of our civilization demand it; the public believe in it, and await with lively interest its practical application to the daily business of the world.

In such a condition of expectancy the chief want is news. Not only those directly concerned in the perfection of the new vehicle, but the reading public as well, wish to be informed of the progress of this great mechanical movement; to know the forms or styles in which the new vehicle is to appear, and to examine the claims that are offered, no less than the facts that are accomplished. To satisfy this demand is the work to which the journalist should bend his energies. Criticism, at such a time, may properly be left to the mechanical expert or the intending purchaser. His chosen task is to collect the materials upon which an intelligent judgment may be based.

At this formative period of the motor vehicle industry, exact data are difficult to obtain. All over the country mechanics and inventors are wrestling with the problems of trackless traction. Much of their work is in an unfinished state; many of their theories lack demonstration; but enough has already been achieved to prove absolutely the practicability of the motor vehicle. What is here presented, however, is merely an earnest of what is to come.

The second number of the HORSELESS AGE will contain a detailed account of the *Times-Herald* contest, which is to be held at Chicago on November 2nd, and many new illustrations. In succeeding numbers, topics of importance to the trade will be taken up for discussion. Several projects bearing broadly on the future development of the industry are now under editorial consideration, and will be announced in due time.



The Horseless Age.

It has a fascinating sound, and ere the close of 1895, the idea will have been proved as practical as the sound is fascinating.

It is often said that a civilization may be measured by its facilities of locomotion. If this is true, as seems abundantly proved by present facts and the testimony of history, the new civilization that is rolling in with the horseless carriage will be a higher civilization than the one we now enjoy.

The aims and ideals of Horseless Age are set forth on the page shown here, which is from the first issue of that publication, November, 1895

REILLY'S DEBUT AS A CONFEREE

How a Dealer Helped Place Business. Before a Hobby—When the Conference is Advantageous and When it is a Business Burden.

August sunshine and the scent of the bouquet on the ante-room table meant nothing to Reilly; nor was the breeze from the electric fan at all conducive to a lowering of his mental temperature. On the contrary, they served only to increase his irritation as he "cooled his heels" beyond the outer bulwark of the automobile factory's office, and since he sat with the breeze blowing from his right side, it lifted one by one the long, straggling hairs which he carefully smoothed over from the left side of his near-billiard-ball cranium and dropped them over his left ear; and every time a hair tickled his ear he became more uneasy. Uneasy, however, was a mild word, and the sight of the calm, gum-chewing telephone girl who had told him to wait in the ante-room aroused such a smildering wrath that, had she been a man, he would have been tempted to choke her at least once, just for luck.

Reilly, although his name might indicate that he was a contractor or a metropolitan policeman, was a smart little business man, and at the factory he was rated as one of its best dealers, although his field centered in a small city some thirty or more miles from the municipality of more than a half million population where the factory turned out its several thousand cars every year. Because he was such a good seller of cars, he thought he was entitled to some consideration; anyway, he failed to perceive why any man who called on business should be accorded the reception meted to him. As near as he could ascertain, there must be a big doings around the factory, for there seemed to be an unending succession of conferences which were the stumbling blocks to Reilly's pathway.

It was the time of the year when factories grow anxious about their line and their dealers for the coming season, but Reilly was not cause of worry, for so good was his business that, instead of being purged, he was generally dropped into the big "dos" and signed up in about ten minutes. That was what he was trying to do now. Four times within two weeks he had made the call for the purpose of signing up. The first time he was told the sales manager and other high and mighty ones of the organization were "in conference"; how long it would last the telephone girl said she did not know; so Reilly waited a half-hour and left with the intention of dropping in again and completing the business. The second, third and fourth times Reilly throttled down at the factory door he was given the same old story about the sales manager being "in conference," and not having forgotten the wasted half-hour of the first occasion he lost no time in waiting.

This was the fifth time he tried, and he and the telephone girl felt almost acquainted, and when she smiled wearily and said the sales manager was "in conference," Reilly's Gaelic blood gave an ungovernable surge and he ejaculated "Damn the conference!"

"I almost agree with you," unexpectedly vouchsafed the girl.

"Well, we'll see whether I see the sales manager or not," was his decisive comment. "I came up to-day to see him, and I'm going to see him if I have to wait until next year's cars are out." So he had waited. It seemed longer, but it really was an hour. About the time he had brushed his active hairs back for the twentieth time his active Gaelic temperature gave an upward jump —and to did Reilly.

"Say," he accosted the telephone girl, "when do these conferences generally end?"

"Can't say. Sometimes at one time and sometimes later."

"Well, where are they held?"

"In the directors' room."

"Where's the directors' room?"

"It's the third door down the hall on the left, but there are strict orders that men in conference are not to be disturbed."

"Oh, they aren't? Well, just watch the champion disturber," and before there was time for the spread of an alarm over this breach of office discipline, the irrepressible Reilly went down the hall with his loot on the accelerator, figuratively, and the conference room door, and without even a knock he burst open, and without even a knock he marched into "the conference."

"Can you wait outside a minute, Reilly?" mildly inquired the sales manager, as the invader halted at the table's edge.

"We're in conference just now."

"O, you are?" retorted Reilly. "Well, so am I. I just came in. Didn't you see me? I came in through the door, and I don't know but I'll stay."

"What's the trouble, Mr. Reilly?" soothingly said the vice-president. "Why the hurry?"

"Well, I'll tell you, if you want to know, I'll invite myself into the conference and tell you people a few things you don't know. I honestly think someone ought to tell you, and I guess I can do it, even if I was a trifle warm about the collar buttons when I came in."

"Anyone who has suggestions as to how to improve the business is welcome to our conferences," remarked the vice-president.

"I'm full of suggestions," said the dealer, "but first I would like to know what in hell all these conferences are about. I have been here five times on important business. I have come to sign up for next year, and, incidentally, to hand the sales manager a little information about certain territory that will be worth considerable to him. It's stuff I've got to tell, I can't write it—and where do I get off? The first time I came you were in conference, and I roosted on a seat outside for a half hour; and the second time I came you were in conference, and it was that way every other time. This is the fifth time I've been here, and I waited an hour and then I got a bit hot and decided to see the sales manager if I had to kick in the door.

"While I've been waiting during these several days I've heard your telephone operator repeat 'He's in conference' over the wire until my ear drum aches, and I've seen a regiment of people lined up outside the railing. There was a man from one of the steel mills to see the vice-president, and he waited a while and went away. Half a dozen more were in to see the advertising manager, and there were a lot more that I don't know who they were or what they wanted, but they all seemed to have an idea that the company is on the verge of failure and stacked up against this 'conference' proposition, and I myself haven't been able to figure it out. Now, honest, tell me what's it all about?"

"It seems to me," replied the vice-president, "that you have a wrong idea about things. We aren't going into bankruptcy. We have, however, every day the heads of the conference with the heads of the departments meet with the other men of the company and with the discussion of the subject essential to a decision of the question, and we have a big family wherein each man advances his own ideas and we work for a system of greatest efficiency.

"For instance, and if it's any of my business," boldly asked Reilly, "what were you talking about this afternoon?"

"We were discussing a plan to interest our dealers, as this season we expect to manufacture on a more extensive scale and——"

"Pardon me for 'butting in'; but myself and several more are waiting front hall to get a chance to buy you men an hour figuring how to to sign up, do I get you right?"

"Well," parried the vice-president, "I'm afraid you've got the right idea, that way. I'm afraid you've stood our motive."

"Right here," chimed in the "let me make a speech."

The secretary, be it known, was for results and short sessions, and for things, and was for independent a larger holding of stock he had reinvestment of the business itself, the "saving of it on the sound basis it has not heretofore known, and the establishment of a scale of prices which will permit a living profit. Segall is making a living—his salary guarantees him that—but for the accumulation of previous years the money he has gotten together and put into the business, he has nothing—it is all in the

THE MOTOR WORLD 15

GARAGEMAN WHO INSISTS HE'S IN BUSINESS "FOR LOVE"

Proprietor of One of New York City's Largest Garages Elaborates on Previously Expressed Public Statement—Declares He Makes a Living But No Interest on Investment—Claims Gasolene and Other Profits Equalize Storage Losses and Gives Figures.

When a man arises during an open meeting of his fellow tradesmen and declares that he has been doing business "for love" for some three years, and that he is still pursuing the same profitless existence on the "love" basis, he at once becomes an interesting personage, although many who attended the recent dinner of the garagemen of New York City and who heard this statement made by Maurice Segall, president of the Ashburp Garage Co. grinned or were inclined to doubt the sincerity of Segall's statement for the Motor World's benefit, he sure has produced figures to prove his assertion. His startling arithmetical demonstration resolves itself into the reason why with an investment of no mean proportions, he is realizing not one cent on it.

Segall's establishment is one of the largest and best kept in New York City and is housed in a five story concrete building at 214-16 West 10th street. His brother, J. Segall, is treasurer of the concern, and another brother, David, is employed by the company. All three brothers draw salaries, in fact, and lest it be hastily surmised that the profits may be returning to the Segalls in the way of salaries, Segall stated the amounts received by each, and considering the volume of business and the responsibility entailed, it is fair to add the salaries of the Segalls are far from exorbitant, in fact, some men would hesitate to accept their positions at the prices.

Leaks Stopped, Yet No Profits.

"When the salaries and other expenses are paid," said Segall, "we have absolutely nothing as an interest on our investment; in fact, in the summer months we frequently run behind."

And all this results in a garage which appears to be managed in a thoroughly modern manner, under methods which show "here every cent goes and the source from which every cent is derived. The system of management apparently has stopped up the "leaks" which are the ruination of so many garage businesses and Segall declares emphatically that what is needed is a rejuvenation of the business itself, the

WHY ONE GARAGE DOES NOT PAY.

Receipts—	
Storage	$35.00

Expenses—	
Storage	$14.28
Cleaning	01.20
Inspection	2.70
Material	1.20
Lights, heat, etc.	1.75
Telephone calls	4.30
Total cost	$45.93
Profits	Negligible

were working for another man for a wage and got no further benefit from the establishment.

"Why is it this way?" said Segall. "A great many people do not know. But I know, we are not making a profit on our storage and other sources of income that is at all commensurate with what we have to put into it."

Segall and others who are familiar with the garage trade know that the great trouble with too many garagemen is that they have little system and do not know whether they are making money or losing it. If they come out behind they naturally conclude they have lost it. But where it may have gone they do not know. If they win, they also are in ignorance of the reason. All cry about the high price of gasolene—and this is one reason for Segall's losing game—but when asked for a concrete illustration of the manner in which the raise has affected them, they are at a loss for an answer.

"My brother and I took over this business about three years ago," said Segall, "and today I consider that we have one of the best and most desirable garages in the city of New York. We have tried hard to make it make money, it ought to show a profit of several thousand dollars a year—but it doesn't. We have here a capacity for one hundred cars, and most of the time we are practically full. We charge a flat $35 rate of storage for open cars, runabouts and touring cars alike, while for closed cars our price is $40. We make no difference in price because a car is small, for it takes up just as much room as a big car, and it takes almost as much time to take care of it.

How Storage Charges Work Out.

"Just to show you where we are losing, let me give a few figures that I know are right, because we have an accountant to here every two months to go over our books, and we can put our finger on every penny any minute. Here we are getting $35 a month for a touring car; that figure we will place on one side of the sheet. Now on the other side let us set down a few items showing what it costs to prepare this service that the owner of the car begin for $35. The storage of the car alone we have ascertained from real figures is $14.28 a month for each car, there is a big shop all the $35 goes at one clip. Then there comes the washing and cleaning, this costs us 30 cents a car, and it has to be done every night, that is, provided the car goes out every day, and there are very few which do not. Assuming that there are thirty days in a month, which figure will allow for a few of the days the car does not go out, the monthly cost for cleaning and washing is $21—add that to the cost of storage and we are fifty cents in the hole already.

"You say we can make it up elsewhere! But can we? Look here! After the car has been cleaned by the night man a day man has to look it over. This takes on an average of, say, twenty minutes, for if he finds something not just right, he often has to spend an hour on the car. This is an item that an unsystematic business man likely would overlook, but it counts up. The man works by the week and probably averages 20 cents an hour, this adds about nine cents a day to the cost of keeping the car, and the 30 days total is $2.70. Two dollars and seventy cents isn't much, but on one hundred cars it is $270. That brings the storage cost up to $38.20.

Material Used and Telephone Calls.

"Now, wait a minute! Here's more! The day man in monkeying around the car getting it on first class condition uses up an average of two cents worth of material, and on the monthly total this adds $1.50, making the cost of storage to us $39.70. So far we have lost $4.70 a car and on 100 cars it is $470. Pshaw that loss was my salary. Oh, there's more yet, don't stop figuring! We have considerable overhead that cannot be dispensed with, and for light, heat and elevator power the cost per car

The first Reilly story appeared in MOTOR WORLD *Aug. 8, 1912, when Reilly took up the question of organization conferences. This was the first step by* MOTOR WORLD *toward its present intensive merchandising form. Its second step was a story on a garageman's business, shown on the right, which appeared Sept. 19, 1912.*

terms of "less horses" and so called the vehicles "horseless carriages." It could not decide on a term that was not linked up with the horse.

The early pages of Horseless Age are filled with discussions as to what the new vehicle should be called. It was contended that "motor car" might do for a processional vehicle but never for anything else. Those who drove the cars were to be called "motormen." The word "chauffeur" was as yet unknown.

Engineers contended as to the power of the future. They favored gasoline, electricity, spring motors, acetylene, steam and almost everything else.

A glance at the early pages of Horseless Age seems like a glimpse into a dreamland. There are types of vehicles that present-day men have never seen or suspected as having existed. Moving films of the early days of this industry would pack any movie house to the doors.

Wherefore the earliest papers catered only to engineering and maintenance, and Horseless Age became one of the greatest in this line. It succeeded so well that in March, 1899, it became a weekly, and continued as such until recent years, when it became a semi-monthly.

It delved deeply into the fundamentals underlying this engineering field, which was so new that gasoline education had to be secured with a note-book and a traveling bag. There were no schools that taught about the automobile. The automobile engineers of those days had to build themselves with their own hands in a field whose atmosphere was foggy and shifting, with winds blowing this way and that and a feeling of permanency lacking.

And these early-day editors had to be engineers. They had to study hard. They had to be keen analysts and observers. They had to maintain equilibrium and balance in the midst of instability and freak ideas.

All of this is exemplified no better than in the early pages of Horseless Age. Despite all the turmoil of ideas and so-called engineering the paper aimed true and straight for the industry of to-day. It became a big factor in the industry.

Horseless Age continued as a great engineering and maintenance publication. It printed engineering stories that could not be found in text books. It disclosed maintenance and repair methods that were as Greek to the early tradesmen, many of whom went by guess and some of whom guessed right and are with us to-day.

And then, as the industry began to develop, H. M. Swetland and his brother, A. B. Swetland, realized the possibilities and needs of the field and formed The Class Journal Co., which has operated with the same aims along an unbroken line until to-day. It began with the Motor Review. Later The Automobile was acquired and the two were merged as The Automobile, which to-day is Automotive Industries. At various times it added to its business structure by acquiring such publications as Motor Vehicle Review, Dealer & Repairer, New Centaur, Motor Age, Motor Life, Motor Field, Light Car, Southern Garageman, Southern Motoring, Motor World and now the Horseless Age.

When any of the acquired papers served a class it was continued as a class paper. Others were merged with the papers in the class they most nearly covered, which leaves Motor World, Motor Age and Automotive Industries as the dominating "big three" of the automotive field.

Motor World, which also is a pioneer in automobile publishing, made its appearance five years after the birth of Horseless Age. The first issue was dated Oct. 4, 1900. It has always been published weekly. Something of the aims and objects which have permeated the whole existence of this publication are disclosed in the announcement of the

Digitized by Google

publisher in his first issue when he said: "Motor World harbors no pet hobbies. It believes in progress, improvement and development. Steam, electricity, gasoline and whatever else may be the motive power, and whatever may be the means of applying it, has each its sphere, and each is too full of possibilities for a normal man to set up himself as the limit of knowledge.

"Its editors and publishers are no strangers to journalism. It will be their effort to publish a journal that will be a credit to themselves and to the world within the world that it stands for—a journal that will be free, fair, readable and newsy, and one that will be *steered as far from the rut as efforts can make it.*

"If success is won by deserving it, Motor World pledges itself to leave nothing undone to prove itself deserving."

This motive has been that of the paper since its first issue, and nothing that could be said to-day expresses better the course that Motor World has followed and is pursuing. It has departed from "the rut" in taking the lead in merchandising and business practices.

Until a few years ago there was no merchandising paper. This portion of the field was being neglected, and in order to cover it Motor World was assigned to the duty of representing and promoting merchandising interests.

When Motor World first began its career it became a trade newspaper, and portrayed from week to week the activities of the growing industry. It was considered a leader in the publishing of automobile news, and its coming was watched for by the trade—from men in repairshops to the heads of the largest corporations in the business.

And so Horseless Age and Motor World paralleled each other's efforts, the one covering the engineering and maintenance end of the field, and Motor World reporting the progress of the growing industry.

Motor World of course included in its publication of news the annual technical descriptions of cars, and the descriptions of all accessories and devices that were introduced as allied products of the industry. It also covered races completely. It was read extensively by dealers, and was considered a great dealer paper. The dealers' interests were always kept in view, but it did not go so far as to intensify its field and become a merchandising paper until recent years.

About 1912 Motor World set out as a pioneer to develop the idea of merchandising and business management among automobile dealers, garage operators, jobbers, etc., and devoted considerable study and space to business methods and to automobile and accessory salesmanship.

In the summer of 1912 the "Reilly" stories made their first appearance. The first Reilly story—or rather a story of that character—was in Motor World of June 6, 1912, although the name of the character had not yet been made "Reilly." The second story of this character was in the June 13 issue. The third story was in the issue of July 18. The fourth was in the issue of July 25.

They had appeared more or less irregularly up to this time, but in the issue of Aug. 8, 1912 the character "Reilly" was introduced in a discussion of the question of office conferences, and with very few omissions the stories have appeared weekly during the succeeding six years, a total of nearly 300 "Reilly" stories. These stories were the beginning of Motor World as dealers know it to-day. It was the first systematic attention to merchandising and business methods.

Automobile Club of Great Britain.

The Winton 1898 Model.

The picture at the top of this page from an early issue of The Horseless Age is a Duryea model of 1898. *The lower picture is the first Winton sold and its sale, according to the records, was the first one made in the automobile industry. The car was sold by Thomas Henderson of the Winton company to Robert Allison of Port Carbon, Pa., and was paid for and shipped April* 1, 1898. *The advertising manager of the Winton company at that time was Charles B. Shanks, who is now manager of* MOTOR WORLD

About a month later, in September, 1912, Motor World began to accumulate and print stories relating to the business establishments and methods of dealers and garage operators. The first story was concerning the business of Maurice Segal, who told why his business didn't make more money than it did, and how difficult it was to get from the garage business a reasonable profit. Segal at that time ran the Apthorp Garage in New York City, on West Eightieth Street. Other stories followed. The second related to the manner in which Glen Tisdale, the Franklin dealer in New York, arranged cars on his salesroom floor in order to get a certain effect.

The third story was entitled "Transforming a Fifty Thousand Dollar Loss Into a Snug Profit," and this title typifies the character of dealer stories that were carried thereafter in Motor World from week to week. These stories were the second merchandising feature when the development of this big new idea was begun.

The third feature added was the "Wide-Awake Merchandising Department," which made its first appearance in the issue of Sept. 19, 1912. This department contained sales, advertising and business hints of value to dealers, garage operators, salesmen, jobbers and others. The department was continued until the spring of 1916, when the department was discontinued as a department because the entire paper had become in reality "Wide-Awake Merchandising."

From the year 1912 the progress of the paper began to be more rapid along merchandising lines. It conducted a used-car contest and went into other trade problems.

One of the big feature movements on the part of Motor World was the establishment of its Before Shows Issue. It was realized that dealers want to know what is doing in the industry before they go to the New York and Chicago shows, and that it is inefficient to withhold information about the shows until after they have returned home. What the dealer wants to know is what is going to be at the show so he can study the information and go to the show in search of certain specific things. Wherefore Motor World set a precedent for all publishers Dec. 26, 1912, when it issued its first Before Shows Issue, analyzing the industry completely, and telling dealers what they would find when they got to the New York and Chicago shows.

In the summer of 1913 Motor World conducted a contest on "My Best Sale; How It Was Made," which developed interesting stories on salesmanship and how difficult sales were consummated. About this same time a series was conducted on "How the Manufacturer Can Help the Dealer." This incorporated comments by dealers, the relations between the factories and the men who sold the cars.

But the real big development of the merchandising idea began March 1, 1914, when Motor World, which had been

Digitized by Google

operated as a separate paper by A. B. Swetland, brother of H. M. Swetland, president of The Class Journal Co., was purchased by the latter corporation and became one of The Class Journal papers.

After that the merchandising idea was developed in a typical Class Journal manner. Research was begun to determine what were the needs of dealers, and the paper was revamped in many respects in order that it might better serve its reading clientele.

One of the first departments introduced was entitled "Advanced Maintenance," and had to do with the scientific handling of repairshop jobs.

Realizing that legal problems often embarrass dealers, the present legal department was introduced, and since March, 1914, has continuously handled problems of law relating to the trade. Analytical stories on business conditions throughout the United States were gathered and printed.

For the first time in the history of trade publications a show was "covered" from a merchandising standpoint. Under the new Motor World methods the Boston show was analyzed on an advertising and salesmanship basis. This story compared the good and bad methods of dealers at the shows, pointing out how show displays should be arranged and should not be arranged, how a salesman should operate in a show exhibit, how show work should be planned, and went thoroughly into all those other features that are of business interest and value to the dealer who is spending money for show space.

Since that date Motor World has enlarged this work greatly. As a result of its efforts in the winter of 1915, the show methods in hundreds of cities have been entirely revamped. Displays are better, great efficiency is secured by dealers, and the financial benefits to the readers of Motor World are beyond estimate.

One of the most progressive steps by any paper in the trade was taken in the winter of 1915, when Motor World adopted the practice of sending its editorial men out on the road, traveling from town to town, calling on dealers and garagemen, and finding out what their business problems are, what their good and bad methods are, and in that way getting close to the trade and its problems and making itself better able to serve its readers. Since that date Motor World representatives have traveled thousands of miles and have spent months on the road. *There is hardly a time throughout the year when some editorial representative of the paper is not absent from the office on outside work of some kind.*

The organization is always kept close to association work. Representatives of the paper are often in consultation with the engineers of factories months before new models are put on the market. In this way the publication has been able to be in advance of the trade in methods and practices, and has become a leader and a teacher, rather than a mere reporter of news.

Statistical departments were another development. It was realized that dealers want to know the statistics of all the cars on the market from week to week. One of the first features of this kind was the "Motor World Guide," which has since then expanded until it appears monthly in complete form, taking 15 or 20 pages, and covering cars, trucks, tires and other things.

MOTOR WORLD

DIRT vs. $'S

The Dirt vs. $'s Campaign was one of the most effective enterprises ever undertaken by MOTOR WORLD *and made thousands for many of its readers in showing them how to clean up their place of business and make money out of the sale of accessories*

Marking a step in trade journalism, and proving a sensation throughout the trade, Motor World, April 28, 1915, began its now famous campaign entitled "Dirt vs. $'s." This aimed strong shafts at the methods of dealers and garagemen whose places are not clean, and who are not developing the retail sale of accessories to its possibilities. This campaign was conducted in energetic form for several weeks. Since then it has been continued as one of the standard lines of progress of Motor World, and always will be continued until—if that day ever should come—there is no longer a need for it.

Campaigns were aimed at the mail order houses, and methods were suggested to dealers for meeting the competition of the mail order house, especially in Western territory.

But one of the biggest benefits Motor World ever gave to the motor trade was its Winter Business work. A special Winter Business Number appeared for the first time Oct. 11, 1916. Following this number Oct. 11, the Winter Business idea was pushed in a two-page department for twenty weeks during that winter. Last fall the second Winter Business Number appeared, and the Winter Business idea was again followed up energetically throughout the winter. The Winter Business idea is now familiar to every one.

Complementing the Winter Business Number, Motor World published also a Summer Merchandising Number, which appears at the beginning of the summer season and is filled with ideas and suggestions that make money for its readers during the summer months.

There is no phase of dealer activity that hasn't been covered in Motor World from the service department to the office of the business manager out front.

In order to cut costs and produce greater speed in service work, the Department of Better Mechanics was added. This told step by step how certain difficult repair jobs were made. The Repairshop Shortcuts, which consists of two pages of illustrated and simply described shortcuts to efficiency in repair work, has proved valuable. A window display service was operated. A department is conducted wherein readers may express their own opinions.

Opened Washington Office

Since the war started The Class Journal Co. has opened an office in Washington, D. C., and maintains a representative there at all times in order that readers of Motor World and the other Class Journal papers may be kept in closer touch with developments in the national capital at this critical business period.

About two years ago The Horseless Age also began to concentrate on the merchandising idea and changed its editorial make-up until it was operating in practically the same field as Motor World. Both papers were aiming at the same object and were pursuing approximately the same methods. Therefore, The Class Journal Co., when the opportunity offered, added The Horseless Age to itself in order that it might go forward in a still larger way to continue the development of the merchandising and better business idea.

This combination of the most advanced ideas of the present day, and the most remote history of early days in the industry, finds The Class Journal Co. and its publications more strongly intrenched than ever. Greater plans for the future are in prospect. Just as the trade has watched from week to week the new things that have appeared in Motor World, so it may expect to find in succeeding weeks other new things and other ideas and methods that will serve to help the trade more profitably to merchandise the automotive products and become more progressive.

Underlying it all remains the fundamental Class Journal idea, which is that no paper can succeed unless it also serves. On that basis Motor World has been built until it is

"More Than a Trade Paper—
An Institution of Service."

Drive-away Bureau

ASK FOR INFORMATION—AND—GIVE US INFORMATION

THIS department will be continued indefinitely. Its aim is to provide a clearing house for information as to routes, road conditions, hotel rates, garage rates, unfair conditions, new routes, etc. Motor World will make an effort to get any information you desire. In return, all dealers are requested to forward promptly any information they have regarding drive-aways. Send your information so it will reach New York not later than Monday of each week.

Here Is a Good Plan from W. A. Rutz

EDITOR Motor World: In reference to your drive-away page in Motor World, I have read some of the letters with considerable interest. We, of course, have to drive all our Buicks, and as I have told you in previous correspondence, Peerless and White either drive or get their cars by express to New York so that we get New York delivery on them.

In reference to driving, as long as it is a necessity we are going at it as systematically as possible and with good grace.

We have hired one man whose duty it is to drive or have charge of driving all cars from the factory. When we have three or more cars, we send one good mechanic from the shop to take care of minor adjustments that are occasionally necessary.

Rules for Drivers

The man in charge, the captain, works under strict rules as to maintenance of sensible speed, observation of road rules, etc., and each driver signs an agreement, copy of which is attached and which seems to have a good effect upon their behavior. We are also attaching a copy of instructions given to the captain.

Oil in Gasoline

In our opinion cars that are driven over the road the way we do it are much better cars to deliver to our customers than those that come by freight. In the first place, we put a quart of cylinder oil with every 5 gal. of gasoline the first few hundred miles. Then for the first few hours a speed of 20 miles an hour is maintained, and thereafter they never go over 30 miles an hour.

At the Finish

When the cars reach here we clean the carbon, touch up the valves, take out all rattles and squeaks, put fresh oil in the crankcase, and from our experience to date we see very little of these cars after they are delivered to our customers, whereas when we deliver a car which has arrived by freight we usually have it in every few days for the first five or six hundred miles to have the little things taken care of that we take care of on the driving and after the car arrives here.

Very few people that we sell cars to say anything to us as to whether the cars have come by freight or whether they have been driven, and when the question is brought up it is a very easy matter to convince them that cars that have been driven are much superior and easily worth the extra money we have to pay.

We are charging $100 for transportation on Buicks, which just about covers the driving expenses and tuning up before the car is delivered.

So far we have brought all but three cars through without a scratch. We had one bent fender on one, one broken windshield on another and one smashed rear wheel on the third. For a matter of about $2 or so we covered them for collision insurance when en route, and we think it is very well worth while because if we ever have a real smash-up we will be ahead of the game.

Trusting some of your readers may find the foregoing of value, that is, if you consider it worth publishing, I am yours truly, The White Motors Co., New Haven, Conn., W. A. Rutz, General Manager.

Rutz's Driving Orders

I (name of driver) do hereby agree to serve The White Motors Co. in the capacity of automobile driver from Flint, Mich., or any other given point to destination as specified by said company's representative. I further agree:

1—To obey all orders or requests from the captain, Mr. John H. Law, or any other captain who is in charge.

2—I am willing to be up bright and early in the morning at whatever time the captain says, and be ready to start with the rest of the crew. I will be willing to do my share of the greasing, oiling, etc., at night when I get in and before I get cleaned up and eat my evening meal.

3—To obey all speed laws or traffic regulations, and promise that at no time will I exceed a speed of 30 miles an hour, and will only travel at this rate after the car is thoroughly limbered up and when the roads are good; otherwise my speed limit will be 25 miles an hour. These limits are only to be reached when within the speed law and the condition of the roads warrant it. I will be particularly careful to observe speed laws and traffic regulations when driving through villages and towns.

4—I promise to keep in my respective position as assigned to me by the captain when driving, and to keep 100 ft. distant from the car in front of me. Should my car be disabled I will signal the horn three distinct times, in which case all drivers should stop. I promise that at no time will I separate from the rest of the crew that I was sent with, unless authorized by the captain to do so.

5—I promise to look presentable and to act in a gentlemanly manner at all times when in hotels, restaurants and trains. I will also make as little noise as possible when going through towns, and be particularly careful not to annoy anyone when blowing the horn.

6—I promise not to run with the cut-out open. I will also see that the tires are inflated not too hard at all times and will not run my car unless both the foot and emergency brakes are in proper working order. I will not put the top down nor will I lower the side curtains unless authorized by the captain to do

Digitized by Google

so. If I am allowed to put the side curtains down on account of rain, I promise to get them up as soon as possible when it has stopped. In addition to taking the best of care of the car, I will also bring in complete all tools, accessories or any other material that is given to me for that purpose. I will not make any marks or impression on the top, body, or any other part of the car. I promise to be of whatever assistance I can to the rest of the men of the crew in helping them bring the cars in as nearly brand new automobiles as possible.

7—Should I be arrested for violating any of the state, city or county laws, I agree to pay the fine wherever same is imposed, and where there is an alternative of serving the time I will not do so. If I have no means of making settlement I will agree to let the captain do so, and that the amount involved will be deducted from my salary.

8—I promise again to obey all orders issued by the captain, and should my services not prove satisfactory the said company's representative has permission to discharge me on the road and pay me my salary up to that time. Said company is not obliged to pay me any further compensation, or to pay any of my traveling expenses after I have been discharged.

9—In consideration of the above I am to receive $3 per day and my necessary traveling expenses, and hereto attach my signature in acceptance thereof.

Signed (Driver's signature).

Instructions to Rutz's Drive-away Captain

1—All accidents, whether personal or property, must be reported. Wherever a slight accident occurs and does not warrant reporting same to the insurance company from this office, always get a release signed by the person affected.

2—Whenever a car is disabled and cannot be brought in on its own power, tow it if is safe to do so. If it is more than a few days' run from New Haven get the necessary work done at the first Buick repairshop that can take care of it that you strike. Don't leave any cars on the road or in storage anywhere unless it is absolutely necessary.

3—When cars are left for the night you should see that all cars are locked and retain the keys. Cars should not be left unguarded at any time during the day unless the switch is locked.

4—Caution your men not to take any chances and impress upon them to give any other vehicle the right of way at all times. This is the safest way.

5—Speed laws of the various states should be strictly observed. In the first place these new cars should not be driven over 30 miles an hour for the good of the car, and in the second place, if you hold to 30 miles accidents are frequently avoided that happen when going over 30.

6—If it is necessary to leave a car which is disabled, see that it is stored with responsible parties and get a receipt for it. Make a note of the parts which need replacing and see that it is as complete as possible. This will enable us to get the parts to the car within the least possible time and also a man to make the necessary repairs.

Here's a Free Driver

Editor Drive-away Bureau, Motor World: In connection with your "Drive-away Bureau" I will be glad to get in touch with one of your readers who anticipates making a drive-away from Detroit or Flint or other plant to a point *west* about June 10-20.

Am going to 'Frisco to bring back a car that is there in storage, and will be glad to "Hooverize" expense going out by driving part way—the further the better.

Have had 17 years' experience, can furnish references and drive all types of cars.—Yours very truly, River Road Garage, W. Andreas, Prop., Teaneck, N. J.

Want Some Women Drivers?

Editor Drive-away Bureau, Motor World: Your very interesting article in the May 22d issue of Motor World with respect to drive-aways and the fact that you ask for information has attracted our attention, and we are pleased to put before you a plan that is not new and has been tried out with great success in many cities throughout the United States.

Women drivers have proven their claims with regard to caution, carefulness and good understanding of varying road conditions in all drive-aways in which they have participated, and results prove that an equal number of driving miles per day at a speed not to exceed 30 miles per hour has been consistently accomplished by them in all of the drive-aways where women have been employed.

The Women's Motor Vocational and Industrial Corps, with headquarters at 231 West Fiftieth Street, New York City, Mrs. Harper, M.C., directress, has just organized a number of branch drive-away units—one of the many business branches of her corps—and each of these women drivers is a capable, experienced road driver with complete understanding of the conditions under which drive-aways are conducted. The units when engaged by any motor car company that has difficulty in securing men to take care of delivery will make a valuable business asset and publicity feature.

The advantageous points of securing the services of these units of women are these:

No drinking, no smoking, early rising for an early getaway in the morning, a dignity that carries weight wherever the cars are driven, splendid publicity and one-third less expense.

We inclose a picture of one of the units, and shall be glad if you wish to furnish you with the details of some of the experiences already had in this kind of work if you consider the printing of any part of this article or letter in your paper. The picture may be used if you care to give it space or we can furnish a better one if wanted.—Yours truly, Women's Motor Vocational and Industrial Corps, New York City, V. W. Spurgeon, Director.

DRIVERS FROM THE WOMEN'S MOTOR VOCATIONAL AND INDUSTRIAL CORPS—Mrs. M. C. Harper, chief; Lieutenant Geise; Sergeant Carmichael

Wilmington Drive-away

WILMINGTON, DEL., May 31—Wilmington, being situated on the direct railroad line between New York and Washington—Pennsylvania and Baltimore & Ohio—where there is especially heavy government traffic, is handicapped so far as commercial transportation is concerned more than many other cities, and, while some of the dealers are contenting themselves with the extra cost of express shipments, which are proving satisfactory and dependable, most of them are now in the drive-away class.

Some send men all the way to the factories in the Middle West, while some have arrangements whereby they can get what they want from intermediate drive-away points. There are still others that can get their cars from water points, where transportation by boat brings the cars part way. Some are driving in as many as 15 to 20 cars a month, in addition to what they can get by freight.

Among the concerns that are driving in cars either from the factory or intermediate points are: F. B. Norman & Co., Ford; Packard Co.; Guy R. Ford, Overland; French Street Garage, Reo;

Drive-away Bureau (Continued from Preceding Page)

Cahill & Co., Dodge; Gomery-Schwartz Co., Hudson; Delaware Motor Sales Co., Cadillac; Sweeten-Wilmington Co., Hupmobile; Taylor Motor Car Co., Haynes. —A. O. H. Grier, Motor World representative.

What Drive-aways Have Done

Governors of the different states, who are in all cases at the head of the various State Councils of Defense, will be asked by the National Automobile Chamber of Commerce to request local authorities not to interfere with the overland delivery of new automobiles and motor trucks from the factories to dealers.

The manufacturers and dealers are relieving railroad freight congestion by delivering new cars under their own power instead of shipping them by rail. Thirty-three per cent of the production of eight of the larger automobile manufacturers was delivered over the highways during the first three months this year. The number of machines driven away was 38,900, which relieved the railroads to the extent of about 10,000 freight cars. With a probable production of 1,000,000 motor vehicles this year, the total saving in railroad cars by this method will amount to about 80,000 cars.

Considerable trouble has been caused by local officials, who insist every car in the drive-away "strings" shall carry a state license plate, and sometimes that each driver shall have a state operator's license. Owing to lack of uniformity in the state motor vehicle laws, full compliance with requirements in one state is not held to be sufficient in some of the other states, and much delay, annoyance and additional expense have resulted needlessly.

The N. A. C. C. has taken this matter up with the Director-General of Railroads, with the Secretary of War as chairman of the Council of National Defense, and with the Secretary of Commerce as a member of the Council. It is also preparing a definite plan to offer to the governors whereby motor vehicles in transit may be allowed to proceed to destination without interference over the question of licenses.

When the motor vehicle laws were enacted, no such shipping situation as now exists was foreseen, and no provision was made for delivery of motor cars by highway. The purpose of license plates is to identify the car and its ownership in case of accident or infraction of operating regulations, and where a string of drive-away cars remains together and the cars carrying improvised duplicates of the manufacturer's or dealer's license plate such identification is sufficiently established for this purpose.

Many manufacturers and dealers are urging the enactment by Congress of a Federal license law which will sweep away the lack of uniformity in the state laws that are now interfering with this form of interstate commerce.—National Automobile Chamber of Commerce.

Philadelphia Drive-aways

PHILADELPHIA, May 29—Among the dealers who are driving cars in large numbers from the factories are:

Oldsmobile Co., 231 North Broad Street, Oldsmobile; Peerless Automobile Agency, 2314 Chestnut Street; Paige-Detroit Motor Car Co., 304 North Broad Street; Packard Motor Car Co., 317 North Broad Street; Fanning-Mathis Co.; Marmon Motor Car Agency, Broad and Race Streets; Studebaker Agency, Broad and Callowhill Streets; International Motor Co., Mack, Chestnut, near Twentieth Street; La Roche Bros., 1214 North Broad Street, Velie; Bell Motor Co., 613 North Broad Street, Empire, Davis and McFarlan; McCurdy-Brainard Co., 707 North Broad Street, Jordan; Hupmobile Sales Corporation, 441 North Broad Street; H. P. Baker Motor Co., 918 North Broad Street, Oakland; Thornton-Fuller Auto Co., 2037 Market Street, Dodge; Cadillac Auto Agency, 144 North Broad Street; Buick Motor Co., Broad Motor Co., 669 North Broad Street, and Poplar Streets; Samuel Earley Mercer.

Routes to Philadelphia

Michigan and Ohio Points to Philadelphia with Some Alternate Routes—The favored short route from the various motor car factories in Michigan follows: Starting from Lansing, Flint, Pontiac or Detroit go to Jackson, to Blissfield, turn toward Toledo, skirting city on Cleveland road to save time; thence to Maumee, crossing Maumee River bridge to Perrysburg on direct route to Fremont, Ohio; to Bellevue, to Norwalk, to Elyria, Ohio, first big stopping point en route. Lansing to Elyria is a 12-hour run, starting at 8 a.m. usually and finishing at 8 p.m. Leaving Elyria next morning, follow fine macadam road 25 miles long to Cleveland.

There run out Euclid Avenue to Euclid, turning right at centering corners and turning left on first road to Chagrin Falls, thence taking old Cleveland-Pittsburgh turnpike to Warren, to Youngstown, to Darlington, to Beaver Falls, next big stop. From Beaver Falls run to Pittsburgh, taking Lincoln Highway through Greensburg. McConnellsburg, Chambersburg, Gettysburg, through Lancaster to Philadelphia, a distance of 750 miles from Lansing. Other stops usually made at Chambersburg. Lansing to Philadelphia is a four-day run.

An alternate run is from such Michigan points as Lansing, Jackson and Flint to Toledo, Monroe and Detroit, taking steamer to Buffalo, thence running from Buffalo to Williamsport through Harrisburg to Philadelphia; or from Buffalo to Binghamton to Scranton, or through Wilkes-Barre to Philadelphia, the run from Buffalo to Philadelphia consuming two days. At the start, skirting Toledo, as per first route given, is 50 miles shorter then going through by way of Detroit.

Here is what is known as the "war route," now largely used by truck manufacturers working on government contracts: Detroit to Toledo, to Fremont, to Bellevue, to Norwalk, to Elyria; thence to Cleveland, to Ravenna, to Canfield, to Darlington; thence to Beaver Falls and so on to Philadelphia as per first route mentioned.

Drive-away managers report gasoline along these routs never more than 30 cents a gallon, and some points as low as 22 cents. Garages consistently fair, in no case more than 50 cents a night, the usual charge being exceeded for storage charges.

Farmers in vicinity of Beaver Falls inclined to charge exorbitantly for pulling cars out of mudholes in rainy weather. One flagrant case was where a charge to one dealer whose three cars were thus stranded was a "hold-up" of $25 to get the machines free of the mud.

Hotels along routes usually good and charges always fair, ranging from $2 upward.

Roads out of Michigan into Ohio good in dry weather, but through the valleys land is flat and settling pools of water, seeking soft and lower points, makes bad going and deep ruts. Roads need elevating above mud level in some places en route to Elyria. Fine running from Elyria into Philadelphia, except in winter, when drifts form.—K. H. Lansing, Motor World representative, 1406 North Sixty-second Street, Philadelphia.

Dealers Can Avoid Drive-away Difficulties

DETROIT, May 29—Factories are notifying dealers who participate in drive-aways, and who are frequently stopped by local officials of the insufficient supply of license plates, that they can avoid much of this difficulty by purchasing a number of duplicates and attaching them to each car in the train. These duplicates can be used again on subsequent drive-aways during the year. In a letter to the National Automobile Chamber of Commerce, Francis M. Hugo, Secretary of State of New York, writes:

"The motor vehicle law of this state does not authorize this office either to grant privileges (for running cars through the state under their own power) or to issue any 'in transit' tags. The proper way to do is to get out extra sets of dealers' plates enough to cover all shipments of cars to be used on the cars while going through the state. After the cars are delivered at their destination the plates can be shipped back to the manufacturer and used for the next lot."

Under the reciprocity provisions of the different state laws, these plates will be recognized and the strings of cars permitted to pass through. A fee of $5 is charged for each set of duplicate plates for one car.

Digitized by Google

Boston Drive-aways

BOSTON, June 1—The New England motor dealers have solved the problem of getting cars here by their drive-aways, though some of them have had cars come by freight and express recently. Overlands from Toledo, Empires, Coles and Marmons from Indianapolis, Dorts from Flint, Chalmers from Detroit and Oldsmobiles from Lansing came through by train within a couple of weeks.

Others have had to drive over the road. The Mitchell-Lucas Co. sent men to Racine and they reported good roads to Chicago except 10 miles; very good to South Bend; a few poor stretches to Cleveland, and from there through Buffalo, Albany, Springfield to Boston very good.

Dodge cars have been coming regularly over the road, and the drivers report better roads now with the dry weather. They come from Detroit via Cleveland, Buffalo and Albany. The Buicks have been driven to Detroit and then sent by boat to Cleveland and Buffalo; the Studebakers have come all the way through from Detroit, and so have the Cadillacs.

In all cases the machines need merely a little washing and brushing when they get here. None of the companies getting cars over the road report instances of overcharging at garages or hotels along the route. They have made their arrangements for night stops at some of the places recommended by dealers in the same lines as they handle, and in this way are not being held up.—James F. Sullivan, Motor World representative.

St. Louis Drive-aways

ST. LOUIS, June 1—No changes are suggested by drive-away directors in the route given from Detroit to St. Louis in Motor World of May 22.

There is another route from Toledo that some of the leaders like, but even they do not say that it is better than the other. The route given was Detroit to Toledo by the Government truck route —from Toledo through Defiance, Fort Wayne, Alexandria, Anderson, Indianapolis. Here is the other route: Toledo to Bowling Green, Lima, St. Mary's, Celina, Cold Water, Portland, Muncie, Anderson and Indianapolis. George Weber, of the Weber Implement & Automobile Co., is one of those who likes this route. Asked if there were any warnings against it, he said: "The hotels, restaurants and garagemen over the entire route from Detroit are strong for the drive-away parties now. They like our business and they treat us well."

The drivers who have made the trip numerous times say the only complaints heard recently from hotel and restaurant men was this: "I wish you had wired me and I would have had something extra for your boys."

During the last two weeks the weather has been ideal for roads, except as to dust. In the main the country road overseers are showing great zeal in keeping their highways shaped up despite the heavy traffic on some sections. The idea of police protection for cars parked over night appears to be spreading.

Recently work has been started on a brick road south from Effingham, Ill., that will make travel better to Greenville when completed. It is understood that the work is to go on this summer to completion.—Clyde Jennings, Post-Despatch, St. Louis, Motor World representative.

Michigan to Kansas

Editor Motor World: Enclosed under this cover you will find write-up of drive-away from Flint, Mich., to Kansas.—G. H. Schultz, care William Small Co., 112 West North Street, Indianapolis.

In the May 15 issue of the Motor World occurred a very interesting letter from H. S. Collinson of Arkansas City, Kan., regarding drive-aways from Flint, Mich., to his destination in the West.

I have had quite a good deal of experience over the different routes leading out of Flint to points south and west, and will outline the best route and the only one worth while considering in my estimation.

In the first place, endeavor to miss the sandy roads and heavy hills of south Michigan and west Indiana, also straighten out the trail and return your mileage, thereby saving time as well as expense on the trip.

From the main street in Flint go west to the Chevrolet factory, turn south at the little Greek restaurant on the corner, two blocks, then west on the Lansing road, which will prove to be a good hard road and about a 65-mile run. Turn south at Lansing on first business street, go past the State House and near the south part of town you will notice the Reo Motor Co.'s large factory on your left. Continue on south, several blocks further the street develops into a fine drive along the river bank, with a southwest angle, passing the beautiful cemetery on your left, you make Albion your next objective city. You will find a beautiful country, fine roads and numerous well-kept small villages.

The road is not marked, but get your routing at the small towns you pass through.

You will find the people very courteous. Reaching Albion, go south on main street, cross railroad track and inquire at first large garage on east side of street your routing to Quincy, which will be your next large town.

You will find this garage a good one to take on supplies. I have stopped there numerous times, and although a "stranger in a strange land" was treated very courteously with reasonable prices and efficient service.

Your road to Quincy will take you by some beautiful lakes, and if you are a follower of Isaak Walton you will be greatly tempted to stop and enjoy the sport.

Just before you reach Homer there is a bad curve down and around a steep hill, but the road is solid and although there have been some bad accidents at that place you should not worry, for it isn't good policy to be "hitting her up" too fast on a strange road. The road then on to Quincy will be nearly all level. Drive with an angle of west by south.

Quincy has good reasonable hotel and garage service and the proprietors will not take undue advantage of a tourist. I have stayed there over night and speak from experience.

Leave Quincy on the main street, go west about three miles, then turn south and head for Angola, Ind.

You will have only one or two hills with no hard grades, no sand of any consequence and a good hard road past fine farm houses and through a progressive, wealthy, farming and dairying country.

Reaching Angola you will find good restaurant service at several places around the circle and a good garage on the second street south of the circle.

Take Wayne Street leading south from the circle and on through the picturesque little hamlets of Pleasant Lake and Waterloo to Auburn, about a 20-mile drive over a fine macadamized pike. Go south on Main Street to the end of it, then west two blocks, turn south, cross the railroad, then head for Ft. Wayne, about 22 miles, over a fine pike with very few abrupt turns and all places where you would be likely to get off the road, you will find large finger boards pointing the road to Ft. Wayne.

At the edge of the town you will cross a large iron bridge over the river, then on to Burr Street to Main Street, then west to Court House Square.

Ft. Wayne is quite a busy city and accommodations are ample to suit all sized purses. In getting out of this city to Huntington, Ind., your next large town, you will have to be careful or you will get off the route.

From Court House Square go out Main Street to Broadway, then south under the railroad viaduct, follow the Blufton interurban car line, out the Blufton pike about five miles to a school house, then take the right-hand fork road, west by south angle, through Zanesville then nearly west on to Huntington. As soon as you come to the main street leading south turn and cross river bridge, go two squares beyond the bridge, then turn west and follow south across long covered bridge, then on to Mt. Etna, straight through on south by west angle—fine pike on to Marion.

This city has good hotel and garage service and the folks are a very congenial bunch.

Leave Marion out South Washington Street to Kokomo Pike, then west through Swayzee and straight on to Kokomo. From Kokomo leave the Court House Square, go south to where car line turns west, take this pike through Russiaville and on south by west to Frankfort.

You will find this a progressive, hustling town and good accommodations.

From Frankfort take the angle, west

HIS OLD MAN WAS A DRUNKARD

ISN'T THE JOBBER TO BLAME FOR CONDITIONS IN ACCESSORY RETAIL MERCHANDISING?

A BOY grows up in the slums. He becomes an anaemic dwarf with the morals of a gunman. He fails in school. He fails in the field of business.

All through his youth he is a problem. The police have trouble with him. School teachers can do nothing with him. Nobody can make anything out of him.

And then—one day somebody says: "Oh, he can't help it! His father was a drunkard!"

The lad never got a fair start in life. He rushed the can. He was bred in immorality and the absence of real civilization. Can the boy be held to blame? There are those who say the blame rests upon society—upon you and me.

If the boy makes a medium mark for himself in the world he is entitled to much more credit than another boy who reaches the same mark but didn't have so far to go.

And we find the same set of circumstances in the retail merchandising.

In Other Trades

IF a man wishes to set up in the hardware business, one of the first things he can do is go around through the hardware trade and get ideas as to how a hardware store ought to be run.

If a man wishes to set up in the drug business, he may go around through the drug trade and see the best methods that are employed in the drug business and the best plans for laying out and conducting a store.

The same thing may be done in the drygoods and many other trades.

After all these people have made their investigations in the trades they are about to enter, they will find that they must conform to rather high standards if their establishments are to hold their own in the competition they are to meet.

At the center of a live eastern village is a drug store that compares well with the big city stores. On a side street is another drug store run by a man who has all the earmarks of poor business. But this man nevertheless has a pretty fair looking drug store.

Why?

Because he knows that if he is to amount to anything at all he must come somewhere near the standard of his trade. And to know what this standard is he has only to go down to the corner of Main Street and see how the other operates.

He is not a good drug store man because he is naturally so. If all other stores were poorly run his would be poorer than all the others—but circumstances compel him to be modern.

No Good Examples

But if a man wishing to enter the automobile and accessory retailing business makes such an expedition he does not return from it with as high an idea of trade standards as is secured from visiting older and more substantial trades. *He finds few or no good examples. He has poor neighbors.*

This lack of higher standards—of good environment—is one of the drawbacks in the motor car and accessory business. The purpose of this story is to discuss the accessory end of it, because that is the one feature of the motor car trade that has lagged more than any other during the years that the automobile business has been developing.

The absence of high-grade methods and high-grade stores is one of the things that is lamented by the jobber of accessories. He complains that his goods do not move on to the public in sufficient volume because the dealers are not highly educated along business lines and do not maintain stores that are an attraction to the public. Furthermore, he contends that the dealers do not use aggressive merchandising methods and are passing up many opportunities of selling accessories.

All of these things are true.

There are a few good accessory stores, but there are thousands of accessory stores that can no more compare with hardware and drug stores than the Bowery can compare with Fifth Avenue.

The Jobber's Duty

There is therefore a great opportunity for someone in taking a more aggressive lead in setting up higher standards of "tradesmanship" in the accessory retailing field. *There is an excellent chance here for the accessory jobber to take the lead in the constructive work that he would like to see done.*

Of course, publications have taken up this work and prosecuted it actively for several years, but something in addition to that is needed if the desired progress is to be made. *The backward environment must be removed. New standards must be set up.*

One does not censure the heathen in Africa because he isn't a more intelligent or ethical man, because it is well known that he is in an environment that is not conducive to more rapid development. *He looks about him and sees other savages, wearing no clothes, knowing very little, and making no effort to acquire education or civilization. Therefore if he can acquire a herd of cows and a half dozen wives he becomes a man of influence in his part of the dark continent and is considered a leader in such civilization as his country boasts.*

He is not held to account—*because he has no one to teach him better.*

The operator of a garage may visit all the places in his town and not see anything that is very constructive. He may come back to his own place and find that it compares very favorably with the others. *On the other hand a critical observer may go into this so-called "best place in town" and find that from a merchandising standpoint it is several years behind.* It cannot compare with the few isolated instances of aggressive merchandising that exist in a few of the cities of the country.

Good Standards An Essential

The drug store man, if he makes a circuit of the trade, will find that his store must be neat, that his floor must be clean. He must have counters and

Digitized by Google

showcases and shelves. His goods must be neatly arranged on the shelves. He must have scales, wrapping paper, twine, in the summer a soda fountain, uniformed attendants, a pay-station telephone, a department for the sale of stamps, red and green bottles in the window, a good sign over the door, a good display window and a great many other things.

The hardware man will find that he must have a somewhat similar lay-out. The interior of his store must be up-to-date—although, of course, there are very ancient models of merchandise to be found in all trades—but in the hardware and drug trades, for example, the general plane of business is much higher than it is in the garage and accessory fields.

For the ideal merchandising of accessories there should be in every garage an accessory department. *This should include wall shelves, such as are found in hardware and drug stores, showcases of glass, good display windows, a cabinet beside the entrance where all the cars drive in and out of the garage, well-dressed and intelligent clerks, a sales and merchandising system, accounting methods and many other features.*

But the garage and accessory man who goes around the town in his own city looking for the best methods that are employed is quite likely not to find set

before him all of these things which he ought to have if he is going to conduct a business that will net him profits reasonably near the maximum.

The ideal arrangement, of course, would be for the entire trade to move upwards at the same time, so that all of it would reach a higher level at the same time, but this is rather problematical and highly improbable. THE GREAT NEED IS FOR THE CONSTRUCTION IN THE TRADE OF SEVERAL WHAT MIGHT BE CALLED HIGH SPOTS THAT WOULD SERVE AS AN EXAMPLE FOR THOSE WHO ARE OPERATING ON A LOWER MERCHANDISING LEVEL—JUST AS SOCIAL WORKERS OPERATE AMONG THE POOR.

Even greater than the need for these high spots is a systematic campaign for bringing these better examples of merchandising to the attention of those who can profit by them.

How then can this be done?

It is possible for the jobber to do a considerable portion of this work and benefit his business now and during the years that are to come to an unthought of degree.

How can the jobber do this?

He can do it by setting up somewhere in his own place of business, or in the place of business of some good dealer, a model merchandising store.

This would be laid out along the most approved lines for the selling of accessories, and would be operated with the best of methods. The jobber might set up such an establishment in his own place of business and sell accessories at retail, although of course the jobbing trade is to-day trending away from the retailing of accessories rather than toward it.

Use Dealer as Model

As an alternative, a jobber might induce a good dealer in his own city to permit the jobber to work with him in laying out a model accessory store. This store would then always be available as an example to dealers who were customers of the jobbers.

The jobber could bring the dealer customers from his territory in to the home city once in a while, take them around to this model store and show them how it is operated.

There would be available the business records of the store, showing the forms and systems that are used, how profits and losses are watched, how leaks and losses have been corrected, how profits in certain departments have been increased, how slow moving goods have been disposed of, how advertising has been conducted, how the clerks dress and conduct themselves, how car owners are induced to increase their purchases of accessories, and how the whole business has been made to grow and increase and profit by the use of these more modern methods.

If a jobber were able to get 100 customers from his territory into this model store in the course of a year, the ideas that would be disseminated throughout the trade should do a great deal to boost the business of this particular jobber. Furthermore, it should help increase good-will, *which is one of the factors that is getting and requires serious attention at the present day in the accessory trade.*

Teach the Dealer

Having shown the dealer this model store, the jobber might then volunteer to assist this dealer in putting his own place of business on this modern basis. He might go so far as to operate a *garage efficiency department*, as does one Philadelphia jobber, the sole purpose of which is to teach dealers how to run better places of business, how to sell more accessories, how to make more money for themselves, *and at the same time how to increase the business of the jobber.*

Furthermore, every time a dealer is educated along these better lines, and is made a better business man the business of the jobber is not only increased but the securing of it is made much easier—*and the sales cost is decreased.*

How to do this is probably the great problem. Were all jobbers operating retail departments, and were the tendency in the jobbing trade to concentrate on retail business, the jobber's own retail store could be used as the example, but since the tendency is the other way, *the alternative probably is to use the place of business of some dealer.*

Furthermore, the jobber's store would probably be more elaborate, larger and more expensive than anything that the dealer would need in his own business. Therefore, the example, as set up in the jobber's building, would not be true to life and greatest value would not be obtained from it. *What is needed is something that is as nearly as possible like the store that it is expected the dealer will set up for himself.*

Modern business is coming to believe more and more in the theory that a great deal of missionary work must be done, even though it does not yield a money return during the next 6 months, and this educational work comes under that head. One large arms and ammunition company operates a promotion department that is working on the benefits to the company that are expected to come 10 and 15 years from to-day.

All of this will cost money, but there is no reason why a jobber who is making money cannot set aside a certain sum for the operation of such a department and begin at once the education of his customers to buy more goods from him.

What is needed is a greater effort on the part of the dealer, the man who is to pass the goods on to the retail customer, and make 100 *per cent effective the consumer advertising done by the producer.*

The jobber's salesman is the secret of the jobber's success. He can develop untold values if he works along right lines. He can work along right lines—and will gladly do so—if shown the way. *But in order for the jobber to show the way to his own organization in this work the jobber must* FIRST SELL HIMSELF ON THE IDEA.

Why the

Farm Lighting Manufacturer Needs the Automotive Dealer

The Automotive Dealer is trained in outdoor follow-up selling, he has a sales organization that is ready and waiting, and he will give quickly an element of permanence to a new product

THE farm lighting and power plant is assuming an important rôle in the modernization of the farm and the question uppermost in the minds of the manufacturers of these plants is:

"What kind of dealer shall we use to sell to the farmer?"

There seem to be three possibilities in this direction:

1—*The automobile dealer;*
2—*The specialty salesman;*
3—*The electrical supply store.*

The automobile dealer is the logical man to sell these outfits to the farmer. He is personally acquainted with the farmers in his territory. He has sold them automobiles, trucks, and in thousands of cases, particularly in the West and the Middle West, he has sold them tractors, trailers, farm implements and farm hardware.

Salesman—Not Order-Taker

The automobile dealer is a salesman, not an order-taker. Anybody can go around and take orders, but the sale of automobiles requires salesmanship of the higher kind. Farmers do not come to the dealer's store and say: "I want an automobile." They have to be called on at their farms, taken for demonstrations, their whims catered to and often the whole family has to be "sold" before the farmer will put his name on the dotted line.

The man who has successfully carried on this kind of sales work is the man who can and will sell farm lighting and power plants.

Contrast this method of selling with two alternative methods. A specialty salesman is one who takes up the sale of lighting and power outfits and carries a demonstration plant around with him in an automobile—as does the sewing machine agent. He visits the farmers in the territory allotted to him. He is probably unknown to them.

If he is a man of pleasing personality and convincing manner and can tell his story so that the farmer can understand it he may make sales. If he has this ability to sell goods to people with whom he has had no previous acquaintance and can sell them strange goods at that, he will not stay a specialty salesman long. *He will be something bigger, and the agency will be taken up by another.*

If he has not this ability, he will be a failure among this class of prospects and the farmer will class him with the lightning rod agent. Will farmers be willing to give up from $300 to $800 to this kind of a salesman?

The automobile dealer, on the other hand, has a definite place of business. The fact that his establishment is permanent is in his favor and is really a proof that the goods that he has been selling have been giving satisfaction and are reliable. Otherwise he would not be in business to-day. His customers rely on his judgment and are willing to listen to his sales talks on farm lighting and power outfits.

Electric supply stores have been far from successful in selling this equipment. On first thought, the electric supply store would seem to be a logical place to sell this merchandise, but experience has disproved the theory. *Farm lighting outfits must be sold by men who will go out to visit prospects with a demonstration outfit.*

This the electric supply store cannot and will not do. *Its business is done over the counter. Prospects are drawn to the store by advertising in local papers and direct advertising by mail to former customers. The trade has been among town or city folks whose homes or places of business are already equipped with electricity. They do not know the farmers, they have never had occasion to trade with them because the things they have to sell have no place on the farm unless the farm is supplied with electricity. And, if it is, that farmer is not a prospect for a farm power and lighting system.*

Not Used to Follow-Up

Then again, the electric supply store man is not accustomed to going out to visit prospects. Did one ever hear of an automobile dealer who could sit in his salesroom and wait for business to come to him? If so he's probably dead now in so far as being an automobile dealer is concerned.

The selling of a farm lighting and power outfit to a farmer is only the beginning of a line of sales of bulbs, wire, insulators, loom, switches, fuses, sockets, chandeliers, motors, pumps, electric irons, washing machines, coffee percolators, electric toasters and other devices.

These articles are of such a character that they are more susceptible to sale over the counter and there is no reason why there should not be cooperation between the automobile dealer and the electric supply store in this respect.

Assuredly, the automobile dealer is the man to sell the plants and he can sell more of them than the electric sup-

Digitized by Google

ply store could ever hope to sell. But the automobile dealer does not want to stock up with irons, hair curlers and that sort of thing. *This is in the province of the electric store, and this is a part of the trade that can be more satisfactorily taken care of by it.*

It has been stated that the selling of farm lighting and power plants should be an exclusive sales line and not a side line, and that a specialty salesman would devote all his time and energies to the work, while with the automobile dealer the lighting and power plant would be simply a side line.

Dealer Ready and Waiting

Just now, when the possibilities of selling these outfits are greatest, it so happens that the automobile dealer, a trained outside salesman, finds his sales efforts in his own line hampered by the fact that he cannot get enough cars to sell, and a considerable portion of his time can be spent in selling the lighting plants.

While it is true that his entire time may not be devoted to this, the time that he does give will be more productive of results, owing to his acquaintance with his prospects, his superior salesmanship and his knowledge of machinery, engines and electricity.

The lighting plant manufacturer's idea of having a man devote his energies exclusively to the sale of lighting plants is partly a selfish one, and one which if carried out will result in the sales of these outfits by persons who are either unable or unwilling to cultivate the right kind of prospects in the right way.

The income from the sale of lighting plants by itself would be inadequate to keep up an establishment in a territory over which the average agent would travel. *The value of a fixed establishment is too great to be overlooked.* Let the automotive dealer therefore take care of the introduction of the lighting plant which fits in exactly with his other lines and which is to be sold to exactly the same people to whom he is selling other automotive apparatus.

Must Hold Men on Farms

Farm lighting and power outfits are going to play a big part in the betterment of farm conditions and the back-to-the-farm movement. Where is the great army of farm hands that we had not so many years ago? They have gone to the towns and cities and have been transformed into cart drivers, bus boys, soda dispensers and shop clerks. Few rise up through the ranks and stand out above their fellows.

Two things have taken them to the cities—higher wages and better living conditions. The problem now is to keep the men on the farms that are there now and to bring back the men from the cities. *Show them that the high wages in the cities are more than made up for by the higher living expenses. Show them that their savings will be greater on the farm than in the cities, in spite of the fewer number of dollars that they receive on the farm.*

But a far greater task lies in convincing the farm hand that the living conditions are better on the farms than in the cities. He can be told that the air is purer, that the outdoor exercise makes him healthy and strong, but how are the great bugbears of farm life to be hidden—the plowing, the milking, the wood-cutting, the weekly bath in the family wash tub, the pumping of water from the well, the slow drive to town behind "Old Dobbin"? *Can these chores and inconveniences be compared with the conveniences that the city man enjoys—the electric light, the running hot and cold water?* IT CAN'T BE DONE.

Then there is the problem of the retired farmer. In many cases when a farmer thinks that he has made enough money to live on for the rest of his life, or when he gets tired of the farm and hands it over to those who come after him, he decides to move to the county seat or to some large town, or to a city.

Our most efficient farmers are those who have spent their lives at the work. *These men must not retire to the cities where they do no good; they must be helped to remain at their own callings.*

Improve Farm Conditions

We cannot at present force them to remain. We must give them the conveniences of city life, which they are seeking in the cities. Put electric lights in the barn instead of the old lantern. Put running water in the house and the barn and banish the tin basin. Put electric milkers, churns, washing machines and all the other varieties of labor and time-saving devices on the farm and make the farmer a farm executive, directing the energies of the electric current.

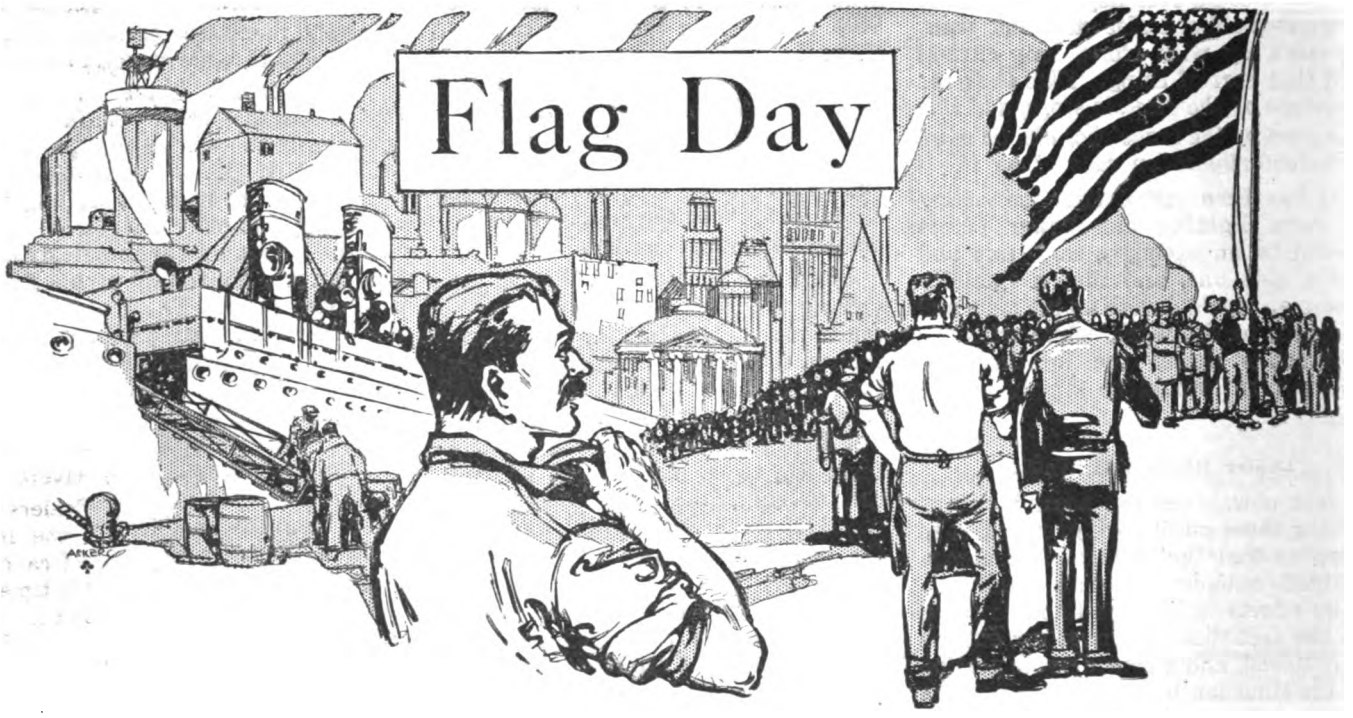
Take him out of slavery and make him the head of his business and you have done much to keep him in the country where he belongs and where he can do the most good for himself and for others.

Farm environment must be improved if our rural population is to be held to its duties producing food for the nation and the nation's army and navy. Labor for the farms can be drafted if necessary, but unless the men on the farms are interested in the work and like it, *the greatest efficiency will be an absolute impossibility.*

The automotive dealer is playing a big part in the back-to-the-farm movement, even though he may not be conscious of it. He is supplying several very important helps in sending farm drudgery into oblivion. He is supplying the passenger car to quickly carry the farmer, his family or his help to and from town. The motor truck to haul the "finished product" of the farm is also supplied through the automotive dealer, and he is further responsible for the introduction of the tractor with its many kinds of farming implements and labor savers.

Here we see a class of dealers who have been responsible for the introduction of speedy methods of carrying people and merchandise and a time and labor saving means of plowing, disking and other operations on the farm. Let the dealer now go a step farther and supply the farm with farm lighting and power outfits; then we shall have a dealer who is doing his utmost to make the farm as attractive from the standpoint of convenience as the city can be.

Become Leader in New Things



This is an age of marvels. It has seen the city workman's living conditions improve until to-day the poorest toiler is provided with luxuries that were not even within reach of the wealthy a few generations ago. Let us carry these "luxuries," which have now become necessities, out to the rural workman.

The dealer in farming communities can easily make of himself a "modernization center" or an institution to keep farm equipment up to date and modern as fast as inventors and factories can turn out new and improved devices for doing more work with less help, in less time and for less money.

It is of the utmost importance that good salesmen, men who will be in business next year and for many years to come, men who know their prospects and will go out and visit them, be selected to sell this modern equipment. There is no better man for this than the motor car dealer.

And we may go even farther. The farm-lighting manufacturer wants permanent and satisfactory distribution—which the motor car man can give him. *Furthermore, he wants immediate distribution, wherefore he finds already at hand in the great motor car dealer organization of this country A WELL WORKING PIECE OF MACHINERY WHICH CAN SEND HIS PRODUCTS BROADCAST TO AMERICA'S SEVEN MILLION FARMS.*

June 14 Is Flag Day for All the Nation

Of course YOUR organization will not ignore this stimulus to patriotic effort

SUGGESTED FLAG DAY PROGRAM

Prepared for celebrations by business organizations to occupy part of noon hour

A committee of employers and employees, with foreign born men represented on committee, should be appointed to arrange details, secure bugler, singers, speaker, and colors.

1—Bugle Call Rally to Flag-Staff or Place of Raising

2—Flag Raising

As Flag rises, "The Star Spangled Banner" should be sung either as solo or in unison.

3—Salute to the Flag

(To be given either as song, chant, or spoken words) "I pledge allegiance to my Flag, and to the Republic for which it stands. One nation indivisible with Liberty and Justice for all."

4—American's Creed

(*to be said in unison*)

"I believe in the United States of America as a government of the people, by the people, for the people; whose just powers are derived from the consent of the governed; a democracy in a republic; a sovereign nation of many sovereign states; a perfect union, one and inseparable, established upon those principles of freedom, equality, justice and humanity for which American patriots sacrificed their lives and fortunes. "I therefore believe it is my duty to my country to love it; to support its Constitution; to obey its laws; to respect its flag, and to defend it against all enemies."

5—Address by Four-Minute Man or Other Speaker

6—Song—"America"

FLAG DAY in each dealer's place of business will help make better Americans of us all—both those born here and abroad. It will spur all on to greater effort patriotically and industrially.

A coupon on this page provides means for each dealer to request speakers, posters, etc., from the Bureau of Education in Washington. But in case your request should not be received in time **make your own speech.**

Distribute copies of the creeds at the left on this page, follow the program as outlined and unfurl a flag in a conspicuous location inside or outside your place of business, according to which location is most advantageous.

But, however you do it, HAVE A FLAG DAY.

Pin This Coupon to Your Letterhead and Mail to

Bureau of Education, Washington, D. C.

SELLING YOUR FUTURE TO

Buy Peace of Mind

By Ray W. Sherman

HENRY BENNETT, who sold the Redman car in Callawassa, was not a competitor of Reilly and the Sennett for two reasons. One was that the Redman was lower-priced and less popular and the other was that the two business houses in comparison were something like a doghouse and Senator Clark's Fifth Avenue palace.

But Henry's friendship with Reilly dated back to the old baseball-in-the-sand-lot days; wherefore Henry always looked over all of Reilly's ideas, declared them to be fine, asserted he would steal them—and then pursued the unruffled tenor of his existence.

Lately Henry had been having hard sledding. When his sales fell off he let them fall—and worried. And when he had worried about four dollars' worth he always went down and talked to Reilly to see if the Sennett business had started to fall off yet.

"What now, Reilly? What now?"

The Sennett dealer's desk was covered with records, books, maps, charts, figures and data and the floor was littered with waste paper.

"Just figuring a bit, Henry. How's business?"

Rotten! Rotten! Rottener!

"Rotten! Getting rottener every day!" Henry was anything but joyful.

"Well—that's bad," said Reilly, still figuring.

"What's the mess?" Henry looked over the disorder in Reilly's office.

"Just figuring to see how few cars I can sell before the sales department ceases to meet the overhead. *Also, I'm trying to see if there is any of the overhead I can shave off if I have to.*"

"Gosh, Reilly, but you're always stirring up a mess of trouble for yourself, aren't you? You never could enjoy life and be happy. You always have to figure yourself into all the hard luck you can. If you're making money—as I'm sure you are—why can't you go ahead and keep on making money? You—"

"Henry," Reilly interrupted, "if more of you lads up and down the row would pay a little more real attention to your hard luck and less attention to your good fortune you would have a greater proportion of good fortune.

"A lot of you are afraid of yourselves. You are afraid of the truth. You don't dare dig into your businesses and find out whether drastic action is needed. The result is that an evil condition some day asserts itself so strongly that something desperate has to be done—and then the patient dies or becomes an invalid for life."

Henry "humphed."

Afraid of Themselves

"You can humph if you want to, Henry, but what I'm telling you is God's honest truth. Most men are afraid of themselves. They are afraid to dig into themselves and find out if anything is wrong. They're afraid they will find something wrong, and they know—as you have said—that this would upset their peace of mind. *The man who thinks that way, Henry, has peace of mind because he has only a piece of a mind,*

"Too many business men—and individuals too—are afraid of knowing the truth about themselves and their businesses. If you have a bum tooth you know there is a chance that there is something wrong with several of your teeth. You know you ought to see a dentist right away and have everything overhauled.

"You also know it is an unpleasant job—and so you postpone it. As long as your teeth don't jump up and down and make life unbearable you chew along on one side of your face, favor the bum tooth and get by as long as you can. Then some day the tooth goes on a rampage and you HAVE to go to a dentist. Being a good merchandiser, he looks them all over and tells you of all the things you ought to have done. Maybe you have let some things go so long that drastic action is necessary and the repair bill is enormous. But you've put it off so long you have to go through with it and pay the bill.

"You were afraid of yourself, afraid of the truth, and you have to pay a big price for salvage. If you can save anything at all at any cost you're lucky.

Cherished Peace of Mind

"The same thing applies to your own business, Henry. You're getting into a tight hole, as I have been telling you for a long time. But you've managed to get along and enjoy what you thought was peace of mind, so you haven't done anything—except drift.

"Months ago you saw your car sales going down. Your factory can't give you the cars you want—and your total sales for this summer aren't going to be as big as last year, even if you could get the cars. Your overhead had been about the same. The result is that your profit income curve has been sliding down toward your expense curve, and you never looked into your business to see how fast it was sliding or how long it probably would be before things hit bottom at their present rate.

"You were not wiling to admit that things might hit bottom. You knew if they ever did you would be out of business over night and you were afraid to look the facts in the face. One half of you ran along as usual and was afraid to let the other half investigate and show up the true situation. It would have destroyed your pieced-together-mind.

Must Face Bold Facts

"But these are days, Henry, when we've got to look facts in the face. If the whole world had looked the truth in the face when you and I were babies there might not have been any war today. But the world let the German philosophy of 'macht' grow unnoticed and unmolested and looked it in the face only when it walked in the front door with a club in its hand. *Then it was too late to save anything except at an enormous cost—which we are paying to-day.*

"During the next ten years dealer businesses must be changed in many ways. The automotive dealer is going to be the firm business rock in this trade. An investigation shows it, but thousands of dealers with their so-called peace of mind refuse to see the signs of the times. Some day they'll make a start when it's too late to catch up.

"And there are things we must know TO-DAY. A storm MAY come. What is it? It may take various forms. It may be a big decrease in car output. It may be a big demand for trucks, or farm lighting systems, or tractors, or other goods. It may be a cut in profits that will necessitate cuts in expenses. But too many of us are unwilling to let ourselves find the truth because it means getting out of old ways and into new ways, reshaping our businesses, acquiring new habits of mind and making real effort. Salesmen and employees do the same thing. They know they are not hitting a hundred per cent and are afraid to find out why. We are selling our futures to buy peace of mind. We—Where are you going?"

Henry started out the door with his hand on his jaw.

"To the dentist. You've talked this darned tooth into a toothache."

How to Lay Out a Building—8

THIS is the last of a series of articles which take up in detail the layout and arrangement of buildings for the dealer, garage and repairshop.

By Harold F. Blanchard

We shall be glad to help you lay out your building. Be sure to send a rough pencil sketch of the location and give all dimensions. Tell us exactly what you want—showroom, garage, repairshop, accessory display.—EDITOR.

Plan No. 11

ASSUME that Fig. 28 calls for a large showroom unit, a used-car showroom, garage and shop for a two-story building on a plot 50 x 120 ft. The showrom unit, Fig. 14, is selected as satisfactory, and the shop unit in Fig. 3 is placed on the second floor. A strip 25 ft. wide across the building directly back of the showroom unit is assumed large enough for the used-car showroom.

The remainder of the space is for the garage. On the ground floor the only way to arrange the cars is crosswise, as an inspection of the space will show. Cars are arranged lengthwise upstairs.

Plan No. 12

A LARGE showroom, small shop and garage for a plot 50 x 100 ft. are the assumed specifications in this case, Fig. 29. Showroom unit, Fig. 13, we will assume is just what is wanted, and the same holds for shop unit, Fig. 30. The remainder of the space is for a garage.

The garage in this case is only about 30 ft. broad, not sufficient for two rows of cars and an aisle between. There are two alternatives. Either the space must be used just as it is, in which case no system can be used in parking the cars, or it might be possible to reduce the depth of showroom and shop sufficiently to make the garage space 45 ft., which would be wide enough except for very large cars.

Plan No. 13

A LARGE showroom and a large shop with the remainder of the space devoted to garage purposes we will assume is required on a corner plot 80 x 150 ft., Fig. 30. Showroom and garage unit, Fig. 13, modified to suit, seem satisfactory, and shop unit, Fig. 18, slightly contracted, is all right for the shop.

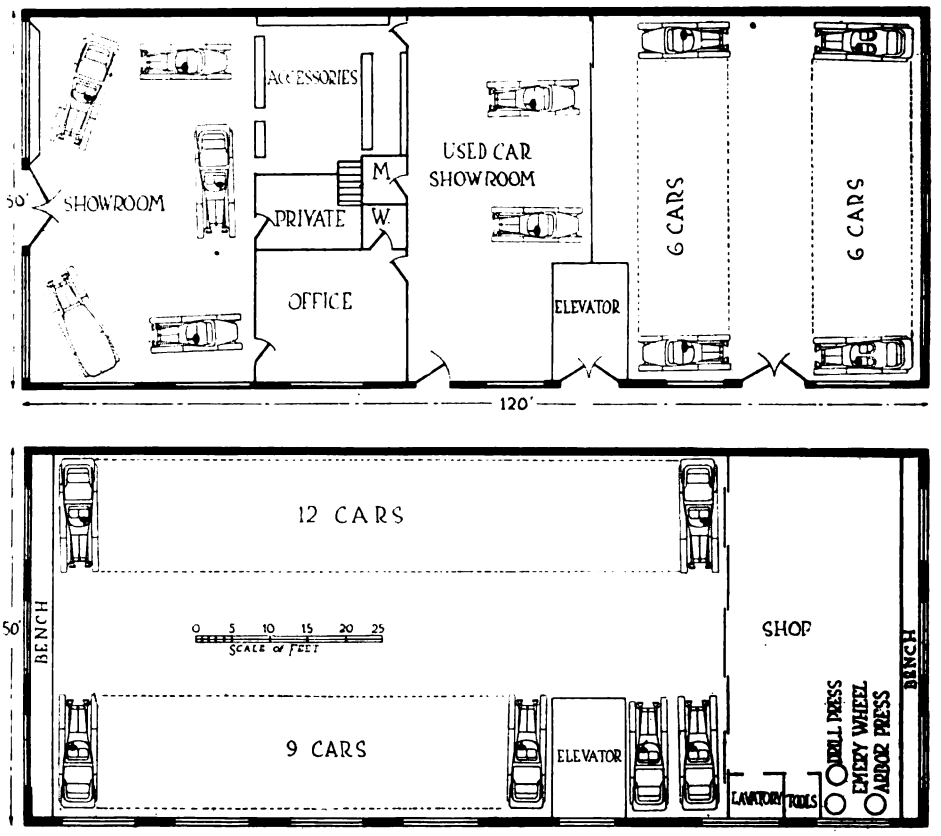
Wants Good Display

Editor Motor World: We are going to build a garage and would like to have you draw us a plan for a front, with all details for glass and doors. Enclosed find a plan of the room as planned. One story high, flat roof towards back. We want the front window sill 1 ft. from floor, about 7 or 8 ft. plate glass and a 3 ft. sash above plate. The front will be brick as high as glass, and from there up building tile. Drive-away door and door into showroom to be set in.—Riendl Auto Co., Tigerton, Wis., Joseph Riendl.

Answer—We shall be very glad to draw a front for you if you will be kind enough to forward a rough plan of the front showing exactly what you have in mind. We are asking you to do this because we are not quite certain, from reading your description, as to what you want, and unless we understand exactly what you desire we may turn out something which would not suit you.

A rough plan of the front similar to the rough garage plan which you sent us is all that is required. Please do not fail to put on any dimensions that you want us to follow.

We should like to offer a suggestion that we think you are making a mistake



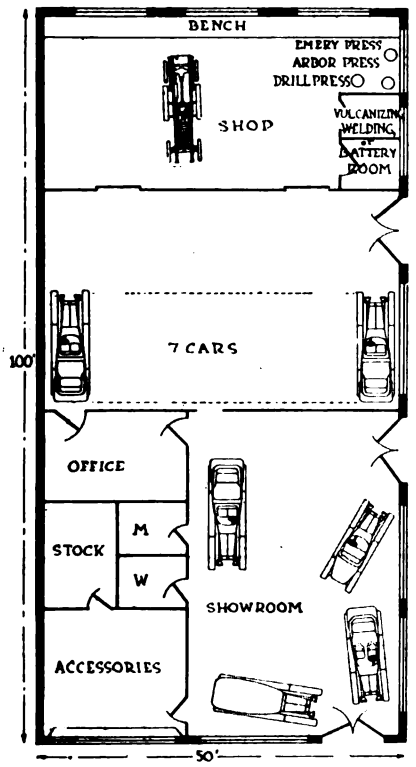


Fig. 28—This plan has been laid out with the view of accommodating a large showroom unit, a used car showroom and a garage and shop

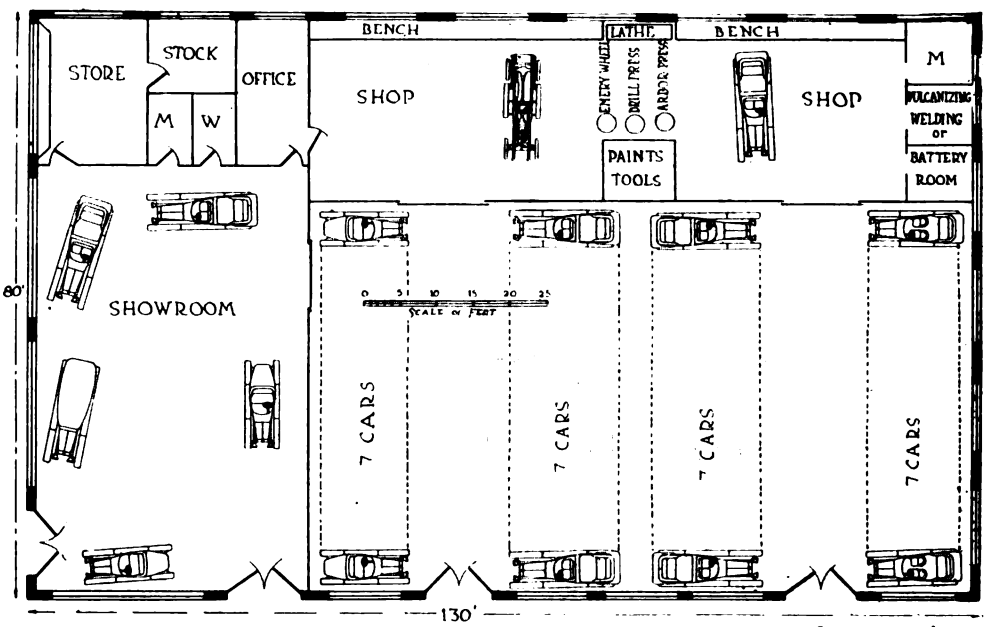
Digitized by Google



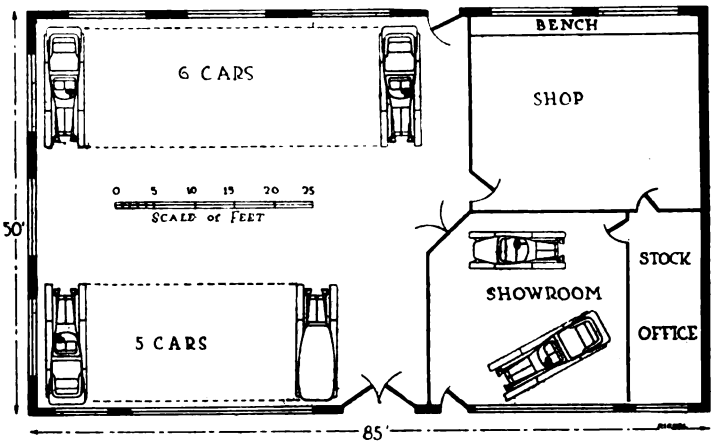


Fig. 29, left—Plan No. 12 is for a small shop and garage on a plot approximately 50 x 100. Fig. 30, above—A large showroom and a large shop with the remainder of the space devoted to garage purposes are the requirements in this case

by putting the garage entrance at one side of the garage room. We believe you will be better satisfied with the door in the center of the space inasmuch as you will find it more convenient in storing cars.

Bloomington to Close Sundays

BLOOMINGTON, ILL., May 31—The Bloomington Automobile Trade Association has taken up the proposition of Sunday and night closing of garages. A committee has been appointed to draw up an agreement by which one or two plants will keep open each night and on Sunday, while the remainder will be closed. It has been found that the night business is about enough to be profitable for one garage, while the Sunday business would pay perhaps two to keep open. For the remainder the active operation would be considered a loss. The dealers are all favorable to the movement and it will likely be adopted at the next meeting. It is proposed to take monthly turns in keeping open and a schedule will be arranged which will be mutually satisfactory.

This is a plan of the garage shown in frontal elevation in the illustration below

More Money for Farmers

WASHINGTON, May 31—A production of about 572,000,000 bu. of winter wheat is forecast by the Department of Agriculture from the condition of the plant in the United States on May 1, which compares with a forecast of 560,000,000 bu. made on April 1. The production last year was estimated at 418,000,000 bu. and the average of the preceding five years was 553,000,000 bu. The largest production ever recorded is 685,000,000 bu. in 1914 and the smallest production of the past 10 years is 400,000,000 bu. in 1912.

Joseph Riendl, Tigerton, Wis., asked for a suggestion for the front of his garage. He wanted good display with plenty of windows and large doors

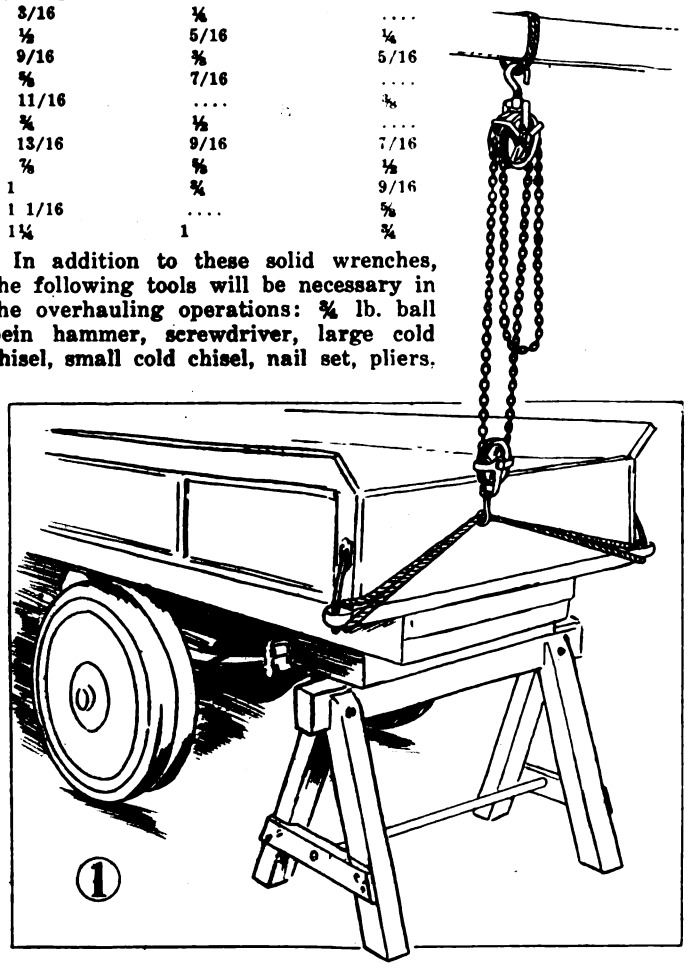
Overhaul Operations on the Republic Truck

By J. HOWARD PILE

IN these overhaul operations on Republic trucks, the same methods apply to all the models with some exceptions as noted, and the same tools will be needed, the only differences being in the size of bolts, cap screws and nuts. The following list gives the sizes of all solid wrenches on all operations on all the models:

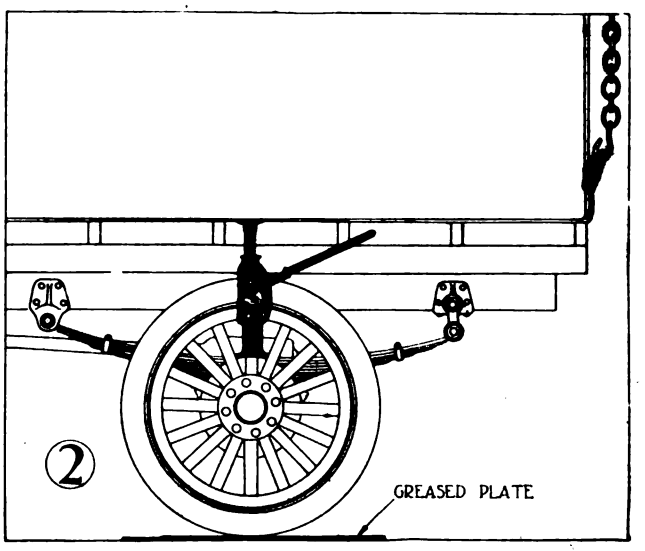


Wrench Opening	Cap Screw Size	Hexagon Nut Size
3/16	⅛	....
½	5/16	¼
9/16	⅜	5/16
⅝	7/16	....
11/16	....	⅜
¾	½	....
13/16	9/16	7/16
⅞	⅝	½
1	¾	9/16
1 1/16	....	⅝
1¼	1	¾

In addition to these solid wrenches, the following tools will be necessary in the overhauling operations: ¾ lb. ball pein hammer, screwdriver, large cold chisel, small cold chisel, nail set, pliers, large monkey wrench, small monkey wrench or adjustable end wrench, two jacks, factory truck, trestle to set rear of body on, chain hoist or block and fall, special bearing adjusting ring spanner, sheet of steel or tin 18 x 6 in. to slide wheel on, paint brush to clean off parts with gasoline, blocks to wedge clutch pedal, oil squirt can.

Materials needed: 6 ft. No. 10 iron wire, cotter pins of the following sizes:

Diameter	Length								
1/16	—	⅝	¾	—	1	—	—	—	—	—
3/32	½	⅝	¾	⅞	1	1¼	—	—	2	—
⅛	—	—	¾	⅞	—	1¼	1½	1¾	2	—
5/32	—	—	—	—	—	—	—	—	2	—
3/16	—	—	—	—	—	—	1½	—	2	3
7/32	—	—	—	—	—	—	—	—	—	3



A working assortment would include not less than a dozen each of the smaller sizes and a half dozen each of the larger sizes. This number will be ample for overhauling one truck. Other materials needed are: gasoline, kerosene, or hot soda solution for cleaning, rags or waste, lubricating oil, grease for gearset, differential and universals, grease for cups, graphite grease for springs, light oil for magneto, replacement parts for those worn out.

1. *The rear end of the frame is raised so that the wheels clear the floor.* 2. *A greased plate is put under the wheel and the wheel jacked down by a jack between the axle and body, till the tire rests on the plate*

Rear Axle Overhaul

This operation applies to all models fitted with Torbensen internal gear drive axles, Models A and 12, E and 11, F and 10 and Model T being so fitted. Some of the models A and 12 have Celfor

Digitized by Google

axles and all of the Model T trucks have Celfor axles.

1. Hoist rear of truck with chain hoist or block and fall and set trestle under rear end of frame. Height of trestle varies with the different models, but should be so that wheels clear the floor by about ½ in.

2. Remove four cap screws from hub-cap flanges.

3. Slip hub cap off.

4. Remove cotter pin from axle spindle.

5. Remove hexagon nut from axle spindle. *This is a right-hand thread on the right side and a left-hand thread on the left side.*

6. Slip off lock washer.

7. Unscrew bearing adjusting ring with special spanner which goes over the spindle and engages the lug on the adjusting ring. *This ring has a right-hand thread on the right wheel and a left-hand thread on the left wheel.*

8. Place jack between top of spring and underneath side of body and raise jack till tire just touches a greased metal plate which has been placed beneath it.

9. Slide wheel off. The outer bearing will come out with the wheel and the inner bearing will stay on the spindle.

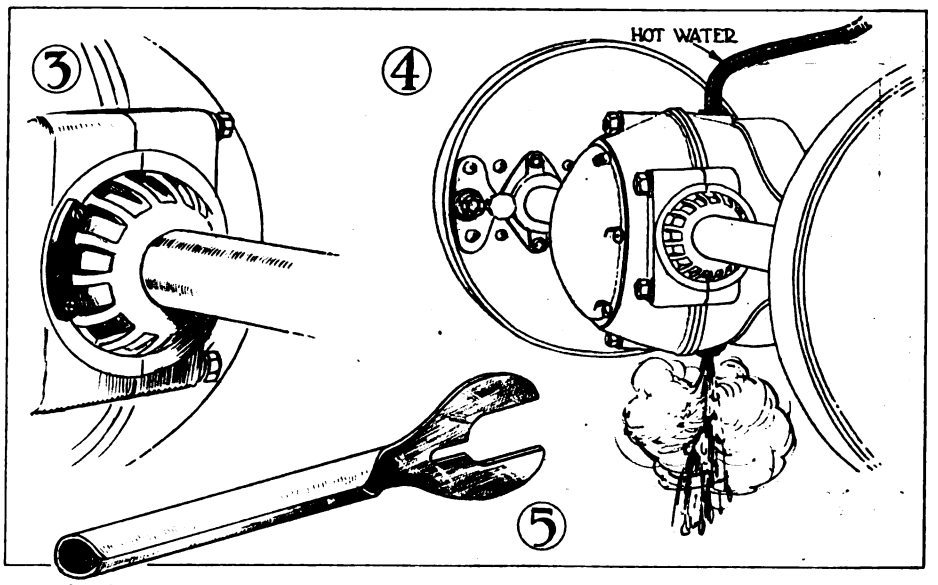
10. Remove the other wheel in the same way.

11. Remove propeller shaft. (*See separate operation on this.*)

12. Remove cotter pins and clevis pins from four brake pull rods where they connect with rocker arms on axle.

13. Remove jacks from between springs and body.

14. Jack up axle till the weight of the axle is on the jacks *and not hanging on the springs. Do not jack up so far that the springs exert an upward pressure on the spring bolts.*



15. Remove cotter pins and nuts from each of the front end spring bolts and the lower end shackle bolts.

16. Roll factory truck under center of axle between the jacks and block with pieces of wood on the two ends, but do not block it up high or the springs will catch in the frame when you attempt to roll the axle out.

17. Drive out the spring bolts, replacing the nut on each as it is taken out.

18. Lower axle onto factory truck by lowering the two jacks and then take the jacks out of the way.

19. Pull truck out from beneath car.

3. The differential bearing adjuster lock is blackened in in the illustration. When the screws are removed, the differential bearing adjuster can be turned. 4. Hot water from a hose cleans out the oil and grease. 5. A spanner to be used on the wheel bearing adjusting ring

20. Turn axle upside down on truck. This will require two men, perhaps three on the larger trucks.

21. Twist a piece of iron wire around the springs on each side of the clips and close to the clips to keep the spring from coming apart if the center bolt is broken or has lost its nut.

22. Remove locknuts and nuts from spring clips.

23. Drive spring clips out with hammer and punch, replacing nuts on the clips.

24. The springs are now ready to be tagged and shipped if they are to be reset and have additional leaves added. This is a factory job and cannot be done satisfactorily in the service station. Springs are usually reset when they become flattened under severe use and heavy loads. If the body has a tendency to come down on the tires under load, the springs should be reset, and if the loads are customarily heavy, extra leaves can be added with good results.

25. If the springs are not to be reset, pry the leaves apart with a screwdriver or spring spreader and spread graphite grease well around with a hacksaw blade. If the springs are very rusty, the wires can be cut after the spring is placed in a vise, the leaves cleaned up with scraper, file and emery cloth, carefully washed in gasoline, kerosene or hot soda solution, greased, leaves assembled, squeezed together in the vise and wired up again. The spring leaves have lubricant pockets in the ends, and these should be well filled.

26. Clean off outside of axle, brake bands and exposed mechanism at the ends, using gasoline, kerosene or hot soda solution.

27. Remove axle drain plug.

28. Take axle to wash rack.

29. Turn axle right side up.

30. Remove top plug.

31. After grease runs out, run boiling hot water from a hose into the top plug and block axle so that it will run out of the bottom plug. About 15 minutes will clean out all of the old grease.

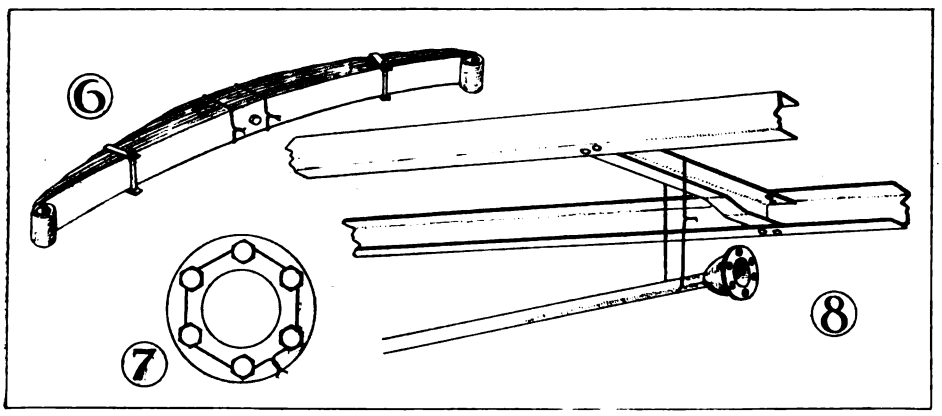
32. Remove two screws from each differential bearing adjuster lock and set differential bearing adjuster with punch and hammer so that there is a minimum of lost motion without binding.

33. Replace differential bearing adjuster locks and replace screws.

34. Replace drain plug.

35. Pack differential with lubricant. This can be done by shooting very heavy oil or fiber grease through the top plug with a grease gun; or the differential cover can be removed by taking out the six holding screws, and the differential packed through the opening.

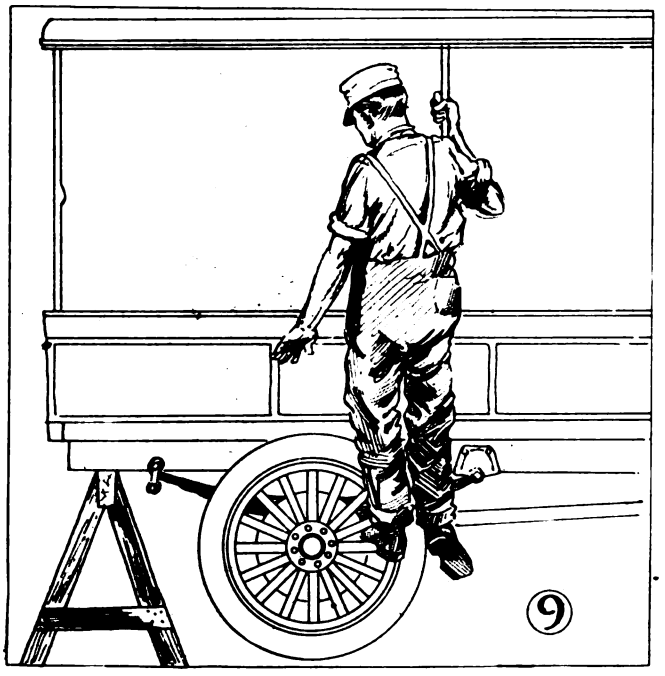
36. Replace top axle plug or differential cover, depending on method which was used to lubricate the differential.



37. Replace springs, clips and nuts, setting up tight as possible, and locking nuts on tight.

38. Put axle on factory truck, right side up and wheel into place under the truck.

39. Jack axle into position with two jacks.



40. Replace spring bolts, nuts and cotters, using grease.

41. Remove jacks and factory truck.

6. Wiring the leaves together before taking off the clips. 7. Wire through the heads of cap screws on the universals. 8. The front end of the propeller shaft is hung in a sling while the back one is being disconnected

Digitized by Google

9. *Adjusting the brakes. A man stands on the spokes to try the adjustment*

42. Replace propeller shaft. (*See separate operation on this.*)

43. Grease inner wheel bearings, pinion gear and internal gear on wheel with heavy grease that will not run. Oil brake cams and joints.

44. Place jack between top of spring and bottom of body and raise jack till axle spindle is depressed so that the wheel will slip on the greased plate into place without lifting.

45. Grease outer wheel bearing and slip in place.

46. Replace bearing adjusting ring, setting it up tight with the special spanner, then loosen it from ⅛ to ¼ turn till the wheel turns without binding, but without shake.

47. Replace locking ring, so that the lug on the adjusting ring fits into one of the holes in the locking ring. If it will not go, turn the adjusting ring to the nearest hole.

48. Replace hexagon nut and set up tight.

49. Put in new cotter pin and spread ends.

50. Replace hub cap.

51. Replace hub cap screws.

52. Put other wheel on.

53. Connect brake pull rods to brake arms, inserting clevis pins and new cotter pins.

54. Adjust brakes. (*See separate operation on this.*)

55. Hoist body and remove trestle.

Propeller Shaft Overhaul

THIS operation describes in detail the taking down of the propeller shaft to lubricate and replace worn parts.

Several types of universals and propeller shafts are used on the different models, including Kinsler-Bennet, Arvac, Acme and Hartford. The operation is practically the same for all kinds:

1. Put a wire sling around the front end of the propeller shaft, hanging it from the cross member of the frame.

2. Disconnect the front universal first. Cut the wire that goes through the heads of the cap screws holding the housings together.

3. Remove the cap screws.

4. Cut wire on rear universal housing and remove cap screws.

5. Drop rear end of shaft down and pull on it. The slip joint will then pull out.

6. Shaft is slipped out of the sling, leaving the sling in place, and shaft is taken to bench and put in vise.

7. Remove felt grease retainer ring with screwdriver.

8. Remove felt grease retainer.

9. Slip housing back on shaft.

10. Remove cotter pins on nuts.

11. Remove nuts.

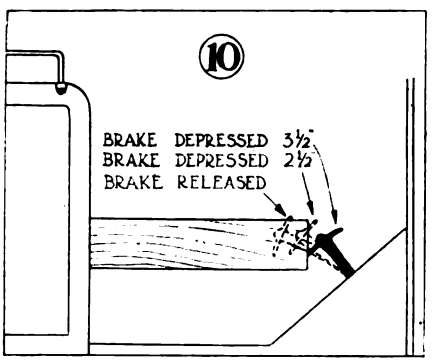
12. Drive universal pin out with punch.

13. Remove key that goes across back of universal with pliers.

14. Remove T-block.

15. Tap bushings out.

16. Wash all parts with gasoline, kerosene or soda solution.



17. Replace worn parts.

18. Replace bushings.

19. Replace T-block.

20. Put new key in back of universal.

21. Slip housing in place.

10. *Two blocks of different lengths to depress the clutch pedal respectively 2½ and 3½ in.*

22. Replace felt grease retainer.

23. Replace felt grease retainer ring.

24. Replace universal pin.

25. Replace universal pin nuts.

26. Put in new cotter pins.

27. Fill housing with heavy grease.

28. Slip front end of housing in wire loop.

29. Draw rear end housing to place.

30. Replace cap screws.

31. Replace cap screws in front end.

32. Remove wire sling.

33. Thread a wire through cap screw heads, front and rear, and twist ends of wire together. This prevents the screws from turning.

Adjusting Brakes

THE operation of adjusting brakes is the same whether for Celfor or Torbensen axle. The brakes should be adjusted when the wheels are jacked up free of the floor. When the rear axle is being overhauled, it can be done before the rear end of the car is taken off the trestle. Have the gear shift lever in neutral. If the rear axle is on jacks, block front wheels securely or the truck will rock off the jacks when you attempt to turn the rear wheels to test the brakes.

Emergency or Hand Brake

1. Loosen locknuts on forward end of two outside brake pull rods going from brake shaft to rocker arms on rear axle.

2. See that wheel is entirely free to turn with both brakes off. If not free, lengthen rods by taking out cotter pin, clevis pin and unscrewing yoke on pull rod two or three turns. Replace clevis pin and try again. If service brake drags, lengthen two inside rods in the same way.

3. Set hand-brake lever back three notches.

4. Shorten outside pull rods by screwing up the yokes till each wheel will just move when a man stands on one of the spokes of the wheel.

5. Set hand-brake lever back one more notch, or four notches altogether.

6. Wheels should not turn under a man's weight, and should just give a trifle when a man jumps on the spoke.

7. See that both wheels are equally braked in this position.

8. Release hand brake and see that wheel still turns freely. If it does not, the brake band may be bent, and it should be taken off and straightened.

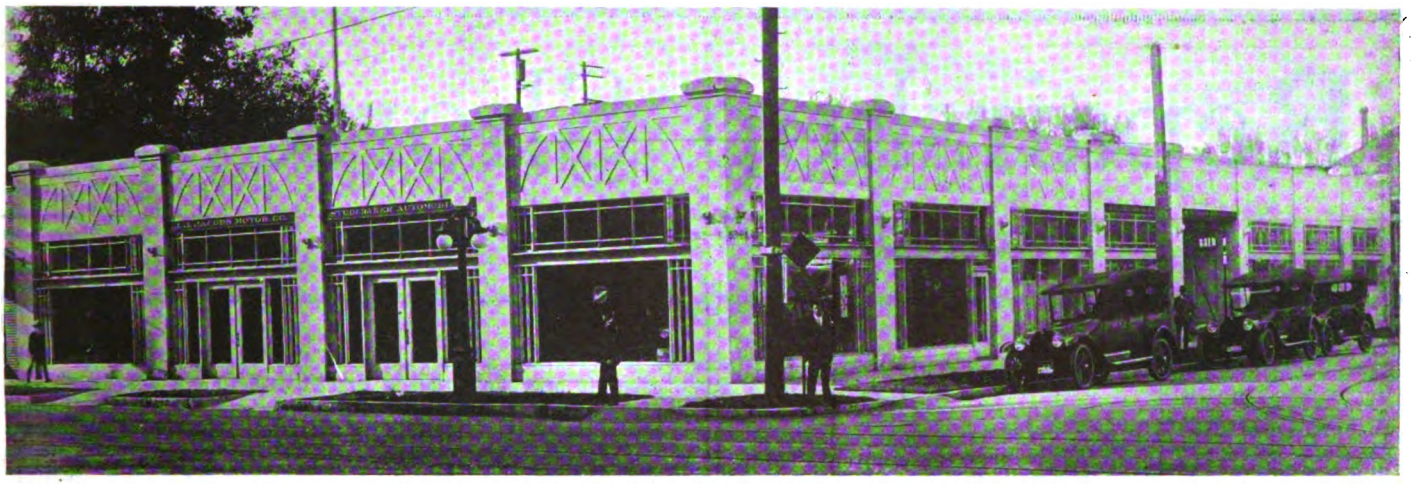
9. Insert cotter pins in clevis pins.

10. Tighten lock nuts against yokes.

Service or Foot Brake

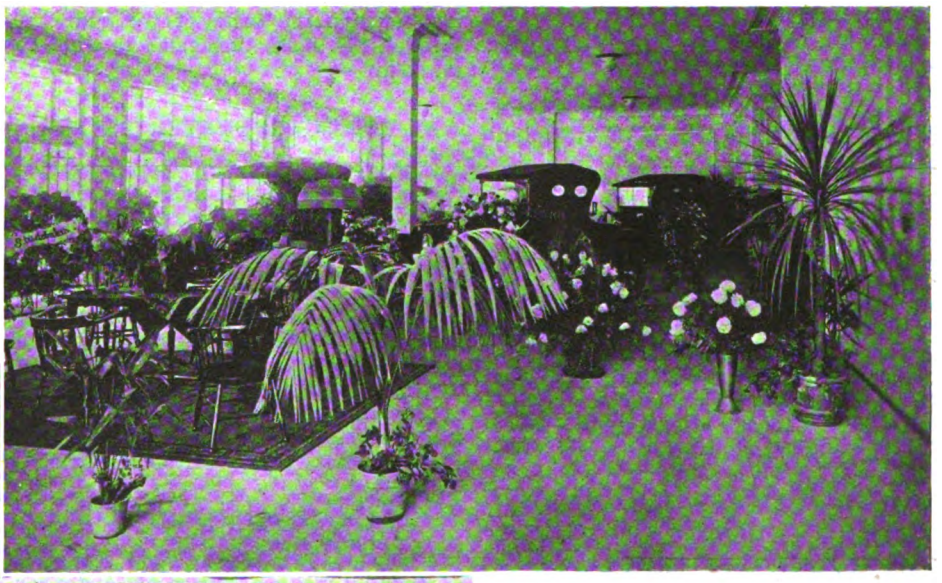
11. Cut two blocks of wood to such a length that when placed between the front board of the driver's seat and the brake pedal, the shorter one will depress the pedal 2½ in. and the longer one will depress it 3½ in.

12. Insert the short block.



13. Adjust inside pull rods till the brake holds the same as it did with the hand brake in the third notch. Each wheel should brake equally.

14. Insert long block to depress pedal 3½ in.



15. Wheels should not move under a man's weight in this position and should

Palms and Flowers Make His Cars Sell Better

Sacramento, where this salesroom is located, is California's capital. It has 50,000 people and 25 motor car dealers

The pictures on this page are of the home of the J. J. Jacobs Motor Co., which sells the Studebaker in Sacramento, Cal. The dealer believes that a fitting atmosphere helps sell cars, so he uses palms and flowers plentifully on various occasions. Decorations to a considerable extent are used at all times

The picture at the top of the page shows the attractive exterior of his building. The other pictures illustrate the effect that is obtained by a fine floor, appropriate furniture, rugs, etc., and the use of flowers and palms

Digitized by Google

Repairshop Shortcuts

From Motor World Mechanics

No. 1691—VALVE LIFTER FOR FORDS

A Ford valve lifter can be altered so that it will not slip through the hook by drilling a hole in the lifter between the end and the bend and riveting a hub brake lever clevis in the hole. The eye end of an old brake rod is secured in the clevis with a clevis pin and the rod cut to a length of 4 in. and bent over. This gives a universal action. The handle end of the lifter is bent down so that it will not wobble in the hand.—Rudolph Balmor, Devine, Tex.

No. 1692—TRAVELING HANGER

A traveling hanger for chain hoist or tackle is made from two pieces of flat bar stock, bent nearly at right angles at the top and drawn down to a round section. Rollers are attached to the ends thus bent, and two cross bolts below keep the hanger together and make a place to hang the hook of the hoist on.—Franklin Service Station, Newark, N. J.

No. 1693—UNIVERSAL RADIATOR STAND

The radiator stand illustrated offers exceptional accessibility in doing radiator work since it carries the radiator on a rotating table whose axis may be placed at any angle with the vertical. The angle at which the stand is set is determined by a clamp at the base and rotational position by the pin at A; there is a circle of holes in the wood block and a single hole in the metal plate beneath so that the table may be held in any position.

No. 1694—GEAR MOVER

The tool shown is for gripping a gear which is stiff on its shaft but which must be rotated for timing or of inserting a key or pin, or in some cases it may be used as a means for turning camshaft or crankshaft, the former for timing and the latter also for timing or in connection with bearing adjustment. It consists of two strips of metal hinged at one end and with the other ends bent in so that they engage the teeth of the gear. A through-bolt holds the members tight to the gear.

No. 1695—CARBURETER TESTER

Carbureters used with a pressure system cannot be satisfactorily tested for float chamber troubles without supplying the fuel under the normal pressure for which the system was designed. The apparatus shown is for this purpose and consists of a small tank mounted on the wall over the bench and having a hand pump, a pressure gage and several outlets for attaching carbureters. Such an apparatus is of value in testing for leaky float valves, setting float levels, etc.—Pierce-Arrow Service Station, Buffalo.

No. 1696—SANDPAPER BLOCK

A sandpaper block for tire repairing is made by tacking a piece of sandpaper to a cylindrical block of wood about 3½ in. in diameter and 12 in. long. This economizes in the use of sandpaper.—C. C. Harry, Harry Motor Co., Mount Summit, Ind.

No. 1697—VALVE-SPRING TOOL

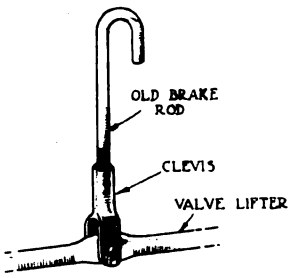
A tool for releasing valve-spring pins in overhead valves is made from a piece of ⅜ in. gas pipe and a door knob. One end of the pipe is sawed up the center about 3 in. and spread to an opening of 1 in. The other end of the pipe is placed in the door knob and babbitt poured around it to hold the two together. The tool is placed over the valve-spring cup and pushed down, thus allowing the pin to be drawn out with the fingers or pliers.—Everett Harlow, City Garage, Macon, Ill.

No. 1698—WHISTLE PRESSURE SIGNAL

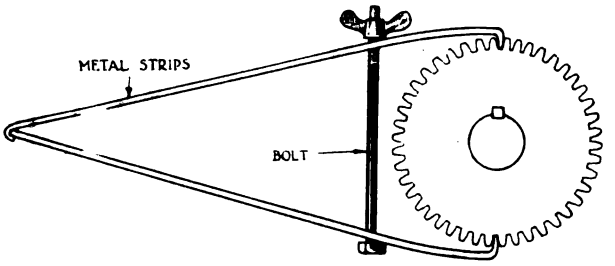
Through thoughtlessness or carelessness the air compressor may be allowed to run until the pressure in the air tank has risen above the desired maximum. A small safety valve with the blow-off connected to a whistle is a simple means for giving warning when the compressor should be shut off. The pressure at which the valve should act may be regulated by moving the weight on the lever arm in or out.—Pierce-Arrow Service Station, Buffalo.

No. 1699—HOOKS FOR CHAIN HOISTS

Hooks are placed in the ceiling over the front and rear of every car so that either end of any car can be lifted with a hoist without moving the car.—Ernest Bregagnolo, Bord's Garage, New York.

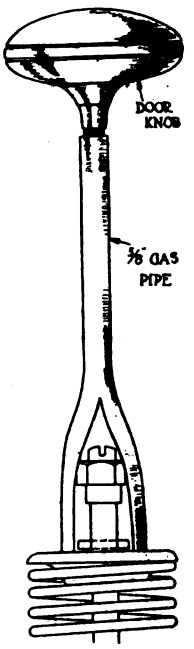


Berrien County Organizes



SOUTH BEND, IND., May 31—The automobile and garagemen of Berrien County, Michigan, have organized the Berrien County Automobile Trade Association. The following officers and directors were elected: President, Philip Friday (Niles); vice-president, Clarence Warner (Benton Harbor); publicity man, Ralph Moody (St. Joseph); directors, H. W. Brewster (Niles), Harry Boyce (Buchanan), A. S. Messner (Benton Harbor), H. H. Gast (St. Joseph), William Puterbaugh (Eau Claire).

$1 a Helpful Kink



HOW often have you been compelled to rack your brain to overcome some difficulty? But when you did find a solution—what a satisfaction it was! Well, here's a chance for you to dig some of those life-savers out of their hiding places and put them to work for your fellow-craftsmen. Send them to Motor World. We will pay you a dollar for every one accepted for publication. The only requirements are these: 1—Describe the short-cut briefly but clearly, in few words. 2—Send a sketch, in pencil or pen, no matter how rough; our artists will finish the job. 3—Write on ONE side of the paper only. 4—Sign your name and initials, the name of the company you are with, and the town. Write plainly. If your name is unusual, print it in capital letters.

Editorial Observation

Centralizing the Industry's Skill

THERE are changes and still more changes due to the conditions under which we are living to-day. One of the changes which have appeared in accentuated form is the scarcity of labor and the inability of many repairshops and service stations to turn out work in the quantity and of the quality that has been known in the past, because of the lack of men.

There is a trend, although it is perhaps as yet slight, toward the centralizing of the more skilled service and overhauling in the larger shops in the larger cities, and whether or not this will work out to the benefit of the trade is something that individual dealers themselves will have to determine.

For instance, in a small town outside Chicago there may be a small dealer who has on his list of customers a man who wants his car overhauled, or perhaps this dealer has taken in a car which needs overhauling before he can sell it. If he can have it overhauled he can realize a bigger profit on it than if he sells it "as is."

This dealer has not facilities for doing the work; there may be a need for autogenous welding or repair to the electrical system. In days gone by the dealer might have more nearly approximated 100 per cent perfection on a job of this kind, but with things the way they are to-day he is handicapped because many of his skilled men have left him and he cannot get any more.

The distributer in the big city, however, is better equipped to handle this work. In some cases the smaller dealers are sending these jobs into the big city shops to have them done. Thus far, it does not appear that any of the big city service station operators have canvassed the outlying trade for work of this kind. The service stations themselves are handicapped for lack of men and some of them doubtless do not want to go to too great trouble in building up organizations unless they are going to be able to keep them busy.

A jobber in Minneapolis is building up a system to-day whereby he has electrical repair work shipped in to him from Minnesota and the Dakotas. The jobber's service department of expert men fixes this work up and ships it back to the outlying dealer by parcel post. This gives the dealer service quicker than he could effect it in his own shop and gives him much better work. Incidentally, he makes a profit without doing anything except pack the electrical apparatus and ship it

There are possibilities in this that are worth reflection. It may not become standard practice during coming months, but it is a movement to which the trade should not turn deaf ears, because it is impossible to-day to tell the exact system under which we shall be operating to-morrow. The time may come when the distributer of goods will also be a distributer of labor and service. Who knows?

Women Salesmen

AS the nation's man power is turned into war and its allied work, women must be more and more used in the motor car trade.

One of their possible positions is that of the sale of the product. They can sell cars and accessories, and possibly trucks, tractors and farm lighting systems. The latter three they may possibly not sell so well—but that selling is something they can well do cannot be disputed. Undoubtedly the man is the dealer's choice, but when there are no men women must be used.

One important consideration should be borne in mind, and that is that the employment of women should not be undertaken solely for advertising purposes. Female employment has gone far beyond that stage. Of course, if there is publicity to be obtained through the employment of women salesmen and other workers it need not be passed up, but the female workers should not be taken on for advertising purposes alone.

There are some women who consider their entry into commerce as an adventure—which it is—and one not to be taken too seriously, but the dealer should check this impression before it takes too firm root. He should select types of women who possess real ability. He should require earnestness and a desire to succeed on merit alone.

He should hire women on the same business basis that he has in the past hired men. If he is progressive enough to train women for real work in these changing times he will get sufficient free advertising, but he will err and pay the price in the future if he considers female labor something to be engaged purely as a means of advertising. He should require women who seek employment in men's work to be serious about it—and he should be serious about it himself.

Letters from Readers

THIS page is for the use of MOTOR WORLD readers with something to say. Letters on subjects of interest to dealers, garagemen, repairmen and jobbers are always welcome.—EDITOR.

Explaining the Trade Acceptance

Editor Motor World: Enclosed is a letter that is being sent to its district sales managers by a New England rubber company, explaining the trade acceptance, and why it is a business essential at this time. Perhaps Motor World readers would be interested in it. —Reader.

What the Trade Acceptance Is

District Sales Managers:
Salesmen:
Branch Office Managers:

We are sending out trade acceptances with our statements and you will be asked why we are changing our methods from the open book account to the trade acceptance. So that you can explain and educate our dealers, I want to give you the reasons why the trade acceptance method is necessary.

Why is there not enough currency in this country to finance both business and the war?

You probably have seen in the papers that the first year of the war cost the United States $12,000,000,000, and that in addition we loaned $9,000,000,000 to the Allies. Government war payments are made in currency, and while only 10 per cent approximately of the $9,000,000,000 loaned to the Allies was sent abroad—yet $8,000,000,000 of the loans to the Allies was spent in this country. Twenty-one billions temporarily taken out of the currency of the country. When put back in, it made what we call "business booming," great activity, and a great demand for merchandise, but, also, an increased demand for currency to finance the making of the merchandise.

Banks Are Using Currency

In ordinary times, when currency is not being drawn upon to finance the war, the banks have it to loan. But to-day the Government has taken the currency in the banks for war purposes. They needed currency to pay their bills before they received the income tax receipts in June, so they took the currency from the banks and gave them instead what they call Treasury Certificates, which were Government promises to pay back to the banks when the income tax payments were made. This took away the supply of currency in the banks and left them with Government promises to pay. So, naturally, the banks do not have the currency to advance to manufacturers under the old system.

The war must be financed first.

We all desire the Government to pay its war bills in currency.

Business must be done on credit.

All possible currency must be released from commercial business to enable the Government to pay its war bills.

How does the open book account tie up currency?

Take the figures from the 1916 Department of Commerce Statistics on the manufacturers of the United States. We find that a manufacturer (to reduce to small figures) had an average capital of $22. He paid $14 for materials and $5 for labor etc., in ten days. He sold the manufactured article to the dealer for $24 on terms averaging payment in 75 days. You can see that he had $19 which he had paid out for materials and labor, tied up for 65 days before the dealer paid him.

Under the banking laws, a manufacturer can borrow 50 per cent of the $24 sold, or $12, on his account with the dealer. He can borrow 10 per cent of his capital, or $2, making a total of $14, but leaving tied up for 60 days or more $5 in currency. Multiply this by 1,000,000,000 and there are $5,000,000,000 in currency tied up in the open book account used by manufacturers for the extension of datings to dealers.

Keep Money Circulating

To go further, the $14 which the manufacturer has borrowed from the bank cannot pass along to the Federal Reserve system. Multiply this by 1,000,000,000 and you have $14,000,000,000, or a total of $19,000,000,000, tied up for commercial business purposes—not available for war currency.

How does the trade acceptance release currency?

It does the whole transaction on credit. The manufacturer pays $14 for his materials, $5 for his labor, etc., just as before, and he sells to the dealer for $24, but the dealer signs a trade acceptance. This trade acceptance is not a note nor a draft. It is simply a record of the business transaction which has taken place, to which both the manufacturer and the dealer sign their names.

The dealer signs to the fact that the manufacturer has sold him some goods, that the terms are a certain length of time, and that he expects to pay on the due date at a certain bank. The manufacturer signs to the effect that the dealer has purchased goods, that the terms are such a time, that he knows the dealer, and that he believes the dealer will pay on the due date. This transfers the transaction immediately to negotiable paper.

Under the trade acceptance law the banks can loan on this paper the whole $24, so that no currency is tied up by the manufacturer in the account with the dealer. The banks will give him not currency but a credit of $24, because they can turn it over to the Federal Reserve bank and obtain $24 in credit and the Federal Reserve bank holds the paper until the dealer makes payment at the bank.

There isn't a cent of currency passed in the whole transaction, simply credits, and the currency tied up in the old open book account method has been released for the payment of war bills.

What happens if the dealer does not meet his trade acceptance?

If the trade acceptance is not marked by the manufacturer, "No protest" when discounted, it will be handled by the bank of the dealer just like a note and the dealer will have to pay protest fee. If it is marked "no protest" by the manufacturer, the manufacturer has to pay the acceptance, and then any extension of time for the dealer should be handled by an interest bearing note proposition—not by another acceptance. An acceptance should never be used for an extension of an account.

On the other hand, when a manufacturer signs an acceptance with the dealer, he is doing it because he believes that the dealer

How an Australian Displays Accessories

This is the place of business of H. V. Duncan & Co., Brisbane, Australia, and it would be hard to find a better arranged, more attractive accessory store which reflects a clearer understanding of the principles of merchandising

Digitized by Google

is going to pay on the due date, practically guaranteeing that he is a good merchandiser, and if the dealer doesn't meet the obligation on the due date he weakens his credit standing both with the manufacturer and his bank.

In our particular case, if the dealer does not pay the trade acceptance on the due date, he loses the 5 per cent cash discount and we would expect a note for the amount of the acceptance, plus 5 per cent, bearing interest for an agreed upon amount of extension. But the customer would weaken his credit standing with us.

We are not asking dealers to sign this acceptance because we are afraid of their credit.

We are not using it as a club to collect money.

We are not asking them to sign because it will help them directly, but because the country must come to the utmost conservation of its currency and do business by credit and, in this way, have business do its bit toward winning the war.

We are not saying that a dealer must sign this acceptance. The Government may force us to say this a little later. All we are asking a dealer to do is to get in line with the foremost business men of the country, help us release the currency from business to the paying of war bills and—let us do our bit toward winning the war.

Sane Selling

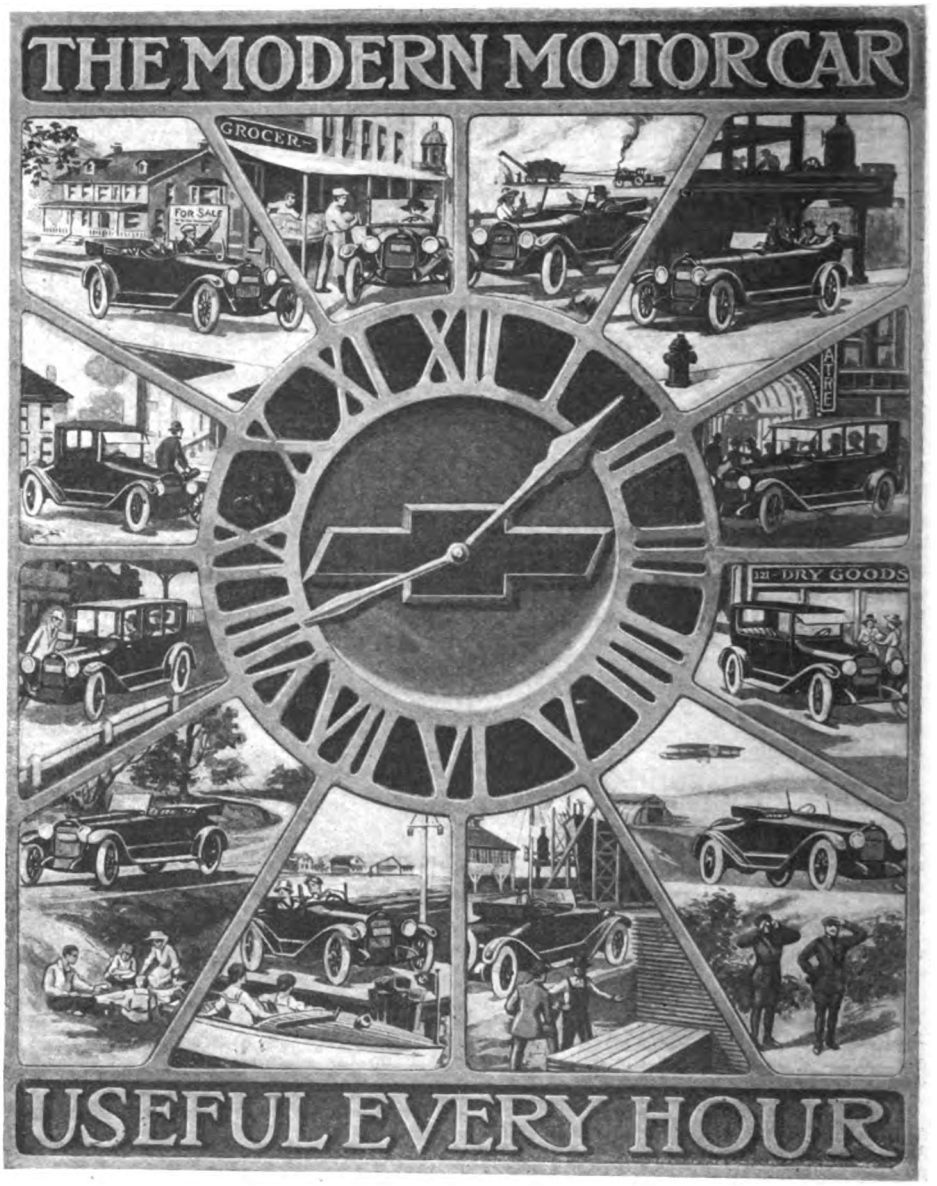
Editor Motor World: I am enclosing what seems to me a mighty important dealer's letter. It discusses a number of fundamental points most valuable for each automobile dealer to know, and being generous of heart, we are willing to contribute this to the industry. You may, after reading it, find it worthy of reproducing.

These letters are sent out weekly by W. S. Sills, general manager of sales of our company. The letters go to 4000 Chevrolet representatives. Nearly 100 of them have been sent in the last year and a half.—Yours very truly, J. H. Newmark, Manager Advertising Division, General Sales Department, Chevrolet Motor Co., New York.

To Chevrolet Dealers

Methods of automobile salesmanship are gradually changing for the better. Honesty in statement is being practised. The truth is being told oftener. And gradually, loose, misleading claims will no longer be made.

All these are good signs. They mean more to the average dealer than he might, at first glance, imagine.



If the prospective purchaser is not told in the beginning what to expect, he will not look for it. If he is not told in the first place that his car will travel thirty miles on a gallon of gasoline, he will not be disappointed if it does not happen—and he will not blame you.

His disappointment came from being "taken in" by the statement, rather than from the failure of the car to do or act as promised. What is true of this statement is true of many others.

You must remember that in the beginning the prospective purchaser did not have any idea what a car was supposed to do. What the motorist was taught to expect of his car was what the salesman told him.

Please give that point serious thought.

A truer statement than that, and one which means more to the average dealer, has never been made. Your "profit and loss" statement will show it clearly.

By way of emphasizing the all-around utility of the motor car, the Chevrolet Motor Co. is sending this poster to its dealers. Dealers who display it will help along in driving home the fact of the absolute necessity of the car

We all remember the time when a salesman would describe an automobile as a reguler perpetual motion machine—that it would keep "going and going"—"with hardly a cent for maintenance expense," and that "it hardly ever would be necessary to buy any parts"—and all sorts of similar statements.

He was promising something that never has happened to any piece of machinery ever made.

We know, and the public knows, too, that metal against metal means friction—that friction means wear—and wear means replacement. More automobile owners are beginning to know that. But it is important that they know that from the day the car is purchased. For if they do, your service problem will be largely solved, as the owner would not expect treatment he was not entitled to receive.

Yours very truly,
W. S. SILLS, General Manager of Sales.

Tractor Efficiency

IN considering tractor efficiency and economy for him the farmer is going to look at the tractor and the implement which it pulls as a unit. It is not the tractor which does the work. It merely provides the power. Yet when the plowing, or the seeding, or the cutting is not being done satisfactorily the blame is going to be laid on the tractor. This may not be right nor just, but it is going to happen just the same. It already has happened in no end of cases, and the tractor has been condemned through no real fault of its own.

The dealer who handles tractors never can forget the probability of this for a minute.

The man who unthinkingly overloads his wagon and gets stuck in the mud cusses his team. The man whose engine plow misbehaves will take it out on the tractor. This is certain and inevitable. For this reason the man who sells tractors must possess the knowledge and ability to distinguish between tractor troubles and implement troubles, and by being able to correct the latter prevent the former. *And this is some job—but not too big a job for the automotive dealer.*

Who Will Awaken the Farmer?

By Ben S. Brown

A TRACTOR salesman got his dander up while in an agricultural community during a Liberty Loan campaign.

He walked into a bunch of middle-aged and elderly but husky men, mostly retired farmers, while a horseshoe game was in progress. He stopped the game and told a few things.

He started with the Liberty Loan, and told why they should subscribe. He mentioned that he was going across this summer—and was wondering whether the fight was worth while if these fellows who were buying bonds so niggardly did not want to help.

Then he touched on the food situation and *roasted them with very plain language for allowing the whole nation, and the world, to pinch and scrimp, while they, expert food producers, neglected the jobs which they could do so well—which had given them a competence—and* PITCHED HORSESHOES!

He was just going good by this time so he pitched in on the labor problem, suggesting that most of them looked able still to do a good day's work.

This tractor salesman had been knocking around that community for a day or so—and he has good ears. He learned that the acreage in crops was not going to be up to normal this year, and that several of the farmers of the community had said that they were not going to put in wheat this fall and would probably rent their farms.

Farmers Are Listless

The apparent listless interest of the farmers in food production had seemed to him heinous and he told the assembly on the horseshoe ground what he thought of it.

He said every retired farmer who owned land ought to go out on it and use the very best up-to-date helps he could possibly secure to get the maximum production from his farm.

Whether the farm was rented or was being run by a member of the family or by a hired manager, the owner ought to consider it his personal responsibility to see that every possible aid to the greatest production were put on that farm.

Did the retired farmers mob the tractor salesmen? They did not.

Did the local dealer handling the tractor faint? He did not—he took the tractor salesman around the corner and hugged him.

For these were things that he had wanted to say. But he had taken his cue in handling the local situation from the bankers and other business men who had the old-fashioned, diplomatc conservatism which prevents a merchant from doing or saying anything which might by any stretch of a comprehensive imagination offend a possible customer.

Some wallop! The tractor salesman who bawled out this bunch of farmers knew what he was talking about; and he handed it to these farmers straight.

Why should they pitch horseshoes while all the rest of the world is at war? But read the article.—EDITOR.

Such things as this tractor salesman said have got to be said in some agricultural communities. There is no blinking the fact that there are hundreds of farmers who have not grasped the gravity of this nation's, and the world's, predicament. If they do know that we are at war they seem to think that there will be plenty to fight it without their troubling themselves.

Thousands and thousands of farmers have made many sacrifices, quite as severe sacrifices as any people in the city. They have planted when they felt sure they would lose money on the crop. They have given of their means and of their time. They have tried to meet the loyalty of urban dwellers' abstention half way.

The other thousands may throw this country into a food famine and so reduce the needed production that possibly this country will for years have inadequate food supply. This right at a time when they have every encouragement and opportunity to increase the food production, shorten the war and establish agriculture on a level which it otherwise might not have reached for many years.

But who is going to waken these farmers?

The agricultural department is doing wonderful work; but it is laboring under the disadvantage that farmers have for so many years left the study of its suggestions to their sons—and too often the sons did not go back to the farm. Farmers just naturally get into the habit of reading or listening to agricultural department suggestions as matters of casual interest and not as something they should themselves immediately adopt.

And perhaps the propaganda with reference to other war needs that representatives of the agricultural department present is received in somewhat the same spirit. Agricultural department representatives must have the strongest kind of co-operation from all business interests and all citizens of every community where they are working to promote better farm production.

Who's going to waken the farmers?

The local business men who have gained inspiration on the utmost support of the government in this crisis from their city connections or through their own mental alertness and devotion to country may do so.

In the cities there are numerous instances where business men have entirely disregarded any retroactive effect upon themselves of their most determined campaign for war enterprises. Committees of business men have called upon citizens who in many instances are the customers of the committee members, and have read the riot act to them on contributing to funds or subscribing to Liberty Loans or giving some of their time to war work. City bankers have forgotten the conventionalities of their profession and often tell their customers where to get off.

Dealer Is the Man

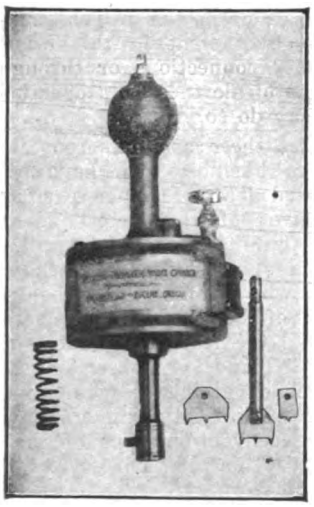
Possibly the country bankers will eventually take the same position.

But there is one class of people who seemed to be called by some providential fate to this duty, that is the SALESMEN AND REPRESENTATIVES OF THE AUTOMOTIVE INDUSTRY.

For one thing the automobile, tractor or truck salesman has the nerve to tell the truth. That's what one tractor salesman said. He was thinking chiefly of arousing the farmers to their duty as citizens. It was only after the question was asked that he made any comment on the aspect of better mechanical equipment for larger production.

Perhaps he hadn't thought of that, because it was self-evident that if the farmer is going to produce more he must have better equipment.

The tractor salesman who made the speech to the horseshoe pitchers wasn't trying to sell tractors. He hadn't cooked up the speech as an introduction to a sales talk on the advantage and necessity of automotive equipment to get the better production. He was really in earnest about the duty of every citizen to do his best for the country.



But when he did later have chances to make sales talks he didn't go about it as though he were trying to dispose of a white elephant.

He very sincerely believed that the farmer ought to produce more crops and do it more economically; that the tractor was a godsend to save the farmer from the hampering effects of labor shortage. He probably hadn't used any more energy by making his strenuous appeal on patriotism than he has used up in straight talks on tractors on other occasions.

But he was a better tractor salesman because he was pleading for his country and for democracy.

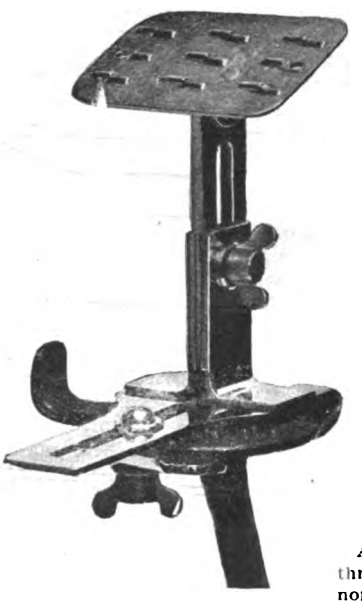
Accessories



VELTUM PNEUMATIC VALVE GRINDER

An oscillating valve grinder operated by compressed air from the tire pumping outfit or any other available supply. The body is an aluminum casting ground to an airtight joint and using no packing. This case contains two opposed cylinders, a connecting rod for each and a crankshaft. Air is admitted by a three-port valve which admits air to the cylinders alternately. Develops ¼ hp. on 80 lb. of air and will operate on any pressure from 15 to 100 lb. Price complete with three different style bits and a spring to put under the valves, list price, $30.—Warnock-Wirth Sales Co., Sioux City, Ia.

NORECA GREASE GUN-KUP

A grease cup that is also a grease gun. When open it holds twice as much as when closed. The act of closing with a simple half turn forces one cupful of grease at once in the bearing, leaving a cupful to be injected with the screw plunger as needed. It fills from the side through a square hole which is closed by turning the sleeve on the shell a half turn. Made of steel, nickel plated, capacity 1/3 oz., ⅛ in. pipe thread, price, 65 cents.—Greist Mfg. Co., New Haven, Conn.

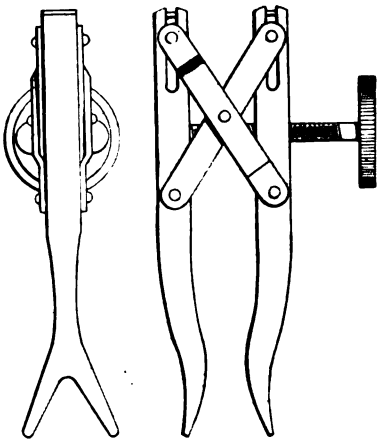
UNIVERSAL EXTENSION PEDAL

An adjustable extension pedal to be attached to the brake and clutch pedals with a clamp which slides so that the pedal can be moved forward or backward and rigidly fixed in that position. One model fits all shapes and makes of pedals. Price $4 per set of two, or $5 if fitted with rubber cushions.—Rich Mfg. Co., 1777 Broadway, New York.

NORECA SIDE-FILLING GREASE CUP

A grease cup that is filled through the side, the cap being non-removable, and the outer cylinder of the cup having a square opening which coincides with a similar square opening in the shell when the cup is turned to open it. A half turn opens or closes the cup and a multiple seal with an expanding sleeve prevents the grease from oozing out. A locknut locks the cup in the threaded hole provided for it. Made of steel, nickel plated, capacity 1/6 oz., ⅛ in. pipe thread, price 65 cents.—Greist Mfg. Co., New Haven, Conn.

SECURITY SWITCH LOCK



A switch lock for Ford cars that is applied over the regular Ford switch by removing the nameplate on the molded switch, or removing the complete metal covering on the all-steel switch on the 1918 model. The housing of the switch lock is applied in place of either one of these, by three screws. When the switch is locked, metal plates come out and cover the screw heads so that they cannot be removed. The action of locking the switch grounds all four coils so that they cannot be used even if another battery is employed. A non-pickable barrel lock with two keys is part of the housing and the lock is finished in black enamel and nickel. Price $3.25.—New York Coil Co., 338-340 Pearl Street, New York.

DISPLAY FOR UNIVERSAL WRENCHES

A window or counter display stand to hold four Universal grease cup wrenches. One of these is included in each package of wrenches. No charge is made.—Prismolite Co., Columbus, Ohio.

EVANS VALVE TOOL

The feature of this tool is that it gives a straight lift on the valve spring, thus releasing the cup so that it slides freely over the valve stem. It will fit practically any engine. Price $1.25.—Leon Evans, Loveland, Col.

THE LAW

By George F. Kaiser

As It Applies to
Dealers
Repairmen
Garagemen

Should You Lie When You Trade?

IN a recent California case it was decided that although the buyer of an automobile is not precluded from setting up misrepresentation as to the year a car was manufactured, by reason of having had it examined to ascertain its condition, the buyer cannot claim oral misrepresentation when the contract provides, "All promises, verbal understandings or agreements of any kind pertaining to this purchase not specified herein are expressly waived."

Suit was started against the dealer for damages for misrepresentation by its agent as to the year the car was manufactured.

It seems that the buyer had negotiated with the agent for the purchase of a used car which was offered for $1,800. The agent stated that it was manufactured in 1913. It afterward appeared that it actually had been manufactured in 1912. The car was examined by the buyer's mechanics by agreement and the car and the batteries were found to be in good condition and the mechanics reported that it looked like "a good buy." The buyer offered $1,700 for the car, which was accepted, and a written contract of sale was entered into.

The dealer contended that in view of the fact that the buyer had had the car examined he could not object to the date of manufacture, but the court held that the examination was had merely to ascertain the car's condition and not the date when it was manufactured. Regarding the dealer's further contention that he was not bound by anything that did not appear in the contract, the court held that, in view of the fact that the contract was a written one and contained the clause set out above, providing that no agreements except those contained in the contract should be binding on the parties, representations by the agent as to the year the car was manufactured were not material and the dealer would not be bound by them.—Munn vs. Anthony, 171 Pac. (Cal.) 1082.

Get Perm't to Use Photographs

While stopping at a garage the other day the proprietor came up and showed me a new advertising folder which he had drawn up to send out to prospective buyers. The folder was well gotten up and attractively printed. It also contained a picture of a family seated in one of the cars sold by the dealer.

I complimented him on the folder and then, just as a matter of course, asked how he came to have the picture. He replied in a casual way that he had taken the picture himself, having taken a snapshot one day when the car had been leaving his service station. I asked him if the car owner would not object to having the picture of his family used for advertising purposes. He replied, "Oh, no, I don't think he will object because he is very good natured."

An assumption of this kind on the part of a dealer is very foolish and is often very dangerous because it may lead to unlooked for results. In a number of states, among them New York, a person has no right to use another person's photograph for advertising purposes unless he first procures written permission to do so. *It is not enough to get verbal permission to use another's photograph for advertising purposes.*

There have been a number of cases taken to court where suit was brought against concerns which used photographs without permission, and in every case where the facts were established judgment was rendered for the persons whose photograph was used. The New York statute on this matter provides as follows:

Right of Privacy—A person, firm or corporation that uses for advertising purposes, or for the purpose of trade, the name, portrait or picture of any living person without having first obtained the written consent of such person, or, if a minor, of his parent or guardian, is guilty of a misdemeanor.

Any person whose name, portrait or picture is used within this state for advertising purposes, or for the purpose of trade, without the written consent first obtained as above provided, may maintain an equitable action in the Supreme Court of this state against the person, firm or corporation so using his name, portrait or picture, to prevent and restrain the use thereof; and may also sue and recover damages for any injuries sustained by reason of such use; and if the defendant shall have knowingly used such person's name, portrait or picture in such manner as is forbidden or declared to be unlawful by the last section, the jury, in its discretion, may award exemplary damages.

But nothing contained in this act shall be so construed as to prevent any person, firm or corporation practising the profession of photography from exhibiting in or about his or its establishment specimens of the work of such establishment, unless the same is continued by such persons, firm or corporation after written notice objecting thereto has been given by the person portrayed.

Garage Contract

I was recently asked for a contract which a garageman could use for customers whose cars are stored, repaired or furnished with supplies. The following form will be found to fill the want:

June 1, 1918.

To the Standard Garage,
1000 Broadway.

You are hereby authorized to provide storage and furnish necessary supplies, labor and material for my car as stated on the reverse side of this order. I warrant that I am the owner of the said car and that the license plates are registered in my name, and I hereby consent that you have the right of lien and sale in the manner provided for by Section 184 of the Lien Law (Consolidated Laws of New York), including the right to retain or retake possession of said car in case of default in payment of any bill or bills.

JOHN SMITH,
Owner
100 West 100th St., N. Y. City.

BACK OF CONTRACT

John Smith,
100 West 100th Street,
New York City.
Owner of car, John Smith.
Residence address, 1179 Broadway.
Business address, Broadway and Wall Street.
Business telephone, Wall 99.
Make of car, Packard; License, No. 1999, New York.
Service ordered, storage, daily washing and polishing.
Rate per month, $35.
Bills are to be sent to 100 West 100th Street.
Should anyone other than the owner of the car be allowed to use same? No.
Storage commenced, June 1, 1918.
Storage discontinued.
Account opened, June 1, 1918.
Account closed.
Miscellaneous.

This form is, I believe, in common use in Detroit.

Digitized by Google

Drive-Away Bureau

(*Continued from page* 13)

by south, pike into Crawfordsville. This is another good town and with good service.

Out of here get your bearings to Rockville, which will be an angle of west by south pike, several turns, but inquire often so you will hold your way correctly.

When you reach Rockville you are then on the Ocean to Ocean trail, with markings of white and red at each turn, so you will have no trouble holding your route.

On west out of Rockville, with a slight angle north, you will cross the Wabash River at Montezuma, then straight on west, crossing the Indiana and Illinois state lines about a mile north of Dana, then on west to Chrisman, Ill. This is not a large town but a very neat and pretty place, with ample service for not too large a crowd.

Leave Chrisman, go north to edge of town, you will come to a brick highway, turn west on this and on to Hume.

You will find these nice level roads, being improved and made into a good gravel highway. Straight through Hume and Tuscola and into Decatur. This is a good manufacturing city, up to date and progressive. Good accommodations.

Leave the circle and head west on a good pike for Springfield, going through Illiopolis, Riverton and several other small towns. You will find some dirt roads but no hills, and in favorable weather a good driving road.

Reaching Springfield you will find a large city and good service with numerous hotels and garages.

The next large town you go through will be Jacksonville, then head for Hannibal, Mo. You will cross the Illinois River, and there you will hit the first large hills of Illinois. After you have crossed the river and up on the flat prairie again you will have a good level run until you reach the hilly country approaching the Mississippi River.

Crossing the great river on the bridge you will find Hannibal a hustling river city with the best of hotel and garage service.

Leave Hannibal and take the marked road to Mexico, which will angle south by west and with no hills of any consequence, some gravel and in ordinary weather a mighty nice drive.

Mexico you will find up to date and with good service at numerous hotels. Leaving Mexico your road will take you west and south into Columbia, which is one of the beauty spots in old Missouri. This is quite a college town, and you will note the newness of the place. I didn't see an old residence, nothing but beautiful new-looking homes and well-kept grounds.

Go out Main Street, south cross the railroad, and you will hit a concrete street leading for miles up one hill and down the other. This is one place, if you are not very conservative, you will let her out to almost the last notch. Your next large town will be Boonville.

Now if you are going on to Kansas City, don't cross the Missouri River here but go to Glasgow, but Mr. Collinson was going to Arkansas City, and he can save quite a number of long miles by leaving the Kansas City trail here, take the ferry, cross the river, out South Main Street, over the long winding hill, on to Bunceton and to Sedalia.

From Sedalia take the pike leading to Windsor, about 20 miles south and a little west; elegant prairie road and marked with state road signs. From Windsor your trail keeps south by west to Clinton, then Nevada.

Crossing the Kansas and Missouri line at the big hill, then into Ft. Scott, Kan.

From Ft. Scott you will have a fine drive to Independence, where you can get the very best Kansas affords at two of the largest hotels in any town of its size in the state.

Here you will strike the famous Oil Belt Route, which is a grand drive.

Leaving the city you will have a level road for about 18 miles, then you will come to the east ridge of the Flint Hills, where it will wind around the bad places and take you past ranches, then about 20 miles of prairie drive before you hit the hills again east of Sedan, Kan.

It is quite hilly approaching and leaving Sedan, but nevertheless the road is mighty good.

Out from Sedan, about a mile, you cross the Big Caney River, then a little ways beyond you will come to a hill that will show what your car can do in "climbing on high." The hill is on a swing to the right and then to the left, starting with a steep, hard grade at first, then terminating into a steady, hard pull for over a mile. If you make it you will have to "hit her hard" at the beginning. You will go through the small town of Wauneta, over some more prairie good roads, then down a dangerous winding hill into the Little Caney bottoms across the bridge, south then west into Cedarvale.

Straight through, south cross the Santa Fe Railroad tracks just east of the depot, then your road turns west. A grand, rich farming country with scores of cattle, and field after field of alfalfa.

Four miles west at the famous J. J. Wilson ranch turn north for about a mile, then on west over the big hill at the Guthrie ranch, through the little town of Hoosier, turn north for about three miles, then straight into Dexter about eight miles away.

This little town, as you view it from the top of the big hill just before you start down into the valley of the Grouse Creek, is one of the prettiest sights along the way.

To cross the railroad watch your Oil Belt Route markings, for you keep west then north, then west, cross the iron bridge, turn sharp to the north, then around the large hill, and you will find the road a dandy with the heavy grade developed gradually, and before you are aware you are again on the level prairie and on west to the cross roads, then north for about three miles and then straight west with a few swings around some heavy hills on through Tisdale, and then you will begin to drop over a small hill or two and then with a nice gradual decline into the valley of Walnut Creek and on into Winfield. This is a beautiful, shady city, with good roads leading every direction. Arkansas City is about 14 miles southwest; Wichita northwest, and the oil fields of Eldorado and Augusta, in Butler County, north.—G. H. Schultz, stockman for William Small Co., 112 West North Street, Indianapolis, Ind.

Girl Leaving Washington

WASHINGTON, May 31—Acceptance of the resignation of Christian Girl, director of production of the Motor Transport Section, was made Saturday, May 25. Mr. Girl, who has been trying to obtain an acceptance of his resignation for several weeks, will leave Washington shortly to return to Cleveland and assume his duties as president of the Standard Parts Co. Mr. Girl filed his resignation last January, when he foresaw that his work would be completed by May 1.

Packard Shipped Its Thousandth Liberty Engine

DETROIT, June 5—The Packard Motor Car Co. shipped its one thousandth Liberty engine last week, just a year to a day from the sending to Washington of blue prints and parts which formed the start of the Liberty motor design. The event was celebrated by the men who, within a year, have had the successive responsibilities of producing the first Liberty engine by hand, the first Liberty engine to fly, the first Liberty engine made from tools designed for quantity output, and now their first thousand perfected engines.

The crating of the thousandth engine was witnessed by the engineer who on May 29, 1917, took down to Washington a trunk, checked as personal baggage, which contained complete blue prints and an all steel-cylinder of an aviation engine. It was the design of this engine, representing at that time more than two years of development work, from which Lieut.-Col. J. G. Vincent, then the Packard chief engineer, and E. J. Hall evolved the design of the Liberty engine.

Upon the completion of Engine No. 1000, a telegram was sent by the two Liberty engine builders who are now in production to President Wilson and Secretary Baker. Congratulations came back praising the "most commendable zeal and spirit with which this task has been accomplished."

Waltman Joins Hupp Motor

DETROIT, June 3—C. M. Waltman, formerly general superintendent of the Weidley Motors Co., has been appointed assistant to the vice-president of the Hupp Motor Car Corp. in charge of production.

Finish of the 10-mile at Sheepshead, May 30

De Palma Takes Harkness Race

Final Check of Scores Gives Packard Pilot First at 102 M.P.H.

Harkness Trophy Race, 100 Miles

Driver and Car	Time	Handicap
Ralph De Palma, Packard	58:21	1:01
Tom Milton, Duesenberg	58:31	2:05
Barney Oldfield, Golden Submarine	59:20 1-5	2:10
Ed. Hearne, Frontenac	1:00:52	2:12
Denny Hickey, Hudson	1:01:40 4/5	3:10
Omar Toft, Miller	1:03:23	2:35
Louis Chevrolet, Frontenac	1:03:35	Scratch
I. P. Fetterman, Peerless	1:04:40	4:00

SHEEPSHEAD BAY SPEEDWAY, June 1—Ralph De Palma took the honors at the Harkness Trophy race here to-day with a Packard, and Louis Chevrolet accounted for the final heat of the Futurity handicap. De Palma finished the 100 miles in 58:21, which is at the rate of a little better than 102 m.p.h., and is quite a bit slower than the time made by Chevrolet last year when he won in 54:20.98, or at 110 m.p.h.

The program was witnessed by one of the biggest crowds that has packed the inclosure. The grandstand was filled and it is estimated that between 40,000 and 45,000 persons saw the races. This is the first time that the race has been run on the handicap basis.

De Palma's most serious rivals were Resta, who went out at the end of 54 miles with a broken piston; Ralph Mulford who quit at 68 miles with a broken oil feed connection; and Chevrolet who stopped for tires three times and lost so much time he was only able to finish seventh.

After the 28th lap it was a great race. It was so great in fact that the timers and scorers were all at sea as regards results and a groan of disappointment went up when Tommy Milton was the first to get the checkered flag. A later check of the score sheets revealed that De Palma had beaten him by the narrow margin of 10 sec., which is not much on paper but which is nearly quarter a lap of the track.

Futurity Handicap—First Heat

Ralph Mulford	Frontenac	6:10 2/5
Tom Milton	Duesenberg	....
Jack Le Cain	De Iago	....

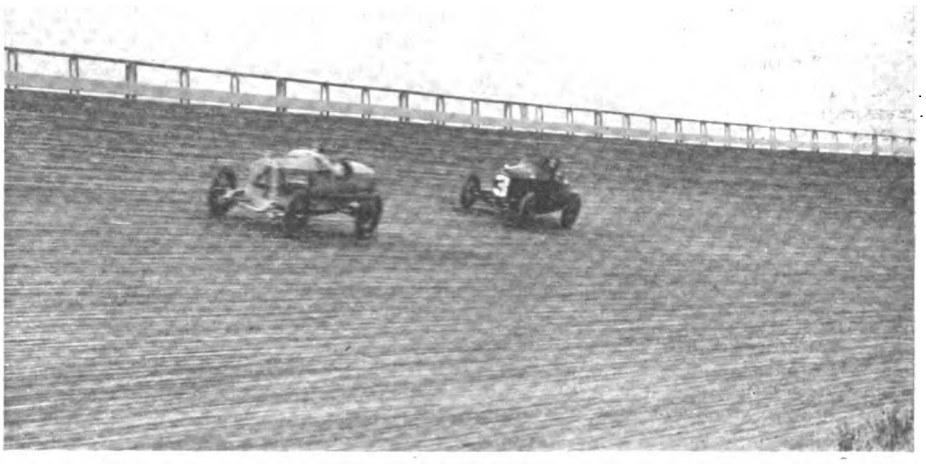
Second Heat

Dario Resta	Resta	6:07
Ed. Hearne	Duesenberg	....
Louis Chevrolet	Frontenac	....

Final Heat

Louis Chevrolet	Frontenac	5:57 2/5
Ed Hearne	Duesenberg	....
Dario Resta	Resta	....
Tom Milton	Duesenberg	....

Early in the race it became apparent that it was to be a sort of three-sided duel between De Palma, Chevrolet and Resta, with a possibility of Mulford springing a surprise on any one of them. But the hopes of the crowd were dashed when Chevrolet commenced stopping for tires.



But whatever disappointment Chevrolet may have felt at losing the major event, was made up in part by his good work in the final heat of the Futurity Handicap. This he won in 5:57 2/5.

In the big event, the real fight was between De Palma and Tommy Milton. De Palma started with a handicap of 61 sec. whereas Milton had 2 min. and 5 sec., giving him a lead of 1 min. and 4 sec. which is practically a lap. With Chevrolet and Resta out of the way, De Palma went out after Milton. He was driving carefully and consistently, doing laps regularly as clockwork at 1:05 which is practically 110 m.p.h. But it was not until the 28th lap, or just about at the half-way post, that De Palma was able to get the Duesenberg pilot.

It was manifest that De Palma's Packard was quite a bit faster than Milton's Duesenberg, and immediately after he had passed Milton, De Palma slackened his pace and Milton hung within a dozen feet of his axle all through the rest of the race to within four laps of the finish. Then De Palma commenced increasing his lead and at the finish line had opened up a gap of nearly a lap between himself and Milton.

The veteran Barney Oldfield, driving his famous Golden Submarine, which is no longer a submarine because Barney could not breathe in its close atmosphere and amputated the egg effect, was always a dangerous contender. He went through the race without a stop, finishing in third place without any particular difficulty.

The real thrills came in the short races. The handicapping was good and it brought the cars almost together in the stretch. In the final heat, Chevrolet had driven into the leading position in three laps and at the finish had plenty to spare. De Palma looked like a contender in this heat, but pre-ignition so reduced his speed that he could not overcome Mulford's handicap.

De Palma, the winner, and Chevrolet, fighting it out on the bank at the turns

America to Be Felt in Air Fighting by September 1

Present Indications Are That Planes Wil Be Coming Through in Quantity by Early Autumn

DETROIT, May 31—The United States will make itself felt materially in the air by Sept. 1, according to present indications in the factories in this vicinity. Liberty engine production is moving ahead at a rate which promises to see a great many of these engines in the air within 2 months, and a sufficient number of American planes equipped with either this engine or other engines by Sept. 1 to become a weighty factor in the supremacy of the air.

At the present time at least 1500 Liberty engines have been manufactured and shipped. Nearly 1000 of these have left the Packard factory, and 300 have been shipped from Lincoln Motors; General Motors, Ford, Trego and the other concerns are rapidly getting into quantity production.

The Fisher Body Co. is now in production on battle planes in addition to the large number of Dayton-Wright training planes turned out daily by this concern. Production in other manufacturing zones such as around New York where the Hispano-Suiza engine is being turned out at the factory in New Brunswick, N. J., and at the plant of the General Vehicle Co. in Long Island City, is also going ahead rapidly.

Curtiss Making Strides

All of these concerns are organizations which were not in airplane manufacture previous to the war. Plants like the Curtiss Aeroplane & Motor Corp. at Buffalo have been also making giant strides. Curtiss is in production in the Sunbeam engine, having a contract for 1000 of these with the British government. A small number of the engines have been manufactured and actual production should now come along rapidly. The second large contract for the Curtiss company is for 5000 type OX-5 eight-cylinder training engines for use in training planes at the several cantonments in this country. To take care of this contract, three buildings were constructed at Elmira; an assembling plant, a testing plant, and a take-down and re-assembling plant. The rate of delivery on these engines may be judged from the fact that in March the original schedule called for 700 engines, while 835 were actually delivered. In April the original schedule called for 800 engines and 1003 were delivered. During the months of May and June there will be 1000 of these each month, so that at the present time more than half of the 5000 have been completed.

For the United States Navy the Curtiss Aeroplane Company has developed a flying boat of the HS-2 type, this being a biplane with a 72 ft. span, having a ceiling of 1300 to 1400 ft. and a speed of 85 miles per hour. It uses one Liberty engine, this being of the navy type, in which the compression is slightly lower than that used for the army. This flying boat has already been successfully tested out and has given satisfaction to the naval officers stationed at the Curtiss plant.

Engine Characteristics

Various reports, which may or may not be authentic, regarding the Bristol type have been given out. Some of the aviators flying it regard it as tricky and rather unstable, due, it is claimed, to a down draft on the elevator caused by the upper plane.

One of the points regarding the Liberty engine which has to be carefully watched and which may require a change in design is that of the fire danger in starting. Owing to the large gas passages to accommodate the high speed of the engine, it is a rather difficult engine to start, requiring heavy priming. This, in starting, causes a flame to issue from the exhaust port, which is in close proximity to the plane. Recently at one of the tests at the Curtiss plant where the HS-2 type was being tried out the lower wing was set afire due to the flame from the exhaust port in starting, and a delay of over 2 hr. was necessitated while the wing was patched. Accidents of this kind are apt to result in precarious delays, and this is a matter which should receive consideration. After the engine is started, of course, the draft from the propeller draws the flame away from any of the structural parts of the machine, and, furthermore, when the mixture is correct there is no flame in the exhaust.

Potter Heads American Truck

NEWARK, OHIO, June 1—Col. Joseph D. Potter has been elected president of the American Motor Truck Co. The financial end of the business has been taken over by the R. L. Dollings Co. of Columbus. Col. Potter was formerly connected with the Kilbourne & Jacobs Mfg. Co., Columbus.

General Motors Buys St. Louis Site

ST. LOUIS, June 3—The General Motors Co. has bought a 105-acre tract known as the "Union Race Track" at Union Boulevard and Natural Bridge Road for a body factory and assembly plant. The immediate construction of a plant to cover 40 acres is planned. This announcement follows that of Russell E. Gardener, president of the Chevrolet Motor Car Co. of St. Louis, that he had sold his holdings in that company to the Chevrolet Motor Car Co. of New York, for $1,000,000. A manager representing the purchasing company will take charge of the plant Aug. 1.

The Chevrolet Motor Car Co. of St. Louis, formerly was the Banner Buggy Co., which was founded by Gardener and which became the largest factory of its kind in this section. It has been the body factory for the western assembly plants for Chevrolet cars and employs more than 1100 persons.

Opinions of Business in Detroit

DETROIT, May 31—In its trade letter the National Bank of Commerce, which is now checking Detroit business conditions every month with about 100 executives and credit men, gives a table which shows the comparison between the composite opinion as expressed in April and again in May, 1918. The following figures are the percentages of the total replies that each class was credited with:

Future business conditions:	April	May
Above normal..	29.03%	26.26%
Normal	38.72%	46.74%
Below normal..	32.25%	25.00%

Future business conditions:	April	May
Improving	61.40%	51.12%
Stationary	33 33%	35.55%
Declining	5.27%	13.33%

Receivership for Monroe

PONTIAC, MICH., May 31—At a meeting of the creditors of the Monroe Motor Car Co. held a few days ago a friendly receivership was decided on so that the company could continue until it was on its feet again. Robert T. Armstrong, Flint, an accessory manager and well known figure in General Motors, may be named receiver. It is stated that the joint claims of the Hess Spring & Axles Co., Cincinnati, and the Electric Auto-Light Co., Weinegar, Ohio, aggregate $380,000 and the company's liabilities total $538,000. The assets are said to be slightly less than the liabilities.

Cleveland Garage Owners Organize

CLEVELAND, June 1—The Garage Owners' Assn. of Cuyahoga County has been organized here, and headquarters have been established in the Olmsted Hotel. Semi-monthly meetings will be held at which there will be lectures on garage management, service, business accounting and other problems. The officers are: President, C. W. Wood of the Hough Avenue Garage; vice-president, J. E Dietrich, Lorain Avenue Garage; secretary, E. S. Crane, Brookside Garage, and treasurer, F. D. Cook of the Detroit Electric Service Station.

These Windows Were Clean

ST. LOUIS, June 3—Several Motor Row companies recently have installed show windows with no noticeable baseboard for the glass. Within a week prospective visitors have tried to walk through these windows, breaking glass in the showrooms of the Newell Motor Car Co. and the Rottersman Automobile and Truck Co.

Michigan University Wants Motor Teachers

Unless It Gets More by June 15 It Can't Teach Mechanics for Uncle Sam

ANN ARBOR, MICH., May 31—Unless the University of Michigan gets more instructors before June 15 it will not have adequate facilities for teaching the 700 students who will be sent there by the War Department at that time for the purpose of being trained in automobile mechanics. The university is calling for thirty-five able gas engine men who because of their previous training are fitted to instruct students in automobile adjustment and repair work.

Besides the regular instruction staff, an additional thirty-five men will be required to train these men and inasmuch as the university's contract with the government is made on such a meager basis of profit, the way is opened to men who have foremanship qualifications and some experience in automobile work and who are either above the draft age or who are disqualified for active service, or exempt because of dependent families, to do a patriotic service at home.

Instruction to be given is in chassis repair, engine repair, carbureter repair and adjusting, and instruction in starting, lighting and ignition adjustment and repair. Two kinds of men are desired: experts, and men who have only a limited amount of knowledge about automobile building and repair, as a whole, but who do know well some one thing about an automobile.

American Commercial Car in Production

DETROIT, May 31—The American Commercial Car Co. will be ready in 2 weeks to make its first shipment of 1½-ton trucks, for which it has orders aggregating 100 vehicles. This company recently contracted for Fletcher carbureters as standard equipment.

Texans Society to Buy Ambulances

FORT WORTH, TEX., June 1—The Texans Beneficent Society expects to close contracts for 500 ambulances for field service at the battle front within 90 days. The organization is seeking specifications and prices on these. Literature should be addressed to H. E. Ferree, 610 West Broadway, Fort Worth.

Successful Truck Transport Routes

COLUMBUS, OHIO, June 1—J. F. Dewey, who has been operating motor truck transport routes out of Columbus to nearby towns and cities now has two trucks in service and another has been ordered. The business so far has grown to a considerable extent and Dewey is encouraged to open new routes. He now has three routes out of Columbus which are paying propositions. One of the routes runs through Columbus Center, Granville, Jacksontown, Newark, Kirkersville, Hebron, Etna, Wagram and Reynoldsburg. Another route runs from Columbus to Baltimore, Basil, Greencastle, Hookers, Lithopolis, Lancaster, Millersburg, Pleasantsville, Summerland Beach, Thurston and other towns. Still another route runs from Columbus to Worthington, Delaware, Dover, Marysville, Milford Center, Unionville, Plain City and Dublin. No announcement has been made as to the other route to be opened.

Grossman Using New Wrapper

NEW YORK, June 1—The Emil Grossman Mfg. Corp. is using a new kind of wrapper for Red Head Spark Plugs. This consists of a small sheet of wax paper on which is printed, in red, directions for tightening the terminal nut.

Motor Liverymen Organize

MILWAUKEE, June 1—The Milwaukee Motor Liverymen's Association has been organized by representatives of about thirty establishments in Milwaukee, with Robert W. Bauer, president; Jacob W. Endler, vice-president, and John F. Pergande, secretary-treasurer. The membership includes both liverymen and funeral directors operating liveries. Beginning to-day, charges for the use of hearses advanced $2 and a similar increase is made in 8-passenger limousines, so that hereafter the hearse will cost $12 and the limousine $10 for each funeral.

Kansas City and Red Cross

KANSAS CITY, June 1—As in the Third Liberty Loan campaign, the motor car dealers of Kansas City had no distinctive part in the Red Cross campaign. Nearly every retail establishment and distributing station, however, had representatives on the soliciting committees. J. Frank Martin, manager of the Buick branch in Kansas City, was chairman of the important branch house committee which secured the co-operation of Kansas City branches of foreign firms. There were many comments upon the effectiveness of this committee's work.

Want Big Representation

ST. LOUIS, June 3—President F. W. A. Vesper of the National Association of Automobile Dealers has sent a request to more than 50 dealers' associations asking that they send delegates to a meeting to be held at the La Salle Hotel in Chicago June 14 and 15. The call says that taxation, legislation, etc., will be questions to be considered.

Plans of Air-O-Flex

DETROIT, June 1—Air-O-Flex Automobile Corp. has purchased a small plant at 217 Franklin St. to manufacture its products and expects to begin activities along this line in 45 days. At first the company will manufacture complete trucks but later will confine its efforts to suspensions alone.

Milwaukee on Record for War Conservation

To Carry Out to the Limit the Ideas of the N.A.D.A. War Service Committee

MILWAUKEE, June 1—Members of the Milwaukee Automobile Dealers' Association, embracing practically every distributer and dealer in Milwaukee, on June 1 put into effect new rules suggested by the War Economy Board to the National Automobile Dealers' Association. The Milwaukee society met Wednesday evening, May 29, and voted unanimously in favor of meeting all of the requirements of the Government in order to release man-power for strictly war purposes. The ranks of Milwaukee garage forces already have been quite generally depleted by voluntary enlistments and the selective draft, and nearly every garage and service station flies a service flag with three or more stars. The new regulations, however, will release a considerable number of mechanics, as a further contribution by the Milwaukee trade to the immediate requirement of 30,000 motor car mechanics.

Kansas City for Conservation

KANSAS CITY, June 1—The Kansas City Motor Car Dealers' Association has decided to go the limit in the adoption of conservation measures. The details of the plan are now being worked out and probably it will go into effect about June 15.

Jacksonville Joins N. A. D. A.

ST. LOUIS, June 3—The Jacksonville, Fla., dealers association is the latest to come into the N. A. D. A. with full membership.

Commandeer St. Louis Ford Plant

ST. LOUIS, June 3—W. C. Anderson, manager of the Ford Assembly plant here, has received notice that the building will be taken over within 30 days by the Government as a food warehouse and that Ford work here will cease. Anderson says that the working force in the plant has been reduced from 700 to 300 men and these have been offered positions in the food depot if they care to take them.

Outdoor Show for Bloomington

BLOOMINGTON, ILL., May 31—After a series of delays, due to unfavorable weather the proposed spring outdoor show of the Bloomington Automobile Trade Association will be held early in June. The first exhibition of this kind was held last August, the cars being grouped around the sidewalk on the court house square. The merchants co-operated, paying for the decorations, and the display was a drawing power that proved

Digitized by Google

profitable to nearly every line of business. The dealers also traced much new business to the show and also found that the expense did not exceed $8 per firm. Although the dealers here have been unable to secure anything like the number of cars required by their respective contracts, yet they feel that it would be unwise to discontinue sales boosting or lessen the usual business activity while the war is in progress. The exact date when the show will be held will be fixed at the next meeting.

Open Cars for Road Materials

WASHINGTON, May 31—The Railroad War Board has ruled that open-top freight cars may be used for the transportation of sand, gravel and other road material, thus acting in line with the policy adopted by the United States Chamber of Commerce at its annual meeting in April.

The ruling, which has been prepared by the Car Service Section of the railroad board, provides that available open-top cars not suitable for the transportation of coal, coke or ore may be furnished for the transportation of stone, sand and gravel; when so furnished shall be used preferentially for the transportation of highway maintenance material. It is further ruled that cars used for coal, coke and ore may be used for the transportation of road materials on their return trips to the mines, and that every endeavor should be made to furnish shippers of stone, sand and gravel with a minimum of 40 per cent of their normal weekly transportation requirements.

Universal Attachment Deliveries Start

DETROIT, May 31—The first deliveries have been made on the new Detroit Universal truck attachment, manufactured and sold by the Parkview Sales Co. A complete line of attachments is offered running from the 1¼-ton size, adapted for Ford cars, to the full 3-ton job, to be used for converting the largest cars for truck service. Many special bodies are adaptable for use on the Universal truck attachment, and there is also a range of wheel bases available.

Mail Air Service Satisfactory

WASHINGTON, May 31—Postmaster-General Burleson has expressed himself fully satisfied with the air mail service and is arranging plans for its extension. Of the twelve trips made during the 2 weeks, eight were completed before 3 p. m. and two before 2.50 p. m. One trip was completed at 2.25 and two at 2.34. There were two delays when the mail reached New York at 4.45 p. m. The airplane mail service from New York arrived in Washington six times before 3.30 p. m., twice between 3.30 and 4 p. m. and four times after 4 o'clock.

Abbott Sale Ends June 1

DETROIT, May 31—The sale of the stock of the bankrupt Abbott Motor Co. will end to-morrow. Miscellaneous parts and accessories are included in the sale.

Licenses Furnished By Syracuse Dealers

Open Bureau That Makes It Easy for Car Buyer to Get Tags for His New Car

SYRACUSE, June 1—A special bureau of the New York State automobile bureau was opened here this week for the convenience of automobile buyers and dealers. Licenses will hereafter be issued for new cars through the Syracuse Automobile Dealers Association offices. Plates are only issued to owners of new passenger cars and trucks living in this city. Motorcycle licenses for all users are also to be issued.

The new bureau was formally opened by Gustave C. Miller of Buffalo, representing Secretary Hugo. Syracuse stands at the junction of the Buffalo and Albany license zones and has encountered considerable delay in getting plates from Buffalo. The new bureau will materially aid Syracuse dealers in being able to put new cars into use by owners the day they are sold.

Horey Wins at Columbus

COLUMBUS, OHIO, May 31—Fred Horey won the principal event in the race meet held here Monday under the auspices of the National Motor Contest Assn. This was the 30-mile sweepstakes run in three heats of 10 miles each. Chevrolet, driving a Case, was second, and Clark, also in a Case, was third. The event was the culmination of a day of racing which was attended by a fairly good crowd. Intens- heat interfered with the racing. The summaries:

Five miles; cars with less than 300 cu. in. piston displacement. Won by Willard (Prince Henry); second, Cline (Briscoe); third, Soules (Darracq).

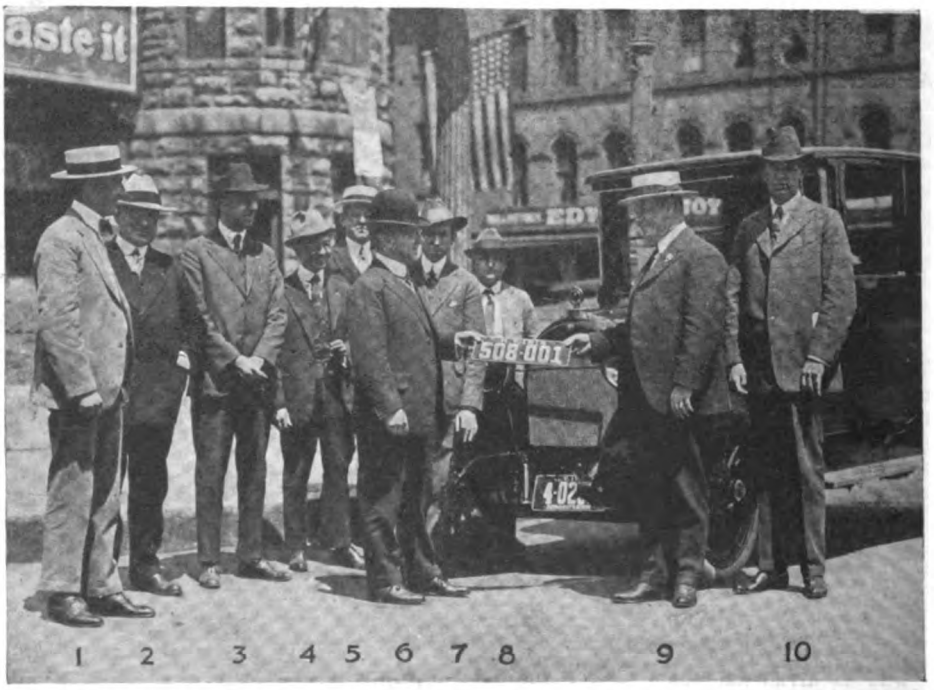
One-mile exhibition trials. Horey (Fiat), 51 2/5; Clark (Case), 52; Ellingboe (Briscoe), 53 2/5; Haughdahl (Maxwell), 54 2/5; Chevrolet (Case), 54.

Ten-mile, first heat sweepstakes eliminations. Won by Cline (Briscoe; second, Chevrolet (Case); third, Ellingboe (Briscoe). Time 9:45 2/5.

Three-mile special match race. Won by Clark (Case); second, Ellingboe (Briscoe); third, Horey (Fiat). Time 2:56.1/5.

Ten miles, second sweepstakes elimination. Won by Horey (Fiat); second, Clark (Case); third, Haughdahl (Maxwell). Time 9:18 1/5.

One-mile exhibition. Horey (Fiat), 51 4/5; Clark (Case), 52 2/5.



Ten mile final heat, sweepstakes. Won by Horey (Fiat); second, Chevrolet (Case); third, Clark (Case). Time 9:23 2/5.

Livingstone Succeeds Tyler

WORCESTER, MASS., May 30—W. R. Livingstone has been chosen secretary and treasurer pro tem of the Worcester Automobile Dealers' Association. He succeeds O. P. Tyler, who has joined the service of this country. The executive committee was revised as follows: F. H. Kenney, H. J. Murch, W. R. Livingstone, F. S. Howard, F. G. Chandler, S. E. Hale and J. C. Harvey

Palmer Plant Leased

DETROIT, June 3—The plant formerly used by the Palmer Mfg. Co. has been leased to the Everitt Bros. Co., body painter and finisher. The plant has about 40,000 sq. ft. of floor space.

Assistant Secretary of State Gustave C. Miller issuing first license at new Syracuse Bureau: 1—Secretary Harry T. Gardner of Syracuse Automobile Dealers' Association. 2—Simon Silverman, vice-president of association. 3—T. A. Young, treasurer. 4—Harold N. De Witt, director of association. 6—J. Allen Smith of Syracuse receiving first license plates. 7—John W. Lee, Jr., president of association. 8—C. J. Nichols, head of Mutual Motor Car Co. 9—Gustave C. Miller. 10—George H. Norris, director of association

Digitized by Google

War Convention!

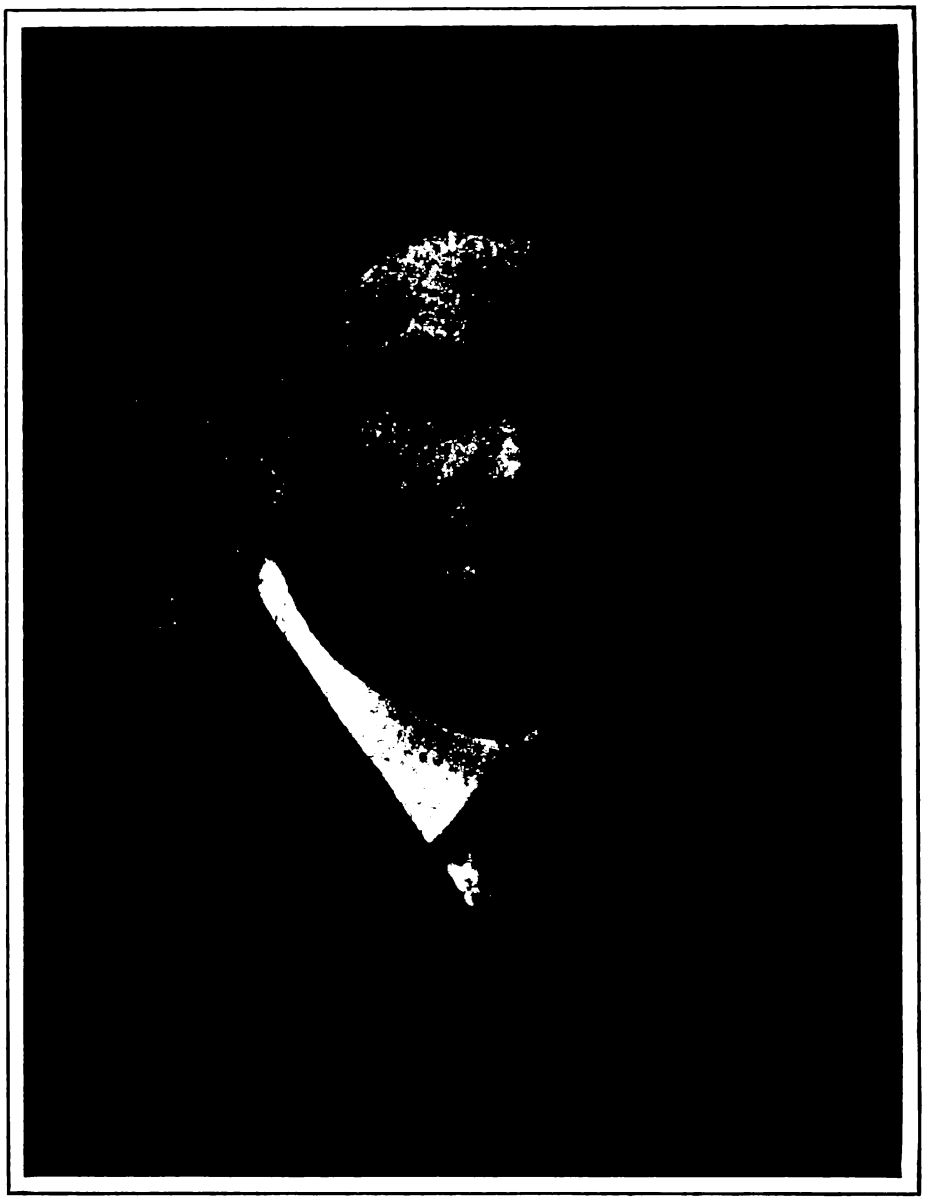
Called by National Automobile Dealers' Association

Dealers Will Gather in Chicago June 14 and 15 to Discuss Problems Due to Changed Conditions

ST. LOUIS, June 3—A general meeting of representative dealers from the whole United States has been called for June 14 and possibly 15 at the Hotel La Salle, Chicago, by President F. W. A. Vesper of the National Automobile Dealers' Association.

Requests have been sent to all the city dealer associations in the country, asking that each city be represented by the president, secretary and two accredited members of the local association.

The meeting will not be limited to members of the national association. All representative dealers are urged to come.



War-time problems will be taken up, including the association, recently formed plan of business conservation and the elimination of waste.

Seventeenth Used Car Report Out

CHICAGO, June 3—The Seventeenth Edition of the National Used Car Market Report has been issued by the Chicago Automobile Trade Association. Cars that have been added are the Commonwealth, Harroun, Moore and States. Cars that have been dropped are Benz, Meteor, Michigan, Palmer-Singer, Rayfield, Selden, Woods Dual Power and Columbus electric.

Miller's Accessory Division "Over the Top"

NEW YORK, June 3—Chas. E. Miller, who is divisional chairman of the Red Cross, reports that the accessory men of the Metropolitan Section have made good on their quota. Miller's establishment is 100 per cent Red Cross subscribed, and also flies the Liberty Loan Honor Flag, as well as a service flag containing 12 stars.

E. E. Peake

Who has been made executive secretary of the National Automobile Dealers' Association

ST. LOUIS, June 3—E. E. Peake, secretary of the Kansas City Motor Car Dealers' Association and president of the National Association of Automobile Show Managers, has been made executive secretary of the National Automobile Dealers' Association and will be in charge of the membership campaign. He will spend most of his time on the road, reporting directly to President F. W. A. Vesper's office in this city.

Peake is widely known to motor car dealers and has been active in the work of the N. A. D. A. By invitation, he has been making many addresses for the association and his effective work brought the new appointment to him.

Prominent Tradesmen Assume New Duties

Resignations and Promotions Place Workers in New Places

H. F. Bennett, who has been manager of the advertising and efficiency departments for the Overland Automobile Co., St. Louis, has resigned to join a Detroit factory.

A. J. Lindenberger of Detroit, has arrived in St. Louis to become manager of the branch office of the Ahlberg Bearing Co., vice L. Berry, who goes to Chicago.

Fred Z. Wright, a special representative of the Bell Telephone Co., St. Louis, has accepted the position of assistant general manager of the Newell Motor Car Co., St. Louis.

Thomas G. May, city sales manager for the Ford Branch at St. Louis, has entered the U. S. Service as a gasoline engine expert and will be stationed at the Great Lakes Training School.

George M. Price, president of the Great Western Motors, Seattle, Paige distributer, has joined the ambulance corps.

L. E. Warford, advertising manager of the Seattle branch of the B. F. Goodrich Co., has joined the Aviation Section, Signal Corps, U. S. Army.

E. M. Mark, secretary and treasurer of the North Pacific Oakland Co., Seattle, has severed his connection with that firm to become president of the Pacific Motors, Inc., Elgin distributer in the Northwest. Mark will also head the Seattle Motor Car Corp., retailing the Elgin and Harroun in King County.

A. D. Kelley, assistant general manager of the Signal Motor Truck Co., Detroit, formerly connected with the Chalmers Motor Co. and Dodge Brothers, has resigned and became associated with the government June 1. His duties will not take him away from Detroit.

A. C. Burch, who recently resigned from the Signal Motor Truck Co., Detroit, has become associated with the Clyde Cars Co. as vice-president. He assumed his duties June 1 and has complete charge of sales.

Russ Baldwin, formerly connected with the Champion Ignition Co., Flint, as head of the speedometer department, resigned recently and will shortly announce his new connection.

W. L. Agnew, formerly advertising manager of the Hudson Motor Car Co., Detroit, and later with the Chalmers Co. in the same capacity, is now connected with the Moore Motor Co., Liberty distributers in Columbia, S. C.

Richard Ferguson has been appointed managing director of the Grant-Lees Gear Co., Cleveland. He was formerly general manager of the company's East Sixty-ninth Street plant.

Max Hagelstine has been appointed factory manager of the Detroit Battery Co. and the Disco Electric Mfg. Co., Detroit. For the last ten years he has been associated with the Studebaker Corp.

F. W. Henderson has been elected president of the Signal Motor Truck Co., Detroit, to succeed A. C. Burch, who resigned.

C. T. Chenevert, formerly vice-president of the Denby Motor Truck Co., Detroit, has been commissioned a senior lieutenant in the Bureau of Aviation Operation, to supervise navy trucks in France.

Victor M. Stamm, general manager of the Milwaukee branch of the United States Rubber Co., 41 Oneida Street, Milwaukee, Wis., has been elected first vice-president of the Rotary Club of Milwaukee.

James H. Hay, superintendent of the Wallis Tractor Co., Racine, Wis., since its establishment, has resigned to accept a similar position with the Lavine Gear Co., Racine Employees presented him with a diamond ring upon leaving the Wallis plant.

H. W. Kardell, president of the Kardell Tractor & Truck Co., has removed from St. Louis to Oldsmar, Fla., where he will look after the work in the factory opening there.

L. Q. Slocumb, a salesman for the Rottersman Automobile & Truck Co., has opened a law office in St. Louis. He studied law while selling motor cars.

H. F. Bennett, who joined the staff of the Overland Automobile Co. of St. Louis from the factory at Toledo, has resigned to join a factory staff in Detroit.

H. W. Richards of the Superior Motor Car Co. staff, St. Louis, has been promoted to sales manager.

Ernest H. Craw, for ten years with the Studebaker Corp. in various capacities, has joined the New York City sales organization of the Rainier Motor Corp.

Horace G. Johnson has associated himself with the sales department of the Rich Tool Co., Chicago, and will make his headquarters at the Detroit office, 709 Kresge Building.

J. Henry Smith, manager of sales, motor parts dept., Rich Tool Co., Chicago, will make his headquarters in Chicago and all sales will be handled from there.

Charles S. Shuman, for many years connected with the Klaxon Horn organization, and recently manager of the automobile department of the Standard Metal Mfg. Co. of Newark, N. J., has resigned the latter position to become sales manager of the Vacuum Muffler Corporation of 154 Nassau Street, New York City.

Peninsula Buys Factory Site

DETROIT, June 4—The Peninsula Milled Screw Co. has acquired 10 acres of land on which it will erect a factory building covering one-half of the property. This will be built next year.

Power Truck Leases Factory

DETROIT, June 4—The recently incorporated Power Truck & Tractor Co. has obtained a 5-year lease on a factory building here. This will be equipped shortly.

Gas Shortage Story Without Foundation

Surplus of Fuel in Country at Present Time—Tank Cars Idle in Yards of Distributers

WASHINGTON, May 31—Reports to the effect that a gasoline shortage prevails are entirely untrue. Motor World states authoritatively that at the present time there is a surplus of gasoline in this country. There is no shortage of transportation. Tank cars are standing idle in the yards of many gasoline distributers. News dispatches published in the daily papers recently that gasoline and kerosene were to be mixed for the purpose of conserving gasoline and another rumor that gasoline cards are to be issued and automobiles placed on a ration of 1 gal. per day are said by Government officials to be pure propaganda fostered by manufacturers of appliances designed to operate on kerosene or on a limited supply of gasoline.

Government officials do not deny that there may be a shortage of gasoline in the future when this Government reaches its maximum power in the war. When many thousands of airplanes, tractors, tanks, trucks and passenger cars are employed for the big drive there is no question but that there will be some conservation of gasoline, but the suggestion of gasoline cards or of giving a ration of 1 gal. per day or to make a mixture of gasoline and kerosene are denounced as "wild, unsubstantiated rumors."

Receivership for Monroe Motor

PONTIAC, MICH., June 4—At a meeting of the creditors of the Monroe Motor Car Co. held a few days ago, a friendly receivership was decided on. Robert T. Armstrong, Flint, may be named receiver. It is stated that the joint claims of the Hess Spring & Axle Co., Cincinnati, and the Electric Autolight Co., Weinegar, Ohio, aggregate $380,000 and the Monroe company's liabilities total $538,000.

Here are three of the Fordsons demonstrated by T. W. Meiklejohn at Fond du Lac, Wis., one drawing a two-bottom plow, another a disk harrow and another a spring-tooth harrow

First Fordson Tractor on View in New York

Rochester Distributer Receives Machines—To Hold Series of Demonstrations

ROCHESTER, May 31 — The first Fordson tractor arrived in Rochester on Monday and has been placed on exhibition in the salesrooms of Thomas J. Northway Co., distributer for this locality. Since that time the salesrooms of the company have been crowded and the only complaint of the company is that by no possibility can it secure as many tractors as it could have sold during the past week.

Since only 1000 of these tractors have been allotted to New York State, distributers have been cautioned to use extreme care in the sale of each tractor that it may be placed where the greatest food production will result. The allotment of 1000 tractors provides for the placing of about one tractor in each township, and before the distributers are allowed to sell two tractors in a town the prospective purchaser is required to present a statement from his local farm bureau head stating that in his opinion the placing of a tractor on that particular farm would result in a material increase in the food production of the state.

This does not mean that the state farm bureaus are indorsing the Fordson tractor, but that the distributers are using their knowledge of conditions to place the tractors where they will do the most good.

Northway has arranged for a series of demonstrations at a number of different points throughout western New York in order to acquaint purchasers with the best methods of handling them. On May 29 a demonstration was given at Benton Center, in Yates County, and on Decoration Day another was given at the Livingstone County fair grounds at Avon, where thousands witnessed the event.

Moline Develops New 4-Cylinder Tractor

MOLINE, ILL., May 31—The Moline Plow Co. of this city has just announced a new model of its Moline Universal tractor, known as Model D. It differs from the previous model chiefly in being equipped with a 4-cylinder engine instead of the former 2-cylinder. The well known Moline 2-wheel principle is retained. The engine is of the valve-in-head type and delivers 18 hp. for belt work. Clutch, transmission, differential and final drive are completely enclosed and operate in an oil bath. There are 12 Hyatt roller bearings in the transmission and drive. The tractor complete weighs 3380 lbs., of which 98 per cent rests on the 2 wheels and only about 2 per cent on the implement pulled, so that nearly all of the weight is available for traction. Every Universal tractor unit has a Moline 2-bottom plow included in the price, which is $1,375 f.o.b. Moline. Complete electrical equipment, including starter, lights and engine governor, is furnished.

Macbeth Lens for Fords Raised

NEW YORK, May 31—The Macbeth-Evans Glass Co. has increased the price of its Ford size lenses from $4 to $5.

2000 Farmers Witness Fordson Demonstration

Meiklejohn Stages Exhibition That Draws From All Over State of Wisconsin

Editor Motor World: We note the article in Motor World of May 22, describing the demonstration of the Fordson tractor given at Dayton, Ohio, May 17 and 18, and believe that you might be able to use something on the demonstration and initial appearance of the Fordson tractor in Wisconsin, which took place May 11, 1918, in Fond du Lac.

About 2000 people from all over the state witnessed the event, which was under the direction of T. W. Meiklejohn, who has volunteered to distribute the Fordson tractor to Wisconsin farmers at factory price, without any profit to himself.

We are enclosing photographs which were taken at this first demonstration, and also others which were taken at a competitive demonstration held May 21, and in which several different makes of tractors participated.—T. W. Meiklejohn, Fordson Service for Wisconsin, Fond du Lac, Wis.

Part of the crowd that turned out to see the Fordson tractor demonstration put on by Meiklejohn at Fond du Lac

The Age of the Salesman Is Coming

So Says Lee Anderson in Pointing Out the Need for Real Merchandising Ability

DETROIT, May 31—At the meeting of the Detroit Section of the Society of Automotive Engineers held here last week, Lee Anderson, vice-president of the Hupp Motor Car Co., delivered an address on the sales problems of to-day and to-morrow. Mr. Anderson told of the serious problem which confronts all manufacturers to-day in adequately supporting their dealers. The distributing organizations which have been built up during peace times are hard put to secure sufficient products to maintain their sales volume to a sufficient extent adequately to cover their investments. As a result, many of these distributing organizations are in a precarious condition and the problem relating to their maintenance is one of the most important features of the sales manager's duties at the present time. It is not a question of seeking a market for the product, but rather seeking a product for the market. A digest of Mr. Anderson's talk follows:

Big Production After the War

This is the age of the production manager and the engineer. This condition has been brought about by the shortage of material and transportation facilities which have so changed the situation that there is no real sales problem as a sales problem now. The age of the salesman, however, is coming. The war period is causing the erection of new factories and the expansion of old factories, which, after the war, will have manufacturing facilities which will far exceed those of the period before the war. It is then that the salesman will come in to dispose of the greatly increased production activity of the plant.

Engineering improvement is part of the coming problem. The engineer must have devices to sell. The world is learning to use new things, and the war is destroying the old things. Therefore, the great problem before engineers in the future is to produce new things which meet the demand for devices of the highest efficiency.

If there is any mistake that the United States is making it is a disregard for the future sales problems. This is not the case in Europe. Already engineers of great automobile manufacturing plants have been in this country to study our market with a view of disposing of their products in this country after the war. Europe is studying the needs of America, and engineers who come over here on war work always have their mind's eye on the future sales possibilities of their products in this country.

There is no sales problem connected with disposing of automobiles at the present time. All the automobiles that the factories can produce in the next 24 months will practically sell themselves. This is true because of the absolutely inadequate production at the present time, and the uncertainties of maintaining even this production during any definite period.

Dealers' Position Causes Alarm

The position of the dealers is one which causes us the most concern. A considerable proportion of the dealers now in business are wondering how long they can keep their doors open; they are scrambling for cars and will take any cars which they can secure and any lines which they can secure, because of the insufficient quantity now being produced.

The industry owes a debt to the dealer which it must always keep in mind. It is up to the industry to keep these dealers in business, and yet this is one of the most difficult problems which could possibly be faced. If the production of the factories is spread too thinly over the entire country it does not do any of the dealers any good, and all of the dealers would have to close their doors. Therefore, it becomes a matter of selecting the dealers and sacrificing some to keep the others alive.

Speaking of the Hupp company, Mr. Anderson stated that one of the biggest reasons for supporting the dealers, outside of the debt which the industry owed them, is the fact that the dealer organization is what maintains public opinion, and public opinion is required to sell any car. He stated that in the 9 years that the Hupp company has been in existence it has spent over $5,000,000 to create a market. This is small as compared with some companies. Willys-Overland spends one and one-half million dollars alone per year. Public opinion is the foundation, and all of these millions will be wasted if this public opinion is lost, and it can be lost by losing dealers.

The Hupp company has three rules by which it works out its eliminations of what might be called non-essential dealers, in order to keep the really essential ones alive. The first question which is asked is: "Is the automobile business a side line, or is it the principal source of income?" If not absolutely dependent upon the automobile business the concern can be eliminated. The second question asked is: "To what extent is he dependent on one product or one line?"

If he has a variety of lines he cannot be considered as essential to the company as the dealer who lives only by the sales of the one line. The third question asked is: "How large an organization is at stake, how much overhead does the organization carry?" This is highly important because a dealer having a high overhead and maintaining a big organization for the purpose of distributing the product of the company must have more cars in order to maintain the standing which he has created for himself.

It is necessary that the automobile manufacturer maintain a market for his product because this market will be multiplied a hundred-fold after the war. The country cannot do without cars. When the passenger cars of the country are cut down, the efficiency of the people of the country is also cut down; furthermore, the possibility of cultivating remote expanses of farm territories is also reduced.

Only 2 per cent of the entire amount confess that their cars were bought for pleasure purposes. The day of the passenger car as a joy-riding proposition has passed, because the percentage used for purposes of this kind is so small that it need hardly be considered.

There are really five reasons behind the curtailed production. These are as follows:

1—Transportation, not only of the outgoing cars but of the incoming materials.

2—Labor; scarcity and price. It is a noteworthy fact that in spite of the 20,000 shortage in Detroit there is an average idleness of 12,000.

3—Steel.

4—Coal.

5—Rubber.

Engineers Must Study Sales

Engineers should be closer to the sales department. The engineer of to-day is inclined to be arbitrary. He is inclined to believe that because he has designed something which he believes is right the public is forced to take it. The time has passed when this can be done, and in fact, Mr. Anderson stated that he did not believe he was exaggerating when he stated that the attitude of the automobile engineer is the only thing that has not changed in the industry during the past decade.

The salesman of to-day is just as technically trained as the engineer. He can tell just what the effect of any given set of words will be and a great many other problems in sales psychology which are just as intricate as those of the engineering laboratories. The salesman knows the cars that will sell best because of his contact with the public, and consequently it is advisable that the engineer keep in close touch with him in order to produce a product of the higher success. The present-day buyer is a better buyer now than he was a year ago. The buyer of to-day will pay the price, but he wants efficiency for it. He wants economy, and he wants a dollar's worth o car for every dollar spent. This continual talk of thrift has had its effect on everybody. Everybody who buys to-day wants to justify his expenditure in his own mind. He wants the style, but good style must be in conformity with good taste, because good taste remains good longer than any fad. The buyer of to-day wants durability, he wants simplicity, and cars are selling to-day which base their entire selling arguments on performance and economy.

The RETAIL NEWS

EAST

John C. Mattice, distributer of Oakland cars and Atterbury trucks, has enlarged his showroom and garage at 230 Stradford Avenue, Bridgeport.

Bert the Tire Man, formerly associated with the East End Supply Co., Bridgeport, has opened a vulcanizing shop at 14 Sixth Street.

J. Lebas and I. Nichthauser have opened a vulcanizing, repair and accessories shop at 2063 Fairfield Avenue, Bridgeport, under the style Lebas Service Station.

J. A. Morris, distributer of the International Motor Co., has opened a sales branch and service station at 673 Connecticut Avenue, Bridgeport.

William A. Konopaska, East Hartford, Conn., has sold his Willard battery service station in the East Hartford Garage to William Howe and has opened a new place in Willimantic, Conn., under the style Windham Battery Co.

R. Robins has sold the Valley Road Garage at East Northport, L. I., and has opened the Triangle Tire Shop at 1323 Boston Road, New York City.

C. M. Botsford & Co., Horseheads, N. Y., has been discontinued and the business taken over by H. R. Bottsford.

The Franklin Motor Car Co., Rochester, hsa moved its salesroom from 37 East Avenue to 19 Scio Street.

Gay S. Clampitt, Rochester agent for the Westcott and Rausch & Lang electrics, has discontinued his salesrooms at 19 Scio Street and will hereafter handle all business at his Park Avenue garage. The company will be styled Electric Car Sales and Service Co.

The Harrisburg Auto Co., Harrisburg, Pa., is building next to its present site a brick garage, shop, office, showroom and stockroom, and will move into the new structure in September.

The Terwilliger Equipment Co., 2013 Market Street, Philadelphia, has been made distributer of Winther trucks for this territory. H. J. Smith has been placed in charge of the line.

The Crown Auto Painting Co., Philadelphia, has leased the three-story building at 1406 Vine Street, which contains 20,000 sq. ft. of floor space.

M. J. Scott, Philadelphia, has purchased the brick garage at 5123 Sansom Street.

The Overland-Harper Co., Twenty-first and Ludlow Streets, Philadelphia, is making alterations in its Parts Department.

Hanwaring & Goodman, Philadelphia distributers of Day-Elder trucks, have moved to larger quarters at 1517 North Fifty-ninth Street.

The United Auto Stores, Inc., distributer of the Miller carbureter, has added a Philadelphia branch at Thirty-third and North Chestnut Streets, West Philadelphia.

The Penn-American Motor Car Co. has opened a salesroom at 2063 Market Street, Philadelphia, for the American Six. A service station will be conducted in connection with the business.

W. Clark Grieb, 306 North Broad Street, Philadelphia, has added Kissel trucks to its regular line.

The Larson-Oldsmobile Co., 231 North Broad Street, Philadelphia has added the Master truck.

The Painter-Dunn Co., Pittsburgh, has taken the agency for Sanford trucks in western Pennsylvania.

Kingsessing Garage Co.....Philadelphia

SOUTH

The Motor Sales Corp., Birmingham, Ala., has moved into new quarters at Twentieth Street and Avenue D. Salesrooms have been opened for Maxwell and Stearns cars, and a service station will be maintained for each.

The Taylor Motor Co. has purchased a building at 2022 Fifth Avenue, Birmingham, and will open salesrooms for Cole cars.

H. M. Newell has been appointed sales manager by Chester P. Wilson, Kentucky distributer for Smith Form-A-Trucks, Louisville.

The Liberty Auto Co., recently appointed distributer for the Maxwell in this territory, has opened an office and salesroom at 507 East Broadway, Louisville. R. D. Otter is president and Wallace Embry, Jr., secretary and treasurer.

The Yager Motor Car Co. has been appointed Liberty distributer in Louisville, and has opened an office and salesroom at Second and A Streets. Roy D. Yager is president.

The Monarch Auto Co., Louisville, Ky., has taken on the distribution of the Fordson tractor.

The Ex-L Auto Tire Co. has moved to its new store at 668 South Third Street, Louisville. The company, of which J. J. Goullon is president, handles the Marathon tire, and for several years has maintained a salesroom at 935 South Third Street.

The J. R. Callum Co., Norfolk, Va., has moved to new quarters in the Texas Building at Granby Street and Olney Road. The company has a filling station and complete accessory store.

MIDDLE WEST

The Lane Motor Truck Co., Detroit, has opened a New York branch to look after eastern trade.

The City Garage, Negaunee, Mich., has taken the agency for the Buick for Ishpeming, Mich.

The Prothero-McGinnis Co., Baraboo, Wis., Buick dealer, has added the Nash line of passenger and commercial cars.

L. W. Frane has opened a tire and vulcanizing shop and battery recharging and service station at Colby, Wis.

The Hunt Garage, Boscobel, Wis., has installed an electric lighting system for illuminating its building and for recharging storage batteries. The unit is of the 16-battery type and is manufactured by the International Gas Engine Co.

The Voell Auto Sales Co., 24 East Division Street, Fond du Lac, Wis., has been appointed Nash dealer.

E. A. Shinner, Hartland, Wis., has sold his garage, repairshop and Ford agency to G. B. Schneider and H. E. Salsich of Hartland, who will continue the business.

The Sterling Motor Truck Co., Milwaukee, manufacturer of the Sterling truck, has opened a service station at 704 National Avenue, Milwaukee, for the convenience of local owners. The plant is located at Forty-sixth Avenue and Burnham Street, West Allis, a suburb, and formerly all service was given at the factory.

NORTHWEST

The Des Moines Storage Battery Co. has opened a new service station at 415 East Fifth Street, Des Moines.

The Consigny Motor Truck Co., Des Moines, has moved into new quarters at 1314 Locust Street.

The Strandburg Auto Co., Dayton, Iowa, has succeeded the Freeborn Auto Co.

H. R. Knight, Eldon, Iowa, has sold his garage to Glen Wilson.

The Monticello Garage, Monticello, Iowa, will be managed by Ike Schneider during the absence of F. C. Byrne and M. First, who are in the army.

The White Way Auto Co., Pella, Iowa, will be conducted in future by A. A. Van Meer.

The Carroll Truck & Auto Co., Eleventh Street, Sioux City, Iowa, has been formed by W. F. Carroll and H. S. Kloke. The company will distribute Traffic trucks in the Sioux City territory.

A. W. Muchow, Central City, Neb., has bought the Central Garage.

J. E. Beacon, Dodge, Neb., has opened a repairshop.

The Ulmer-Frost Co., Lincoln, Neb., has moved into its new building at Eighteenth and O Streets. This is 2 stories and has 29,000 sq. ft. of floorspace.

The Victor Motor Co., Omaha, will take over the distribution of Dart trucks and tractors in the State of Nebraska and a section of western Iowa.

A. L. Wright, Scottsbluff, Neb., has bought the South Side Garage from Frank N. Cline.

Willis Pickering, Syracuse, Neb., has bought the interest of his brother, D. R. Pickering, in the Pickering Brothers Garage.

A. E. Hannen has opened a tire repairshop at Tilden, Neb.

C. R. Glenn has opened a tire repairshop at Wayne, Neb.

W. C. Gage has opened an accessories store and tire repairshop at West Point, Neb.

The Hahn-Jonas Co., Sioux Falls, S. D., has moved into new quarters at Ninth and Dakota Avenues. The new building is 2 stories high and of modern, fireproof construction. The company distributes Lexington, Cadillac and Harroun cars.

Book Review

TIRE Making and Merchandising by F. R. Goodell, published by the U. P. C. Book Co., 239 West Thirty-ninth Street, New York, $2 net. The book is one of great practical value and real interest to anybody engaged in the tire business. It is also useful for a man engaged in any allied business.

The first chapters take up the history of the rubber business in America, and then go into the manufacture of tires, beginning with rubber at its original source in the forest and taking it right through to the tire factories. The book tells why some tires are good and some tires are bad, and points out the different methods of manufacture that can build mileage into a tire or leave it out.

Sometimes a dealer or a buyer is unable to understand why certain things are done in tire making, or why certain tread designs are manufactured. This book points out the reason.

It analyzes tire costs and shows that tires are not entirely made of rubber, despite the common belief that rubber is a big percentage of the volume and the cost of the tire. Many other things are necessary.

The book then takes up the merchandising of tires and tells what must be done by a dealer to make money in the tire business. Seconds and gyp tires are discussed, and the book shows the relation between selling cheap tires and quality tires at a higher price. Another chapter is devoted to tire adjustment, and the damage that is done to tires by various road conditions is pointed out by illustration.

There is also a chapter of tire "lingo," consisting of the terms that are used in the tire business.

This is followed by a tabulation of all the cars made since 1915, with the tire sizes and rim sizes used on different models. There is a further tabulation of all the different tire sizes, showing what cars these tire sizes fit. It gives the dealer an idea what size and how many he should carry in stock. There is also a list of all the tire manufacturers in the country, with various other tables and data that are invaluable to the tire man.

Meeting Problem of Human Nature

PERHAPS what will prove to be the most perplexing problem which the automotive dealer will be called upon to solve will be to meet the difficulties which will be presented by the human element. What is meant by this is the difference in his customers as regards their ability to master power farming problems.

To meet this successfully will demand the exercise of all the tact and discrimination he can muster. He must be competent to analyze and estimate the individual competency of his individual tractor customers, and he must be acute enough to estimate how the competency or the incompetency of the individual will affect the efficient operation of the machine after it passes into his control.

The average farmer habitually thinks out his power problems in terms of horses. It is inevitable that he should do so because as a rule he never has known anything else and therefore has no other standard by which to go. Yet horse standards are comparatively worthless by which to judge the tractor, because the latter is a power unit of a totally different kind.

The farmer, therefore, who readily passes from horse farming to power farming and experiences little difficulty in adapting himself to the new conditions must possess a special aptitude for the manipulation of power machinery. But it is very obvious that aptitude of this kind is not possessed by all farmers in equal degree, hence the degree of success attained in tractor operation will vary. The dealer must then be able to discriminate between aptitude and ineptitude, and he must be in a position by means of instruction and service to supply the deficiencies of the latter.

The tractor is revolutionary. It meets old conditions in a new way and in the doing so introduces new problems which are all its own. Some farmers are so readily adaptable that the new problems present little difficulty to them; to others they appear to be almost insuperable. Thus unless the dealer has the ability to help and the tact to proffer it unobtrusively and without offense these latter never will make successful tractor operators.

One such in a locality is a blot on the dealer's record. The chief duty of the automotive dealer will consist in seeing to it that whatever he sells renders effective and continuous service. In fulfilling this duty the chief obstacle he will encounter will be the incompetency of some of the men to whom he is compelled to sell. He must overcome this if he is to be accounted truly successful as a dealer.

Des Moines and Red Cross

Editor Motor World: You may be interested in knowing that in the recent Red Cross campaign the motor interests of Des Moines continued their splendid record.

The Des Moines quota was $150,000. Approximately $225,000 was finally raised.

Motor Trades, which was one of the 26 teams representing different classifications of business, had the highest number of subscriptions, and next to one other classification, which included capitalists and retired citizens, had the greatest production.

Motor Trades Bureau of the Chamber of Commerce, R. J. Clemens, chairman, included upward of 100 houses and 150 individuals, or about 85 per cent of the motor industry of this city.—Very sincerely yours, R. H. Faxon, General Secretary, the Des Moines Chamber of Commerce.

Overhaul Operations on Republic Truck

(*Continued from page* 24)

just give when the man jumps on the spoke. Adjust the two brakes equally.

16. Insert cotter pins in clevis pins and set up locknuts against yokes.

17. Remove pedal block and see that wheel turns freely. If it does not, the brake band may be bent, and this should be taken off and straightened.

18. Lower truck off jacks or trestle.

19. Take truck out on road and test brakes independently. Either set should be capable of locking the wheels. If a particularly careful job is wanted, the axle can be jacked up again after the road test, and the adjustments gone over to see if they are still all right.

20. Oil the following brake mechanism: twelve brake clevis pins, two brake shaft supports on center shaft, two brake pin arms, one on each side on external bands, hand brake lever shaft.

21. Fill and screw down grease cups on the following: two cups on brake pedal and clutch shaft, two cups on brake shafts on rear axle (*one on each side*), two cups on brake shaft supports on rear axle (*one on each side*).

American Commercial Car in Production

DETROIT, June 4—The American Commercial Car Co. will be ready in 2 weeks to make its first shipment on the 1½-ton truck, for which it has orders aggregating 100 vehicles.

Monkey Wrench One Tractor Problem

A MONKEY wrench is a dangerous tool to have around. The combination of monkey wrench and even a mild form of "tinkeritis" can raise havoc with the best-constructed tractor on earth. Toddy, of Helen's Babies fame, is not the only one who "wants shee wheels go wound." There are others. A propensity to peek into things seems to be natural with a good many men; more general by far than the counter ability to get things back into proper shape again.

The monkey wrench is indispensable around the tractor, but it should be used, not abused. Just because it happens to fit a certain nut is no reason why that nut should be turned—always. Tractors are supposed to come from the factory with all major adjustments made. Local adjustments, to meet particular conditions, should be made by some one who knows how, and then the operator should let things alone as far as possible. More often than not serious difficulty develops from unwarranted tinkering rather than that tinkering is necessary to correct difficulty. The dealer who sells tractors can do his customers no greater service than by impressing this fact firmly upon their minds.

Firestone Steel Products Co. Formed

AKRON, OHIO, June 3—The Firestone Steel Products Co. has been incorporated to manufacture demountable rims. It has completely absorbed the interests of the Firestone rim plant. H. S. Firestone, founder of the new company, has been elected president.

The officers of the company are the same as those of the Firestone Tire & Rubber Co., with the exception of J. G. Swain, who becomes vice-president and factory manager. The officers are: H. S. Firestone, president; R. J. Firestone and A. C. Miller, vice-presidents; J. G. Swain, vice-president and factory manager; S. G. Carkhuff, secretary; J. C. Robertson, treasurer. In addition to the further development of the standard Firestone rim, the company will expand its business to include the manufacture of other metal accessories for automobile wheels and tires.

Coming Events

Racing

Chicago	Chicago Speedway	June 22
Cincinnati	Cincinnati Speedway	July 4

Conventions

Hot Springs, Va.	Convention National Association of Automobile Accessory Jobbers.	June 5-13

Show

Dallas, Tex.	Seventh Annual Texas Automobile Show Texas State Fair.	Oct. 14-27

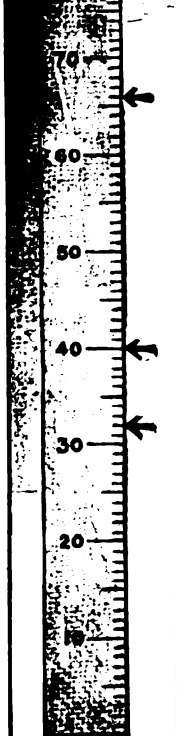
HORSELESS AGE, The oldest automotive paper published in the English language has been purchased by The Class Journal Co. Its merchandising features, and a part of its circulation, have been merged with MOTOR WORLD



MOTOR WORLD for DEALERS, JOBBERS AND GARAGEMEN

Volume LV
No. 11

New York, June 12, 1918

Ten cents a copy
Two dollars a year

Highest previous resistance to current when heated

Highest previous resistance to shock and vibration

Highest previous resistance to sudden change in temperature

Big Increase in Porcelain Efficiency

The Romance of Experiment 3450

TEN YEARS of constant research and experiment—day after day of unremitting laboratory work — with the laboratory furnaces glowing night after night!

Thousands of different combinations and mixtures of materials gathered from all over the world!

Each carefully recorded formula tested in the laboratory furnaces under different degrees of heat!

Steady improvement in spark plug porcelains all this time—but no great gain upon the increasingly severe requirements of new developments in gasoline motors!

3449 different experiments—until—finally—the startling results of Experiment 3450 showed a long stride ahead in all the essential requirements for spark plug insulators.

Champion 3450 porcelain is so far ahead of any other insulator that it stands today clearly and distinctly in a class by itself—unchallenged.

So Champion Dependability takes on new meaning—for no spark plug can be more dependable than its insulator.

FROM A FORD ROADSTER TO A HALF-TON TRUCK

IN TWO SECONDS!

$32.50

PATENT PENDING

2 SECONDS AGO → AND NOW

THE NEW UTILITY DISAPPEARING TRUCK FOR FORDS

Once the Utility Disappearing Truck is installed on a Ford roadster it requires only 2 seconds to change the car into a half-ton truck. The truck is completely out of sight under the **original** turtle back of the Ford car. When not in use there is absolutely no hint of the truck—the car looks just as it always did.

The Utility Disappearing Truck can be completely installed in one hour by anyone with a hammer and wrench. Only four bolts used in attaching it. No rattle—no vibration—a truck body made of heavy gauge steel that is held securely in place.

The turtle back cannot be marred or injured when Ford is being used as a truck. It lifts up automatically and protects back of seat from scratches. This truck has proved very popular with merchants, salesmen and everyone who has packages to be hauled.

DOUBLES THE VALUE OF A FORD CAR

Combined with the Utility Disappearing Truck a Ford roadster is the most useful car on the market. It is not only a passenger car but a commercial car as well. No matter what the nature of the load to be carried if it does not exceed a half ton it can be carried quicker and cheaper with the Utility Disappearing Truck.

Made of heavy gauge steel, beautifully finished in black baked enamel and can be pulled out to the desired length. Practically indestructible because no bolts or rivets are used in the acetylene welded body.

Utility Sure-Grip Pedals for Fords

$1.00 per pair

Absolutely prevent foot slipping from clutch or brake pedal. Utility Sure-Grip pedals transform the small, smooth Ford pedals into standard size, safe, comfortable pedals.

Attached instantly—no holes to drill, no special tools required—one nut to tighten and the job is done. Once they are installed they absolutely cannot slip off.

DEALERS—Send for a sample pair.

DEALERS!

Order your sample now and write for complete details and the agency for your community.

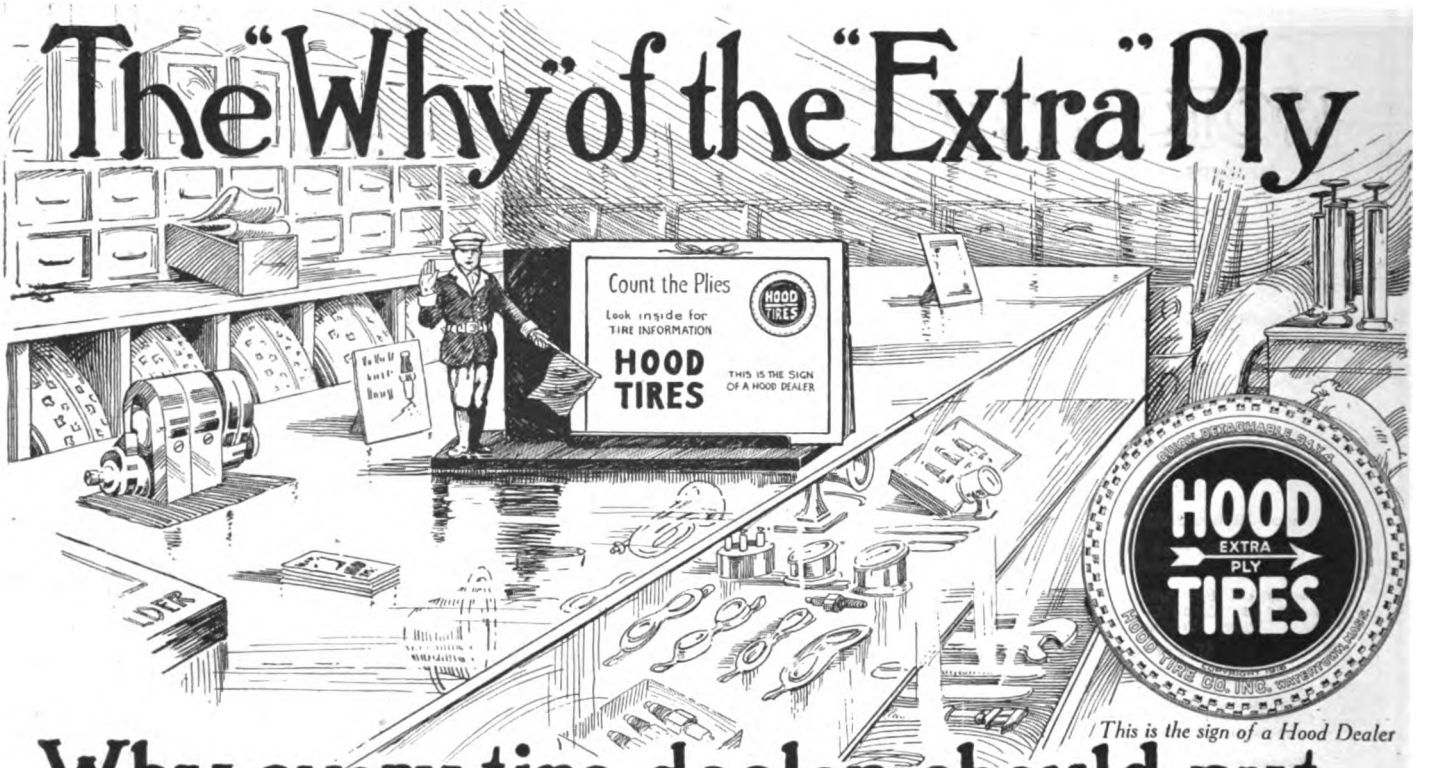
Simplicity That Assures Strength and Accuracy

THE accompanying illustration shows the absence of complicated mechanism and emphasizes the simple sturdiness of the operating parts in the

CORBIN-BROWN SPEEDOMETER

It will be noted that the parts are few, big and strong. They are made to wear long and stand up under the hardest jolts and the most severe, continuous usage.

The centrifugal governor in the Corbin-Brown has four balance weights so sensitive that they respond to the slightest variation in speed. This centrifugal principle is the same that applies to the control of engines. It insures absolute regularity of revolution. In any mechanism, simplicity, strength and reliability always go together. That is why you find all of these qualities so strongly featured in the Corbin-Brown speedometer.



Ask your dealer about the Corbin-Brown Maximum Speed Hand and be sure to specify it. This extra feature registers your highest speed and remains at that point until reset to zero, which can be done in an instant.

Catalog on Request.

The "Why" of the "Extra" Ply

This is the sign of a Hood Dealer

Why every tire dealer should put this Silent Salesman on his Counter

Because this Silent Salesman proves "Why" the Hood Arrow Tread Extra Ply Tire has won a reputation for low cost mileage that, tire for tire, is unequaled in the business—

Because this Silent Salesman shows the different construction of the Hood Tire, its greater wear resisting strength, its thickness, toughness, quality—

Because this Silent Salesman gives a convincing sales reason to every tire purchaser and any Hood Tire will back it with performance.

Because this Silent Salesman makes sales and Hood Tires keep them repeating for every dealer who sells them—

Because repeat orders and selling a tire that gives you a reputation for quality is an asset, good business to invest in—

Because we place a large organization behind you, working all the time to promote your sales by national advertising and personal assistance and—best of all—give you a tire on which you can make the most profit per tire sold.

Write us—let us prove it. Fill out and mail the coupon.

Jobbers Convene

Broadened Scope of National Body May Bring Change of Name—Rising Costs and Chicago Exhibit Chief Topics of Discussion

By Ray W. Sherman

HOT SPRINGS, VA., June 10.—The proposed jobbers' exhibit or show in Chicago at the time of the fall meeting and the rapidly rising cost of doing business are the two big subjects that have come up thus far at the Summer Session of the National Association of Automobile Accessories Jobbers.

It also is not unlikely that the organization may change its name to International Automotive Equipment Association, the better to describe its aims and membership. It to-day took in a member from London, England, and for some time has had a strong membership in Canada.

From the way things are moving at the opening session, it looks as though the show, or exhibit as it is styled, will be held at the time of the fall meeting and that the dates will be the last 4 days in October and the first 2 days in November.

This afternoon, separate sessions were held by the manufacturers and jobbers. The manufacturers aired several matters relating to the show and put their sentiments into a resolution for introduction in the joint sessions on the following days of this week.

They also discussed the advisability of manufacturing members being placed on the same basis as jobber members. At present the manufacturers pay smaller dues and receive no convention expenses, while the jobbers get some convention expenses, yet pay larger dues. The net result is much the same financially, but the present arrangement tends to require an attendance of jobbers, and there is no financial incentive for the manufacturing members.

At the session of the jobbers much interesting discussion developed on the subject of rising costs. Catalogs are printed and sometimes before the ink is dry prices change. Some are resorting to sales letters and special bulletins to publish new prices, while others have found no way of getting from under. The result is that some jobbers are in a quandary as to what to do to make money this year.

On articles of which there is no widely advertised list prices, it was reasoned that new lists can easily be made, but that on articles with advertised lists it is difficult and sometimes impossible to make any profit.

It was suggested that it would be a good idea if list prices were left off cartons and packages temporarily at least. Some of the jobbers are marking prices up sufficiently to protect themselves against the numerous expense increases, such as rail rates, traveling costs and labor.

Among those present is former President Sidney B. Dean, who is now a lieutenant buying trucks for the Signal Corps in Washington.

An ovation was given the Canadian members when J. Ernest Millen delivered a patriotic address and presented the association with a Canadian flag. The service flag of the association contains 14,876 stars.

There was some discussion when it was proposed that all future members must qualify as wholesale only, but since this means a change in the by-laws it cannot be acted upon until the fall meeting.

The jobbers to-day also discussed in detail the manner of paying salesmen and the cost and method of using cars in traveling the men. Most of them favored the use of cars and nearly all differed in their method of handling their road costs.

Sessions will be held every morning until Friday with an afternoon session Tuesday also.

The attendance is up to par, which is considered exceptional with the time of year and conditions considered.

This Organization Has

No Dues, No Constitution, No By-Laws

Yet the Chicago Used Car Managers Association Is Working Wonders in Taking the Snarls Out of the Trade

THE Used Car Managers' Association of Chicago is a peculiar and unique institution, if institution it may be called. It has neither constitution nor by-laws; it has no membership dues; it has a membership limited strictly to the used-passenger car department of the motor car business and even this is a delegate membership and is not invariable; it has but one permanent official, the others changing every six months; it has no executive authority or power; it has no influence upon the motor car trade except indirectly and only insofar as that influence may affect the morale and personnel of the used car trade. Yet, despite all these negotiations, it is a tangible organization for a distinct purpose and accomplishing much good in the direction of that purpose.

Good fellowship breeds plain speaking. Secrets are bared and ill-feeling simply cannot exist when a bunch of men get their knees under the same lunch table. That's why this association is so successful.

Essentially a Committee

The Used Car Managers' Association is in substance a committee which exists under the immediate direction and control of the Chicago Automobile Trade Association, yet none of the men composing the committee are members of the trade association. Every used car dealer, whether he operates independently or whether he is the hired manager of the used car department of some passenger car company, may, in the former case, delegate one of his employees to represent him in the association, or, in the latter case, may himself be a member. Each firm may be represented by one delegate only, and in the case of the independent dealer he himself cannot belong. Neither is the independent used car dealer permitted to attend any of the meetings of the association. The delegate members belong indefinitely. The effect of this is to limit the membership to employees only, and to only one employee from each firm represented.

The executive officer of the association is T. D. Beard, assistant secretary of the Chicago Automobile Trade Association, whose official title in the Used Car Managers' Association is secretary-treasurer, although as the association has no dues, hence no funds, the second half of this hyphenated title is a sinecure. The office of secretary-treasurer is not elective, Beard serving permanently. The other officers of the association are a chairman and a vice-chairman, selected semi-annually, the present incumbents being J. L. Kelly of the Peerless used car department and J. McCarthy of the Wilton, respectively.

The association meets once a month at dinner, each member paying his own shot, In time the cost of the dinner may be assumed by the Association, or will be assessed against the used car firms represented, since all the independent used car dealers and the motor car companies maintaining used car departments belong to the trade association, but for the present the other custom prevails. The dinners are exclusive affairs, none but the delegated representatives of the interested firms being permitted to attend.

The association has a short code of rules and regulations drawn up by the Automobile Trade Association, which sets forth the object of the association, defines the limitations upon membership, provides for the exclusion from the meetings of all those not eligible to membership, including representatives of the press, and places limits upon the powers and prerogatives of the organization.

As set forth in the rules and regulations, the primary object of the association is to promote good fellowship and acquaintance among the men engaged in the used car industry, and the activities of the organization are kept strictly confined to this purpose. There are in Chicago in the neighborhood of sixty concerns, independent used car dealers and used car departments of passenger car concerns which are entitled to representation in the association. Up to the present time about thirty-five of these have delegated representatives, but Secretary Beard says the membership soon will be 100 per cent representative of the used car industry.

Its Simple Objects

As a matter of fact the association has no powers in a business way and business matters rarely are discussed, save in a narrative way, at the monthly dinner. One topic which is not taboo, however, is sales methods. There is a friendly exchange of experiences, often illustrated with typical examples and instances, which give the representatives a better insight into competitive methods and which tend to broaden their perspective of the possibilities in the used car business. The prohibition of dealer attendance removes the restraint sometimes imposed by the presence of the "boss" and the men talk freely and unreservedly. The discussions are strictly informal and every man has a right to the expression of his opinion.

This extraordinary association was conceived in the minds of some of the used car men about the time of the used car show last winter. Some things occurred at that time which emphasized the apparent desirability of a better acquaintance and understanding among the used car dealers.

Why it is Successful

A few men got together around a dinner table and discussed the feasibility of an organization. A committee was appointed to canvass the used car managers and feel out the sentiment. Two or three dinners were held before a definite plan of organization was determined upon. Of course, realizing that nothing could be accomplished without the sanction and co-operation of the Automobile Trade Association, nothing was attempted without consultation with officials of that organization. Beard, attended every meeting and gave the used car managers the benefit of his experience as an organization man and also kept them within the bounds of the trades association.

The result of this co-operation was the placing of such limitations upon membership and activities that the new organization could count upon the recognition of the trades association. The present organization was the result.

And it is doing good work. Those honored with membership in the association are enthusiastic about it. It has broken down the barriers which existed in the used car trade because the dealers and managers did not know each other. It has smoothed out some of the asperities of competition. It has brought the men closer together and each has a better conception of the function he is called upon to perform in the motor car trade. It has improved conditions all along the line. Also, with a readily growing membership, it appears destined to still further influence for good with permanent effects on the trade. While it works in an indirect and intangible sort of way the influence of this unique organization is none the less real and beneficial.

How St. Louis is Adopting War Service.

Although the Plan Has Been Operating Only a Week It Is Working Well Already

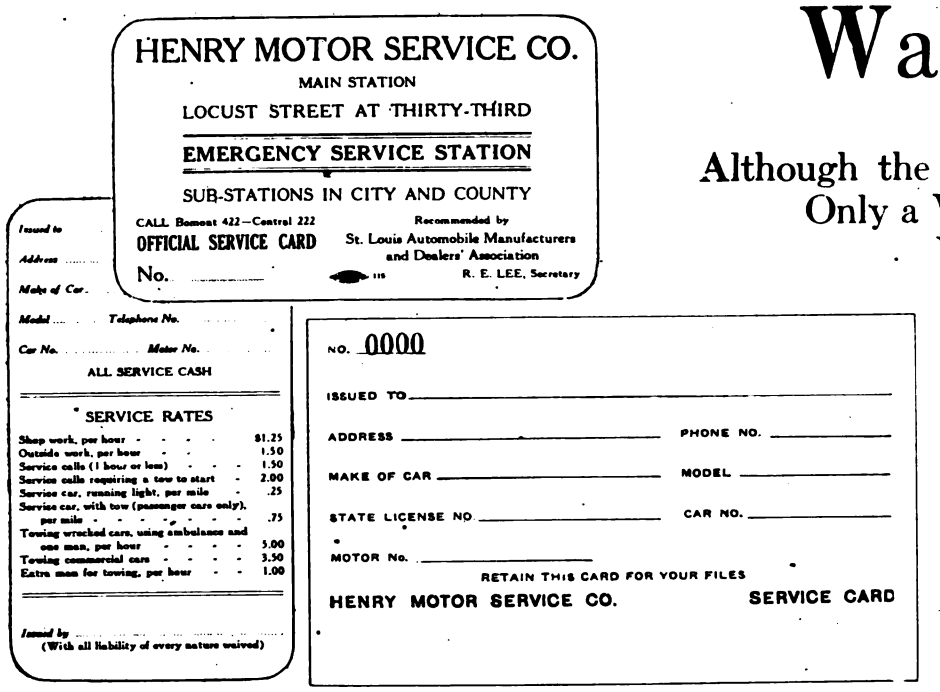

Fig. 1—Above and left are both sides of the card given to each car owner and at the right (Fig. 2) the record card for the office files

ST. LOUIS, June 8—A week ago St. Louis went on a "war service basis" for motor cars. There were many misgivings at that time and the first week started anxiously. At this time the anxiety has changed into interest and in most cases to satisfaction. No one now doubts that the car owner is going to accept the new order of things willingly, outwardly at least, and no one believes now that a serious hardship will be imposed.

Briefly, the plan is that all service shops are closed nights and Sundays. It is estimated that more than 100 mechanics were released. This has imposed no hardship because there were jobs open for every man, if he wanted to work. Some may complain because of the shift, for few on the night and Sunday shifts worked very hard.

The plan accepted and which is being recommended and adopted by other cities is in the main that worked out by W. L. Patterson, secretary and treasurer of the Henry Motor Service Co., which does the night and Sunday work. Patterson worked out this plan with a view that some time motor car agencies would become tired of the unprofitable night and Sunday service and would want some company to take this off their hands. The need came along and has been adopted. The Henry company was ready and is taking care of the job nicely. The idea was there, it was only necessary to get the forms printed and go to work. The Henry company has four stations open at night and on Sunday.

As a first step each service manager makes out a card (Fig. 1) for each customer. This card contains directions for calling up the service stations, data identifying the car and a price list. It says "all service cash." The men who go to the rescue of a motorist carry with them blank checks to be filled out if the car owner lacks the money.

The information placed on this card is also written on two card index cards (Fig. 2), a red one, which the station which issues the card keeps, the other being sent to The Henry Motor Service Co. These cards are different colors to avoid confusion.

The Henry company has a special blank (Fig. 3), on which a record of all calls is kept. On this record goes the customer's number of card, the shop number and time record. This is open to inspection of any service manager whose customers raise any question. When the work is completed a bill (Fig. 4) is made out in triplicate. One for the Henry office file, one for the customer and one attached to the job but retained in the station where the work is done. Finally a special bill is sent to the service station whose customer

SCHLECHT SAYS:

"Be sure and present it as a 'war service plan.' Be sure and make it clear that waste of mechanics must be conserved to win the war. Remind the people that one of these night men might be able to keep the airplane aloft that will smash up Hindenberg's headquarters, perhaps drop a bomb on the Kaiser's palace. Talk these things long and loud.

"The rest is easy. People are not objecting to war necessities. Even if any had objection they would not talk about it, but most of them would blow up their own cars in a minute to win the war or put them in a garage from now until Christmas to help even a little bit to win the war. Make the war talk strong and the battle is 99 per cent won."

SERVICE CALL RECORD

HENRY MOTOR SERVICE COMPANY

3227-29 LOCUST STREET

ST. LOUIS, MO.

For the Customers of

DATE	STATION	CUSTOMER'S CARD NO.	NATURE OF CALL	ELAPSED TIME	CHARGES	

Fig. 3—This is the record blank on which a report of all service calls is made

Digitized by Google

had work done. This shows at which Henry station the work is done, nature of the work, the customer's card number, time and the charge. This is sent to the service station manager early in the day after the work is done.

So far the plan had worked beautifully. Of course some objections have been made. President Joseph A. Schlecht, of the Automobile Manufacturers' and Dealers' Association, under whose direction the work is being done, has had several appeals. Two of these are:

A man owning a light car broke an axle in the suburbs. He was charged $6.50 for a tow and appealed. He has been "mooching" his repair work. He was told that he was fortunate, that $10 would have been a fair price.

Foolish Complaints

The owner of a heavy car sent in a frantic appeal to have his oil pump adjusted—"it would not work." The mechanic found the pump all right but no oil to be pumped. He was charged $1.25. He insisted that the company that sold him the car should pay. He was told that the education was worth many times the cost to him and might save his car from serious damage when he was farther from a service station. Also that no company should do such things without charge.

"Such complaints as these," says Schlecht, "can be handled now in a way to make the customer see that he has no just claim. When he was calling on the company that sold him the car he obtained much unjust free service to avoid a row. The Henry company is told "to treat everybody alike, absolutely no favoritism," and it is the judge of what should be free service and its recommendations will be made to the service station that should care for the car.

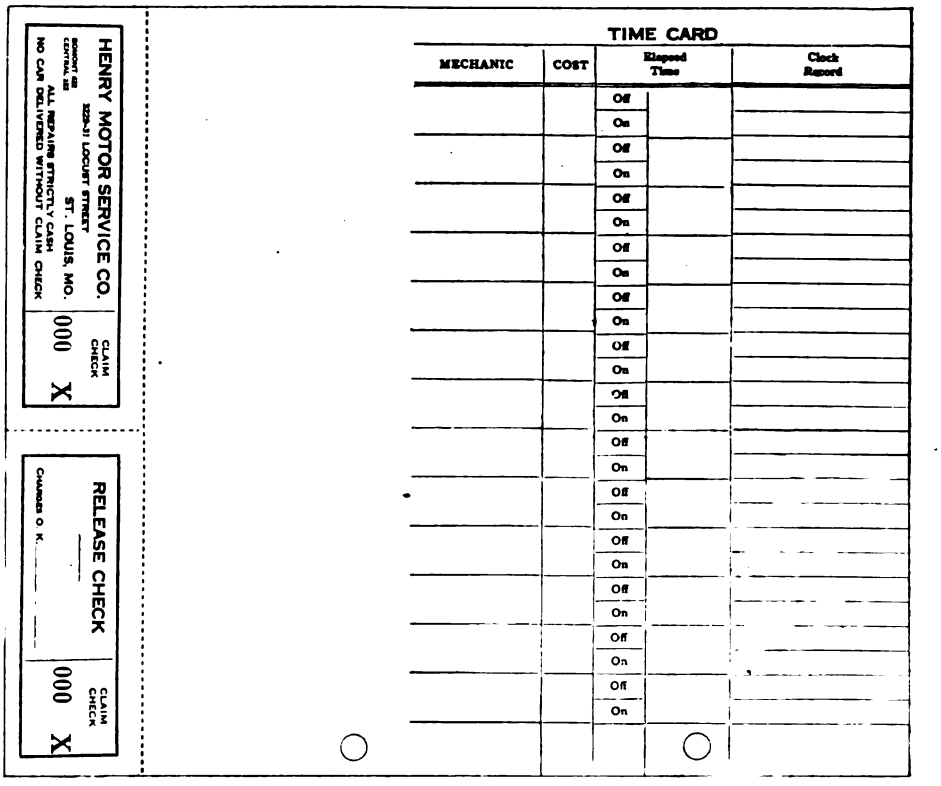

Fig. 4—Back of the repair order card which goes with the car and to which are attached stubs, one for the car owner and the other to be signed by him when the car is released

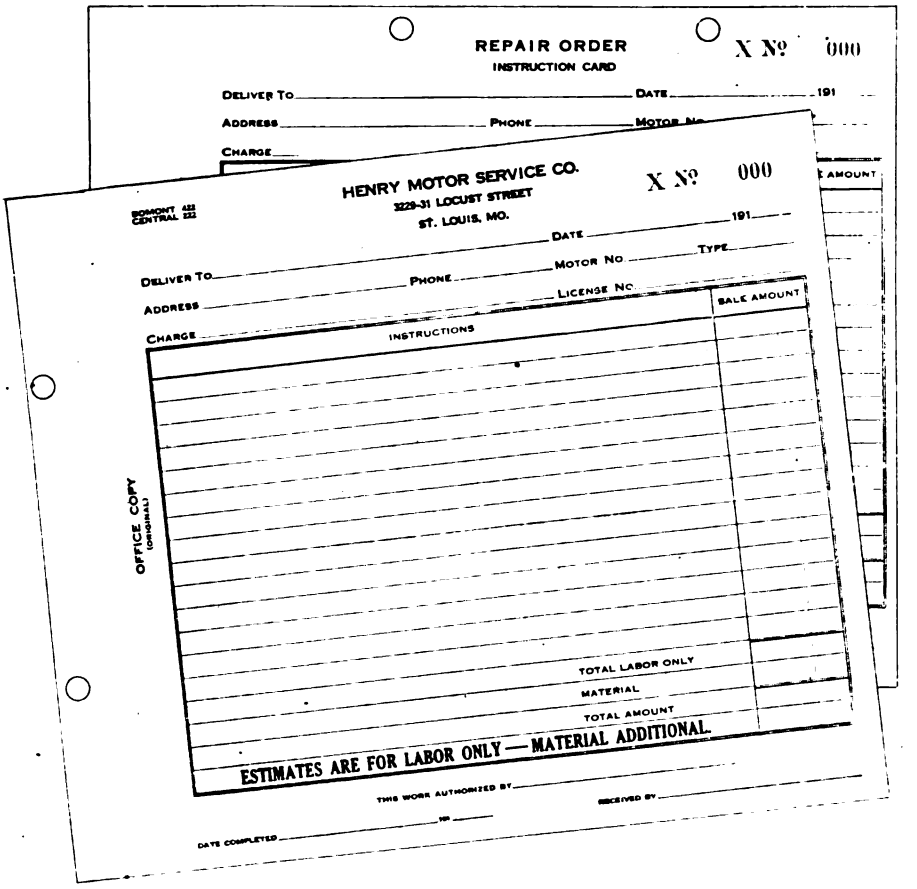

Fig. 4—The repair order card is made out in triplicate, one for filing, one for billing the customer and one for a record of the time put in by the mechanic

"After one week's experience I regard this as the greatest step the St. Louis motor car trade has ever taken. It will lessen the cost of doing business, teach the trade, especially salesmen, to promise less, and will learn car owners many things they should have learned years ago."

L. Chapman, superintendent of service for the Overland Automobile Co. of St. Louis, said:

Benefit Whole Trade

"This is going to benefit the automobile trade in half a dozen different ways. First is the immense saving. Night and Sunday work can never be made profitable. I should say, off hand, that a company that received $1,000 for the work done at night and on Sunday would have a pay-roll of $600 a month. I think this proportion would work out. One man cannot do work alone, so there must be at least two. Light and heat bills for shops at night and on Sunday are immense.

"Second, it is going to educate car owners in what they have a right to expect. The Henry company can tell customers things that we could not. The man who has paid a bill will never be as hard a kicker as the man who is about to pay one. He gets in trouble on the road, pays for the work, thinks it over and knows that he has no claim for a rebate.

"Third, a lot of 'good fellows' who dropped in at night with a pocket full of cigars, or an invitation to 'come and

Drive-away Bureau

ASK FOR INFORMATION—AND—GIVE US INFORMATION

THIS department will be continued indefinitely. Its aim is to provide a clearing house for information as to routes, road conditions, hotel rates, garage rates, unfair conditions, new routes, etc. Motor World will make an effort to get any information you desire. In return, all dealers are requested to forward promptly any information they have regarding drive-aways. Send your information so it will reach New York not later than Monday of each week.

"Make It Snappy!"

New Regime of Military Precision in Drive-aways

By K. H. Lansing

DELIVERY tours from motor car factories to Philadelphia are increasing steadily because of growing favor in this method of transportation, both as regards the customer and the dealer, and the manner and method of the drive-away, like the motor car itself, are subject to change and improvement. But there is a tendency of late to approach what, for want of a more descriptive term, might be called "standardization" of the mode of bringing a string of cars overland under self-power. That is, widening experience has shown manufacturer, distributer and agent that it pays to observe certain rules, not only "of the road" but also of conducting the caravan.

Not so long ago, in Pennsylvania, as elsewhere, manufacturer and agent were content, at times, to foster the business of the drive-away contractor—usually a shrewd farmer, or "country sport" who, with an eye to the high dollar, always was ready to "try anything once;" and once was just about enough for the party of the second part.

Old-Time "Contractor" Passes

The contractor, in a gambling spirit, would first find out and list all the young men in his vicinity—of course as near as possible to a dealer's center—who could drive anything from a traction engine, or a tractor, to a high-power automobile. He would studiously pick out the country boys and avoid the city "chaps," because he could obtain the services of the yokels at a much lower figure on account of their eagerness for the experience and because they were not so particular about hotel accommodations and railroad transportation to the drive-away point.

The contractor would pick out a hit-or-miss itinerary, make terms with roadhouses and hotels, then with this accumulated information enter into a contract with a manufacturer or dealer, as the case might be. No rule, except that of "get there somehow" was observed on the run in; the constables took their toll of the driving force and the extempore chauffeurs slammed their way through mud, mire and sand roads. Most of the cars usually arrived either in whole or in part, more often in part. The contractor usually was the only one pleased with the transaction.

While a few of these buccaneers may be employed in an emergency, their popularity has waned. Now an almost military precision, with the cantonment watchword, "Make it snappy," is prevailing on drive-aways—at least to Pennsylvania points, Philadelphia in particular.

Strict Discipline on the Road

Among the leading automobile concerns in the Quaker City which observe strict discipline en route from the factory is the Oldsmobile Co. James K. Mogee, service manager at Philadelphia, is known along Automobile Row as an especially efficient and experienced drive-away expert, and what he says along these lines carries weight with the trade.

"The lead-off man of a drive-away," says Mogee, "must have as his prime qualification that of a good business manager. He must act as guide and routing agent; must be thoroughly familiar with the country to be traversed and, as he must house and feed the 'string,' he should be able to make the best of terms with hotels and roadhouses, and this means tact as well as acumen. He must not only know the most advantageous route from point to point, but he must be well informed as to alternate routes, where there are any, in case of mudholes caused by rain along the regular thoroughfare.

"He must be to the caravan all that the advance agent is to the theatrical troupe and then some. He must know his jumps like a book, and all his stops are "one-night stands" except in case of being snow or flood-bound. Of course he must know repairshop and garage locations along all routes where there are any, even if a service car accompanies the 'string.' He must see to it that the proper gait is struck and a certain set speed not exceeded for tire depreciation reasons as well as to keep on the right side of the road authorities.

Good "Lead Off" Man Needed

"A good lead-off man keeps away from the big cities, so far as possible, because city traffic is apt to hold up his 'string.' And where it is necessary to pass through towns, I would emphasize the necessity for going slowly. It is necessary to minimize the danger from collisions. Whenever the lead-off man notices that the rolling stock is keeping uneven intervals, he should slow up and wait until all are in line and the right distance apart.

"Next to the lead-off man in importance, or perhaps equal to him in that respect, is the tail-end man of a drive-away. He is the foreman machinist in charge of the men en route," continues Mogee.

"It is his duty to see that all the cars are kept in first-class shape. He, too, sees that the men obey the rules, and from his vantage point at the rear of the procession, where he always should be, is able to attend to this better than the lead-off man. He keeps close watch on the caravan, both as a unit and individually, sees traffic laws are obeyed and looks after the outfit in such a way that there shall be a minimum of repairs along the way. He gives orders before the start, that if the driver of any car is skeptical as to the way it is performing, or if there are any symptoms of trouble, to leave the line, pull up always to the right and come to a stop until the

Digitized by Google

tail-end man can come up and examine the car. He maintains his car there until it is fixed and the journey resumed.

"The extra man—and there always should be an extra man on a delivery tour—acts as the lieutenant to the lead-off man. He checks up the cars at every stopping point, sees that all are supplied with gasoline, lubricating oil and water. He helps to make arrangements for quarters at hotels and notifies garages and repairshops of any contingency where their aid is required. He has a thousand and one errands to do, so that he might be called the 'extra-busy' man.

"Before an Oldsmobile drive-away starts from the factory we go through what is known to us as the 'dolling-up' process. That is, we go very carefully over each machine, see that everything is tight and in place and in good working order, and then we always coat over with body polish, which is easily washed down at the finish of the run. We do not do as some other factories—send out the cars unfinished as to varnish, the final coat to be put on at the end of the route. We have found that body polish is the better way. Then all that is necessary to do at the finish is to wash down, tighten and oil up.

Number of Cars Limited

"We try to make it a rule not to take more than fifteen cars along on a drive-away to Philadelphia. This, we have found, is the maximum number to be handled conveniently and economically. A larger number means, of course, many men to look after, house and feed. With our extra-man scheme, this makes only sixteen men on our drive-away of usual size.

"From Lansing to Philadelphia is 750 miles, and in wet weather the roads as far as Elyria, Ohio, are not of the best. While we have made trips with as many as fifty cars at a time, it has been the exception. For a branch, fifteen cars should be the maximum, while for dealers usually only two or three cars are run at a time. In case of deep snow or mud, however, the smaller drive-aways are apt to suffer in some localities from the greediness of the farmers, who exact the last penny to haul the cars out of their difficulties."

Not only farmers, however, seem to enjoy holding up drive-aways. What Thomas A. Edison recently expressed aptly as "the interference of small, but very officious, officeholders," in a telegram of protest recently sent to the Governor of New Jersey, when he was bothered by them while operating new Ford tractors on his farms at New Village, has been responsible, especially of late, for the stalling of delivery tours in the Pennsylvania district, including New Jersey and parts of Maryland and Delaware.

Overzealous local officials, employing petty technicalities of the various state laws, are stopping caravans and threatening with arrest or fine the drivers, who sometimes have to use extreme diplomacy and cleverness in order to get away. Not infrequently even this fails and the "hold-up" is complete. Sheriffs and constables alike prove pests of the road in this respect. Often magistrates stand in with them.

Where One String Was Caught

A string of sixty cars driven recently from Lansing to New York was halted in York, Pa., because only the first and last cars had license plates. Hereafter license plate provision is going to be made a special point with Philadelphia dealers. The sheriff in this particular instance insisted that every car should have a plate. To take out a Pennsylvania license would have cost $20 for each car, although the train was merely passing through a corner of the state and all the vehicles were being delivered to a single dealer in New York. It was necessary for the dealer to obtain more than fifty duplicates of his New York dealer's license plates at $5 each and ship them to York, Pa., before the drive-away was permitted to proceed. This caused a delay of more than one day and entailed expense of more than $250 for plates alone, to say nothing of added and unexpected expense for housing and feeding the men, the hotel and contingent expenses running up to $750. Hence, it cost more than $1,000 to drive sixty cars just once through the northeast corner of Pennsylvania.

In another instance, a string of more than thirty motor cars was stalled at Wilmington, Del., and the chauffeurs threatened with arrest because they did not, of course, have state operators' licenses. The cars in this case were being driven from New York to a dealer in Norfolk, Va.

Police Sometimes Officious

Neither New York nor Virginia requires such licenses and the Norfolk dealer contended that it was unfair and unnecessary to insist that the drivers of cars simply passing through a corner of Delaware on a single business trip take out licenses to operate for a year in that State. The police in Frederick, Md., objected, also, because some of the cars had the dealer's license number merely stenciled on pasteboard instead of the approved metal plates. In Virginia, only six or eight duplicates of the dealer's license plate are issued to a single dealer, who is allowed to make temporary duplicates himself, but the authorities in Maryland threatened him with a fine for this.

The annoyance and expense involved are due to a lack of uniformity in state laws, and this doubtless will be the subject of a determined "drive" in the not distant future by manufacturers backed by dealers in concert.

Among the proofs that the drive-away is increasing in popularity are the facts that more than 12 per cent of the Packard Motor Car Co.'s motor carriages and 21 per cent of its truck deliveries to branches and dealers since Dec. 1 have been made by the drive-through method; and that the advance squad of Peerless cars for spring business in Philadelphia and vicinity, 400 in number, came overland under self-propulsion from the factory in Cleveland.

Baltimore

BALTIMORE, June 8—While some Baltimore dealers drove sufficient cars during the winter and early spring months to take care of their needs for the season a number of other Baltimore and Maryland dealers figured in drive-aways during the past week and will continue to drive both passenger cars and trucks throughout the season. Drive-aways will be continued by those Baltimore dealers and distributers as long as it is possible for them to get machines.

Among the firms driving are the Zell Motor Car Co. (Peerless and Chalmers); United Auto Sales Co. (Studebaker cars and trucks and Garford trucks); Eastwick Motor Co. (Dodge); Schall-Crouch Auto Co. (Paige and Atterbury); Sietz Auto Co. (Velie and Service trucks); Franklin Motor Co. (Franklin); Chevrolet Motor Co. (Chevrolet); and the following Ford dealers: Backus Motor Co., Hosbach Motor Co., Wilcox-Brown Motor Co. and West End Service Station.

Not a complaint was made by the drive-away managers against hotel or garage charges. Most of the Baltimore firms have been able to obtain the service of some of their customers in bringing down cars, thus saving the wages of the drivers and having the use of them at home.

Dealers Using Boats

Several Baltimore dealers have their machines shipped by boat from Detroit to Cleveland.

Cleveland to Baltimore, via Pittsburgh, road good except between East Palestine and Beaver Falls. From Pittsburgh to Uniontown to Hagerstown and down the Maryland state roads, via Frederick.

Syracuse to Baltimore—Syracuse to Ithaca to Watkins to Elmira to Williamsport to Sunbury. It has been necessary to make a detour by way of Milton recently, thence to Harrisburg to Gettysburg to Emmittsburg to Frederick and down the Maryland state roads. Most of the Pennsylvania roads are dirt, but the New York roads are stone and Maryland roads are in good shape, except for a few bad places.

Tarrytown to Baltimore—Down the stone road to Yonkers to New York City, across Forty-second Street ferry to Weehawken then down the Hudson Boulevard through Newark, Elizabeth, Rahway, New Brunswick, Trenton to Philadelphia, thence to Wilmingon.

From the time one leaves this point until the Delaware state line is reached the road, which is dirt, is in terrible condition. Drivers who have been driving over that section for several years say nothing has been done to fix the holes that have been torn in them and it is impossible for safety sake to make better than 10 miles an hour on this stretch. The Maryland state roads are in fairly good shape, except for a few bad holes around Belair, which are expected to be put in repair shortly.

Buffalo to Baltimore—After leaving go by way of Batavia to Corning, Pa., to Sunbury, Pa., to Harrisburg to Gettysburg to Westminster. From Harrisburg to Westminster the National pike used

Digitized by Google

Drive-away of Oldsmobiles from the Olds Motor Works, Lansing, Mich., en route to Philadelphia. One of the large spring caravans not under the 15-car plan

and the roads are in good shape all the way into Baltimore.

Lima, O., to Baltimore—Lima to Canton to Darlington to Pittsburgh and then by way of Fort Loudon to Hagerstown and down the Maryland state roads.

Chevrolet drove in 54 cars for themselves and dealers in this territory and will take as many as the factory will permit. Ford dealers are driving them in dozen lots. Paige brought in 20 and Dodge is bringing in anywhere from 6 to 12 and 15 at a time.

Many dealers have been able to get their cars by railroad, the Lambert Auto Co. having been able to get shipments in right along. Chalmers are being shipped to Jersey City, Newark, N. J., and Harrisburg, Pa., and also to Arlington, Md., and the drive-aways have been short.—Charles B. Weiss, Motor World representative.

Albany

ALBANY, N. Y., June 8—Albany dealers are not driving cars from the factories in great numbers, and some have discontinued the practice with improved traffic conditions. The city is the stopping point, however, for great drives to New York. Most of the cars come from Cleveland and points farther west and come by boat to Buffalo; the shore road is then taken through Erie, Pa., where road conditions are reported bad; then along the lower road through Canandaigua, avoiding Rochester and following the line of the barge canal through Syracuse, Utica, Schenectady and Albany. The dealers now driving cars are: Franklin Motor Car Co. (Franklin); Oldsmobile of Albany (Oldsmobile); Overland-Willys, Inc. (Overland); Wescott Burlingame (Cadillac); Buick Motor Car Agency (Buick); Tri-City Motor Co. (Chandler).

Peoria, Ill.

PEORIA, ILL., June 8—C. A. Porter is Peoria's drive-away demon. Since early spring he has received most of his cars through the drive-away system and has not depended upon the railroads.

Several times he was forced to secure a number of women to drive cars for him from Detroit to Peoria. He declares that the hotel men appear to be very anxious for patronage and city and state authorities realize that the drive-away system is a patriotic measure and do not interfere with them.

Garage men are also very reasonable and in many cases offered the men goods at cheaper prices than quoted to the public. The route from Detroit to Peoria follows:

Detroit, out Michigan Avenue, to Wayne, Ypsilanti, Ann Arbor, Jackson, Battle Creek, Kalamazoo, St. Joe (201 miles covered in 7 hr.), Michigan City, Valparaiso, Dyer, Chicago Heights, Joliet, Ottawa, La Salle, Bureau, Henry, Chillicothe and Peoria (a total of 478 miles). On the last lap Porter started at 7 a. m. and completed at 7 p. m., including 2 hours for lunch.

This route is fine in wet or dry weather with the exception of the stretch from Joliet to Peoria. In dry weather this is O.K., while in wet weather he goes to Aurora, Princeton, LaSalle, Henry, Chillicothe and Peoria.

Rochester

ROCHESTER, June 8—It is safe to say that no motor cars are now being brought into Rochester other than by drive-aways, conducted either wholly or in part by the distributer. The fact that Rochester is situated so near to a lake port has relieved the strain here greatly since navigation opened, as many of the factories are now shipping their cars to Buffalo by lake boats and dealers are driving them from that port to all poins east. The General Motors Co. has chartered a fleet of steamers on which all Dort, Oldsmobile, Cadillac, Oakland, Buick and Scripps-Booth cars are being brought to Buffalo. There are, however, a number of Rochester distributers who are still making straight factory drive-aways. These firms are:

Alling & Miles (Hudson); Moline-Knight Sales Co. (Moline-Knight); Overland-Rochester Co. (Overland); Peck & Arnold (Studebaker).

Firms which are obtaining their cars by lake carrier and are driving from Buffalo are:

Mabbett-Bettys Co. (Cadillac); Clark Auto Co. (Nash); George W. Henner (Oldsmobile and Dort); Frank P. Hunt (G. M. C. trucks); William P. Knipper (Saxon); Thomas J. Northway (Reo and Maxwell); E. J. Ellis & Co. (Packard and Dodge); George W. Stafford Co. (Cole); Strong Motors Co. (Chalmers); H. J. Sturtevant & Co. (Pierce-Arrow); C. L. Whiting (Buick).

All Ford cars, which are handled in Rochester by four distributers, the Mandery Motor Car Co., Ball-Washburne Co., Wagner Motor Car Co., and the Genesee Motor Vehicle Co., are assembled in Buffalo and driven by the dealer to this city. The Buffalo assembling station also supplies a part of the Philadelphia and Boston territory and many cars bound for these points pass through Rochester daily. Franklins are of course driven in from the factory at Syracuse.

The principal routes which are being followed by Rochester dealers making factory drive-aways are:

Moline-Knight Sales Co.—From the factory at Moline, Ill., to Chicago, to South Bend, Ind., to Cleveland, by boat to Buffalo to avoid bad roads, and from Buffalo to Rochester. The following information regarding this route was furnished by Herbert C. Kelly, secretary of the firm, who recently made the trip with a string of cars: "I would advise all following this route to go from South Bend to Toledo instead of going straight to Cleveland, as there is less chance of getting off the track in this manner. Also to keep to the Lincoln Highway wherever practical. Where we did this we had no more trouble than when driving in our home town."

Peck & Arnold (Studebaker)—From factory at South Bend, Ind., to Toledo, to Cleveland, to Buffalo, to Rochester. Report some parts of road in bad condition and no traffic troubles, as they furnished a pair of licenses for each car.

Overland-Rochester Co.—Driving fifteen to twenty cars a week from Toledo to Rochester, and have not yet made the detour by boat from Cleveland to Buffalo. No traffic troubles reported.

There are, however, many cases reported where Rochester distributers are being held up and fined while making drive-aways. Thomas J. Northway,

Digitized by Google

Rochester distributer of Reo and Maxwell cars, recently brought down a string of ten cars. He had no difficulty until he reached Buffalo, but no sooner had the cars reached that city than his men were arrested by a traffic officer for driving with only one license plate on a car. The drivers were detained at the station house and finally compelled to leave one of the cars for bail until the fine had been paid. Mr. Northway claims that applications had been placed for licenses but that he had been unable to obtain them. It is said that the Buffalo manager of the State License Bureau is very unreasonable in these matters.

The Mandery Motor Car Co. recently brought a string of Fords from the assembling plant at Buffalo and was held up by State Troopers in Batavia for the same offense. Drivers were fined.

There is no reason to believe that there will be much change in these conditions for some time, except that until the lake season is ended more and more distributers will continue to take advantage of the facilities for delivery offered by the lake steamers. If enough barges are provided for use on the barge canal it may be possible that the cars will be delivered to the city in this manner and thus eliminate all drive-away. The only prospect for a great change is that later in the season the lake boats may all be taken over by the government to carry the wheat and grain crop and thus force the distributers to the factory drive-away again.

Chicago

CHICAGO, June 8—Not a day passes but one or more drive-aways of passenger cars from the motor car factories of Michigan and Ohio reach Chicago. So thoroughly established has the custom become that it is regarded as a regular part of the business and excites neither surprise nor comment. Many of the motor car companies maintain regular crews of drivers and make regular schedule trips. In some factories traffic managers have been appointed to take charge of this work and drive-aways move with more regularity and precision than it would be possible to obtain from rail transportation.

Practically all the kinks and difficulties experienced by the first drive-aways have been removed. Roads have been improved here and there, town and village restrictions on motor car traffic have been compromised, over-charging garagemen have been led to see the error of their ways, hotels are recognizing the value and importance of the drive-away trade and welcome it, and the whole traffic has been brought to a conventional and uneventful basis.

Two well-established routes are followed from points in Michigan to Chicago. One is known as the Northern Route, is better piked than the other, and is the more satisfactory and surer route in winter. The other is known as the Chicago Trail Route, and runs through southern Michigan and northern Indiana. This is the favorite route in summer, and is much the more picturesque, as in its Michigan stretch it runs through the southern Michigan lake district.

The northern route from Flint, Mich., to Chicago runs from Flint to Owosso, Perry, Williamston, Lansing, Charlotte, Bellevue, Battle Creek, Kalamazoo, Paw Paw, Lawrence, Hartford, Watervliet, Coloma, Benton Harbor, St. Joseph, Bridgman, Galena, Three Oaks, New Buffalo, Mich., Michigan City, Ind., Gary, South Gary via Ridge Road, Tolleston, north edge of Hammond on St. Joe Pike, Lake George Road to Indianapolis Avenue, South Chicago, Lincoln Highway through Jackson Park into Chicago.

This route is marked at present by signs, "Buick Route to Chicago," and soon will be indicated also by Reo signs which are being prepared. For the most part it is good in all seasons of the year, although there is a sandy and rough stretch between Kalamazoo and Paw Paw. Some complaint has been made about overcharges at a garage in Paw Paw, but the chances are that this will be corrected in the very near future. Drive-aways and tourists are advised to keep away from Battle Creek as a stopping place for the night because of the chronic congestion there owing to the proximity of the United States cantonment.

The Chicago Trail Route is defined as follows: Flint, Mich., Fenton, Highland, New Hudson, Whitemore Lake, Ann Arbor, Salina, Clinton, Cement City, Somerset, Somerset Center, Moscow, Jonesville, Quincy, Coldwater, Kinderhook, Mich., Orland, Ind., Howe, Shipshewana, Middlebury, Elkhart, Osceola, Mishawaka, South Bend, New Carlisle, Laporte, Pinola, Burdick, Chesterton, Porter, Gary, into Chicago by the route already indicated.

From Laporte there is an alternative route which some prefer. This is from Laporte to Valparaiso via Westville, from Valparaiso to Hobart and into the Ridge Road and thence into Chicago via South Gary and the route previously given.

During the summer this Chicago trail is a beautiful route and has few, if any, disadvantages. Early in the drive-away period a good deal of trouble and annoyance was experienced at South Bend, but this has been corrected and the best of treatment may be expected there.

Wilmington

WILMINGTON, DEL., June 10—Nearly all of the larger dealers in Wilmington—as well as in other parts of Delaware—are driving their cars from the factories or from transfer points to which they are driven or delivered by boat for them. The following Wilmington dealers are making a practice of driving in the cars:

F. B. Norman & Co. (Ford), French Street Garage (Reo), Cahill & Co. (Dodge), Gomery-Schwartz Motor Car Co. (Hudson), Delaware Motor Sales Co. (Cadillac), Sweeten-Wilmington Co. (Hupmobile), Taylor Motor Car Co. (Haynes), Packard Motor Car Co. (Packard). Dealers in other parts of the state cover the same routes as those from Wilmington, finding it convenient to come through or near Wilmington in getting to their destination.

Routes to Wilmington

Detroit to Wilmington—To Monroe, Bellevue, Norwalk, Oberlin, Toledo, Elyria, Pittsburgh, Dorchester, Pa., thence over the Lincoln Highway to York, Gettysburg, Bedford, Coatesville, Downington, West Chester, Pa., thence to Wilmington. The roads are good in the main, though in a number of places a hold-up game is practised the hotelkeeper sizing up his victim, according to appearance, and charging all the way from $1.50 to $3. Garage rates vary from 50 to 75 cents per car.

Buffalo (to which point some of the cars are shipped by boat) to Wilmington—To Batavia, Mt. Morris, Dansville, Wayland, Bath, Penny Post, Lawrenceville, Mansfield, Rossburg, Libertyville, Williamsport, Sunbury, Harrisburg, Lancaster, Downington and West Chester to Wilmington. The roads are good, with the exception of about 150 miles of dirt road, which is dusty in dry weather and muddy in wet weather.

The hotels in some of the New York towns charge exorbitant rates, appearing to have no fixed schedule, ranging all the way from $1 to $3. On this route, which consumed 17 hours of running time, the night stop is usually made at Williamsport, Pa., where good hotel accommodations can be had at reasonable prices and there is now a uniform garage charge of 50 cents. At first the rates varied, running up as high as $1, but competition has brought the charge down to 50 cents.

Columbus, O., to Wilmington—To Zanesville, Wheeling, Little Washington, Uniontown, Hagerstown, Washington, Baltimore and Wilmington. There are good hard roads and the hotel and garage charges are satisfactory.

Lansing, Mich., to Wilmington—To Nason, Leslie, Jackson, Manchester, Tecumseh, Litchfield, all in Michigan; Sylvestar, Geneva, Woodville, Clyde, Bellevue, Norwalk, Oberlin, Elyria, Ridgeville, thence along Lake Erie to Cleveland, through Bedford, Hudson, Ravenna, Palmyra, North Jackson, Augustine, O., Darlington, Beaver Falls, Pittsburgh, Chambersburg, Gettysburg, York, Lancaster and Coatesville, Pa., to Wilmington. The roads are good and hotel rates reasonable, while the garage charges range from 50 cents to $1.

In some of the small towns in all of the above routes the authorities kick when all of the cars do not carry license tags, while one local dealer has so far paid $25 in fines on this account. Otherwise the drivers are not molested.—A. O. H. GRIER, Motor World Representative.

New York

NEW YORK, June 8—With the arrival of warm weather drive-away conditions have improved considerably, but the attitude of dealers here toward the drive-away problem varies. Some dealers are getting all the cars they need by freight and others are still continuing to drive their cars overland.

Studebaker, for example, is still driving in 90 per cent of the cars needed. These are shipped from Detroit to Buffalo by boat, and then are driven to New York either by way of Albany or Binghamton and Elmira. A regular crew is at work, and will continue driving the cars in from Buffalo throughout the summer.

Digitized by Google

Cadillac is also driving in from 25 to 50 per cent of its cars from Buffalo. The exact number varies with freight conditions. Although the route via Binghamton is 75 miles shorter than the Albany road, practically all the cars have come over the latter. The only bad part of this road is a short stretch near Tarrytown.

Buick and Oldsmobile are following the same plan of shipping about half of their cars to Buffalo and then driving them in via Albany. Both companies find road conditions excellent, and will continue driving a large percentage of their cars in throughout the summer.

On the other hand, the Overland, Maxwell and Dodge Brothers distributers are getting all the cars they need by freight and have discontinued driving cars in. This has been the case with all three companies for about a month, and all report that as long as cars can be brought in by freight they will not revert to drive-aways. The Franklin distributer is also getting all the cars he needs by freight, as the factory is in Syracuse, and there is plenty of room in freight cars for short hauls.

Denver

DENVER, June 8—The drive-away plan has been used scarcely any thus far this year by Denver distributers for bringing cars from factories. The two main reasons given are: (1) That railroad conditions have not yet seriously demanded the drive-away, and (2) that highway conditions in the Middle West are too unfavorable this early in the year.

Shipment reports indicate that the railroads are having far less difficulty at present in moving freight from Chicago, Indianapolis, Moline, Minneapolis and other points in that zone to Denver than they are between factories and large distributing centers in the East. Besides, leading distributers here have been making a practice of storing heavily for the last year or more, as a precaution against freight emergencies.

The largest drive-away enterprise reported to the Motor World representative here was a recent fleet of 28 Buicks driven from Flint to Denver and nearby points by the MacFarland Auto Co., Buick distributer for Colorado and Wyoming.

Sales Manager W. J. Haughey states that road and weather conditions ran the expense of this trip up to $168 a car, without counting the time of the men on the drive.

In spite of the utmost care several of the cars were so badly scratched and otherwise marred by the severe travel through hundreds of miles of deep and heavy mud that they required considerable revarnishing. So Haughey's verdict is that the trip didn't pay.

The route followed was the regular "Buick route" from Flint to Chicago via Lansing, Charlotte, Battle Creek, Kalamazoo, etc., and on from Chicago to Denver over the Lincoln Highway through Cedar Rapids, Omaha, North Platte, etc. Some of the fleet of cars branched off near the Nebraska-Colorado state line for Wyoming points, while the others came on into Denver and nearby Colorado towns.

Arrangements have now been completed by the MacFarland Auto Co. to get its supply of cars shipped mainly from the assembling branch at Minneapolis.

The drive-away has been used extensively between Denver and points out in the Rocky Mountain territory, and has won a great deal of favor. Distributers and dealers are also ambitious to see the plan operated successfully on the larger scale of factory-to-Denver driving. Some of them insist that the importance of motor transportation will bring about sufficient building of permanent highways for all-year use to make the drive-away practical and popular on a transcontinental basis before many years.

San Francisco

SAN FRANCISCO, June 10—While deeply interested in the drive-away idea, San Francisco's dealers are not in position, due to geographical location, to take advantage of the plan.

To drive cars from the manufacturing centers to the Pacific Coast would mean a journey for the round trip of from 4000 to 5000 miles as well as at least three weeks' work away from the dealer's establishment.

The plan of driving cars from San Francisco to interior towns has been used for some time by out-of-town dealers.

San Francisco, acting as the main distributing center of Northern California, distributes its cars to Sacramento, Stockton and Fresno, the dealers in those cities then parcelling out to their sub-dealers in the smaller towns.

Water transportation between San Francisco, Sacramento and Stockton makes drive-aways between those points unnecessary, but they are on the increase as regards Fresno.

San Francisco to Fresno, automobile ferry boat to Oakland, thence along paved State Highway, a distance of a trifle more than 200 miles. The route is through Manteca, Modesto, Turlock, Merced and Madera and an overnight stop is usually made at Modesto, where hotel and garage accommodations are of the best.

Memphis

MEMPHIS, June 8—Chief drive-away dealers in Memphis are the Oldsmobile, Union Motor Co., Lilly Carriage Co., Ford Automobile Co., Maxwell, Buick, Winton, Overland and Chevrolet.

Routes across Tennessee eastward from Memphis are the Bristol to Memphis Highway, via Brownsville, Jackson, Huntingdon, Camden, Nashville and Eastward. Routes have been laid out St. Louis to Savannah, Tenn., via Paducah, Ky., Paris, Tenn., McKenzie, Tenn. There is a route north and south of Paducah, Ky., to Memphis, via Dyersburg, Covington, Union City, etc., and the Grey Hound Route, via Paducah, Ky., to Murray, Ky., Paris, Tenn., McKenzie, Tenn., Bradford, Tenn., Alamo, Tenn., Brownsville, Tenn., Stanton, Tenn., Memphis. No special hotels but good inns and taverns at all these points and attractive country; most of the routes marked and well graded.

19,000 Liberty Engines by Sept. 1

WASHINGTON, June 10—Nineteen thousand Liberty engines will have been delivered to the government by Sept. 1, 1919, according to the members of the Senate Committee in charge of the Senate investigation into aircraft production, who were in Detroit this past week. The Senators, upon their return here, refused to go into a detailed account of the results of their journey. They prefer to tell the complete story in the report which will be issued in the near future.

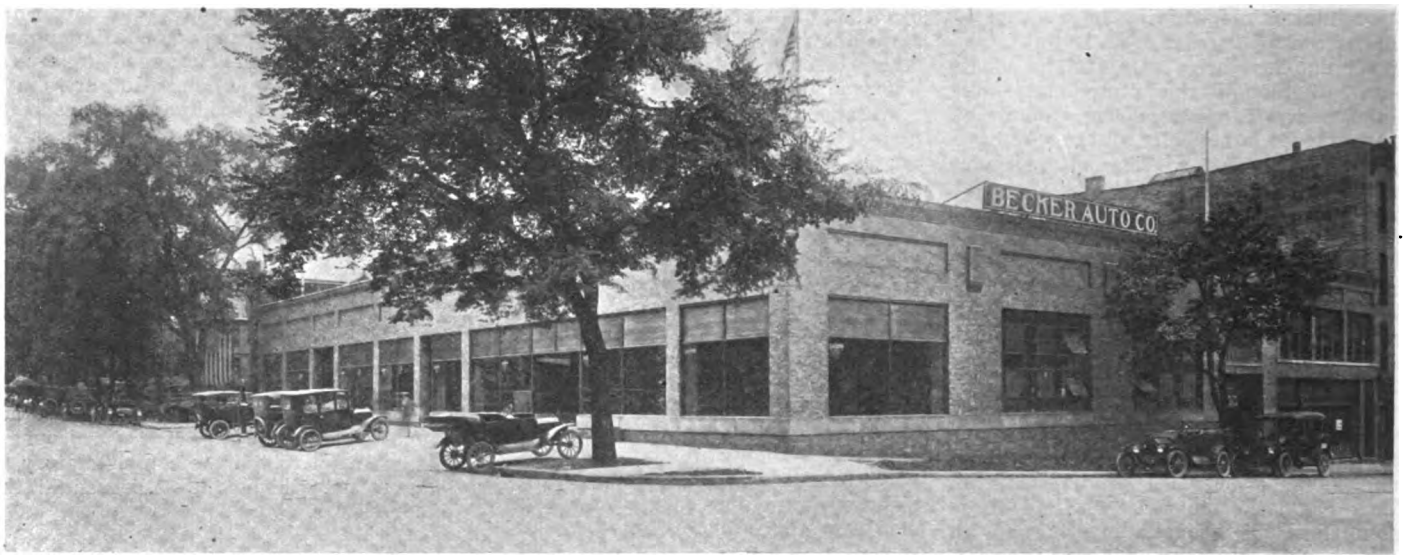
St. Louis War Service

(*Continued from page 8*)

get a drink' are going to pay real money. Every service manager knows about these fellows. The boys in the shop figure 'we are not doing anything anyway,' so they do his work. He will wait if a real customer comes in, so work that should come in daytime and be paid for is done for nothing.

"There is hardly a service shop in the country that does not wash recently sold cars when they come in, especially at night. The Henry company will not.

"Fourth, service departments will attain the dignity they should have. The automobile business is the only business I ever heard of where the seller of the article bows to the disgruntled customer. True, the maker will supply a defective part, but the seller must put it on and the labor and overhead is far greater than the cost of the part. Our selling departments have been anxious to please. We have been anxious to help. So we have become 'customers' servant departments.' We bow and scrape to the man who talks like he might get sore. Now he is going to be educated.



"Another result soon will be better service and perhaps cheaper service, for cost bills now are arranged in an effort to cover the service that is given free, unjustly so. We are willing to shoulder all that should be given free, but the rest of it must be covered some way."

This tells how St. Louis feels about it. Reports have reached the National Automobile Dealers' Association, which is promoting the "war service plan," that a similar arrangement is effective or soon will be in Denver, Des Moines, Louisville, Cleveland, Philadelphia, Boston, Los Angeles, Minneapolis and Atlanta.

W. L. Patterson, who has given more thought to details of this plan than probably any other man, says: "The thing is right. And after a week's trial I am convinced that I can put it over anywhere. If there are doubters and they want to hear from me, I will answer their call."

Messrs. Schlecht and Chapman agree on their views, and they both gave one bit of advice to any organization about to introduce the plan.

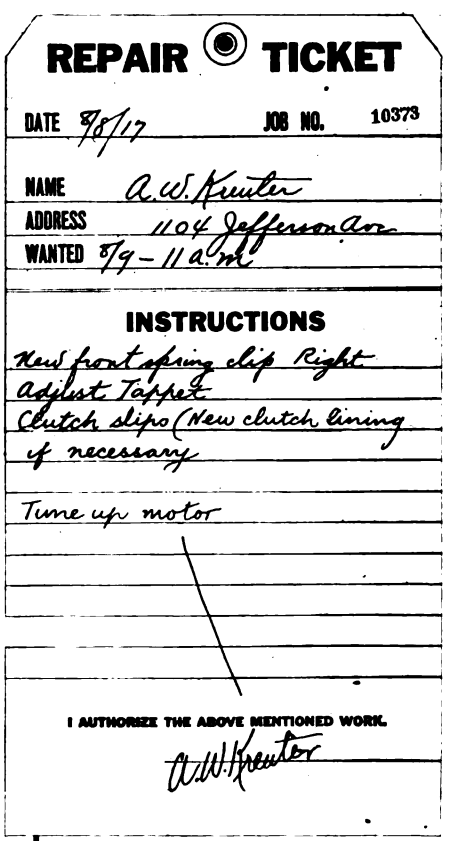
The Becker company sells Studebakers and Saxons and has an altogether model place of business both from the point of view of appearance and arrangement

Linking Simplicity and System

How Becker Keeps Track of Everything without Being Swamped by Detail



SIMPLICITY is the basic principle of all good shop system. Yet combined with this simplicity must be the ability to check each item for accuracy—the provision of complete data, even though any one step be lost—and the power to trace back every step the job has taken through the shop, either after completion, or at any future date.

Such a system is in use by the Becker Auto Co., Grand Rapids, Mich. For five years it has remained essentially the same, though here and there steps have been eliminated or added as experience proved necessary. It is a system that has stood the test of time.

The first step taken was to divide the service department into five sub-departments, each independent, and each responsible for the work of its department. These sub-departments are: repairshop, stockroom, inspection, accounting and service manager's office.

The duties of the repairshop are definite, as are those of each of the other departments. All the repairshop has to do is to follow the work instructions, obtain the necessary parts from the stockroom, and turn a record of the workman's time in to the accounting department.

All parts and supplies are issued from the stockroom, and it is its duty to see

REPAIR TICKET

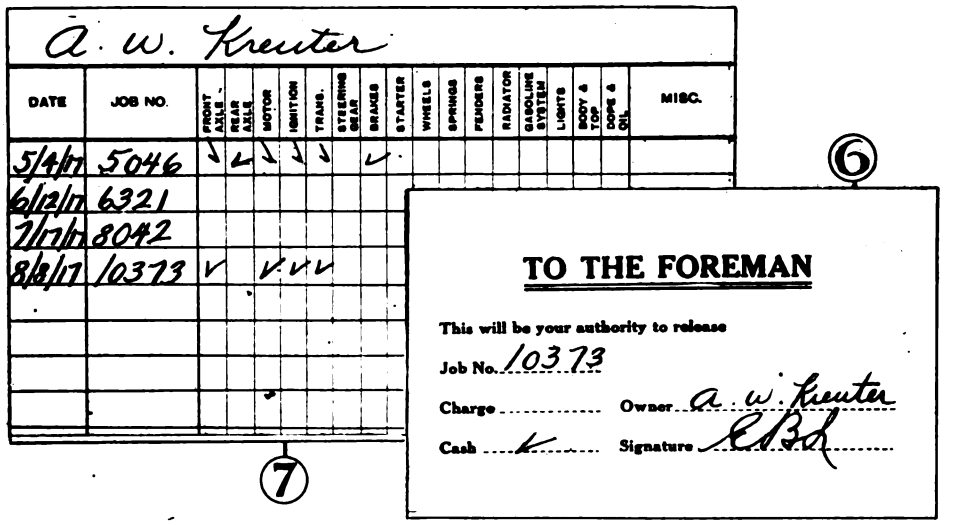

Fig. 6—The owner cannot obtain his car until he has either paid his bill or convinced the accounting department that his credit is good. Thus the accounting department is made responsible for all credits. Fig. 7—A summary of all work done on every owner's car is kept on the above card. These are kept in a card index case

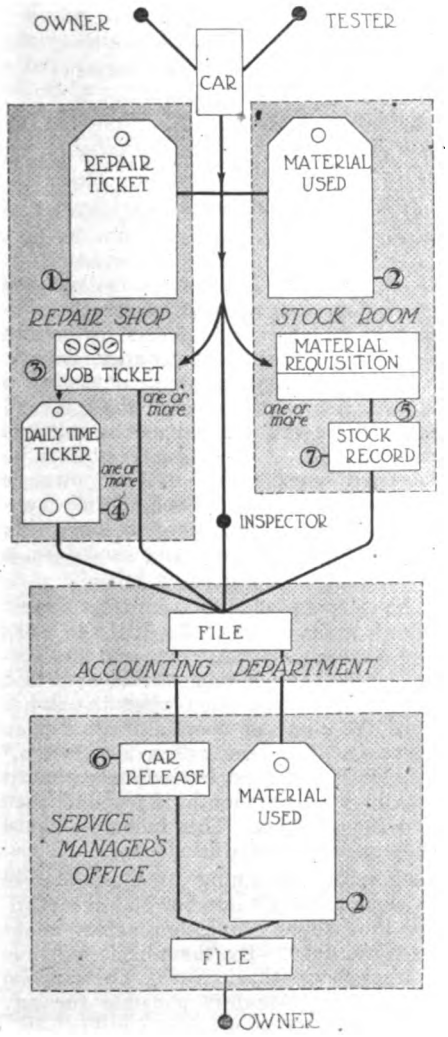

Fig. 8—This chart shows the divisions of the service department and explains the use of the forms in each department. Note that though the record is made in duplicate, in no part do the forms overlap or interfere with each other. And the service manager can trace back through each step with ease

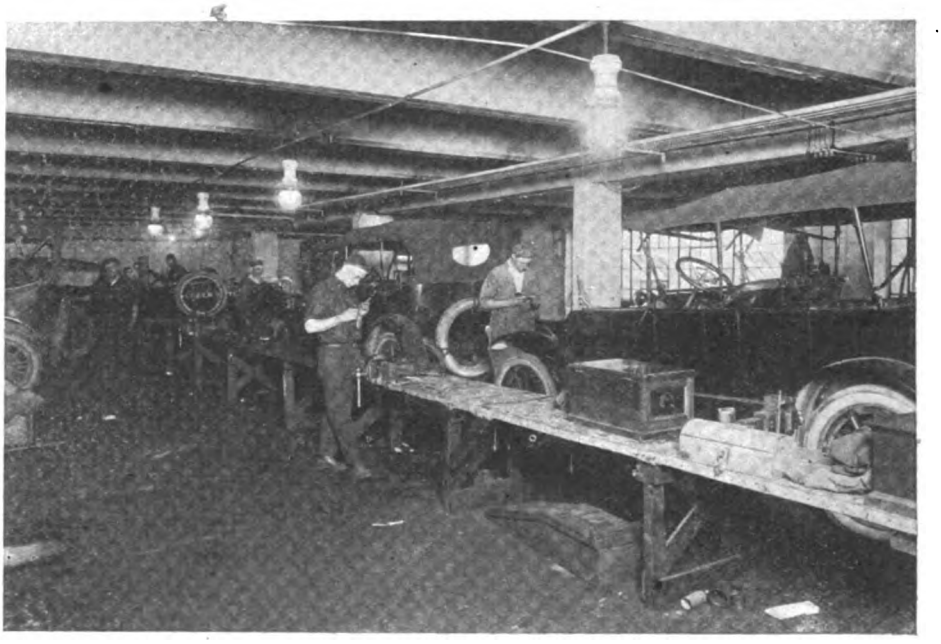
that proper entries are made on the work cards, and sent to the accounting department. The stockman is simply a storekeeper, with the single duty of seeing that a sufficient supply of parts is on hand for all emergencies and that proper entry is made of their delivery to the repair department.

In order to provide impersonal judgment of the work done, a separate subdepartment—the inspection department—is provided. Each car is tested after the completion of the work, and the inspector either approves the work, or sends the car back to the repairshop. This department is not concerned with time or materials. It answers he question "is the work done right, as directed by the owner?" and checks up the work of the repairshop.

All shop and stockroom records are sent to the accounting department, and the detail work of preparing the statement is done. This department checks through all the time cards and material requisitions, and handles the money end of the service work. This department, and this department alone, can issue a release permitting the owner to take his car.



In the main, the duties of the service manager's office are those of supervision and record. This office is the point of contact between the owner and the service station. Here all jobs are started, followed through the shop, and when finished, a complete record made of their passage. It is its duty to see that the owner is satisfied in the quickest possible time—*and is kept satisfied.*

Though only seven forms or cards are used in the system complete data is supplied to each department and a complete record is always available. These forms together with their use are best explained by following a car through the departments as some typical service job is done.

On coming into the service station the owner is met by an inspector. The two confer and agree upon the work that is to be done. The repair ticket, Fig. 1, is obtained, and the work to be done noted and signed by the owner. A promise is made on the job; the owner leaves, and the car goes to the repairshop.

Here the foreman reads the insruction ticket, and assigns the car to the departmen and workman that is to do the work. If rear axle work is necessary the car goes to the rear axle department; if engine work, to the engine department, and so on through the main units of the car. If work from several departments is required the car is sent to that department having the least work on hand at the time.

Immediately on starting any part of the work, the workman stamps the time on the job ticket shown in Fig. 3. When that part of the work is done, the workman stamps out on the time clock, checks his work from the repair ticket, and

In the repairshop of the Becker company the cars are run right alongside the benches. One bench and one lighting system serves all repair stalls, and the mechanics have the maximum room to work

Digitized by Google

enters the time on his daily time ticket. The job ticket is sent to the accounting department, and the daily time ticket follows at the end of the day.

If any material or parts are needed by any of the workmen a material requisition, Fig. 5, is made out and presented to the stockroom together with the instruction card. The stockman obtains the desired parts, enters the items in the "material used" column on the reverse side of the instruction card and sends the material requisition to the accounting department. Before doing this, however, he checks the part from his perpetual inventory for his own records.

When the job is completed the car is turned over to the final inspector with the instruction card. Here the car is tested and if all the work desired is done the job is approved. If not the car goes back to the shop for more work. When final approval of the work has been obtained the car goes to the delivery floor and the instruction card is sent to the accounting department.

All cards are now in the accounting department and, as each bears the serial number of the job, are filed until the receipt of the instruction card shows that the work is completed. These cards are then checked to see that nothing has been omitted or entered incorrectly and the total amount of the bill is placed on the back of instruction card.

In doing this work the material requisitions are checked up with the "material used" column on the instruction card. The job tickets and workman's daily time tickets are compared and the cost entered on the instruction card. Addition of the material and labor costs give the total bill.

It will be seen that two checks are provided for both labor and material. The labor charges may be taken either from the job ticket or from the daily time ticket, and the material bill may be taken either from the material requisitions or from the reverse side of the instruction ticket. This is a valuable feature, as it obviates the possibility of loss through mistakes or loss of any of the cards.

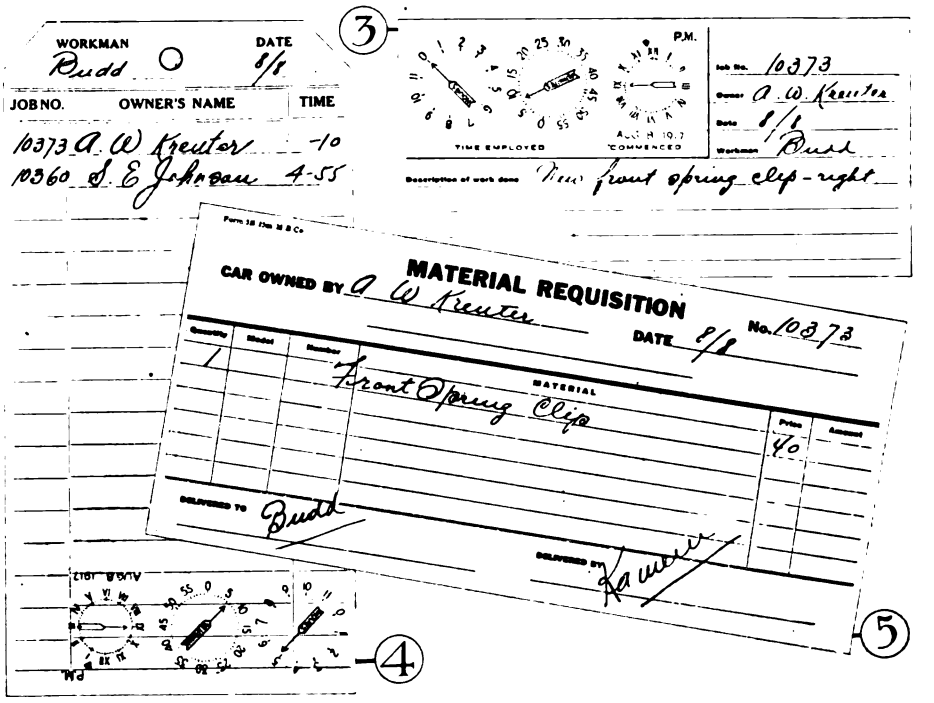


Fig. 3—As the workman starts any part of the job, he punches in on this job card. When the work is done, he punches out, and enters the elapsed time on to his daily time ticket. The job ticket goes to the accounting department. Fig. 4—This is the daily time ticket of the workman, and it must check with the individual job cards. Fig. 5—No material is issued from the stockroom except on the receipt of a material requisition. This shows the car receiving the part, and the workman to whom the part was delivered

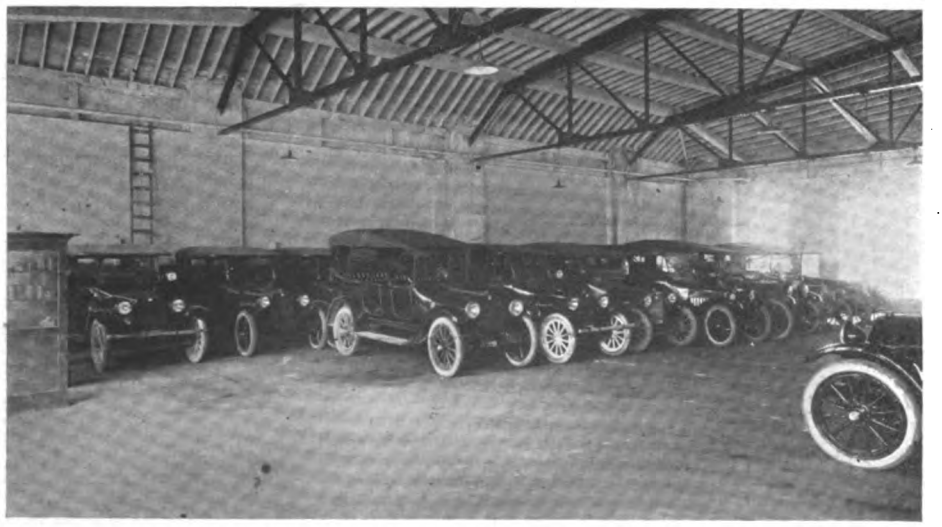
The work is now completed and the bill made out. However, the customer cannot obtain his car until he presents a car release ticket from the accounting department to the service foreman. This throws the entire responsibility for extended credit upon the accounting department—*another feature of the complete system.*

The owner delivers the release card and the instruction card to the service manager's office, receives his car and leaves.



In the service manager's office a complete record of the car releases is maintained. This is done in a car release ledger, the sole purpose of which is to see that no cars are released without a release card from the accounting department. It is simply a book containing a list of the serial numbers of the jobs and the numbers are checked as the releases are received.

A card index record of each owner's car is also made out in the service manager's office. This record is shown in Fig. 7, and contains in condensed form a complete summary of each job.

The purpose of this record is to provide a continuous record of all the work done on any particular owner's car, giving the date, job number and parts that received attention. Then when the owner offers the common complaint that "you overhauled that rear axle a month ago," evidence is provided immediately that it actually was six months ago—and then upon the gearbox. This index is also a check to careless work.

All cards pertaining to each job are filed under the job number and are available in case any question arises about the work done. By them it is possible to trace back through the system and hold the individual responsible for any mistake.

Though this system has been developed in a shop employing from 30 to 40 men it could readily be applied to a shop of any size. It has promoted individual responsibility among the workmen and at the same time given satisfaction to the dealer and the owner alike. *It is a straight-line, clearly defined time-keeping system for the repairshop.*

This is the Becker receiving and delivery room. The service manager's office is at the far left, near the entrance

Co-operation That Is Co-operation

Why the Harrisburg Motor Dealers' Association Is Successful

THE dealers of Harrisburg, Pa., have gotten together. Their organization shows such good results that they just can't hold in. They have found real co-operation so good for business that they want the other fellow to know about it. This letter from the president, George G. McFarland, is a crackerjack and will be an inspiration to other dealer associations.—Editor.

EDITOR, MOTOR WORLD: We are bubbling over with enthusiasm at the organization we have in our dealers' association. The trouble is that we have accomplished so much to protect, safeguard and advise our dealers that we almost hesitate to talk about it.

I have never tackled anything in my life that I have been as much interested in, or that has offered as many possibilities for straightening out, as the organization of our local dealers, garagemen and all those affiliated with the automobile industry. I find that this business has been run in the most slipshod way of any business I have ever heard of, and the encouragement we have had from the dealers, their willingness to follow good practical lines looking to the putting of their business on a paying business basis, has been very gratifying.

Making Real Members

You know that when you infuse some real ginger into a business man, back him up with a regular organization; make him get his price and he finds at the end of the day he has some hundreds of dollars more in his pocket than he would have had had he not followed the new rules, besides the additional self-confidence and respect he has for himself, you have made a real member, and the second battle for price comes much easier than the first.

Our boys get up and tell of one transaction after the other in which they demanded and received the full list price. The interesting part is that they also tell us of the cute and peculiar remarks that the customer makes in reference to this change of heart among the dealers.

To say that we are enthusiastic is putting it mildly, and the way things are going now makes it simply impossible for anybody to spill our kettle of beans.

The only thing essential to the successful operation of similar plans throughout the country is the proper handling.

It has taken us about 18 months to get our association in its present condition; it took 15 months to get every dealer in the organization to have implicit confidence in the officers, and then the balance came easy. Why, our fellows get up and tell every little thing that happens every day. There has not been a member who has kicked over the traces or taken unfair advantage of anything divulged.

We have almost forty members, and 80 or 90 per cent of them attend every meeting. We are busy from 7:30 to 12 o'clock at night, and don't want to go home when 12 o'clock comes, and all want to know when we are going to have another meeting.

Men Who Get Results

Our officers are: Geo. G. McFarland, president and member of board of directors, who handles the Reo and Duplex cars and Cleveland tractor; Patrick Driscoll, vice-president and member of board of directors, Chevrolet distributer; Carl Hanson, member of board of directors, Overland distributer; E. L. Cowden, member of board of directors, Page and Apperson distributer; Frank Bosch, member of board of directors, distributer for Miller tires; J. Clyde Myton, secretary and show manager, who is also secretary of the Motor Club; Chas. Ensminger, treasurer, distributer for Dort cars.

At the present time we have thirty-eight members. There are only about six people who have garages or do repair work in Harrisburg who are not members. We have two classes of members, both of them active. The one handles automobiles and accessories and does a regular automobile business. This class pays $50 initiation fees and $15 a year dues. The second class have garages and sell sundries, but don't sell automobiles; they pay $25 initiation fees and $15 a year dues. When the garageman takes on an automobile he pays $25 more to join the first class. Both classes have the same privileges, but we figured that the automobile dealer has more gratuitous work done for him by the association than the garageman. Hence the two classes.

We have suggested to our members that they have a minimum charge for mechanical labor of 75 cents an hour, the maximum charge to be whatever they please.

We have, or are getting as the old ones run out, uniform leases, notes and selling agreements. We have a standard 24 hour guarantee coupon book, which allows a customer 7 hours free service per month, but he must come to our repair shops every month to get the benefit of that 7 hours.

This guarantee covers 3 months. It cannot be 21 hours in one month, or on one job for nothing, but must be spread over 3 months. We figure that if he comes to our place at least 7 hours for 3 months we have been able to instruct him and reinstruct him in the care of his car. If he has 20 hours work done in one month we credit him with seven and he pays the balance.

We also assume the factory guarantee to replace any defective part or material for the term of that guarantee free of charge for the part, but charging for labor and carrying charges.

Discouraging the "Shopper"

If Bill Jones offers me his car as a trade-in, and I make him a price of $500, we tell the members that we have offered Bill Jones $500 for this car in exchange for another kind of a car. This is to prevent Bill Jones telling the other dealers that we offered him $600 or $700, and playing both ends against the middle.

We also incidentally speak about our bad customers who owe us money and complain about repair bills that we have trusted them for, in open meetings. We have a uniform cash card nailed up in conspicuous places in our garages, announcing that all repair work is cash, except, of course, for such concerns as we are absolutely sure will pay their bills promptly. All of our guarantee books, leases, etc., are endorsed by the Harrisburg Motor Dealers' Association.

Another rule is that we cannot hire a hand from another repairshop or garage

Digitized by Google

without first consulting the proprietor of that repairshop or garage. He tells me what he paid that man when he worked for him last, and what kind of a workman he was. One of the most important items to raise the character of the automobile repairman and employee is that we have told them in a very nice, diplomatic manner that their poor workmanship, their thieving, and other crooked work will be reported to the association, if detected, and that inasmuch as we give them their full salary every Saturday night in their envelopes, we expect full service in the shape of labor from them; that it is a 50-50 give and take proposition, and that if they are blacklisted with our association dealers it will be practically impossible for them to secure any labor in automobile work in Harrisburg.

Not a Single Knock

You have no idea how much good this has done us already. During the show just over there was not a single knock. If a man could not sell his own car he boosted every other car in the place. Nothing but clean work has been done up to date. If one dealer makes a sale the other fellows congratulate him.

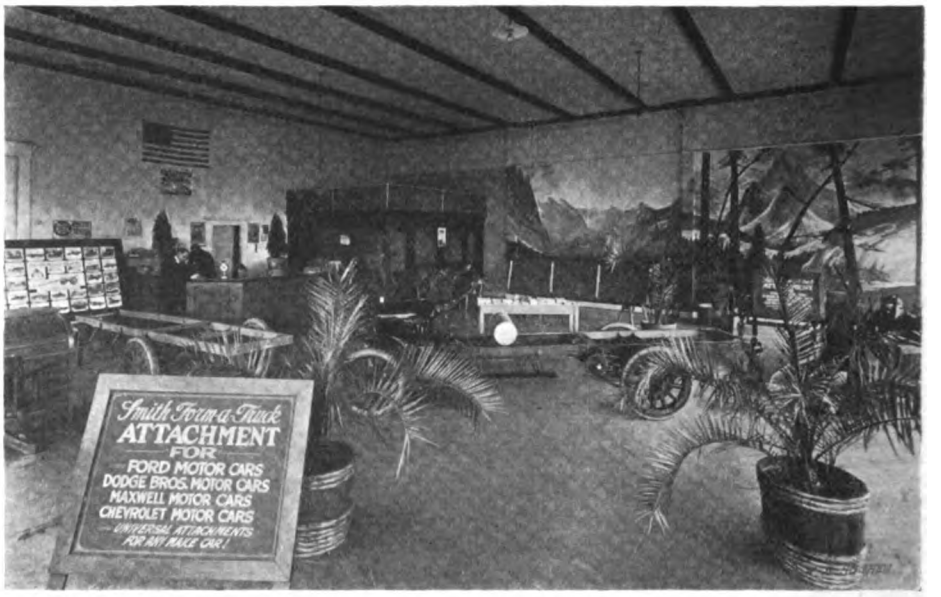
We meet at least every two weeks, either at an evening or noonday luncheon, which the association pays for. Any surplus money we have from initiation fees or dues or the show is spent in cooperative advertising.

We are fined 10 cents if we call anybody "Mr." in the meeting, or on the streets. We have to shake hands all around before we can sit down. We have to know everyone. We won't let any outside automobile or accessory be displayed at the shows unless it comes through a dealer. We buy from each other. Our show space, including signs, advertising, electric lights, etc., has been worked down to costing our dealers less than 10 cents a square foot.

The directors are also the show committee, and while they have arbitrary power to do anything, yet they always tell the association members what they anticipate doing in advance, and get their views of it.

The more progressive dealers explain their systems at the meetings for the benefit of the balance of the members.

What the Members Get



Our means of transaction and way of doing business is always open to any member for his assistance. We have legal advice free, and keep our members informed of all the new laws that are enacted looking toward our business. In other words, we are doing now what any practical set of business men should do toward getting for ourselves legitimate profits, having our bills promptly paid and protecting ourselves from shysters.

We are incorporated and have bought some Liberty Bonds. You can readily see that working as a unit we can accomplish a great deal. Don't think that we don't have our troubles, because we do, and don't think that we will not have our troubles this coming summer when business gets good, but every litter of pigs has its runts, and we have some in our association.

These fellows we are advising, counseling, and taking particular care to keep them straightened out and impressing upon them the fact that they have to stay straight.

Our rule that no dealer can take on another dealer's car agency without the first dealer's consent has already worked a wonderful benefit to us. This one feature alone I figure would almost keep us together. We, of course, will have to fire a few dealers if they don't break up before we fire them. We are going to try to prevent their breaking up, but if they prove themselves unworthy of being members of the association they are going to be dropped.

We find since we are organized that the big people of the community are asking us to use our united influence toward getting better roads and getting our city and county officials to co-operate with the state and government road officials toward the getting of better roads.—Geo. G. McFarland, president Harrisburg Motor Dealers' Association.

DECORATING a large salesroom for the artistic and impressionistic presentation of such a prosaic product as a truck unit attachment no doubt is considered by many dealers as somewhat of a job. The Smith Form-a-Truck Sales Co., Los Angeles, however, seems to have found the solution. The main wall is painted to represent a mountain landscape and a neat arrangement of potted palms and foliage plants helps out. The complete converted truck, separate attachment, special farm body and tractor attachment are all on display.

SHORT TRACTOR TRUTHS

Proper Care Means Long Life

THE life of the tractor on the farm is determined in no small measure by the skill of the man who operates it. It often is said that the man who understands the principles of construction and operation of the gasoline engine, or who can diagnose and remedy automobile troubles, is competent to undertake the operation of a tractor.

This is true in a restricted sense only. The tractor is far more than a gasoline engine on wheels, and it differs profoundly from an automobile. The gasoline engine and the automobile expert has a good start toward the understanding of a tractor, but it by no means follows that he is therefore a tractor expert. The ability to get the most and the best out of a tractor comes only through experience with the tractor itself. Many a machine has gone to wreck because of over-confidence on the part of the operator.

Must Fit Tractor To Job

REAL salesmanship in the tractor business is the fitting of the tractor to the job. There is no such thing as a tractor of universal adaptability. In all probability there never will be such a thing. Experience in tractor use has dissipated for all time the notion that there ever will be a machine of standard design which can be made to fit any combination of working conditions. Specialization will establish its necessity in the tractor trade just as it has in so many others. The man who would succeed in selling tractors must recognize this fact and he will display his ability by the selection of such a line as may be especially fitted for the average of conditions in his locality.

The Greatest Thing That Hasn't Been Done

By Ray W. Sherman

"MILLER," said Reilly, as the dealer's service manager sat down beside the Sennett dealer's desk, "we've got to go at this conservation thing and get our business into shape. We've got to do it. We're going to skin through this period of stress if possible, and one of the things we're going to do is take some of this cost out of the service station."

Conservation—Not Conversation

"Conversation?" questioned Miller.

"No! ConSERvation! Not conVERsation! There's been too much conversation already. What we need now is a little action. Here's the National Automobile Dealers' Association, it has studied this thing and made a lot of recommendations about what we can do to make our businesses more efficient, and I for one am going to do something about it. I'm through just talking."

"Well! What and how?"

"Well," explained Callawassa's biggest and best dealer, "we of course shall cut out all the extra costs and wastes we can find; but one thing we're going to start is the elimination of all fussy, free service so far as possible. We are going to develop this idea for after-the-war use as much as for present use. We might have been a long time coming to it if it hadn't been for the war, but now that the war's here we're going to fly at it.

Teach Owners to Serve Themselves

"We're going to teach our owners how to give themselves a lot of the service that has been costing us money. We're going to teach them how to fix their own cars. We're—"

"Car owners can't fix cars," was Miller's contemptuous interruption.

"I don't expect they're going to overhaul motors," Reilly asserted, "but there are a thousand little things any car owner can do if he only has some intelligent and capable man like yourself to teach him how."

The compliment softened Miller. He relented.

"Well," he said, "maybe they could. I guess I didn't get you the first time."

"Now, here's the idea," Reilly continued. "Every time we sell a car we're going to take the owner in hand and teach him all we can about it. We're going to teach him how to make adjustments, how to fix grease cups, how to fix tires, how to do a lot of things and how to keep his car out of our service station.

"If he can do those things he will save us a lot of money. Instead of running down here every time the car has an ache or pain he will know enough to look around himself and find out whether the job is serious enough to require your attention. If it does, he will bring it in. If it isn't, he'll fix it himself.

"We have for a long time operated on the theory that we were giving service to our owners when we kept a service station here with a lot of expensive men to fuss and fool around with a lot of little things that any owner with sense could have fixed. Perhaps we even thought we were keeping a grip on our owners by keeping them in ignorance—but if so, it was a wrong theory.

Owners Who Know Are Good Boosters

"The more our owners know the more it is going to benefit us and the motor car business in general. It is going to make car owners better boosters for the business in general. We have advertised our cars as something any one could own and drive and then we have maintained an elaborate organization for taking care of the things the buyers couldn't do after they bought them.

"These buyers could do these things, however, if we would only do a little teaching. And the more the average owner can fuss with his car the better he likes it. We have always discouraged it on the ground that he didn't know anything about the car and therefore might do a lot of damage. The truth is the damage might be done because we didn't teach him how to do his own monkey-work. For the time being we may not be able to decrease the size of our service organization, but eventually we shall be able to get along with fewer men because so many of the owners will be doing their own service work. We can then keep our service station going on repairs and service for which we can collect real money.

"Instead of giving a man a service card that calls for a certain amount of free service we are going to work toward a form of service card—if we have any at all—that will provide for instruction in the operation of the car. We shall insist that if a man wants a nut screwed up he shall screw it up himself—but we'll show him how.

Familiarity Will Breed Friendship

"This close relationship between the buyer and his car will bring us back more repeat sales, I do believe. If a man once gets his fingers into the inside of his car and comes to know it he is going to love it more and more and believe there is no car in the world just like it.

"As to how we'll do it, that is something you and I will have to work out. We may do it through establishing an owners' school to which motorists and their wives may come of evenings and get instruction from you on the little things that constitute simple service.

"We can let them listen to motor noises and all sorts of knocks and symptoms and teach them what to do when they encounter various emergencies. If we can teach them what they can do and what they can't do and get them to do the things they can do and bring the other things to us we shall have revolutionized service so far as the Sennett car is concerned. And it will save us thousands of dollars.

"Now that the matter has been brought to my attention through these war-service recommendations it looks like a very simple and much-needed thing. It's so simple that I wonder nobody ever thought of it before.

Free Service—Big Overhead

"For years all us dealers—and especially the bigger ones in the larger cities—have been staggering along under an enormous overhead, part of which is occasioned by such things as our free service. We have all lamented the fact that we haven't made as much money as we should, and here one of the reasons is thrust right into our faces.

"Why we didn't get together and do it before is more than I can tell. Miller, it's the greatest thing that hasn't been done, and if we put it over it will be one of the most far-reaching reforms that has ever hit the industry."

"I'm for it," said Miller. "I'll try anything once."

Standardized Jobs on the Ford

Labor Charges for Every Kind of Repair Tabulated for Reference

By S. T. Williams

PERHAPS more than any other company, the Ford Motor Co. has applied modern production methods to giving the owner service. Where possible, factory tools have been applied to service work, and special tools have been designed.

Much of this has been rendered possible by the fact that the Ford car is practically standard—but the methods and systems that have been developed could readily be applied in almost any service station.

At present the tendency in service station work seems to be toward the "job basis" system. That is, each possible job on the car is classified, and the price of each job determined from the average of a large number of such jobs. To this is added a small margin that will permit the dealer to make a legitimate profit on the service work.

Then, when an owner brings his car to the service station, he is told the labor cost before the work is started—not a "guess" price, but the actual price that he will have to pay for the work he wants done. The desire to know the price in advance is common to all men; the ability to satisfy that desire creates confidence. And confidence is not commonly present in the average owner's mind.

The job basis system is simplicity itself after it has once been installed. But two cards are required—the productive labor card and the non-productive labor card.

On the productive labor card are listed the most common jobs to be done, together with the price of each job. Blank spaces are provided for the uncommon jobs, and these are copied from an office job list when required.

This card carries the owner's name and authorization of the work to be done, the reverse serving as a material and time record of the workman doing the work. The only purpose of this time record, however, is to see that the workman keeps within the time limit allowed for the job. When the limit is consistently exceeded, either the workman or

Front of the non-productive labor card, showing the method of making entries

the limit is changed. The average, however, should be well within the limit.

In figuring the cost of any one job, it is the usual practice to determine from many tests the average time required by a workman to do that job. The labor cost on the job is then determined by multiplying the time by the cost per hour of the workman. Then the cost to the owner is twice the labor cost plus a legitimate profit.

All of the cost above the labor cost covers the expenses incurred by providing the means whereby the workman can work, plus a legitimate profit to the dealer. This includes the rent, light, heat, equipment and management expenses, and is termed the "overhead expenses." In many shops the overhead is more than equal to the labor cost, but

NON-PRODUCTIVE LABOR

Quantity	Description of Materials Used	Price	Extension

1	Ring gear		
	Oil and grease	25	

TOTAL TIME | EMP. NO. | RATE | AMOUNT

2 | 15 | 12 | 50 | 1 | 25

Start 8.30 Finish 9.45

2 | 15 | 1 | 08

TOTAL LABOR 1 | 25

Back of the non-productive labor card on which the charge for labor is entered

the following example will show how the total cost may be figured for any job:

Total shop expenditure for 1 year. $17,000
Total labor cost for 1 year..... 8,000

Total shop cost for 1 year..... $9,000

$$\text{Percentage overhead} = \frac{\text{shop cost}}{\text{labor cost}} = \frac{\$9,000}{\$8,000} = 1.125 \text{ per cent}$$

Job cost = labor cost + 1.125 (labor cost)

Thus if the labor cost on any job be $2, the total job cost equals $2 + 1.125 × $2 = $2 + $2.25 = $4.25. To this should be added whatever profit the dealer feels advisable, giving the cost of the job to the owner.

All unproductive labor records are made on the cards shown in Figs. 3 and 4, and in this is included all work on shop cars, free service, and, in fact, all work not paid for by some outside party. All of the labor cards are made to fit into a loose leaf ledger, and when the work is completed are filed serially. The individual workman's time records are taken from these cards and used to check up the daily time records.

Labor Operations Covering Repair Work for the Ford Car

ENGINE DIVISION

The following charges cover work on cars driven into the agencies

Operation Number		Labor Charges
1	Overhaul engine and transmission	$21.00
2	Overhaul engine only	17.50
3	Overhaul transmission only or repair or replace magneto	11.00
4	Rebraze crankcase arms or support or repair leak in case by taking out engine	10.00
5	Install or refit one piston or one connecting rod	4.50
6	Install or refit two or more pistons or connecting rods	5.50
7	Replace transmission band or transmission cover gasket	2.00
8	Change engine	$5.00
9	Replace camshaft or refit bearings	4.00
10	Replace cam gear—large	2.50
11	Repair cylinder front cover or replace old style	2.50
12	Remove starter and put on standard equipment	3.00
13	Grind valves and clean carbon	2.50
14	Remove carbon only (this operation to be used only when customer will not permit grinding of valves)	1.75
15	Repair cylinder head bolts stripped—one or two	2.50
16	Repair cylinder head bolts stripped under dash	5.00
17	Clean out oil feed pipe	3.25
18	Replace cylinder head gasket	1.25
19	Replace radiator or one or all three hose connections	.60
20	Replace crankshaft starting pin or pulley	1.50
21	Tighten engine to frame	1.25
22	Clean crankcase or install gasket under lower cover	.75

Digitized by Google

It is essential, in installing a system of this nature, that the cost be based upon the average time that the job requires. If the time limit is too great the workmen will tend to loaf; if too little, it is unfair to the workmen. By using the average time and placing a small premium on all jobs completed under the scheduled time, the system is made fair to both workmen and employer.

The greatest benefit from the installation of the job basis system seems to be that it introduces the element of competition into the repairshop. Each workman knows the time usually required to do the job on which he is working—and sets out to better that record. He knows that by doing this he will get more money, but more important, that he will break his own or his fellow workman's previous record.

To do this he will think out short-cuts and special methods whereby he can do the work quicker. He will talk with the other workmen and watch them in their work; he is open to suggestion from the foreman, for the job basis of doing work provides the workman with a measure by which he can gage his efficiency.

In these shops in which the job basis system has been installed the following seem to be the conclusions drawn:

1—The customer is better satisfied, after understanding the system.

2—The dealer is assured of a fair profit from the shop.

3—The workmen receive recognition for individual effort and work.

The list herewith shows the prices charged for each possible job on the Ford car, and the more common jobs are also listed on the job card. This list will serve as a guide to any dealer that desires to install the job basis system, or it can be used without change in those shops doing Ford repair work.

Operation Number		Labor Charges
23	Replace carbureter or manifold, or repair leak in manifold	$0.75
24	Install new butterfly spring	.75
25	Overhaul carbureter	1.50
26	Repair leaky carbureter	1.00
27	Replace commutator wire loom and brush—each or both	.75
28	Replace commutator pull rod joint	.60
29	Replace or rebush fan pulley assembly	.60
30	Adjust clutch fingers or trans. bands	.60
31	Stop oil leak in valve doors	.50
32	Install spring on foot pedals—each	.50
33	Replace core plug, one or more	.50
34	Install new starting crank handle	.50
	Operations 5 and 13 combined on one order	5.50
	Operations 6 and 13 combined on one order	6.50
	Operations 9 and 13 combined on one order	5.00
	Operations 13 and 15 combined on one order	3.50
	Operations 7 and 17 combined on one order	4.25
	No charge for operation 14 when combined with operations 5, 6 or 9.	
	No charge for operation 19 when combined with operations 228 or 238.	
	No charge for operation 30 when combined with operation 7.	
	No charge for operation 19 when combined with operation 11.	

The following extra charges should be made for special equipment

Overhauling engine equipped with starter (according to time required to remove)	$2.00 to $5.00
Grinding valves, fitting pistons or connecting rods when necessary to disconnect starter or special ignition system wires	1.50
Overhaul engine equipped with Bosch, Splitdorf or special ignition system	1.50
Overhaul engine when necessary to remove special body	5.00

Parts brought in or shipped in for repairs

55B	Overhaul engine and transmission	$15.75
56B	Overhaul only	11.00
57B	Overhaul transmission only	4.00
58B	Rebore cylinder only, including fitting of pistons	2.00
59B	Rebore and rebabbitt cylinder, including fittings of pistons	3.25
60B	Rebabbitt cylinder only	1.25
61B	Rebabbitt cylinder, fit crankshaft and run-in	2.00
62B	Rebore and rebabbitt cylinder, including fitting of pistons, crankshaft, connecting rods and running-in	5.00
63B	Rebore and rebabbitt cylinder, fit pistons, valves, push rods, camshaft, crankshaft, connecting rods and run-in	7.50
64B	Rebore and fit piston and valves	2.50
65B	Rebore and fit pistons, valves and push rods and straighten and fit camshaft	3.25
66B	Rebush three transmission drums	1.50
67B	Rebush transmission drums—each	.60
68B	Rebush three triple gears	.75
69B	Braze crankcase arms and supports	2.00
70B	Repair crankcase drain plug housing	2.00
71B	Overhaul or repair carbureter	1.00
72B	Disassemble ⅝ in., 9/16 in. or ¾ in. magnets from flywheel and install new set	$0.60
73B	Straighten crankshaft	1.00
74B	Straighten camshaft	.60
75B	Straighten camshaft and fit bearings	1.00
	Operations 69B and 70B combined on one order	3.00

REAR SYSTEM DIVISION

The following charges cover work on cars driven into the agencies

96	Overhaul rear axle assembly and rebush springs and perches when necessary	$6.00
97	Repair or replace driveshaft tube	4.00
98	Repair or replace one rear radius rod	1.50
99	Replace rear spring tie bolt or new leaf, including polishing and graphiting of leaves and lining up of body (when overhauling rear axles or graphiting springs no charge should be made for removing shock absorbers)	3.00
100	Remove front and rear springs, polish and graphite leaves only	3.00
101	Remove shock absorbers and install perches	1.5
102	Pad rear spring to line up body or replace rear spring tie bolt only	1.50
103	Rebush spring and perch	2.00
104	Install universal joint	2.75
105	Straighten axle shaft (without removing from car)	1.50
106	Tighten rear radius rod	.75
107	Install felt and steel washers—one side 60 cents, both sides	1.00
108	Install one or two brakeshoes and equalize emergency brakes	1.25
109	Tighten universal ball cap bolts	.60
110	Install or tighten rear spring clips	.60
111	Tighten rear hub lock nut (one side or both)	.50
112	Fit new hub keys—each side	.75
113	Replace pull rod supports—each or both	.60
114	Rebush hub brake cam or replace cams—each side	1.50
115	Replace rear axle assembly	2.25
116	Adjust pull rods or replace one	.75
117	Straighten rear radius rod (in car)	.75
118	Install outer roller bearing—each	1.25
119	Replace rear axle shaft, drive shaft pinion or drive gear (no other work necessary)	3.00
	Operations 96 and 99 combined on one order	7.25
	Operations 96 and 102 combined on one order	6.50
	Operations 96 and 110 combined on one order	6.25

The following extra charges should be made for special equipment

Axle	Overhaul, when necessary to remove special truck racks or truss rods	$1.00
Axle	Overhaul, when car has shock absorbers and owner will not permit removal	1.00
Axle	Overhaul, when car is equipped with special hub brakes	1.50

Parts brought in or shipped in for repairs

140B	Overhaul rear axle	$4.00
141B	Re-rivet rear axle housings—each	1.00
142B	Install new drive shaft tube in drive shaft assembly only	1.00
143B	Re-rivet or rebraze drive shaft tube	1.00

Digitized by Google

Operation Number		Labor Charges
144B	Straighten or repair rear radius rod	$0.60
145B	Overhaul differential assembly with shafts	1.00
146B	Remove old and press new gear on axle shaft—each	.25

FRONT SYSTEM DIVISION

The following charges cover work on cars driven in the agencies

167	Overhaul front axle, including rebushing of spring and perches when necessary, straightening of parts and lining up and adjusting of wheels	$5.00
168	Rebush spindle bodies and arms—each side	1.50
169	Replace or straighten front axle (no other repairs)	2.50
170	Rebush spindle body—each	1.00
171	Rebush spindle arm—each	.75
172	Replace broken off radius rod ball cap stud	2.50
173	Replace front spring tie bolt or new leaf, including polishing and graphiting of leaves; or remove shock absorbers, installing standard material and graphiting leaves	2.00
174	Replace front spring or tie bolt only	1.00
175	Tighten radius rod or steering gear ball cap	.60
176	Replace radius rod	.75
177	Straighten front radius rod and line up front assembly	1.00
178	Replace spindle arm or body and line up assembly	.75
179	Replace radius rod ball cap with new style	.60
180	Tighten all sockets and joints of front end	1.25
181	Replace or straighten spindle or steering gear connecting rod	.60
	Operations 167 and 172 combined on same order	6.50
	Operations 167 and 173 combined on same roder	6.00
	Operations 167 and 208B combined on same order	6.50

The following extra charges should be made for special equipment

	Overhauling front axle when bumpers, special radius rods, "Little Steersmen," and such devices are used	1.50

Parts brought in or shipped in for repairs

202B	Straighten front axle	1.50
203B	Straighten radius rod	.60
204B	Install stud in radius rod	.75
205B	Rebush spindle body and arm	.75
206B	Rebush spindle arm	.40
207B	Rebush spindle body	.50
208B	Rethread front axle by drilling out and bushing	2.00

CHASSIS DIVISION

The following charges cover work on cars driven into the agencies

Front End and Frame

228	Replace front cross member	$6.00
229	Replace front cross member when radiator is off	5.00
230	Straighten front cross member (without removing from car)	3.00
231	Replace rear cross member	7.50
232	Replace side member or frame	13.50
233	Install engine pans—one 75 cents, both	1.25
234	Tighten engine pan	.60
235	Tighten crankcase front and bearing cap	.60
236	Install hood clips or springs—or hood board—each side	.60
237	Free up hand-brake lever	.60
238	Remove radiator to replace radiator stud or tighten fender brackets—each or both	1.00
239	Replace starting crank ratchet pin	.60
240	Replace starting crank or sleeve	1.25
241	Install runningboard bracket	2.50
242	Repair hand-brake lever assembly, including replacing of pawl	1.00
243	Replace hand-brake lever quadrant without removing runningboard shield	1.25
244	Tighten all bolts and nuts on car	3.00
245	Tighten body bracket bolts	1.00
246	Install tail lamp bracket	.60
247	Install new gas line for Presto tank or generator	.75

Fenders and Runningboards

258	Replace or tighten fender or runningboard	.60
259	Tighten all fenders, runningboards, shields and truss rods	1.75
260	Remove fender or runningboard and straighten	1.00
261	Replace runningboard shield—one $1.25, two	2.00
262	Install fender-to-shield bracket—each	.60
263	Install metal tool box	.75
264	Repair, tighten or install rear fender iron	.75
265	Replace truss rods—each or both	.60

Dash

276	Replace dash	4.50
277	Replace dash when engine is out	1.50
278	Tighten dash bracket to body and dash	1.25
279	Replace coil and install Yale lock	1.50
280	Replace coil, install new switch on coil box or repair the box	.60

Steering Gear

291	Overhaul steering gear, including replacing of quadrant or gear case and rebushing of bracket	3.50
292	Overhaul steering gear when engine is out	2.50
293	Tighten rivets of internal gear case	1.25
294	Tighten at dash and rebush bracket	1.25
295	Replace wheel or spider	.60
296	Tighten at dash and post	.75
297	Replace steering gear assembly	3.00
298	Rebush bracket only	.75
299	Tighten steering gear case cover	.75

Muffler

310	Change long exhaust pipe	.75
311	Replace or repair muffler	.60
312	Repack exhaust pipe pack nut	.60

Gas Tank and Line

323	Repair leak in touring car gas tank	1.50
324	Repair leak in touring car gas tank (when necessary to remove body)	6.00
325	Clean sediment bulb, gasoline feed line and drain carbureter	.75

Hood

336	Straighten hood	1.00
337	Install hood leather	.60

Radiator

348	Overhaul radiator	6.00
349	Overhaul radiator (installing new core only)	3.75
350	Repair radiator, solder one or two tubes and replace one or both sides	3.00
351	Solder neck or top tank or repair without removing from car	1.00
352	Solder casting to lower or top tank when necessary to remove radiator	1.50
353	Replace radiator pet cock	.60

Wheels

365	Change hub, rear or front and install wheel and tire	1.25
366	Replace wheel and tire—each	.60
367	Adjust and dope front wheels	.60
368	Remove wheels and change hub parts or cones	.60
369	Line up front wheels when brought in for this operation only. (When car is in for other repairs no charge should be made for this work)	.60
370	Oil and dope car, including material. (Graphiting springs in car $0.75 extra)	.75

Paint Division

391	Repaint and revarnish chassis only	10.00
392	Repaint and revarnish car—touring or runabout	20.00
393	Repaint and revarnish coupelet	35.00
394	Repaint and revarnish town car	30.00
395	Repaint and revarnish sedan	45.00
396	Repaint and revarnish body only—touring or runabout	10.00
397	Revarnish body only—touring or runabout (on chassis)	5.00
398	Revarnish body only—sedan or couplet (on chassis)	10.00

Digitized by Google

399	Refinish deck on torpedo runabout	$1.50
400	Refinish fenders, dust shields, running boards, wheels, hood or tool boxes off car, each	.50

Body Division

411	Tighten all doors	1.25
412	Install new lock—touring or runabout—each	1.00
413	Replace town car or sedan door lock	1.50
414	Replace top irons, each	1.00
415	Install new leather on door panel—one, $0.60—two	.75
416	Install new leather on arm rest	1.00
417	Patch section of upholstering	1.00
418	Re-upholster touring body (using new material)	6.00
419	Re-upholster runabout body (using new material)	3.00
420	Change closed body	8.00
421	Change touring or runabout body	5.00
422	Take dent out of any side panel	4.00
423	Take dent out of any side panel and refinish	6.00
424	Take dent out of door	2.00
425	Take dent out of door and refinish	3.00
426	Take dent out of rear or corner panel without removing from car	8.00
427	Take dent out of rear or corner panel and refinish without removing from car	10.00
428	Take dent out of rear or corner panel (when removed from car)	13.00
429	Take dent out of rear or corner panel and refinish (when removed from car)	15.00
430	Take dent out of torpedo deck and refinish	2.00
431	Repair front or rear seat cushion	2.50
432	Replace binding on one or more doors	.75
433	Put on new trim rail	2.50
434	Replace door hinge	.75

Top and Windshield Division

455	Overhaul touring car or torpedo top, including recovering, lining-up and fitting of curtains	6.75
456	Replace top deck or side quarters—each or both	4.50
457	Line up and dress top	2.00
458	Install and fit top (if new top is purchased—no charge for labor)	1.25
459	Repair tear in top up to 4 in	$1.00
460	Replace front or rear bow-touring or runabout	2.50
461	Replace center bow-touring or runabout—each	1.25
462	Patch small pin holes	.60
463	Patch hole in curtain or replace celluloid	.60
464	Replace back stay—1914 and earlier	.60
465	Replace back flap curtain—1914 and earlier	.75
466	Replace celluloid in back flap curtain—1914 and earlier	1.00
467	Replace back curtain—1915	1.50
468	Replace celluloid in back curtain—1915	1.75
469	Refit complete set of side curtains	1.50
470	Refit one side curtain $0.60—two	.75
471	Replace top box socket—touring or runabout	1.25
472	Replace windshield—1914	.75
473	Replace windshield—1915—and line up windshield frame	1.00
474	Replace windshield glass upper 1915	.60
475	Replace windshield glass lower 1915	1.00
476	Replace windshield glass 1914—each	1.00
477	Replace hinge—1914 or 1915	.60
478	Replace or tighten dash clips and hinge screws	.50
479	Pack windshield glass to take out rattle—each	1.00
480	Replace windshield bracket—1915	1.50
481	Repair windshield lower frame 1915 and install glass	1.75

Lamp and Horn Division

502	Replace or repair electric headlight switch	.60
503	Straighten damaged head lamp	1.25
504	Take dent out of head lamp door frame and replace glasses	.75
505	Clean up and repair set of oil lamps 1915 to make burn	1.00
506	Install electric horn and wire	1.00
507	Install electric headlights and wire	1.50
508	Install new parts in oil lamp—each	.60
509	Take short-circuit from switch or lamp	.60

Special

530	Tow-in-per-mile (beyond city limits, charge extra according to time consumed)	.50
531	Start-up (add for each additional mile 15 cents)	.60

Explaining the Advantages of Rural Express Plan

WASHINGTON, June 10—The Highways Transport Committee, Council of National Defense, has issued a bulletin calling the attention of the nation to the rural motor express plan. The bulletin tells in detail the need for rural motor express establishments, and shows that the reasons for it are threefold, including the increased volume of foodstuffs to be hauled during the war, the need for man labor on farms, and the need to encourage local food production.

The bulletin tells the advantages of the rural motor express:

1. Food production as stimulated by the regular outlet to the market.

2. Shortage of labor has been reduced, since the motor trucks will leave the farmer on the farm.

3. Farm machinery proves efficient because spare parts and repairs can be made properly.

4. The railroads are relieved of local freight, permitting them to handle carload lots for long hauls.

5. The rural motor express helps to avoid the necessity for local freight embargoes.

Suggestions on conducting rural motor express routes, including expense, charges and other details, will be furnished to any one interested by the Highways Transport Committee of the Council of National Defense, Washington, D. C.

Reproduction of poster which the Oliver company is distributing to dealers to advertise tractor plowing

Oliver Sets Week to Boom Tractor Farming

THE Oliver Chilled Plow Works, South Bend, Ind., has dedicated the week of June 10-15 to the promotion of tractor farming, and is devoting all its efforts to helping Oliver dealers impress upon the food producers in all farm communities the one vital fact that "food will win the war," and the grave importance of preparing at once to insure the mammoth production of foodstuffs which it is not only our duty but our necessity to produce. To assist dealers in carrying out the idea of National Oliver Week, the Oliver company will run advertising campaigns in farm papers, supply dealers with advertisements for local papers, supply posters, award prizes to dealers in each branch district for the best advertising effort and supply stickers for correspondence.

The entire personnel of the Oliver organization, including two factories, seventeen branches, fifty-three stock transfer houses and the entire corps of salesmen, numbering about 500, will participate in the movement. Each man will devote his full time and energy to it and each dealer will preach the gospel of early ordering in conjunction with the Oliver organization.

A very conspicuous poster has been prepared by the Oliver company. It will be prominently displayed by dealers during Oliver week.

THE LAW

By George F. Kaiser

As It Applies to
Dealers
Repairmen
Garagemen

Law or Wit?

Sometimes even a lawsuit causes a hearty laugh. Recently suit was brought by the proprietor of a garage who sued a motorist for the amount which he claimed was due for repairing the latter's automobile. The motorist claimed that the work had not been properly done and had to be done over, and when the garageman asked for particulars the following "knockout" was furnished by the motorist as his reason for being unwilling to pay:

"The items of work done and material furnished in making such repairs were: The engine was adjusted, so that the same would operate and propel said car without unseemly noise, and without forcing the push rods down with excessive force, and without causing the same to become bent and disabled; the pistons were properly adjusted, and number six piston was placed in its proper place, and so was number one piston; the bearings were corrected and properly adjusted; the cylinder head gasket was repaired and the leak therein stopped; the crank case repaired and the leak stopped, and the engine was adjusted so that no oil would be thrown over it; one bent push rod was taken out, straightened, and replaced; one valve that had been bent by the push rod was taken out and a new one inserted; two valves which had been bent were straightened, and all of the valves were properly timed, so that the engine would operate and propel said car easily, smoothly, unhesitatingly, unintermittently, and in a mechanical and proper manner, and so as not to cause or allow to emit therefrom the loud and unseemly noises which were emitted as a result of plaintiff's alleged repairs thereto, to the great damage of the mechanical parts of said automobile, the undue disturbance of the peace and quietude of the streets and highways of the city, the intense aggravation and disgust of the general public, the fiendish amusement and delight of the children on the streets, and to the utter amazement and undying chagrin of this helpless and unfortunate defendant."

Beware the Minor

Another case showing the danger of dealing with a minor has just been decided—this time by the Supreme Court of New Jersey—and it was held that a garageman's lien for storage in that state does not attach against a car owned by one under age.

Suit was brought by a minor owner of a motor car to replevin it from a garage keeper who held it and refused to surrender it under his claim of a garageman's lien. The garageman claimed that the minor was indebted to him for repairs, for supplies, and for storage.

The minor admitted that he had stored the car in the garage, that the supplies had been furnished and that the repairs had been made, but claimed that he was nevertheless not responsible for the indebtedness because he was not yet twenty-one years of age.

The garageman contended that the minor was guilty of misrepresentation because he had held himself out to be over twenty-one years of age at the time he delivered the car for storage, and that as the minor was engaged in the business of using his car as a passenger vehicle for hire he should be held responsible on the ground that the supplies, repairs and storage were "necessaries," as even minors are responsible and are bound to pay for necessaries.

The court in deciding the case, however, refused to adopt the garageman's theory and held that even though a minor decides to go into business on his own account that that does not cure his incapacity to contract, and the fact that a minor misrepresents his age cannot be set up against him. The contract was therefore decided to be invalid and the court further decided that the garage keeper had no valid garageman's lien under the New Jersey law but must surrender the car even though he was still unpaid.—LaRose vs. Nichols, 103 Atl. (New Jersey) 390.

Can "Beat" the Boss

The Supreme Court of Wisconsin recently decided that a salesman whose employer's contract of agency with an automobile manufacturer is about to expire may solicit for himself his own appointment to the agency upon the expiration of his employer's contract without being guilty of such a breach of duty toward his employer as will justify the latter in refusing to pay a balance due the salesman under their contract of employment.

Suit was brought by a salesman against his employer for a balance due under a contract of employment which had been entered into between them.

It appeared that the employer had had an agency contract with the Ford company in his state, which contract was to expire on Aug. 1, 1915. In June and July of that year, and while still employed as a salesman, the salesman circulated a petition which recommended himself and another man to the company for appointment to his employer's agency for the new term. The salesman was unsuccessful and his employer obtained a renewal of his contract with the company.

After Aug. 1 the employer heard of the salesman's attempt to get the contract away from him and refused to pay him a balance due under his contract of employment on the ground that he was guilty of a breach of duty in soliciting the agency while he was still employed. The court decided, however, that there was no breach of the employment contract on the salesman's part and that therefore there was no forfeiture by him of the amount which he claimed from his employer.—Rathenberger vs. Jacobs, 167 Northwestern (Wisconsin) 271.

Fight Removal of Curb Stations

DETROIT, June 8—The proposed city ordinance ordering the removal of gasoline filling stations and air service pumps from Woodward Avenue was defeated by the opposition of the garagemen and accessory store proprietors; who circulated a petition of protest among their patrons and motor car owners. At a meeting held in the Board of Commerce, W. T. Wilson, chairman, declared that to remove his sidewalk equipment, which was installed at a cost of several thousand dollars, would cost more than the equipment would be worth. He also stated that the enforcement of the proposed ordinance would mean the commercial ruin of many garagemen and accessory dealers.

As a result of this meeting it was proposed that the garage men form a permanent organization. Indications point to a fulfillment of this proposal.

Ford Motor Co. Moves

DES MOINES, June 8—The Des Moines branch of the Ford Motor Co. began moving into its new $1,000,000 assembly and service plant at Grand and Eighteenth streets May 28 and was ready for business June 1. The new service plant is a six-story structure of concrete, steel and glass, 453 x 120 ft. in ground area. Its present capacity is the assembly of 400 cars per day.

Repairshop Shortcuts

From Motor World Mechanics

No. 1700—SWINGING VISE CRANE

A swinging vise crane is made with a pillar cut from a length of 1¼-in. iron pipe, the base on which it rests being a short piece of the same size pipe, split half its length and bent out so that it can be drilled and fastened to the bench with lag screws or bolts. A piece of solid round steel stock to fit in the pipe is pinned in the base, the upper end projecting for the pillar to rest on. The top of the pillar is split to take the arm and a slot is cut about one-third the way up to take the brace. The arm and brace are 1¼ x ½ in. flat bar stock, secured with rivets. A hole in the end of the arm takes the hook of the tackle block and the pillar is fastened to the wall so it can turn by heavy strap iron bent around the pipe.—Charles H. Willey, Concord, N. H.

No. 1701—IMPROMPTU TAPS AND DIES

A damaged thread on a bolt, screw or stud may be smoothed over by taking a nut which fits and filing two slots as shown. If the threads are only slightly damaged it will not be necessary to cut the slots, but if they are very badly deformed it must be done. Likewise a nut with crossed threads may be trued up with a bolt which has similar slots filed in it.

No. 1702—ADJUSTABLE FLOOR-LIGHT CLUSTER

A portable floor-light cluster adjustable for height is made up of pipe and stock pipe fittings. The upper member uses a reducing plug, socket, tee, 45-deg. ell and close nipple, the upright piece of pipe screwing into the tee. The lower part of the stand is made of a size larger pipe into which the upright piece slides, being locked to any desired height by a clamp with lever-handle bolt. Concrete is molded around the lower end to form a base.—Charles H. Willey, Concord, N. H.

No. 1703—VALVE RESEATING TOOL

A tool to reseat air and oil valves is made of a piece of ¼ in. tubing by flaring one end, inserting a steel ball the same size as the one used on the seat and cupping the edge of the flare around the ball.—R. E. Brown, Anderson, Ind.

No. 1704—VALVE SPRING TESTER

In order to insure perfect running of the engine it is necessary to know that all valve springs are of proper tension, and in order to determine this a weighing device such as the one shown is required. A certain spring deflection should occur when a certain weight is applied, the amount depending on the spring. For absolute accuracy a table of spring weights and deflections should be obtained from the manufacturer of the engine. However, even if this is not at hand it is possible to determine whether a given spring is too weak by comparing it with a new one or one which is satisfactorily performing its work. The apparatus illustrated consists of a device for holding the spring, a spring balance scales and a block and tackle for applying the load. The spring is slipped over a rod the size of the valve stem and then the valve spring seat and retaining key are put in place. A pull on the loose end of the rope compresses the spring, the deflection can be measured by noting the movement of the rod in its guide, and the weight is read directly on the balance.—Pierce-Arrow Service Station, Buffalo.

$1 a Helpful Kink

HOW often have you been compelled to rack your brain to overcome some difficulty? But when you did find a solution—what a satisfaction it was! Well, here's a chance for you to dig some of those life-savers out of their hiding places and put them to work for your fellow-craftsmen. Send them to Motor World. We will pay you a dollar for every one accepted for publication.

The only requirements are these:

1—Describe the shortcut briefly but clearly, in few words.

2—Send a sketch, in pencil or pen, no matter how rough; our artists will finish the job.

3—Write on ONE side of the paper only.

4—Sign your name and initials, the name of the company you are with, and the town.

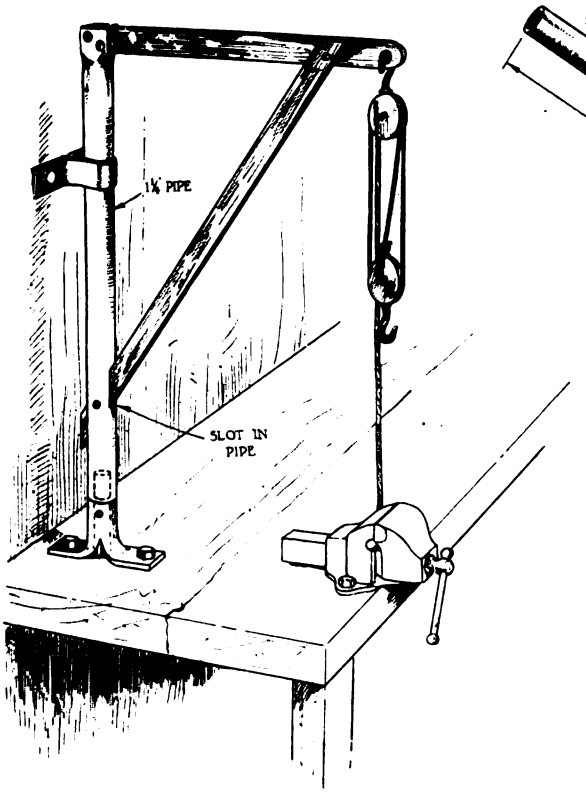
Write plainly. If your name is unusual, print it in capital letters.

No. 1705—CONDUIT FOR WIRING

The flexible tubing which houses the speedometer shaft may be used for metal conduit in rewiring a car. It, of course, may be cut to any length desired, and its original length is usually sufficient for maximum requirements. The ends where the wires leave the conduit should be taped to prevent dirt or moisture entering and also to prevent chafing of the insulation on the conduit.

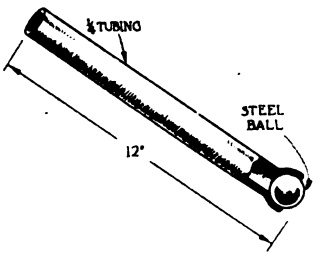
No. 1706—CRANKSHAFT COUPLING WRENCH

A tool for turning the crankshaft by means of a grip on the edge of the coupling is made from flat steel stock with a hole drilled near the serrated end and a U-shaped piece of rod riveted in the hole so that it moves but fits tightly. It is adaptable to all size couplings or spacing of bolt holes.—Charles H. Willey, Concord, N. H.



No. 1707—CONTINENTAL RIM TOOL

The old type split Continental rim with a series of interlocking teeth all around the circumference is perhaps considered the hardest type to take apart, but if a jack is employed there is no type which comes apart more readily. The edge of the base of the jack is set against a large lug adjacent to the locking device and the head against one of the teeth on the other half of the rim. Two or three strokes of the jack are sufficient to do the work. The jack may be similarly used to put the rim together. This is miles ahead of the usual method, which is to use a hammer and a cold chisel.



No. 1708—ADJUSTABLE WORK HORSES

Work horses that are adjustable for height are made by attaching heavy legs to the top beam, which is considerably wider than in the case of a conventional work horse. The top piece has two square holes cut in it, and two sliding pieces which support the top piece of the adjustable member have holes bored in them at intervals. Metal pins slipped in the holes hold the top piece at the desired height. By placing two planks across two of these horses an adjustable platform is made.—Charles H. Willey, Concord, N. H.

Editorial Observation

Good Work

THE work which the War Service Committee of the National Automobile Dealers' Association is doing is good work. This applies particularly to the movement to close service stations and repairshops at night and on Sunday—a movement, by the way, which is spreading rapidly and which gives promise of continuing its spread all over the country. St. Louis started the ball rolling and this week we have reports of Louisville and Chicago following suit.

Any work which conserves man power in these troubled times and which moves in the direction of a form of reorganization which eventually will simplify the work of those who are left to do it can be looked upon as a good work. And it is these two things that the plan of the War Service Committee will accomplish.

In the light of the experience of those who have tried both the new way and the old, it has been nothing but sinful waste and the worst kind of poor efficiency and economy for the majority of dealers to maintain night and Sunday forces of highly paid men to do a lot of jobs which in many cases were mythical, and in others were of such a simple nature that they could generally be taken care of by the owner himself, under the duress of necessity, or at least by much cheaper and less skillful men.

The move to eliminate this waste is a move in the right direction. It is recognition of the need for higher efficiency, for the cutting out of a lot of needless duplication of effort.

Under the new plan, John Smith, motorist, knows that he cannot get a cotter pin inserted at night, or on Sunday, unless it is absolutely necessary; that he cannot get it done for nothing or for a cigar; and that there are only certain specified places in the city where he can get the job done at all, and then only at an expense to him in proportion to the time it takes for the work and the worth of the parts.

Which is good, and as it should be. The general adoption of this plan will mean a very considerable reduction in the overhead of every dealer who becomes a party to it. It will mean the elimination of light, telephone, clerical and labor expense for which the return has always been a matter of question, and will substitute therefore a holeproof system.

Not the least important of the advantages of the plan will be the effect on the car owner. He will, perforce, learn self-reliance; he will do a lot of things himself that he never thought of doing before and for which the dealer in all probability never received adequate, if any, return; and he will learn to have his jobs done during daylight hours, when they ought to be done in the interests of the best service; and last, but not least, the mechanic will get his one day off in seven.

What city will be next in line for such a clean-up of petty troubles?

Harvest Help

WE have heard reiterated so often "Food will win the war" that perhaps some of the significance of the statement may have escaped us. Those who are high in authority assure us of its truth, but they don't always tell us exactly how to apply it to ourselves or our businesses.

It means more than saving food. It means producing more food—not necessarily digging a war garden in the back yard, though this will help mightily; but so arranging our lives that every ounce of man power can be utilized in food production.

Take the case of the States of Kansas and Nebraska. Reports indicate that 36,000 men are needed for the harvesting of the crops. A certain percentage of these men must be skilled in the work; but a large percentage need not be skilled, for this percentage will work under the direction of the skilled men. In other words, it is entirely feasible and quite practicable to take a man out of a repairshop and set him to harvesting grain.

But there is another angle to the situation that must not be overlooked. *If taking that man out of the repairshop and putting him into the fields is going to hold up work on a passenger car, a truck or a tractor—work that ought to be done with the greatest dispatch—then it is wrong to let the man go.* For though he may do the work of one man in the field, he might make it possible for a dozen men to work there by putting a car, a truck or a tractor in condition to transport labor or materials.

Letters from Readers

THIS page is for the use of MOTOR WORLD readers with something to say. Letters on subjects of interest to dealers, garagemen, repairmen and jobbers are always welcome.—EDITOR.

Mr. Richard, Attention

Editor Motor World: It has probably been nearly 3 years since I have written anything for your columns, and while I have felt myself too busy to write I have not been too busy to read, and after reading the article by Mr. Richard of Toledo in your issue of May 1 I am unable to refrain from making a reply.

If Mr. Richard were in Des Moines he would soon see that automobile mechanics were scarce regardless of salary. The shops here are getting 90 cents or $1 per hour, and some even more for machine work, etc., but when it comes to hiring a man of experience at $20 to $25 per week we haven't any. Twenty-five dollars is the minimum for any one who claims to have had experience, and if he is any good he is getting better than $30.

Suppose the shop does employ 5 men. If Mr. Richard were keeping the books in the office he would soon see that a 5-man shop cannot pay the owner a salary and live, on his suggestion that it brings the owner in $500 per month, and that to offset that they claim a high rent, etc., but the storage usually takes care of the rent.

Making Ends Meet

My 18 months trying to make ends meet in a large garage as floor floorman, storing about fifty cars regular and a large amount of tourists, showed me that had we not had a repairshop to charge up some of our storage to we could not have paid our rent, paid the help and kept up expenses; stop to think how much storage it takes to pay the necessary men to look after it regardless of the number of cars stored.

Mr. Richard suggests that some shops charge the customer for more time than was actually worked on their car. *I am going to suggest here that if I knew I was working for a shop that would do this I would be looking for another place right away, because I would not expect this shop to be in business long enough to pay me to waste my time with them.* My experience in the office end of it is that we never, on big jobs, get all the time that is actually worked, from the fact that there are so many times that some mechanic makes a mistake that costs several hours to correct, which while it is really no one's fault, the owner, if he gets next to it, does not want to pay for that time, and you either give him something in the settlement or lose a customer and probably make a knocker on your place.

As to the inducements to start in the automobile mechanic line—to my notion there is nothing for a man who really wants to do some good in the world that affords more of an inducement than the automobile mechanical line.

We certainly are human enough to want to do things for people that they will appreciate. Then think of the automobile owner who knows little about the mechanical construction of his car; some little thing goes wrong; he rushes to a garage in a hurry; has promised to be at a certain place 15 miles away in 2 hours, and the car has gone bad just at a critical moment; he fears he will miss his promise; it is important; what will he do?

You simply turn her over, find in a minute that she is not getting gas, the line is choked; you fix him up in 20 minutes and send him on his way rejoicing. You are the best fellow he ever met, and he would not allow any other mechanic in the town to work on his car if he could get you. Can you picture anything that would give you more enjoyment in any line?

I have had several lines, and I am free to confess that while I am not an automobile mechanic, I have been around machines and close enough to the business long enough, so I have a number of men that feel that way toward me. It is as fascinating as railroad life 20 years ago. If a man works at the mechanic trade with such an object as this in view he cannot help but appreciate his position.

Sure you will have a few cranks that do not appreciate anything, but forget them.

As to charging a man as much per hour for greasing his car as for overhauling his magneto, I have never been employed in a shop where we did this, and unless the work is done by a high-priced man, the charge should not be at the high rate. This, however, is a small item.

I want to enumerate a few of the things that come to my mind that a garage owner has to take care of with reference to expenses, since only rent has been mentioned: (1) Fire insurance; (2) employers' liability insurance: (3) tornado insurance; (4) protection insurance against loss from accounts you have against cars that might be in your shop and get damaged in a fire; (5) taxes on stock and possibly on the building or ground it stands on in addition to your rent; (6) adjustments of accounts—what you give the customer to make him feel right over errors that are bound to get in; (7) letter heads, envelopes, stamps; (8) technical books, trade magazines; (9) special tools; (10) typewriter ribbons, care of typewriter and adding machine; (11) water, gas, electric current; (12) donations, other than patriotic or Red Cross. While these, of course, cost we are not counting them. And no one knows how much more unless he reviewed his books.

I am not trying to say that there is no money in the business, but I do say that automobile mechanics are scarce regardless of wages paid, and that the business must be economically and properly managed if the owner makes any money.—N. T. Miller, 601 Eighth Street, Des Moines, Iowa.

Simple form of time card for use of mechanics

Simple Time Card

Editor Motor World: I am inclosing one of our time cards to see what you think of it. We have one for each job each day.

If the man starts on a job at 7:15 he checks in on that time; then at 10:15 he goes on another job and checks out on one slip and in on another slip and so on.

Then he checks after the part he works on, as brakes and steering gear. These slips are all right, we find, as they give the time and what the time was put on without much trouble. What do you think of them? I thought they might help some other fellow.—M. B. Spooner, Hebron Garage, Hebron, Ill.

Thank you ever so much for your

Digitized by Google

thoughtfulness in sending us the time card which came with your letter.

This seems an altogether simple and very useful way of keeping track of the time of mechanics and workmen, and we are very glad to have it for the further information of readers of Motor World.

Write us once in a while and let us know how things are going. We always like to have letters from our subscribers.

Applauds Optimism

Editor Motor World: When Mr. Ralph and Mr. Beckwith called on me a couple of weeks ago we were very pleased to write a contract for Hill-Smith Metal Goods Co. for some advertising in Motor World and Horseless Age.

When I discussed with Mr. Greene, advertising manager for the Hill-Smith company, the question of adding Motor World to our list of trade publications, he agreed with me that of all the motor magazines we had been reading purporting to aid the dealer with sound merchandising advice the only one of the bunch that hit the nail on the head in any constructive way was Motor World.

I consider that Motor World's editorials are considerably worth while, and if for no other reason than that the tone of your publication will instill into the dealer a cheerful optimism and good courage we should advertise with you to help along the good work.—Yours very truly, Wood, Putnam & Wood Co., Boston, S. M. Fisher, Production Department.

Used Car Figures

Editor Motor World: On page 31 of your issue of April 24, 1918, I am unable to follow your figures under paragraph 4.

My copy says "to the $685 add $40, which gives $869." You use this $869 again in paragraph 7, and there seems to be a mistake somewhere. When I add 685 and 40 I get 725. I shall appreciate a correction.—Sincerely, C. B. Hoadley. Magnesco Refractory Products Co., Los Angeles, Cal.

You are quite right in your letter of May 20 in assuming that there is an error in the explanation under the used-car chart on page 31 of our issue of April 24.

In paragraph 4 it should say "40 per cent instead of $40." This would give you $274 to add to your $685.

But even then the explanation isn't correct because we find on refiguring it that 40 per cent of $685 it $274, and $685 plus $274 is $959; $959 should therefore be used all the way through the remainder of this story in the place of $869. When this figure is substituted the explanation is correct.

Subtracting the $110 that it will cost to fix up the car from $959 gives $849 and not $659.

Stop Car Stealing

Editor Motor World: For some time I have been contemplating taking up, through the medium of your valuable magazine, the subject of starting a campaign, or crusade, for the purpose of creating a public opinion favorable to the enactment of a law that would eliminate, to a large extent, the stealing of automobiles, which is now so prevalent.

I have an idea, which I believe, if laws could be enacted, would practically put a stop to this, and my plan is this: Whenever a dealer sells an automobile which, in every instance, calls for the securing of a new state license, that a law be enacted requiring him to apply at the same time (for the purchaser) for an identification card, this card to contain the photograph of the purchaser, the state under which the license is issued, when it expires, make of car, license number, engine number, name and address of the purchaser, his signature and the signature of the secretary of state.

On the reverse side of this card will appear a form of bill of sale, this to be filled out by the seller on the re-sale of the car, and to contain the following information:

Name of city, date line, name and address of seller, and statement that he is the lawful and rightful owner of the car, that he is selling and conveying same to the party, giving name and address, license number, engine number, make of car, his signature, which must be executed in the presence of witnesses.

This card is to become the property of the purchaser of the car and to be returned to the secretary of state, together with application for a new license number, with photograph of the new purchaser and new identification card issued, the old card to be retained as a matter of record in the office of the secretary of state.

A plan such as this would practically eliminate the question of automobile stealing because, should a man attempt to forge the card, which could easily enough be done, and it should develop that the car had been stolen, which will be determined immediately upon return of the old card to the secretary of state, you will then have the best evidence against the seller, as you will have his signature, executed in the presence of witnesses, and you also have his photograph, and it certainly would make it difficult for him to get away with it.

If you have grasped my idea and would start an agitation along that line, especially with the American Automobile Association, steps might be taken by which similar legislation might be brought before the respective legislatures in different states.

Thanking you and hoping that you will find it to your advantage to do this, I am, yours very truly, C. E. Larson, Marvel Machinery Co., Minneapolis.

Dear Mr. Larson: It is indeed essential that something be done to check the entirely too numerous thefts of motor cars.

It is a subject that is being given attention by different sources, and it is possible that eventually some plan may be worked out.

The secretaries of the different states have an association of secretaries of state, and they are considering a uniform anti-theft automobile law. This will provide for the more accurate registration of cars, and will furnish identification records somewhat along the same lines as you recommend, although our impression is that there is nothing in this regarding photographing.

The status of this law at present is that it has been considered by the association of secretaries of state, and a draft of the bill has been prepared by the secretary of state of Kansas. This draft is to be passed upon by the remainder of the secretaries at a future meeting, and if it meets with their approval steps will be taken to put the law into force in all the different states. The proposed law has been endorsed by the National Automobile Dealers' Association.

Motor World Helps the Government

Editor Motor World: We have received a copy of the Motor World for March 27, and have noted with a very great deal of grateful pleasure the splendid amount and quality of space given the Liberty Loan by the Motor World, and the great amount and fine quality of advertising space given the loan by certain of your advertisers.

We want to assure you, and we want you to assure your patriotic advertisers, of the very sincere and cordial appreciation of the Treasury Department for this patriotic and effective co-operation and assistance.—Very sincerely yours, Frank R. Wilson, Director of Publicity.

Ten Hours a Day for Harvesters

SALINA, KAN., June 8—Ten hours will constitute a day's work in the Kansas wheat fields and the standard wage scale will be 45 cents an hour, with no extra pay for overtime, according to a decision reached by the Kansas wheat growers in session here. One hundred and fifty representatives were present from twenty-six counties.

No Licenses for Truck Makers

WASHINGTON, June 8—A definite ruling by the Department of Agriculture states that companies manufacturing tractors for farm use will be required to take out licenses under the recent presidential proclamation. Motor truck and trailer manufacturers will not, for the immediate present, be expected to take out licenses. These rulings definitely confirm the report published in the last issue of Motor World.

Gilbreath A. A. A. Michigan Chief

DETROIT, June 8—Captain W. S. Gilbreath, manager of the Detroit Automobile Club, has been appointed Michigan representative of the contest board of the American Automobile Association, succeeding W. D. Edenburn, who has directed Michigan races sanctioned by the A. A. A. since 1915.

Sanders County Motor Co.....Wahoo, Neb.

EAST

George Leghorn, Boston, Hupmobile dealer, has taken on the Standard truck.

Bowen, Sanders & Dunbar, Boston, has added the Vim.

C. S. Ransom, Boston, has added the Maccar truck.

C. S. Henshaw, Boston, Dodge Brothers dealer, has added the Graham unit.

The Merchants Motors, Boston, has taken on the Acason truck.

The Signal Truck Co., Boston, has added the Clydesdale.

The Liberty Street Garage, Newburg, N. Y., has added the Koehler truck.

The American Taximeter Co., Fifty-seventh Street and Broadway, New York, has moved to larger offices and salesrooms at 16 West Sixty-first Street.

The Prudential Tire Service, Inc., has opened a salesroom at 121 East Avenue, Rochester.

The Columbia Tire Co. has opened a salesroom at 189 East Avenue, Rochester.

The Terwilliger Equipment Co., Philadelphia, has added the Koehler truck.

MIDDLE WEST

R. M. Morgan, Galesburg, Ill., has sold his garage, "The Square," to M. J. Babbitt, Abingdon.

V. O. Coggins, Hopedale, Ill., has sold his garage to C. D. Crawford.

The Mackemer Co., Peoria, Ill., has purchased the Ford agency of the Dickerson-Lehmann Co. The latter company will hereafter handle only the Oldsmobile.

W. N. Gobel has opened a tire shop in Blissfield, Mich.

The Acme Truck Sales Co. has opened salesrooms in Grand Rapids. W. F. Martin is manager.

Amos Gezon, for several years a partner in the Chandler Motor Car Agency, Grand Rapids, has purchased the interests of his associates and with Clark Raymond will continue the business at the present location.

S. A. Dwight has been appointed agent for the Crow-Elkhart car in Grand Rapids.

George B. and Virginia McQuellan have taken the sales agency for the Detroit Electric in Jackson, Mich.

W. J. Chisholm, Mount Clemens, Mich., has purchased his partner's interest in Chisholm & Miller and will continue the Dodge Brothers agency and accessory business in the same location.

Martin Steger, Monroe, Mich., and J. C. Strickland, Cleveland, have purchased the interests of Fred Neid and Louis Laprad in the Monroe Implement and Tractor Co. at 134 East Front Street, Monroe.

Manley-Thompson Co., Tacoma, Mich., has moved to its new building. On the lower floor of the building are show rooms, offices and stock department. The second floor is equipped as a shop and service department. On the top floor are the storage and used-car departments.

The Schumann Motor Co., Menominee Falls, Wis., Ford dealer, has sold its branch at Cedarburg, Wis., together with the Ford agency, to John Lauterbach, who has been manager of the branch. The company will sell the Fordson tractor.

The Ph. Gross Hardware & Supply Co., 216 Third Street, Milwaukee, jobber and retailer of accessories and supplies, on May 27 celebrated its fiftieth anniversary. The business was founded in 1868 by Philip Gross, who now is 82 years old, but is still active in the management.

Herman A. Netter, head of the Netter, Heiser Co., 704 Grand Avenue, Milwaukee, Ford dealer, has been appointed Milwaukee and Racine County distributer of the Fordson tractor, and will conduct the business under the style H. A. Netter & Co.

F. A. Goold, Montfort, Wis., has sold his garage and repairshop to Albert Dahl and Frank Reinke, who will conduct it under

Digitized by Google

the style Dahl & Reinke. Mr. Goold will take charge of the welding and tire repair departments and deal in specialties for Fords.

PACIFIC COAST

The Hollywood Auto Electric Co., Hollywood, Cal., has moved to a new building.

C. N. Bank, Hollywood, Cal., has installed a Hobbs battery service station.

The Tire Construction Co. has opened a branch at 629 State Street, Los Angeles.

The California Garage, Oxnard, Cal., has been purchased by L. C. Drake, formerly in charge of the Ford Service Station.

The Oxnard Vulcanizing Co., Oxnard, Cal., has remodeled and enlarged its building.

Herbert Hedges, Oxnard, Cal., operating the Willard Storage Battery Service Station, has erected a new building on A Street.

The Oxnard Implement Co., Oxnard, Cal., has added a tire department and will specialize in tractor service.

The Leach-Frawley Co. has moved from Geary Street to the building formerly occupied by the Cole Agency on Van Ness Avenue, San Francisco.

The San Francisco Tire Co. has remodeled and enlarged its salesrooms at 640 Van Ness Avenue, San Francisco.

The Over There Tire Co. has opened salesrooms at Turk Street and Van Ness Avenue, San Francisco.

The Bearings Service Co., San Francisco, has moved to new quarters on Van Ness Avenue.

C. H. Stone has opened a vulcanizing plant at 317 Van Ness Avenue, San Francisco, and will distribute United States tires.

The Pacific Pipe & Supply Co. has opened salesrooms at 706 Van Ness Avenue, San Francisco, for De Leon tires and Palmer tubes.

S. W. Piercy has purchased the vulcanizing plant at 418 Golden Gate Avenue, San Francisco, and will conduct it under the style Piercy Tire Co.

A. Ketchel has purchased the interest of J. W. O'Bryant in the Ellis Auto Repair Shop, San Francisco.

Kahn & Keville have moved to 982 Post Street, San Francisco, and have added an Eveready Storage Battery service station and salesroom.

T. S. McCheseney has opened a branch store for the Tire Construction Co. of Los Angeles at 629 State Street, Santa Barbara.

The Modern Vulcanizing Co. has moved to new and larger quarters on Higuera Street, San Luis Obispo, Cal.

The San Luis Auto Electric Works, San Luis Obispo, Cal., has moved to new quarters on Higuera Street.

J. A. Milne has moved from Los Angeles to Santa Barbara and will operate a vulcanizing shop and Federal tire salesroom on West Corilla Street.

Charlesworth Brothers have opened tractor salesrooms in Santa Barbara.

Harold L. Arnold has opened branch salesrooms at 1129 State Street, Santa Barbara, for Hudson and Maxwell cars.

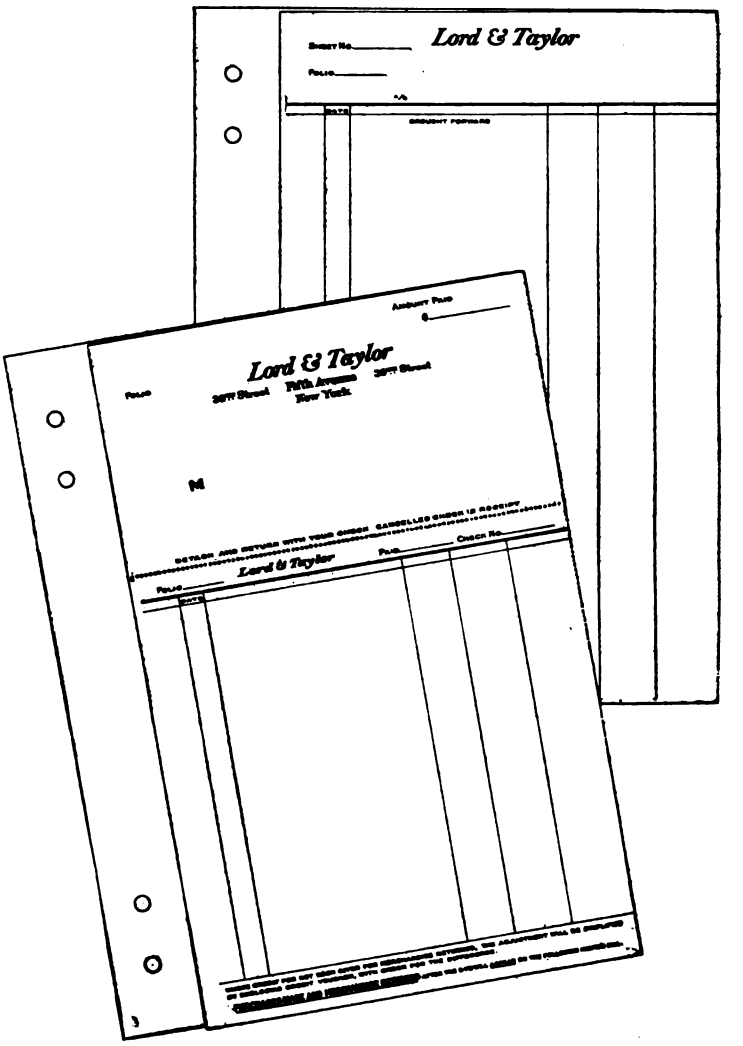
M. A. Durkee, Nash and Cadillac dealer, has moved to a new building at 302 State Street, Santa Barbara.

William Elliott has purchased the business of the California Rubber Co., Santa Barbara.

Wood's Garage, Santa Barbara, has added a department for tractor service. H. Wood, Jr., has secured the agency for the Sandusky tractor.

Freeze & Freeze, automobile accessory dealers in Santa Barbara, have added vulcanizing equipment.

O. L. Petzel, recently appointed Ventura county distributer for the Chandler, has opened salesrooms in Magby's Garage, Ventura, Cal.



The Hutchinson Motor Exchange, formerly of Winfield, Kan., has moved to Oxnard, Cal., and has leased a new building for salesroom and service station for the Overland line and G. M. C. trucks.

The White Garage, Ventura, Cal., has been purchased by P. M. Ranger.

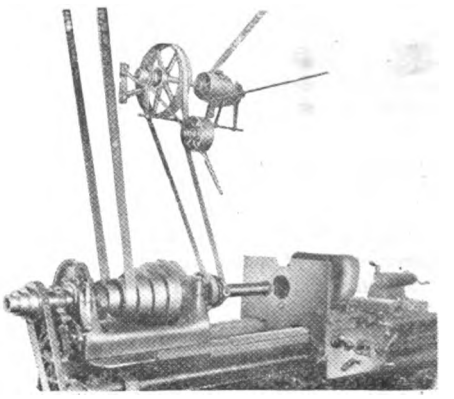
New Garages

El Camino Real Motor Car Co. Garage (addition).....San Francisco
The People's Service Station San Luis Obispo, Cal.

Charles S. Pike has been appointed sales manager of the new truck division of the Paige-Detroit Motor Car Co. He came to the company from the Burroughs Adding Machine Co., Detroit, 2 years ago to take charge of sales promotion of passenger cars when a department for this work was organized.

WITH a 3-cent postage rate it is more than ever desirable to minimize the amount of money spent on postage. The necessity and the expense of sending out receipted bills may be almost eliminated by the simple device used by Lord & Taylor, one of the largest department stores in New York.

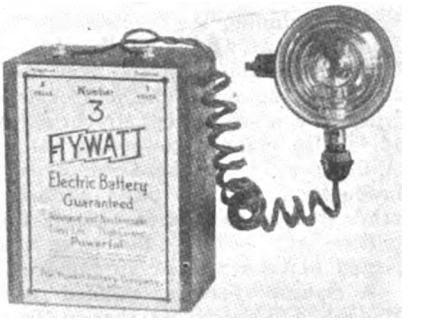
The original of the bill is perforated and there is a request on the upper half: "Detach and return with your check; cancelled check is receipt." The customer keeps the remainder of the bill as his record. This bill is made out in duplicate, the original being filed in a binder as indicated by the punched holes.



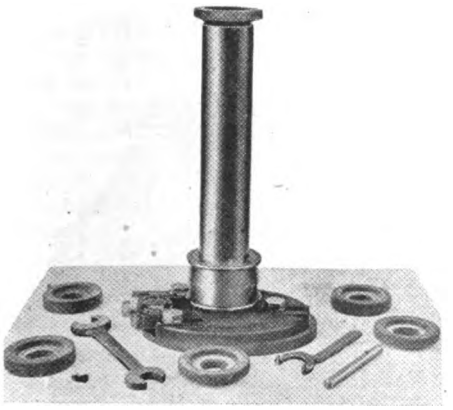
Where a customer insists upon a receipt, the lower half of the bill is signed and returned and the upper half is retained for a cash voucher and for posting purposes. The other form is used as a second sheet where the items of a bill are too numerous to be contained entirely on the first sheet.

Digitized by Google

Accessories

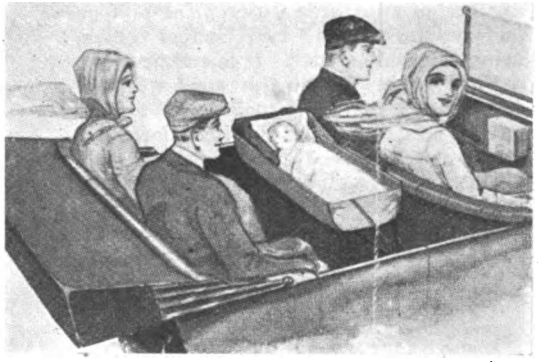


ACME CYLINDER GRINDER

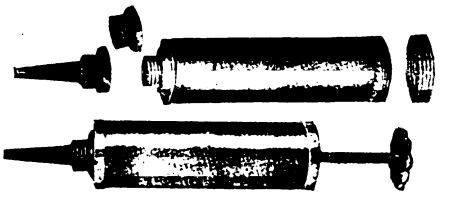


A complete cylinder grinding outfit to be attached to a lathe and so designed that the cylinder block is clamped to the angle plate on the rest and the grinding wheel is mounted on a special face plate eccentrically so that the spindle of the wheel travels around in a circle. The eccentricity of the spindle determines the size the cylinder is ground to and this is adjusted by a micrometer screw and index. A separate countershaft with idler pulley is used for the grinding wheel. Made in two models. Model A will grind cylinders from 2⅞ in. up and any length up to 12 in. Model B is specially made for motorcycle cylinders and will grind from 2½ in. bore up, and any length up to 9 in. Model A sells for $165 complete with angle plate and countershaft. Deductions for these are allowed if not wanted.—Continental Grinder Co., Minneapolis.

HY-WATT TAIL LIGHTING OUTFIT

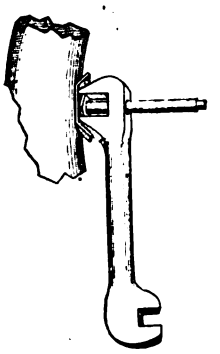


A tail-light outfit for trucks, Fords and other vehicles, consisting of a Hy-Watt battery, tail lamp which can be furnished in different styles and types to show either a red or a white light, and the connecting wires between the battery and the lamp. The battery being waterproof, does not have to be protected from rain. Price of complete outfit, $3.25.—Hy-Watt Battery Company, Cleveland.



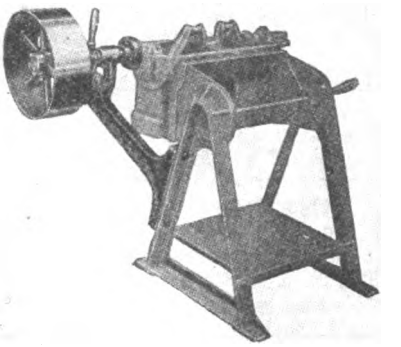
BABY CARRIER

A baby carrier which is hung over the back of the front seat of the car. When not in use it can be folded. Fits any model touring car. Made in 32, 36 and 42-in. lengths, the 32-in. size selling for $8 and the others for $9.—C. A. Hamilton, 250 West Fifty-fourth Street, New York City.



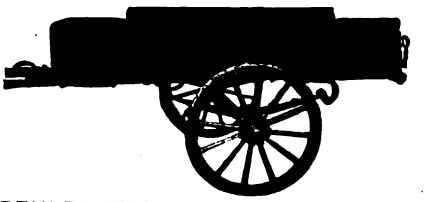
SHIELDS GREASE INJECTOR

A grease gun which is loaded by inserting a cartridge containing 1½ lb. of grease. The cartridges fit inside the gun and the containers are made of a material that will not allow the grease to come through; the cartridge is clean to handle. The injector is made of steel, finished in black enamel with nickel-plated ends and handle. The screw has a square thread. Price $2.50 for the injector and 40 cents each for the cartridges filled with grease.—Wheless-Wilson Auto Supply Company, Shreveport, La.



PERFECT VALVE WRENCH

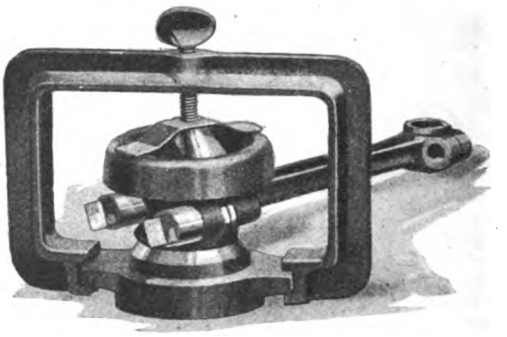
This little wrench has been developed for the vulcanizer or tire repairshop and is for the removal and replacement of the entire valve. The wrench is milled out of cold-rolled steel and case hardened; it is 6¾ in. long and fits both standard sizes. List price $1.25.—Lewson Mfg. Co., Portland, Me.



ECO ENGINE STAND

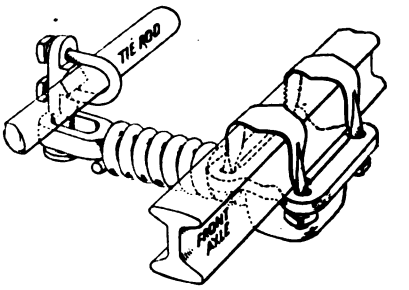
The Eco engine stand is made only for Ford engines and will hold the engine in any position for overhaul work. It is made of cast iron and steel finished in dull enamel and weighs 50 lb. There is a power attachment for running in the bearings, which is supplied complete with a pulley for belting to line shafting. Price of complete outfit, $35; power attachment alone, $15.—Western Mfg Co., Oskaloosa, Iowa.

Digitized by Google



BEHLEN TYPE A TRAILER

A two-wheel trailer of 800 lb. capacity with circle front body, artillery wheels, solid tires and semi-elliptic springs with five leaves. It is fitted with the Behlen quick-hitch universal draw bar. Wheels have ball bearings. Price $150.—Charles Behlen Sons Co., Vine and Fifteenth Streets, Cincinnati.

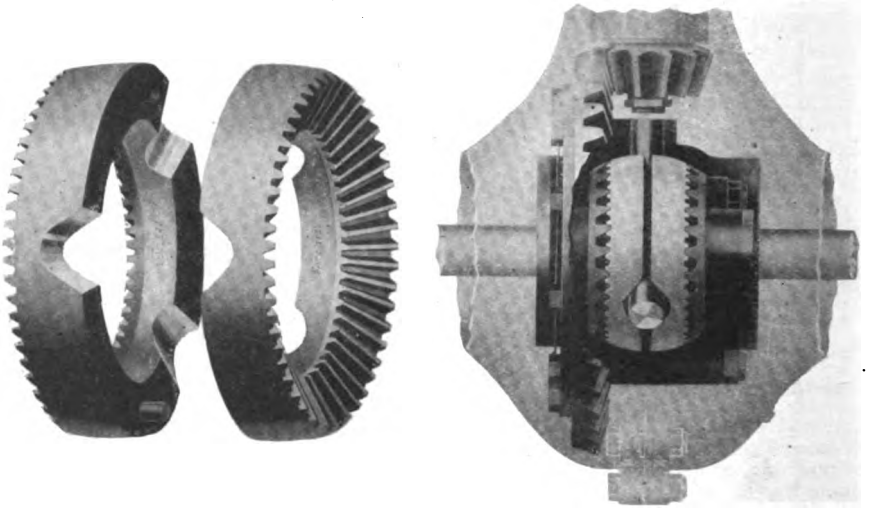


BABBITTER FOR FORD RODS

A complete outfit for rebabbitting the connecting rod bearings of Ford engines. The equipment consists of a small machine into which the connecting rod is clamped. The babbitt metal is cast to exactly the proper size to fit the crankshaft and the job is accurate to within .001 in. Four connecting rods can be babbitted per hour. A slightly larger size is made and sold with complete equipment for rebabbitting the bearings in any engine. — Burlington Machine Works, Burlington, Iowa.

D & O ANTI-WOBBLER FOR FORDS

A spring-operated device to bring the front wheels of Fords back to a straight-ahead position after turning and to prevent wobbling of the steering wheels on rough roads. A spring arm is attached to a pivot, the base of which is clamped over the front axle, and the end of the arm engages a lug clamped on the tie rod. A slot in the end of the arm allows for variation of distance between the axle and tie rod as the rod moves from side to side. Put on with bolts through the clamps and no drilling or machine work required. Price $4.50.—G. H. Dyer Co., Cambridge, Mass.



Badger "Two-Wheel-Drive" Differential

The Lewis Differential Co. of Milwaukee is beginning the manufacture of the Badger "two-wheel-drive" differential. This differential is of the type designed to obviate spinning and loss of traction when one wheel is on slippery ground. It is also claimed to prevent skidding. A differential for the Ford car will be produced first, and sizes suitable for other cars as fast as manufacturing facilities will permit. Six sizes are expected to take care of all requirements.

A special feature claimed for the Badger differential is that it is much simpler to install than similar devices that have been placed upon the market previously. To install it in the Ford car, for instance, requires only the taking out of the three differential pinions and putting in the two Badger gears, using the same spider. It is claimed that a Ford owner can do the work with his regular set of Ford tools, and that a garageman can make the installation in two to three hours.

The principle of operation may be understood by reference to the illustration. It will be seen that the Badger gear set consists of two gear rings which are placed back to back, each of which has three slots of peculiar form cut in its back edge. The walls of these slots serve as face cam surfaces, engaging with the driving pins of the differential. The inclination of the cam surfaces is such that motion can be transmitted through them in one direction only. In turning corners, of course, all of the power is transmitted through the inside wheel.

The Badger gear rings and a differential in which they are installed

Investigate Alcohol-Gasoline Blends

NEW YORK, June 8—With a view to gathering statistics and other information which will be of value in exploiting the use of mixtures and blends of alcohol and gasoline for use in internal combustion engines of every type, the National Automobile Chamber of Commerce is instituting a series of investigations. It is at present gathering data on processes of manufacturing alcohol and on the cost of production. Investigations are also being made to ascertain whether the distilleries and breweries of the country are disposed to go into the production of alcohol on a large scale.

The N. A. C. C. states that alcohol can be blended with gasoline to produce a suitable fuel that will avoid the difficulties of starting a cold engine on alcohol alone and without any change in the carbureter or the compression of the engine. At the present time practically all automobiles in Norway and Sweden are operating on alcohol made from waste from sulphite liquor from paper pulp mills.

Do You Want Farm Work?

WASHINGTON, June 10—Western harvest cutting will start about a week earlier than last year, and will require 36,000 men from outside sources. Six thousand men will be needed for Oklahoma and 30,000 for Kansas. The United States Employment Service is in charge of the situation.

Wages in the main wheat belt are $3.50 per day, with board, to harvest hands in Oklahoma, and $4 to $5 per day, with board, to harvest hands in Kansas. Stackers will receive higher wages. There is a movement on foot to pay the men by the hour, with wages running from 40 cents to 50 cents per hour, with board.

Any one desiring to secure farm work can apply at any of the offices of the United States Employment Service, located in nearly every city in the country.

Wolverine Planning New Model

SAGINAW, MICH., June 10—The Wolverine Tractor Co. is formulating plans to manufacture a four-wheel drive machine with a track-layer attachment. Production is expected to begin in September.

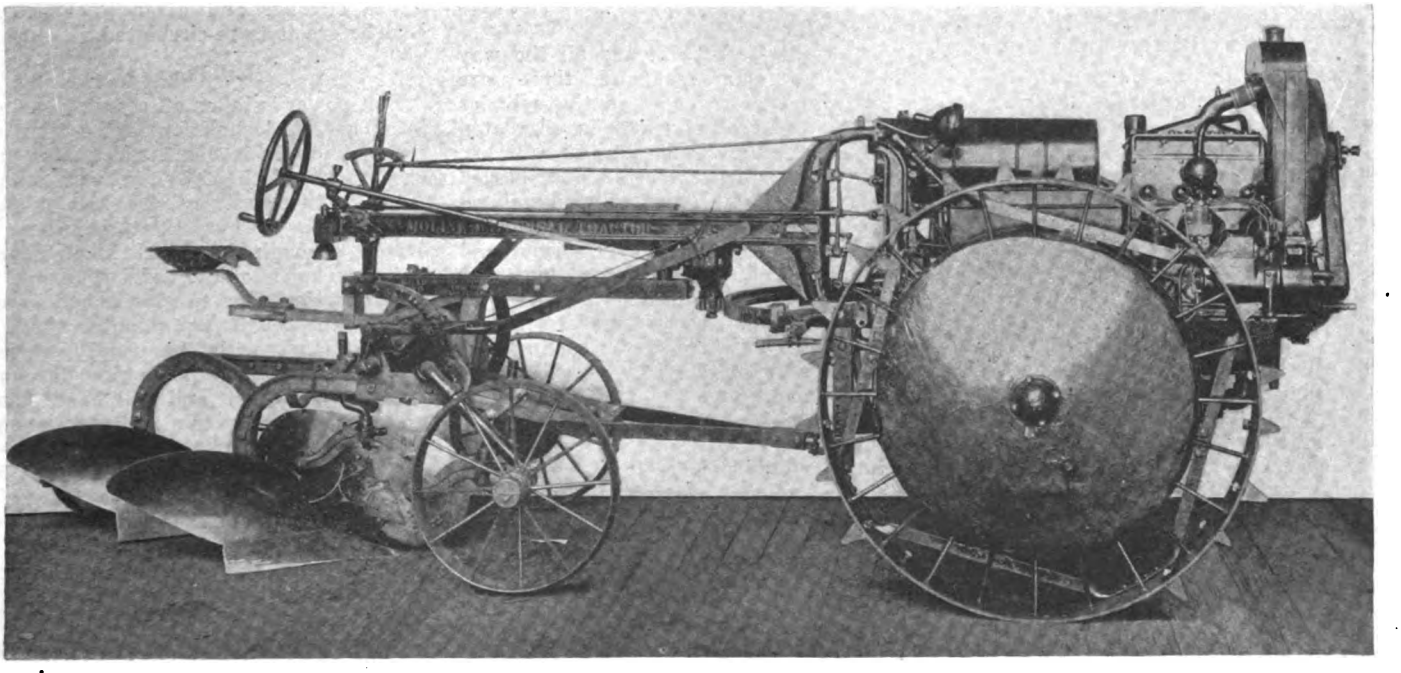
Moline Develops Four-Cylinder Tractor

Model D Has New Valve-in-Head Engine and Electric Starting, Lighting and Engine Governing System

EVEN at this early date there is a good deal of "sameness" in motor tractor design. Most tractors are of the four-wheel drive, and making an exception of the final drive the general arrangement of parts is very much alike on all of them. But the Moline Universal tractor is a type apart bristling with points of originality. The Universal tractor has been on the market now for nearly two years. Its most characteristic feature is that it has only two wheels and that the operator sits on the implement which is being pulled, from which he controls the tractor.

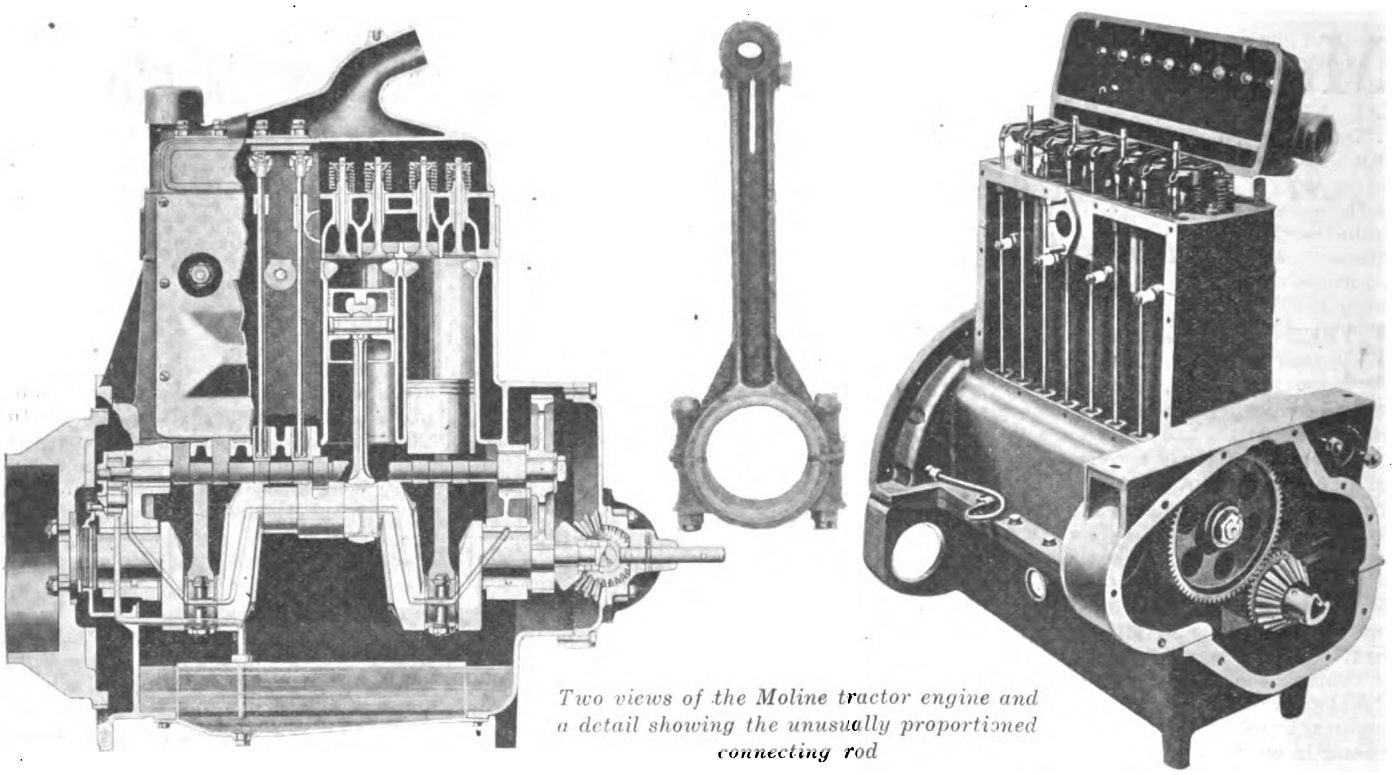
A two-wheeled tractor possesses one important inherent advantage over a tractor in which the weight is distributed over a greater number of wheels. In connection with tractor design the statement is often made that there is no object in trying to save weight, as you need weight to secure traction. Well, only the weight supported by the drivers counts, and if 98 per cent of the weight of the tractor can be made available for traction, instead of the usual percentage of about 70, then the weight of the tractor can rationally be reduced by such expedients as the use of alloy steel in all shafting without fear of lack of traction under different conditions. A saving in tractor weight means a saving in power and, consequently, a gain in fuel efficiency.



The engine of the Model D is of the company's own design and manufacture. It is of the four-cylinder type with valve-in-head cylinders, of 3.5-in. bore and 5-in. stroke. There are only two main bearings on the crankshaft, which is of unusually large dimensions. The cylinders are cast in a block, together with the upper half of the crankcase, while the cylinder heads form a separate casting.

The crankshaft is of exceptionally rugged construction, all bearings being 2½ in. in diameter. The object in using the two bearing type of crankshaft is to make the engine as compact as possible lengthwise. It is claimed that, owing to the large size of the bearings, there is very seldom need for adjustment of same, and when adjustment is required it can be easily made. The combined length of the two main bearings is 5⅞ in.

Pistons are of cast iron, with the usual ribs between the piston bosses and the piston head. The connecting rods are I-section drop forgings, and are of unusual appearance, owing to the large size of the heads. The upper end of the rod is clamped tight to the wrist pin, which latter has its bearings in the piston bosses. The crankpin bearings are bronze backed nickel babbitt bearings, and they can be taken up by merely removing the bottom plate of the crankcase. The connecting-rod caps are held in place by means of alloy steel bolts with castellated nuts. The piston pins are also made of alloy steel and are ground to size. They bear directly on the cast iron of the piston bosses. For this feature the advantage is claimed that more efficient lubrication can be obtained than if there were a bearing in the connecting-rod end, besides which the bearing surface is about 50 per cent larger. The pistons are light in weight, and are all equalized so as to reduce vibration to a minimum.



A one piece drop forged steel camshaft, 1½ in. in diameter, is used. All of the cams are forged integral with the shaft, are hardened and ground to shape, and the shaft is supported in three bearings. The camshaft gears are of wide face, and are cut with helical teeth to insure quiet operation.

Considerable attention has been paid to the design of the valve gear. The valves themselves are made of a chrome-nickel alloy steel, and are surrounded by two coiled springs each. The use of double springs is a safety measure, as the breakage of a single spring will not prevent the engine from operating. It is also claimed that this arrangement of springs makes it possible to open and close the valves quickly, and still insure smooth seating of the valves. The Brush type of tappet lever is used, which has a self-lubricating spherical pivot support adjustable from outside the valve hous-

Four-cylinder Moline tractor with Moline two-bottom plow hitched to it

Digitized by Google

Two views of the Moline tractor engine and a detail showing the unusually proportioned connecting rod

ing. This tappet lever has arms of unequal length and multiplies the cam motion by two. The ball and socket joint of the rocker arm is both hardened and ground, and so arranged that the joint is full of oil at all times, thus insuring long life of the bearings. The valves have a clear diameter of 1¾ in., which is equal to one-half the cylinder bore.

Gasoline is the fuel used on Moline Universal tractors. The fuel supply is carried in a 15-gal. tank, cylindrical in form, which is located in a high position directly behind the engine. A Holly carbureter is used, which draws air through a new type Bennett air cleaner, to insure that all dust and grit are removed from the air before it enters the cylinders.

Remy Battery Used

Ignition is by the Remy battery system, which forms a part of the electrical equipment, all of which is of Remy make. The generator of this system, in addition to generating electric energy for charging a storage battery and operating the electric starter and lights, also serves as an engine governor. A Willard battery is used in connection with the electric system. The governor-generator is driven from the helical camshaft gearing.

It is claimed for this governor that it does not flutter or hunt, but works perfectly, governing the speed of the engine under varying loads on the belt and in the field. One point in respect to which the governor differs from the conventional flyball governor is that there is no one particular speed to which the engine is held, as by means of a control box underneath the steering wheel the speed of governing can be varied within wide limits. The battery is carried in a stamped steel, waterproof case, which is spring suspended to relieve it from sudden jars and shocks. As regards the lighting equipment, the tractor is provided with a movable headlight, which can be set in any position, and also with the lights on the control box in the rear, which illuminates the plow. All wires are carried in armored conduits, and the entire system is waterproof. The control box underneath the steering wheel contains a switch for controlling the ignition and the lights. By pushing the clutch lever forward, the starting motor is thrown into operation by means of a Bendix drive. Thermo-siphon circulation of the cooling water is employed. The water passages in the engine jackets and the radiator are of unusually large size. This system of cooling is said to have proven satisfactory under the most trying conditions.

The water-jecket extends all the way down the cylinders, and there are also large water spaces in the cylinder heads. The cooling water is circulated through a large Modine-Spirex radiator, in front of which there is a four-bladed fan mounted on Hyatt roller bearings. This fan is surrounded by a housing which increases its cooling efficiency and protects it against mechanical injury. It is driven by an inclosed endless woven belt, the tension of which may be readily adjusted. The whole of the cooling system has a capacity of 3 gal. The radiator is mounted on the forward part of the tractor, in a high position, where it is out of the dust, and it is protected from weeds and leaves by a heavy wire screen.

A full force oiling system is used, oil being forced under pressure to all crankshaft bearings. The oil pump is driven from the rear end of the camshaft, and forces oil under 35 lbs. per square inch pressure into the rear crankshaft bearing. The crankshaft is drilled out, as indicated in the sectional view of the engine, and through it oil is carried to the several crankpin bearings and to the forward main crankshaft bearing. A separate lead from the oil pump carries oil under pressure to the camshaft bearings. The pressure employed is higher than usual in force-feed systems, and it is claimed that all the crankshaft, connecting-rod and camshaft bearings float on a film of oil, so that it is impossible for the babbitt and steel to touch. The oil thrown off by the rapidly rotating crankshaft forms an oil mist, which lubricates all interior parts of the engine, the belt pulley drive gears, the camshaft gears and the entire valve mechanism. All excess oil returns to the base chamber, where it is strained through a large gauze strainer and given a chance to cool before it is re-circulated.

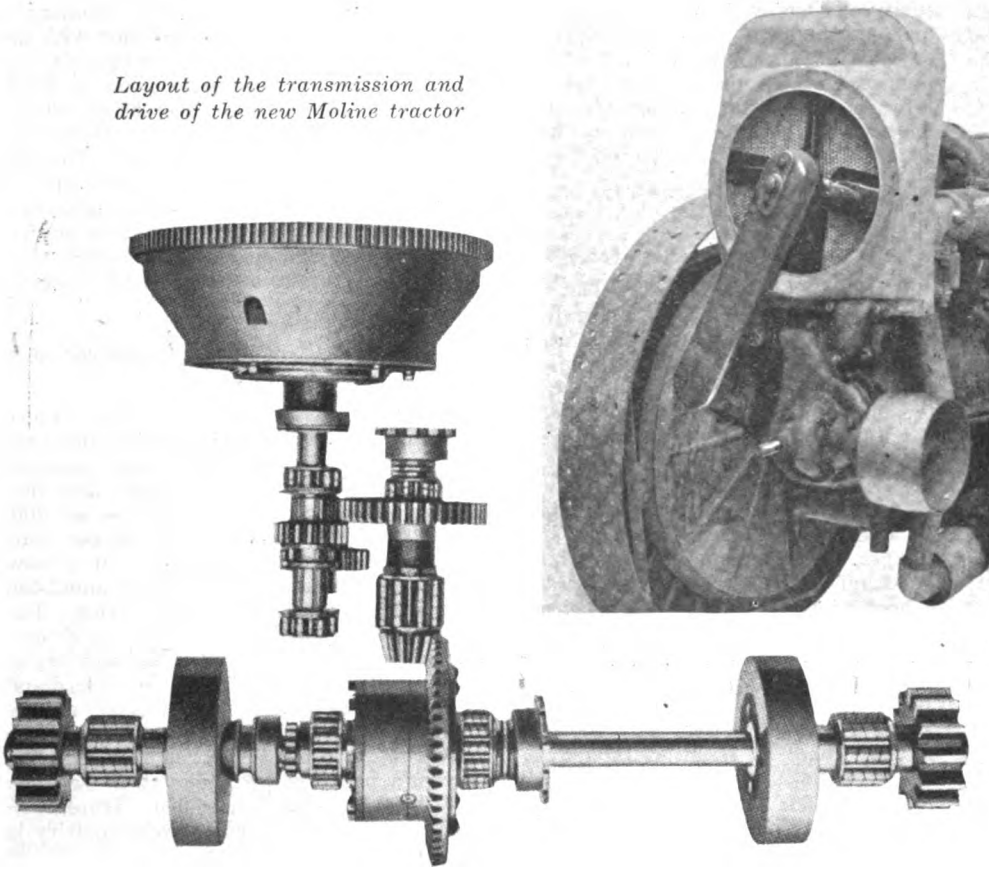
Belt Power

Belt power is taken off a pulley located in an accessible position in the front of the engine. It is 9 in. in diameter and has a face width of 6½ in. with ample crown. The shaft of the belt pulley, which is mounted on Hyatt bearings, is driven through hardened steel gears. This gearing is of the bevel type, and is so proportioned as to give a belt speed of 2500 to 3000 ft. per minute, which is in accordance with the usual practice. It is claimed that the engine develops 18 hp. on the belt, and will handle any farm machinery up to a 24-in grain separator.

A Borg & Beck dry-plate clutch is located in the flywheel. This clutch is well known to our readers, and need not be described here. The transmission is inclosed in a rigid, one-piece cast-iron housing, which holds all bearings in perfect alignment. All of the shafts in the transmission and final drive are splined. In fact, there are seven splined joints in the transmission, and one pinion is formed integral with the shaft.

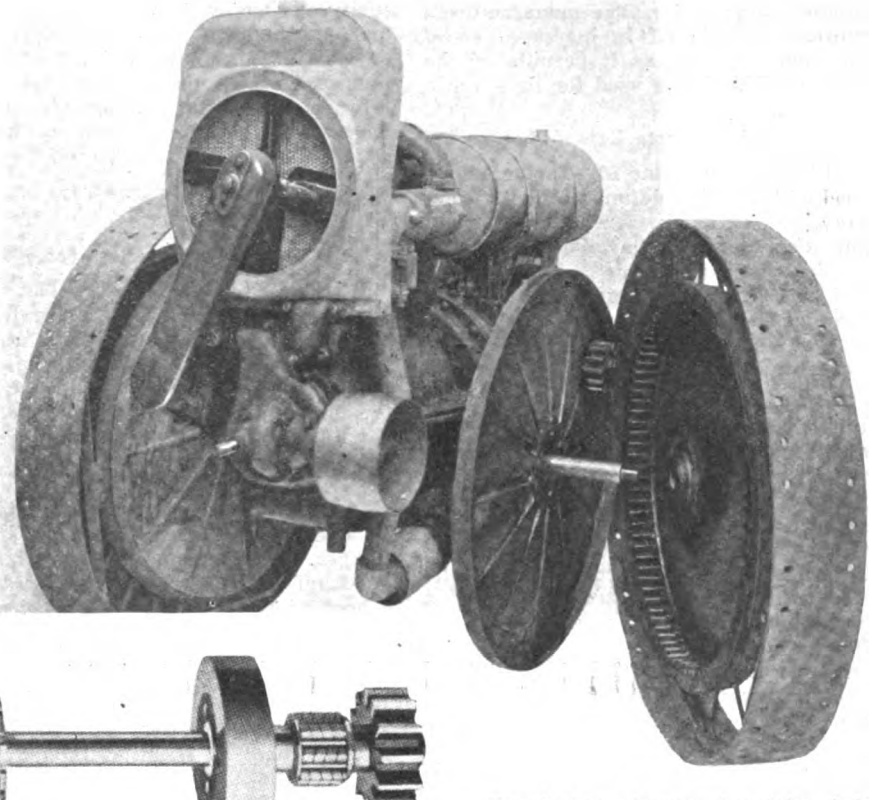
Digitized by Google

A plan view of the transmission layout is shown herewith. There is a sliding pinion on an extension of the clutch shaft. This is adapted to engage either with a gear on the secondary shaft or with an intermediate pinion for obtaining the reverse motion. On the secondary shaft is carried a bevel pinion, which meshes with a bevel crown gear on the differential. It is the bevel pinion which is formed integral with its shaft. Ball thrust bearings are provided on both the secondary shaft of the transmission and on the differential shaft to take up the thrust due to the bevel gear set.



The differential is of the bevel pinion type, containing four bevel pinions. Its master gears are splined to the differential shafts, and to the outer ends of these shafts are splined the bull pinions. This method of securing the bull pinions to their shafts makes it easy to remove them. Anti-friction bearings are used throughout the transmission and drive, there being 15 Hyatt roller bearings and eight ball bearings on the tractor. The entire drive from the engine to the ground is carried on Hyatt high duty roller bearings, which are protected from dust and dirt, and run in an oil bath to insure their lubrication. A feature of considerable importance is a differential lock by means of which one of the differential shafts is secured rigidly to the differential housing. The operation of the lock is performed from the seat. The possibility of rendering the differential gear inoperative is of considerable value when the tractor has to work on slippery ground. The final drive is by bull pinions and internal gears, the latter being secured to the driving wheels, as is plainly shown in one of the end elevations herewith.

All the main connecting parts of the tractor and engine which go to make up the general frame work are held together by bolts, which clamp two faces together, one of which has a heavy circular flange. This flange fits closely into a machined shoulder, taking away any tendency to shear off the bolts. The engine is fitted to the transmission in this manner, and the right-hand axle arm, the right-hand differential shaft arm, and the right and left-hand bull pinions bearing containers are secured in the same way.



Inspection plates are provided on the transmission, clutch and other housings, and enable the operator to get at all important parts readily. On the differential shaft, between the differential shaft and the bull pinions, there are two brake drums, on which act internal expanding brakes, which are controlled from the seat. These brakes serve not only for stopping and holding the tractor, but they also perform a function in connection with the steering. By pushing forward on the brake lever, the right-hand brake is engaged, which permits the tractor to be turned easily toward the right; by pulling back on the lever, the left-hand brake is engaged, which permits the tractor to be turned easily to the left. There is, of course, a special steering gear for steering the tractor, but by means of the brakes the effort required to steer in loose ground can be considerably reduced, which is of importance when the tractor is being operated by a boy or woman.

The bull gears are cast of semi-steel; they are of the internal type and are completely inclosed. Heavy gear grease is introduced through a hole in each inclosing shield, which has a sliding cover. This grease lengthens the life of the bull gears, and forms a seal at the edge of the shield to keep out the dust. The bull pinions are also mounted on Hyatt roller bearings.

While the Moline tractor is designed as a two-plow machine, it is capable of operating at considerably higher speed than the average tractor, and is claimed to be capable of accomplishing as much in a day as the average three-plow tractor. It is said that by the use of the right kind of moldboard, better plowing can be done at 3 to 3½ miles per hour than is possible with the slower plow. Of course, two plows require less draft than three plows, and the whole tractor can be made so much lighter, while the bearing and gear pressures are also proportionally reduced. The model D Universal being a light machine, it can be used also for cultivating and other two or three horse work. Strong claims are made for the advantage of plowing at higher speed. Thus it is said that tough, leathery sod can be turned at 3½ miles an hour which will defy all efforts to turn it with the same plow and tractor at 2½ miles per hour. Stubble ground is said to be broken up and pulverized much better, leaving less air space, which makes a better seed bed and requires little disking and harrowing. With the right kind of moldboard the soil is not thrown at 3½ miles per hour, but turned just in the correct way. Two plows driven at 3½ miles per hour correspond to plowing 10 acres in 10 hours,

Layout of the transmission and drive of the new Moline tractor

Front view, showing fan drive, belt pulley and internal gear drive

Digitized by Google

which is about the same amount of work as can be performed with three plows at 2½ miles per hour.

The Moline Model D has a tread of 56 in., measured to the outside of the wheels, which latter are 52 in. in diameter and have an 8-in. face. Of the total weight of 3380 lbs. of the tractor, 98 per cent rests on the two driving wheels, while the remaining 2 per cent is carried by the implement which is being pulled by the tractor. The left tractor wheel, which runs on the unplowed land, is so arranged that it can be raised or lowered at will, with the object of making the tractor stand up straight, although one wheel runs in the furrow. This makes the tire rest flat on the ground and gives better traction with less wheel slippage.

On 52-in. wheels, disregarding slippage, the tractor travels 2.8 miles per hour at 1400 r.p.m. of the engine; 3.2 miles per hour at 1600, and 3.5 per hour at 1800 r.p.m., the maximum engine speed. The wheel is raised and lowered practically automatically, no jack being necessary. The left driving wheel spindle is secured to an arm which swings around the axes of the differential shaft. An adjusting sector is secured to the side of the transmission housing, this sector having on its inside edge a number of notches into which the arm can be locked by means of a trip lever. If the engine is running, the clutch is let in, and the trip lever is then pulled, the engine will raise the weight of the tractor and automatically lower the wheel. The reverse operation is also automatic, as raising the wheel means lowering the tractor frame, and the weight of the frame takes care of that.

Among the claims made for the new model D tractor is that it steers and handles very easily. The manufacturers express their belief in increased speed for farm tractors, as it permits of the same machine being used for light work.

Standard Parts Gets Abbott

CLEVELAND, June 10—The name and good-will of the defunct Abbott company, as well as the service department, jigs, dies, tools, etc., have been purchased by the Standard Motor Parts Co., and will be conducted in this city under the name of The Abbott Motor Car Co.

Northway Plant Placed Under Oakland

PONTIAC, MICH., June 8—The local unit of the Northway Motor & Mfg. Co., which has been controlled and handled by the Detroit offices, has been placed under direct charge and will operate as a unit of the Oakland Motor Car Co. of this city. The change has been made to bring about greater concentration and also to relieve the Detroit offices of a large amount of work entailed under the former system of control of the Northway plant. The Northway plant employs 1000 men and women. The schedule output is 300 engines daily.

Chalmers Increases Price of Repair Parts

DETROIT, June 8—The Chalmers Motor Co. has increased the price of all Chalmers repair parts 30 per cent.

Tractor Trains Start Regular Daily Schedule

Walter Tractor and Two 5-Ton Trailers Leave Each City Every Twelve Hours

DETROIT, June 8—A tractor train consisting of a Walter tractor and two 5-ton trailers is operating on a regular schedule between Detroit and Toledo, two trains leaving each city daily. Because of a detour that has to be made near Monroe due to road construction the trips now consume 9 hr. After the road is completed it is expected the running time will be cut down considerably.

Owing to the critical steel situation the trains have had little to carry on the trips to Detroit, but capacity loads have always left from this city to Toledo. Nearly everything carried pertains to the automotive industry—motors, springs, bearings, steel, valves, rims, bushings, machinery and submarine chaser plate liners. By fall the company expects to extend its operations to Cleveland, Canton, Akron and Alliance.

Jesse D. Hurlbut is president of the organization, which is incorporated for $100,000. He is also treasurer of the Toledo Grain & Milling Co. Frank C. Schmidt, president and treasurer of the Frank C. Schmidt Realty Co., is vice-president and general manager. Frank L. Baird, of the law firm of Brown, Hahn & Sanger, is secretary. These officers, together with the following persons, constitute the board of directors: Frank C. Hoehler, president of the Security Savings & Trust Co.; L. S. Ottenheimer, president of Cohen, Freidlander & Martin Co.; William C. Carr, vice-president of the Second National Bank; Edward Rosenthal, president of the Home Furniture Co.; Fred C. Ramler of the American Warming and Ventilating Co.

War Chest Drive Nets $87,000

PHILADELPHIA, June 8—The seven-day intensive War Chest drive by the Automobile and Allied Trades Group, under the direction of Lee J. Eastman, resulted in $84,695.87 being pledged, but the campaign, as the minimum quota was fixed at $150,000, is being continued. To date, in round numbers, $87,000 has been subscribed.

For the passenger and commercial automobile trade alone, of which H. B. Harper is chairman, with a minimum quota of $75,000, teams have obtained subscriptions as follows, those where no results yet have been obtained being omitted:

Team 1, J. C. Schwartz, $20,567.08; Team 3, John A. Cleary, $1,650.16; Team 4, W. S. Jewell and D. Garber, $5,700; Team 5, W. F. Roth and C. F. Walz, $7,963.98; Team 6, A. W. La Roche, $7,386; Team 8, John D. Howley, $7,700, and Team 9, B. F. Hoffman, $8,570.

For the accessories and tires, of which W. H. Metcalf, representing the automobile and accessories business association, is chairman, with $25,000 as the minimum, the teams succeeded as follows:

Team 1, George B. Shearer, Jr., and D. D. F. Yard, $1,989; Team 2, Walter F. Bosworth and Malcolm Robertson, $4,517.50; Team 3, Charles G. Frowert and V. S. Fry, $6,547; Team 4, James J. Bradburn and S. D. Winchell, $10,002.96, and Team 5, A. W. Stellwag and W. E. Hoover, $4,657.20.

For the Body Builders, H. G. Moore, chairman, and George A. Spencer, assistant, with $25,000 minimum, collected $3,786.

Robert C. Hupp Dead

DETROIT, June 6—Robert C. Hupp, several years ago prominent in the automobile industry, died at Cumberland, Md., on May 24. Mr. Hupp was the organizer and president of the original Hupp Motor Car Co., which was formed in 1908. During the first three years of the company's existence he was its vice-president and general manager. Prior to the formation of this company he was for some time connected with the Olds Motor Works, becoming eventually service manager. In 1906 he became connected with the Ford Motor Co., in charge of service and accessories, and in 1907 was placed in charge of production for the Regal Motor Car Co.

Columbia Offers New Hearse Body

DETROIT, June 8—The Columbia Body Co. has designed a new hearse and casket combination car which it calls "Liberty." By means of the company's chassis lengthener in conjunction with its patented Sampson load-carrying unit, the large body can be placed on a Ford chassis, making the wheel base 130 in. The body measures 90 in. from the driver's seat and is 42 in. wide. The car is equipped with crown fenders, splash guards, linoleum covered runningboards, demountable rim wheels with over-size 31 x 4 non-skid tires and one extra rim. The body retails at $1,250 f.o.b. Detroit.

White Expects to Do $45,000,000 of Business

CLEVELAND, June 8—The White Motor Co. produced 5900 trucks and 1000 passenger cars in 1917. It is reported that its output of passenger cars this year may not reach in excess of 100. Its truck business will be 60 per cent above last year, it is stated. It is now working on an order for 3000 1 and 2-ton trucks for the United States Army. The company is finishing an order for France for 1500 trucks, and since the war began has delivered 8000 trucks to Russia and 6000 to France. The capacity of the plant is 32 trucks a day, which will be increased to 50. It is reported that the year's business will amount to between $40,000,000 and $45,000,000. More than 70 per cent of the company's capacity is given over to war work.

Putting the Fordson Across

How Herring Will Distribute 1600 Machines in Three States

Home of the Herring Motor Co., Des Moines

The Letter That Helped Sell 632 Fordson Tractors

HENRY FORD is now building tractors at the rate of about 80 per day. He has supplied England with 7000, Canada with 1000, and is now ready to deliver a large part of his output here in America.

Like the foreign orders filled, his aim is to deliver these in such a manner and in such places as will most benefit food production. As distributer for Iowa and some adjoining states, he has allotted me 1000 to be distributed to the farmers direct, without profit.

I want to spread these over Iowa in an equitable manner. In this work I am to have the co-operation of the State Government, and this letter is for the purpose of obtaining your co-operation as to deliveries in your immediate vicinity. Shipments have already commenced, and it is our intention to deliver this entire allotment within 6 weeks, after which time I will be prepared to allot territory to such agents as will be selected to handle Fordson tractors in the regular manner.

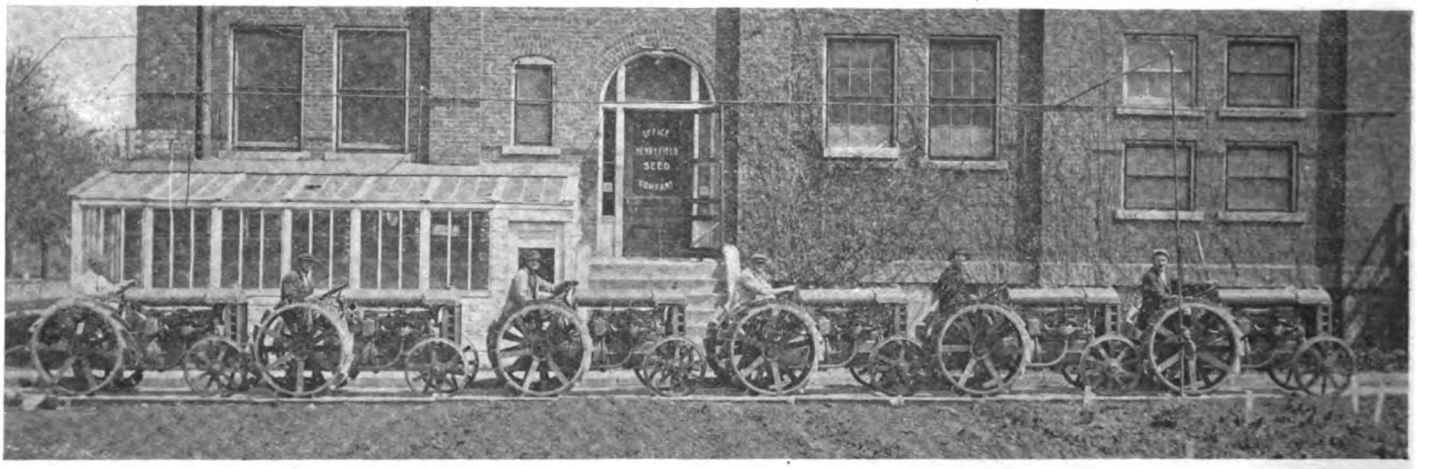
For the purposes outlined above, Mr. Ford has established a price of $750 f.o.b. Dearborn upon these tractors. Added to this will be freight and delivery charges approximating $25.

It is my plan to send a carload to each county seat in Iowa and distribute them with the assistance of the Ford agent, the chairman of the County Council of Defense and the County Farm Agent from that point.

The Oliver Chilled Plow Works has built a two-bottom plow especially for this tractor. Mr. Ford recommends it as the only plow suitable for use with the tractor. I have these en route and will be prepared to deliver them at a price of $140 f.o.b. Des Moines.

I am enclosing such advance literature as I have been able to obtain upon short notice, including two order blanks, which I authorize you to accept from an equal number of farmers who will keep these tractors going in either their own or their neighbors' fields. You may forward these orders and deposits to me and delivery will be made at the earliest possible moment.

There will be no profit whatever to you in this preliminary work other than the satisfaction of having had a hand in the most important step toward increased food production.—Clyde L. Herring, Distributer.



ON April 26 the Herring Motor Co., Iowa distributers for Ford cars in Des Moines, sent to every Ford dealer in the state a letter announcing the forthcoming distribution of 1000 Fordson tractors in the state, of which a copy is given herewith.

So prompt was the response from the motor car dealers that within 10 days replies had been received from over 90 per cent of the Ford dealers in the state declaring their intention to take an active interest in the project to put the farmers of Iowa on a higher productive plane.

To date 632 of the 1000 Fordson tractors apportioned to Iowa have been bought and financed by the motor car dealers and most of them already have been shipped and delivered. It is certain, irrespective of the lateness of the season, that the full quota of the 1000 tractors will have been delivered before the expiration of the 6 weeks specified by the Herring company.

In some respects the plan pursued by the Herring company differs from that

Digitized by Google

Here is a complete carload of Fordson tractors shortly after having been unloaded and just prior to their delivery to a dealer in Shenandoah, Iowa

followed in the states wherein Fordson distributions already have taken place. The points of similarity are that the distribution will take place through the Ford dealers of the state and that as far as the tractor is concerned the distribution will be without profit to the dealer.

The plan of the Herring Motor Co. contemplates the placing of an average of 10 tractors in each of the 99 counties of the state. In every instance the tractors will be shipped in car lots from the factory at Dearborn, Mich., to the Ford dealer at the county seat town, but all the Ford dealers in the county nevertheless will take orders and participate in the distribution.

Apportioning the Tractors

In case orders are received for more than ten tractors from any one county the chairman of the County Council of Defense, or the County Agricultural Agent, as the case may be, will select the most deserving ten from the whole number of orders and the county quota will be distributed among these. The participation of the state government is limited to moral sanction and the co-operation of the local county chairman of the State Council of Defense. For the most part the county agricultural agents are United States Department of Agriculture appointees, but their activity is entirely unofficial.

The Oliver No. 7 plows, which will be used with the tractor, will be delivered l.c.l. from Des Moines and will be shipped direct to the Ford dealer taking the tractor order, irrespective of whether he happens to be the county seat dealer or not. The same plan will be pursued with the Lean engine disk harrow. The dealer will sell the plow to the farmer at $140 and the harrow at $146. In order that the dealer may have something to compensate him for the expense and work involved in the profitless distribution of the tractors, he will receive a profit of $15 on the plow and a discount of 20 per cent on the harrow.

A deposit of $100 on every order taken must be made by the dealer, following which the tractor and equipment are shipped with sight draft attached to the bill of lading for the remainder.

At the conclusion of the distribution of the allotment of 1000 tractors, the Herring company will make regular sales contracts with Ford dealers covering specific territory for future tractor trade. The price of the tractor will be advanced at that time and the dealer will be able to make some profit on future sales.

Must Stock Parts

He also will be expected to put in a stock of repair parts adequate to meet the service needs of all the tractors there may be in his territory. For the present the stock of tractor repair parts will be maintained at Des Moines, shipments being made from there on need.

Future contracts with motor car dealers handling the Fordson tractor will include also the agency for the Oliver No. 7 plow, the Lean harrow, the Emerson seeder and such other equipment as shall receive the approval of Henry Ford. Ample stocks of operative equipment will be carried at all times by the Herring Motor Co. at Des Moines and all equipment will be shipped to dealers f.o.b. that point. Motor car dealers who sell the Fordson tractor in the future will handle no operative equipment for use with the Fordson tractor save that which has received Mr. Ford's o k., but also they will have the exclusive agency for such equipment within their respective territories.

Controls Three States

Essentially, the same plan of distribution will be followed in Nebraska and South Dakota, both of which states, in addition to Iowa, are controlled by the Herring Motor Co. Three hundred tractors have been allotted to each of these states, making 1600 machines in all which the Herring Motor Co. will distribute under the present arrangement. For the present Nebraska and South Dakota will be handled from Des Moines, but ultimately central distributing points will be established in each state.

Letters similar to the one sent to the Ford dealers in Iowa were sent to the Ford dealers in Nebraska and South Dakota within the last few days and already responses are coming in, indicating the plan will be as popular and successful west of the Missouri river as it has proven to be east of it.

As indicative of the interest manifested by the Ford dealers of the west, on the day when the MOTOR WORLD representative was in Des Moines he met Guy Harding, Ford dealer at Pierre, S. D., who did not trust to the mail to secure him his far western agency, but who made the long railroad trip to Des Moines in person so that he should be sure to be recognized.

The Herring Motor Co. has had men at the Ford factory taking a special course of instruction, and four of these will be on the road constantly in Ohio and two each in Nebraska and South Dakota. The company has one or more of these men at every delivery and insists that they instruct the farmer thoroughly in the operation of his tractor to the end that he may be perfectly satisfied with it and that it shall at all times give him the maximum of service.

Clyde L. Herring, head of the Herring Motor Co., is loud in his praise for the patriotic and enthusiastic response made by the motor car dealers of Iowa. He says that were it not for their patriotism, energy and enterprise it would be impossible to put over what the company is doing. He is convinced too that a majority of the better and more progressive Ford dealers in the three states he controls will remain permanently in the tractor business and that there is a satisfactory and profitable trade ahead of them, particularly as they will have the sale of the operative equipment which goes with the Fordson tractor as well as the tractor itself.

Gas Engine Makers Convene

CHICAGO, June 4—The 2-day convention of the National Gas Engine Association and a combined meeting of that organization with the midwest section of the Society of Automotive Engineers closed last night with an annual dinner. An address made by Mr. Van der Bries, secretary of the Central District United States Chamber of Commerce, outlined the assistance that national engineering bodies can give the Government by means of war service committees.

Complete Curtailment of Steel Not Planned

Under Priority System Car and Truck Makers Will Continue to Get Their Share

WASHINGTON, June 10—The motor car industry will not suffer complete curtailment of pig iron and steel shipments in consequence of the agreement between the War Industries Board and the Iron & Steel Institute, despite newspaper reports to the contrary.

Newspaper reports stating that the automobile industry would not receive steel or iron were declared erroneous today by both Bernard Baruch, chairman of the War Industries Board, and J. Leonard Replogle, director of Steel Products.

Under the agreement between the War Industries Board and the Iron & Steel Institute, the situation sizes up as follows:

1—For the time being, manufacturers of passenger cars and trucks will receive pro rata divisions of steel and iron after war needs are met; this puts the automobile industry on the same footing as other non-war industries.

2—The United States and the Allies will be assured of all the steel they need for war work.

3—Every shipment of pig iron and steel must have the approval of J. Leonard Replogle as Director of Steel Products.

4—There is a possibility in some instances for classification of passenger cars and trucks engaged in special work, in a higher division of the selected list, insuring them full steel needs.

The steel agreement means, in brief, that every pound of steel produced must be accounted for. It means that our government and our Allies have first call on steel; and that after all war needs are satisfied, the non-war needs will be taken care of.

The agreement classifies industries into seven divisions as follows:

1—Ships.
2—Aircraft.
3—Munitions
4—Food
5—Clothing
6—Railroads
7—Public Utilities

This is the order in which preference will be given to the various industries by the granting of priorities. For example, after all the steel needed for ships is allotted, then the aircraft program will be taken care of; after that, munitions, including military and naval supplies will be taken care of, and so forth.

If, after all these needs are satisfied, there remains any steel, then it will be parceled out to non-war industries.

Motor trucks for army use will come under the third class, "Munitions." Commercial trucks on the other hand will come under the seventh class, "Necessary transportation equipments." The status of passenger cars and trucks, however, is not definitely settled. In answer to the question, "Will motor trucks used for rural motor expresses be classified as necessary transportation equipment" the reply was:

"If this work is not mere camouflage, they may be classified as necessary transportation equipment."

Passenger cars are not regarded highly by the War Industries Board. One of the highest officials was asked whether they would be classed as public utilities, in view of such classification last winter when the Fuel Administration ordered its 5-day shut-down period. He replied that he was not the priority man but that passenger cars would not come high on the list if he were.

The War Industries Board claims that there is a serious shortage of steel. For months it has been holding conferences with automobile, steel and other industries and making demands for curtailment. The steel makers and others have maintained that there is sufficient steel and recently asked the government for a budget of its needs. The budget was not forthcoming.

Replogle has let it be known that the new agreement will not be completely rigid. It will be sufficiently elastic, so that, for example, a large automobile company that has 90 per cent of materials on hand and needs steel to complete its production, the War Industries Board will not raise an obstacle, in the priority system, but would allow the manufacturer to get the steel.

Class B Trucks Adopted

WASHINGTON, June 7—The Quartermaster standardized 3-ton class B truck has been officially adopted as the standardized heavy duty cargo truck for use by the army in all its departments requiring this capacity truck. This announcement, made by Secretary Baker to-day, marks the first step towards settlement of the controversy on standardized vehicles.

A series of tests for power and fuel consumption was held here secretly 3 weeks ago to determine which trucks were best. Many commercial makes of trucks competed with the standardized war trucks. The announcement by the War Department emphasizes the quality or superiority of the B truck in comparison with all standard makes of trucks.

It is expected that other announcements will be made in the near future, as to the worthiness of the A and AA types of standardized trucks and standardized motorcycles, which were also tested.

The test reports have not been made public. It is doubtful if they will be. To make public announcement of them would be to give publicity to the inferiorities and superiorities of various private makes of trucks and motorcycles. Reports are coming from authoritative sources, indicating that all three of the standardized war trucks, together with the standardized motorcycle made excellent showings in every test, excepting in one instance, where the new standardized four-wheel-drive truck displayed superiority in climbing over a log, one test in which the four-wheel-drive would naturally be expected to be superior.

Nothing Settled on in Taxation Tangle

Imposts on Cars and Gasoline Proposed—Coal Shortage May Affect Production

WASHINGTON, June 10—Doubling the 3 per cent tax on the cost of motor cars, a Federal license tax of from $2 to $10 on the users of cars, and a tax of one-third of a cent per gallon on gasoline used by all commercial gasoline engines, were among the radical tax suggestions made before the Ways and Means Committee late last week.

A blacklist of non-war industries to be definitely curtailed, compiled by the War Industries Board, the Food Administration, the Fuel Administration, Railroad Administration and Labor Administration, is said to be in process of completion.

According to a warning issued by the Fuel Administration, industries not doing 40 per cent of government war work by Oct. 1, 1918, will be reduced 40 per cent in their normal coal allowance. Certain industries doing 100 per cent war work and administrative consumers will receive 100 per cent coal, with those companies compiled is drawn up to inform the non-preference, those doing less or no war work will have little chance for a constant fuel supply.

These serious obstacles to normal production together with the menace of steel shortage created by the steel argument described elsewhere in these columns bring non-war industries into a number of difficulties. The passenger car industry is, according to all reports, considered a non-war industry in Washington. The blacklist which it is reported is being compiled is drawn up to in form the non-essential industries of their position as regards shortage of materials.

Shortage of Materials

Washington officials believe that it will be better to inform these industries definitely what they can expect in the matter of receiving raw materials, than to hold them off longer with vague promises and evasions. They point to the three important factors, labor, coal and transportation, claiming a shortage in all.

The report is to the effect that many manufacturers will be compelled to stop entirely, while others will be curtailed to a great degree. It is anticipated that the Priorities Board of the War Industries Board will be the departmental organization, which will be the agency for working out the blacklist.

P. B. Noyes, director of coal conservation of the Fuel Administration is now warning industries to enter in the war work or suffer fuel curtailment next winter. It is claimed that the United States will fall short 60,000,000 tons of its normal coal needs for this coming winter, and there will be little opportunity for manufacturers of non-war requirements to secure their quotas.

Three Cities Adopt War Service

Milwaukee, Louisville and Chicago to Eliminate Night and Sunday Service

MILWAUKEE, June 10—The decision of the War Economy Board of the National Automobile Dealers' Association to close garages, service stations, tire and accessory stores and shops at 6 p. m. daily and on Sundays and holidays, to release 30,000 mechanics to the Government service, was adopted and ratified by 212 individuals, firms and corporations of Wisconsin at a meeting called by the Milwaukee Automobile Dealers, Inc., at Milwaukee during the past week. The remaining members of the industries are signing ratification cards and it is expected that Wisconsin will stand 100 per cent within a short time.

As a result of the decision, the M. A. D. is preparing a pamphlet explanatory of the war time policy, for distribution among owners. It will give the names and locations of the five emergency stations established in Milwaukee, temporarily appointed as follows:

Downtown, Standard Auto Repair Co., 188 Eighth Street; East side, Wilson's Garage, 375 Summit Avenue; North side, Gas Power Engineering Co., 215 North Avenue; South side, South Side Service Station, 834 Muskego Avenue.

The M. A. D. also contemplates the establishment of a trade school in automotive mechanics to replenish the supply of skilled workers by training men below and above the present draft ages. The plan is similar to that adopted in Canada after one year of war.

The directors of the M. A. D. are considering the organization of divisions of associate memberships for truck, accessory and tire owners, which will add about 100 to the member roll.

It is stated that the new regulations promulgated by the national dealers' association at the request of the Government will not throw any men out of employment in Milwaukee, save perhaps a very few. More than 500 mechanics already have been taken from the payrolls of local establishments by voluntary enlistments and the selective draft and for some time past there has been a virtual shortage of men.

Louisville Falls in Line

LOUISVILLE, June 10—The Louisville Automobile Dealers' Association, of which Prince Wells is president, has lined up with the War Economy Board of the Council of National Defense and adopted resolutions similar to those adopted by the War Service Committee of the National Automobile Dealers' Association. The resolutions follow:

(1) *SUNDAY AND NIGHT LABOR*—A large proportion of mechanical work done on Sunday and night is occasioned by the use of automobiles almost entirely for pleasure purposes and usually emergency road service. It is recommended that a proper curtailment of this service would bring about a material saving of labor and release many automobile mechanics for war service.

(2) *ON AND AFTER JUNE* 15 this company will operate as mentioned below. We request our customers to help us in conserving MAN POWER.

(3) *SERVICE STATION* will not operate on Sundays or night, nor will any mechanics be in the garage to perform labor or adjustments. Customers should have their cars attended to during the week, EXCEPT WHERE absolutely necessary for cars used in actual essential pursuits, including commercial vehicles for commercial purposes which may require immediate attention.

(4) *STOCKROOM* will be closed, and no parts supplied or stock sold.

(5) *CASH*—We request our customers to make settlement for repairs, parts and accessories in cash to help us save unnecessary office labor.

(6) *HELP*—We will endeavor to help our customers by instructing them how to make adjustments which they can easily do to help them in operating their car and avoid unnecessary road service and save labor. Free service coupon books and service cards where used will be discontinued.

(7) *WASTE*—You can help win the war by avoiding waste of gasoline, oil and tires. Stop gas and oil leaks at once. Reduce your speed. Avoid excessive tire wear, and have your tires repaired as soon as they become cut or otherwise damaged.

(8) *SALESROOM*—Will be closed and no salesmen will be on duty, nor will they make demonstrations on Sunday.

We request the public to be patriotic and help us carry out the above requests made by the *COUNCIL OF NATIONAL DEFENSE*.

Chicago Adopts Recommendations

CHICAGO, June 8—Chicago motor car dealers at a meeting yesterday unanimously adopted the recommendations of the War Economy Board at Washington regarding service during the continuance of the war. The action of the Chicago dealers was in line with the resolution adopted at the meeting of the board of directors of the N. A. D. A. at St. Louis, May 17 and 18, when dealers everywhere were called upon to enforce the recommendations of the War Economy Board.

Yesterday's meeting was addressed by E. E. Peake of Kansas City, executive secretary of the N. A. D. A. and president of the National Association of Automobile Show Managers.

The Chicago Automobile Trade Association will entertain the delegates attending the national convention of the N. A. D. A., which will be held at the La Salle Hotel, Chicago, Friday and Saturday, June 14 and 15. A dinner will be tendered the delegates on Friday evening at the South Shore Country Club and on Saturday afternoon they will be guests of the association at the Sox ball park to witness the baseball game between Chicago and Washington. Alternative entertainment for those who prefer will be tendered at the various golf links around about Chicago.

Ohio Out For More Members

COLUMBUS, OHIO, June 10—Victor Moon, commissioner of the Ohio Automobile Trade Association, is holding a number of meetings in various parts of the state in order to work up enthusiasm for the association. He held a meeting in Cincinnati June 5 and another at Athens June 6. Both meetings were well attended. Members are coming in nicely and the work of the association, especially along war lines, is progressing satisfactorily.

St. Louis to Standardize Accounting

ST. LOUIS, June 8—The Junior Officers' Bureau of the St. Louis Automobile Manufacturers' and Dealers' Association has completed its organization. The first task will be that of standardizing accounting and service methods for all member firms.

The organization was completed with 49 representatives of 31 firms. The following were nominated for officers, to serve until January of 1919: for president, C. W. Huth of the Cadillac Automobile Co., and W. L. Hausmann, Velie Automobile Co.; vice-president, Eugene Mussler, De Luce Automobile Co. and R. N. Whitney, Dorris Automobile Co.; secretary, I. J. Messinger, Hudson-Phillips Motor Car Co.; treasurer, Charles Boarding, Davie Motor Car Co.; A. J. Zimmerman, Park Automobile Co., and Walter L. Prack, Vesper-Buick Auto Co.

Boston Re-elects MacAlman

BOSTON, June 8—The annual meeting of the Boston Automobile Dealers' Association was held this week, at which reports were made showing that the automobile show in March was a big success. President John H. MacAlman gave some facts regarding what transpired at the meetings of the National Automobile Dealers' Association recently. The following officers were re-elected: President, John H. MacAlman (Stearns); vice-president, Josiah S. Hathaway (White); treasurer, F. A. Hinchcliffe (Jordan); secretary, Chester I. Campbell. These officers and John H. Johnson (Buick), Charles E. Fay (Maxwell), John W. Bowman (Daniels), J. W. Maguire (Pierce-Arrow), Frank E. Wing (Marmon) and C. F. Rockwell (Nash) constitute the board of directors.

Decatur Holds a Show

DECATUR, Ill., June 10—Decatur's first motor car show given in conjunction with a "Made in Decatur" exhibit, attracted many thousand visitors. The completion of the new factory buildings of the Comet Automobile Co. led to the suggestion that it be dedicated with a display of all products made in Decatur in addition to motor cars. Manufacturers and business men generally gave their support, and the result was an extensive exhibit. The automobile section was occupied by forty dealers in cars, tractors, trucks and accessories. The show opened June 3 and closed June 8.

Car Makers Decide For More Standardization

To Eliminate Some Unnecessaries as Conservation Measure—Drive-aways Decline

NEW YORK, June 7—The National Automobile Chamber of Commerce at its annual meeting yesterday and to-day decided to appoint a committee to delve deeply into standardization and conservation matters with a view to co-operating more closely with the Government in saving materials. Charles Clifton, president of the Pierce-Arrow Motor Car Co., Buffalo, was re-elected president, and all other officers were re-elected, the only change being in the board of directors, where H. M. Rice, Chevrolet Motor Co., takes the place of the late Colonel Pope.

In the matter of conservation, it is the plan of the chamber to investigate the possibility of eliminating a number of unnecessaries such as the use of virgin wool for upholstery material, vanity curtains in limousines and a number of other things of the like. An effort will be made to substitute more common materials for those that are in great demand for war work, such, for example, as chromium steel and tin.

Thirteen Makers Made Members

During the year gone by thirteen manufacturers of trucks have been admitted to membership, bringing the list up to 52 makers of trucks and 85 of passenger cars. The companies added were: Acme Motor Truck Co., Cadillac, Mich.; Bethlehem Motors Corp., Allentown, Pa.; Brockway Motor Truck Co., Cortland, N. Y.; Clyde Cars Co., Clyde, Ohio; Diamond T Motor Car Co., Chicago; Dorris Motor Car Co., St. Louis; Republic Motor Truck Co., Alma, Mich.; Sanford Motor Truck Co., Syracuse; Schacht Motor Truck Co., G. A., Cincinnati; Service Motor Truck Co., Wabash, Ind.; Standard Motor Truck Co., Detroit; Stewart Motor Corp., Buffalo; United Motors Co., Grand Rapids, Mich.; Ward Motor Vehicle Co., Mount Vernon, N. Y.

It has been recommended that the Motor Truck Division appoint a committee to investigate the possibility of further standardization, particularly with reference to axle widths and treads.

Increase Transportation Cost by $6,000,000

The Traffic Committee estimates that the 25 per cent increase in freight rates which is to go into effect June 25 will mean an increase of $6,000,000 in the cost of transportation, based on shipments equal to those of last year. A standard 36-ft. carload shipment will cost $19.25 more between Detroit and New York, and $77.50 more between Detroit and San Francisco than under the old rates. Through intensive loading methods, which means more improved double decking and partial crating, some members have been able to increase the capacity of freight cars from 50 to 100 per cent.

Drive-aways are dropping slightly in the aggregate, due to the reduced output of factories. The chamber is actively working through the various State Councils of Defense to eliminate interference with strings of cars en route by officious or over-zealous police authorities.

With regard to the truck and tractor show which is to be held in Chicago this fall it was decided to notify members of the Chicago Automobile Dealers' Association that their participation be left to their own discretion; it was the sentiment of the truckmakers themselves that they would not exhibit because it is deemed that the time is not opportune.

The next meeting of the chamber will be held at the New York offices on July 10.

Changes in Price

NEW YORK, June 10—The following changes in price have been made during the past week:

	New Price	Old Price
Franklin, 2-pass.	$2400	$2200
5-pass.	2450	2445
4-pass.	2450	2445
Sedan	3350	3050
Limousine	3400	3200
National, Six Cylinder, 2-pass.	2450	2150
5-pass.	2450	2150
7-pass.	2450	2150
Coupe	2945	2645
Sedan	3120	2820
Twelve Cylinder, 2-pass.	3150	2750
4-pass.	3050	2750
7-pass.	3050	2750
Coupe	3545	3245
Sedan	3720	3420

Need 36,000 Men For Harvest

WASHINGTON, June 5—Western harvest cutting will start about a week earlier than last year, and will require 36,000 men from outside sources; 6000 will be needed for Oklahoma, and 30,000 for Kansas. The United States Employment Service is in charge of the situation.

Wages in the main wheat belt are $3.50 per day with board to harvest hands in Oklahoma, and $4 to $5 per day with board to harvest hands in Kansas. Stackers will receive higher wages.

There is a movement under debate to pay the men by the hour, with wages running from 40 to 50 cents an hour with board. Anyone desiring to secure farm work can apply at any of the offices of the United States Employment Service, located in practically every city in the country.

Illinois Tractor to Build

KANSAS CITY, June 10—The Illinois Silo & Tractor Co., Bloomington, Ill., will establish a tractor assembling plant in North Kansas City in the near future. The company, through D. T. Garber, vice-president, has purchased a tract of ground with a 305-ft. frontage, 118 ft. deep. The proposed structure will be four stories and practically cover the ground.

Toledo Jobbers Urge Standardized Packages

Ohio Body Affiliates With N.A.A.J. and Suggests Uniformity in Packing

TOLEDO, June 10—The first quarterly meeting of the Ohio Automobile Jobbers' Association, since its organization at Columbus, Feb. 9, was held in this city recently with quite a large number present. The announcement was made that steps for affiliating with the National Association of Automobile Accessory Jobbers had been completed and it is now an integral part of the national organization. New members were admitted as follows: The Union Supply Co., Toledo, and the York Supply Co., Greenville.

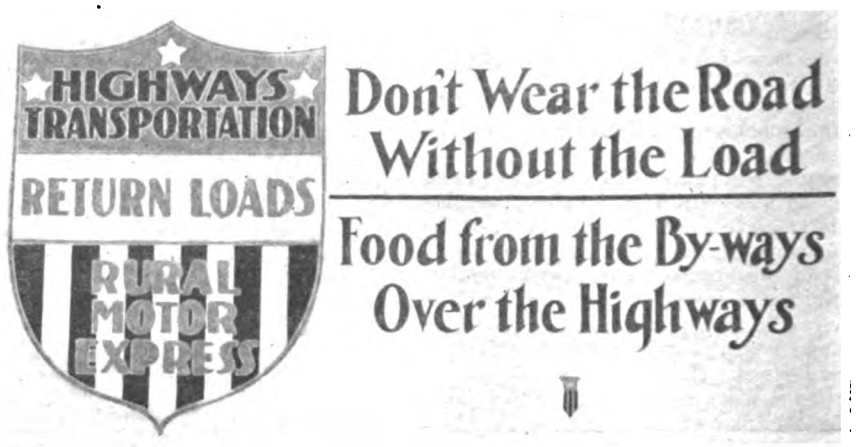
The committee on standardization, consisting of H. M. Dine, Canton; W. L. Derheimer, Cleveland, and H. H. Brenner, Cincinnati, recommended that all packages be made a standard size whenever possible, and that the packing be made the same. It was pointed out in the report that by standardizing packing and sizes of packages much good for the association members would be brought about. The next quarterly meeting will be held in Cleveland some time in August.

Work Started on New Hackett Factory

BURLINGAME, MICH., June 8—Work on the new factory of the Hackett Motor Car Co., which will be composed of four units, is under way. Three of these will be of equal size, measuring 70 x 500 ft. and having a floor space of 35,000 sq. ft. each. These units will be built parallel and will be linked together at the end by the two-story fourth unit, 60 x 400 ft., which will contain executive offices, stockroom, experimental departments, etc. The total floor space of the four units will be 180,000 sq. ft.; and will have a daily capacity of 100 cars.

Duray To Race Here Again

CHICAGO, June 8—Arthur Duray of the French army, old-time racing driver, who finished second in the 1914 Indianapolis contest, arrived here yesterday and is expected to enter the derby scheduled for the Chicago speedway June 22. Duray is in this country in connection with work for the aviation service of the French government. He brought no car with him from Europe but will handle a Frontenac car which has just been purchased by Harry Harkness.



Paige Trucks Ready in July

DETROIT, June 8—The Paige Motor Car Co. has just gone into the last of four new buildings recently erected for the company, which adds 66,000 sq. ft. to its floor space. The company reports that its trucks will be ready for the market the latter part of July. No price has yet been established on the product.

Wanted: More Return Loads Bureaus

Highways Transport Committees of 23 States Tell of Progress and Urge Further Development

New poster, advocating the establishment of Return Loads Bureaus and Rural Express Routes, which has been prepared by the Highways Transport Committee. Its wide distribution would assist materially in spreading the gospel of these two important works.

WASHINGTON, D. C., June 5—The big 2-day get-together meeting of the representatives of the Highways Transport Committees of twenty-three State Councils of Defense with the parent Highways Transport Committee here in Washington was the greatest step forward yet made by that committee to spread to the country at large the necessity of the formation of statewide Return Loads Bureaus and the establishment of rural motor truck express routes. Delegates were present from the far off State of Colorado, where motor trucks are to-day performing a wonderful service in long overland hauls from mines from which vitally necessary war materials are being dug. The other twenty-two states represented were Alabama, Connecticut, Delaware, Illinois, Indiana, Kentucky, Maryland, Massachusetts, Michigan, Missouri, New York, New Jersey, North Carolina, Ohio, Pennsylvania, Rhode Island, Tennessee, Texas, Virginia, Wisconsin, West Virginia and the District of Columbia.

Three Main Topics

The three main topics were Return Loads Bureaus, Rural Motor Truck Express Routes and Good Roads. Roy D. Chapin, chairman of the Highways Transport Committee of the Council of National Defense, presided at the conference and gathered about him such a fine array of well-qualified speakers that practically all of the representatives went back to their respective states with the determination to form Return Loads Bureaus in those states not now having them and to speed up the work in those bureaus already formed.

They also went back with the determination to establish rural motor truck express routes to haul food raised in the vicinity of cities into those cities, to the end that farmers may be kept on their farms, and to work for better roads and better road maintenance.

The imminent necessity for organizing and using the motor trucks of the country at their highest efficiency in order to relieve the railroads of their short-haul traffic and to keep the farmer at actual food production work on his farm by means of supplying him reliable transportation to and from his city's markets, were driven home by the various speakers, who included representatives of the Railroad, Food and Labor Administrations and others who have been closely identified with the work in various parts of the country.

While the Return Loads Bureau idea has been permanently sold in the Eastern States, where the merchants were forced to use motor trucks last winter and this spring to get their goods delivered, the idea has not been taken up to the same degree in the central western part of the country, where the congestion has not been so great as along the Atlantic seaboard.

Practically every speaker brought out the important fact that it is a patriotic duty to form Return Loads Bureaus and rural express lines, and that now is the time to accomplish this work, so that all of the bureaus will have all of their preliminary work done before the traffic jam comes this winter.

Congestion Foreseen

That this congestion will come has been foreseen by close students of transportation for some time, but was brought home forcibly to those delegates in attendance by R. C. Wright, Assistant Traffic Director of the United States Railroad Administration, who said that there undoubtedly would be many embargoes this year, and that the Railroad Administration looks with favor upon the development of highway transportation by means of motor trucks, and will assist in extending truck transportation to the greatest possible extent in order to relieve the railroads of their short-haul freight difficulties and their terminal congestion. It was also brought out that it is not probable that any future short-line railroad extensions will be built, and that the motor truck will be called upon to handle all of this business both during the war and after the war.

The significant fact was brought out by Joseph Husson, editor of *The Commercial Vehicle*, that the Goodyear Tire & Rubber Co., Akron, looks for no relief from the present railroad congestion for at least 5 years. The traffic managers of that company based the reason for their contentions on the fact that the increased war material which must be shipped abroad will offset any increased efficiency on the part of the railroads. All of the food and clothing heretofore consumed by the soldiers of the draft who have been selected from points remote from the Eastern Coast will have to be shipped this year to the Atlantic for transshipment overseas. Our army in France is still small as compared with what it will be, and as it grows at the rate of from 200,000 to 300,000 per month more and more food, clothing, ammunition and various other materials will have to be shipped across the country to the Eastern seaboard. All of this material will have to be moved and will be given preference over any and all commercial products so that merchants who are desirous of carrying on their businesses will have to take second choice and will be forced to use motor trucks to deliver their goods.

W. S. Gifford, Director of the Council of National Defense, in a short talk, publicly urged that highway transportation be increased to the greatest possible extent in order that there be no weakness in that triolgy of transportation means consisting of the railways, waterways and highways.

What the Bureaus Have Done

The actual work which the Return Loads Bureaus already established have accomplished was outlined by D. C. Fenner, of the New York City Return Loads Bureau; by David Harper and J. F. Winchester, respectively president and secretary of the Motor Truck Club of New Jersey, which is operating the Return Loads Bureau in Newark, and by Charles J. Bennett, Connecticut State Highway Commissioner.

Digitized by Google

F. C. Ertsman, secretary of the Highways Transport Committee of Illinois, and William E. Hull of Peoria, Ill., were of the opinion that the poor roads of Illinois would retard the development of a Return Loads Bureau in that state, and that some immediate action should be taken by the Federal authorities in Washington to assist and promote the building of necessary highways in that state and of the maintenance of those roads already built.

It was also brought out that one bad stretch of road about 16 miles long was the one main reason why a great volume of motor truck traffic was not now passing between Chicago and the great manufacturing center of Milwaukee. While it was also expressed that there was not much goods which could be shipped out of Chicago by means of motor trucks, Husson offered as evidence a letter from the Chicago Hardware Foundry Co. of North Chicago, Ill., which showed that that one concern has 7500 tons of goods yearly which can be moved by trucks to Chicago, Milwaukee and Racine Junction.

The necessity for the establishment of Rural Express Routes was outlined by F. C. Marquis, the member of the parent Highways Transport Committee in charge of the rural express work. The United States Food Administration has been so impressed with the possibilities of motor trucks to increase food production that it has given definite orders to all of its local food administrators to assist in every way in its power to establish rural express lines.

The remarkable work which has been performed by such lines in the vicinity of Washington was outlined by P. R. Wilson, the Washington Food Administrator, and by J. N. Barnsley, who operates one of the lines from Olney, Md., into Washington.

Helping The Farmer Produce

C. T. Clayton, of the United States Department of Labor, was of the opinion that the establishment of necessary rural express routes in localities where it is now possible for them to operate would be equivalent to putting more than 100,000 of the very best type of farmers into actual production on the farms of the country. The placing of this large number of men in actual production work would be effected by providing the necessary transportation so that they would not have to drive their own loads to market and be absent from the farms for the length of the trips into the various cities.

If this number of men could be saved for actual food production it would go a long way toward solving the present shortage of farm labor, which is estimated at approximately 24 per cent of the total farm labor supply, although it is thought that the same or a larger production than last year could be made possible by an increase of only 12 per cent instead of 24 per cent.

The work which the National Automobile Chamber of Commerce is doing toward the extension of rural motor express routes was outlined by S. A. Miles, who told of the appointment of district agents in twenty-eight of the leading cities in the country to carry on the work personally and through the medium of booklets issued by the chamber and by newspaper and other publicity.

It was also pointed out that motor trucks will have to be called upon to assist in hauling our great food crops from the fields to the shipping points so that the farmers can remain on the farm during the entire crop season. Our crops of wheat and corn promise to be larger than ever before, and it will be a national calamity if they cannot be moved effectively either by the railroads or by the assistance of motor trucks, to get them to the shipping points in the least possible time.

If any considerable amount of our wheat crops should be spoiled it would mean that everybody in the United States would have to go without wheat for at least 6 months if the Allies are to be supplied with their necessary quota.

Detailed advantages of the rural motor truck express route was pointed out by Barnsley, who put his motor truck into service 4 years ago, and during the period between that date and the present time has cultivated 17 acres more of corn and 22 acres more of wheat, or 39 acres a year in all, than he cultivated before his truck was purchased.

What One Man Has Done

He recently hauled 600 bushels of wheat into Washington in one day with one of his trucks and one man, whereas a four-horse team requiring two men hauled only 100 bushels in the same time. Besides the increased farm production which his four motor trucks have made possible, they have also enabled him to increase the size of his dairy herd because he was able to deliver the increased milk production by trucks, whereas it would have been impossible with horses unless a dozen or more had been added to his stable.

Besides his own work, Barnsley also hauls milk and farm produce for fourteen to sixteen farmers in his immediate neighborhood who would otherwise have to hitch up their own wagons to get their goods into Washington or else purchase trucks which would be used only part time. By making use of Barnsley's vehicles, the latter are run with full loads continuously, and the farmers are able to stay on their farms and aid in increasing their farm productivity.

The use of motor trucks in hauling milk has also proved a great benefit to the farmers in that they have been able to get their empty cans in sufficient time to keep their supplies going forward continuously. A concrete example of the delays which farmers experience in getting their empty cans by railroad express was cited in the case of a Virginia farmer 50 miles from Washington who had 110 cans and who could not get eight or nine cans daily to ship his milk and had to hold it in washtubs until the cans were returned. In some cases they did not arrive in time and the milk had to be fed to the pigs.

It was brought out that good roads are a necessity for the development of both Return Loads Bureaus and Rural Express Routes. The thought that while we all want to see good motor truck highways, but that these cannot be built in a day or even during the period of the war, was well expressed by George H. Pride, a member of the Highways Transport Committee, who pointed out that we must make the best possible use of what highways we now have.

If we cannot have 365-days-in-a-year highways, it is better to have 180-days highways or even 90-days or 30-days highways.

Many of the roads which are now impassable during certain periods of the year could be greatly improved and made passable for motor truck traffic if they were temporarily graded or ditches provided for drainage so that water would not accumulate and result in the mires which are so detrimental to truck progress.

William E. Hall of Peoria, Ill., summarized the road situation in his state, and brought out the fact that Illinois now has $4,000,000 in its treasury which is available for road building work, but that this money cannot be used for the purpose for which it is intended because of the refusal of the Capitalistic Committee, which must first approve of any road-building expenditures. Similar reports were made by the representatives of other states.

The entire road program has taken on a more optimistic color since the removal of the famous priority order No. 2, which prohibited the shipment of all highway materials by railroad, and the situation appears to become brighter due to the fact that the Council of National Defense is now working upon a Federal road policy which it is expected will be promulgated during the course of the next few weeks.

Want More Good Roads

David L. Ludlum, president of the Autocar Co., Ardmore, Pa., presented a resolution to the Council of National Defense urging upon it the adoption of such a policy. The resolution was unanimously adopted by the representatives at the meeting and will be presented to the council by the Highways Transport Committee.

The necessity for better roads in this country was proven by the experience abroad where, if it had not been for good roads, probably all of France would now be in the hands of the Germans. This message was brought by Captain Vandervelde, of the Motor Transport Section of the French Army, who publicly gave thanks that his French forefathers had realized the benefit of good roads and had built them in France so that they were one of the main instruments which was responsible for turning back the Germans on the Marne in 1914. Of the 1000 taxicabs which were employed to transport two divisions of the French Army from Paris to Van Kluck's flank on that memorable day in September, only two did not stay in service until the movement was completed, a tribute to good roads.

Prominent Tradesmen Assume New Duties

Resignations and Promotions Place Workers in New Places

W. E. Hutchison has been appointed manager of purchases of the Denby Motor Truck Co., Detroit, succeeding E. F. Oberlin, who has recently gone into government service. He was formerly purchasing agent for the United States Ball Bearing Co., Chicago.

F. X. Devlin, formerly purchasing agent of the Federal Motor Truck Co. and later purchasing agent and stockholder of the Elgin Motor Car Co., Chicago, has been appointed purchasing agent of the Standard Motor Truck Co., Detroit.

J. A. Stairs has been appointed general superintendent of ordnance production at the Harroun Motors Corp., Wayne, Mich. He was formerly vice-president of the Eastern Steel Co., New Glasgow, N. S., and during the last 3 years has been specializing in ordnance production.

C. B. Gaunt, who left the Paige Motor Car Co., Detroit, to associate himself with another company in January, is now back with the company in charge of the order department.

Walter J. Moore, for the past 2 years office manager in St. Louis for the United States Tire Co. branch, has been transferred to Washington to look after the company's business with the Government.

L. S. James, who has been connected with the automobile business in St. Louis since its beginning, has been made general salesmanager for the Harward Mfg. Co., makers of the Harward piston ring.

Oscar Norris, a member of the staff of the Vesper-Buick Auto Co., St. Louis, departs June 15 for France to take up Y. M. C. A. war work.

A. D. Beach has been placed in charge of the wholesale sales for the Cadillac Automobile Co. of St. Louis.

E. L. Kraemer, Pontiac, Mich., an attorney, formerly of Chicago, has become associated with the Oakland Motor Car Co. to take the position vacated by L. J. Hussey, advertising manager. Kraemer will also direct sales.

Robert M. Gregory has been appointed director of purchases for the Lane Motor Truck Co., Kalamazoo, Mich. He was formerly with the Oakland Motor Car Co., Pontiac, Mich., the Hupp Motor Car Co., and the Packard Motor Car Co., Detroit.

William C. Robb has resigned as purchasing agent of the Detroit Lubricator Co., Detroit, to take a like position with the Detroit Shell Co.

W. I. Denny, purchasing agent of the Davis Mfg. Co., Milwaukee, the motor manufacturing division of the Avery Co., Peoria, Ill., has resigned to enter the military service, being assigned to the ordnance department. He is succeeded by R. Bryant Henning, who has been assistant purchasing agent.

George H. Hunt, former manager of the Detroit office of the Stromberg Motor Devices Co., Chicago, has resigned to become Detroit representative of the Edward G. Budd Mfg. Co., Philadelphia, body manufacturer.

H. G. MacEachen, Pacific coast advertising representative of the Firestone Tire & Rubber Co., Akron, has resigned to join the United States army.

Fred A. Wade has resigned as superintendent of the Buick Motor Co., Flint.

J. G. McHugh has been appointed a special factory representative for the Federal Motor Truck Co., Detroit.

George K. Parson, Detroit manager for the L. V. Flechter Co., Long Island, N. Y., has resigned that position, but has not announced his future plans.

Reo Producing 90 Vehicles a Day

LANSING, June 10—The Reo Motor Car Co. at present is turning out about ninety vehicles per day, of which 55 per cent are trucks. Within 30 days it expects to be turning out its government order for caterpillar tractors.

Campbell To Manage Government Expositions

BOSTON, June 8—Chester I. Campbell, manager of the Boston automobile shows, has been asked by the Federal government to take charge of a number of educational expositions which it is proposed to put on during the next few months throughout the country. He went to Washington to confer with officials there about it, and finally he decided that he would accept the offer. The first exposition will be on the Pacific Coast, and there will be others in big cities from time to time. The details will be placed in Campbell's hands, and he insisted that he be given full power to go ahead without being tangled up in a lot of red tape and departmental orders which might jeopardize the success of the undertakings.

Swaney Company Loses Schilz

FORT DODGE, IA., June 10—Bertrand L. Schilz, for the past 3 years secretary and a director of the Swaney Motor Car Co., Ford distributer, died of pneumonia in an army post hospital at Fort Leavenworth, Kansas, last week. He was but 24 years old and was in the draft increment that left Fort Dodge Feb. 27. After three weeks of training at Camp Dodge he was transferred to Fort Leavenworth, where he was a member of the 31st Engineers company.

Boston Helps Educate Government Mechanics

Dealers Take Army Mechanics Into Their Shops to Work on Regular Overhaul Jobs

BOSTON, June 8—Boston dealers are co-operating with the Federal officials in aiding to train young men sent to the Franklin and Wentworth Institutes to learn about automobile and truck construction and repair. At the Franklin Institute, where 150 young men for the repair section of the army were graduated this week, the soldiers had in addition to the regular equipment, cars and trucks sent by Alvan T. Fuller's service station, comprising Packards and several other makes; some Cadillacs from Albion L. Danforth's repairshop; some Studebakers sent over by Joseph S. Donovan, and some Fulton trucks handled by A. H. Sowers.

Each of these men sent skillful repairmen to the institute, and the soldiers worked under their direction refitting cars and trucks belonging to customers of the dealers. In this way the lads got more thorough instruction than would have been possible had they stuck to the machines owned by the institute. And as there were some 150 men in the section it meant that they could be split up into smaller groups to better advantage.

The Federal government officials sent on some Dodge Brothers cars, some motors of the new Liberty trucks, as well as some new Riker and Packard trucks for experimental purposes. A room was also fitted up for making complete a lot of tin utensils so the soldiers could learn tinsmithing here and do such work abroad.

Stoll Auto Bed and Tent Raised

The Stoll auto bed and tent, made by the Stoll Mfg. Co., Thirty-third and Walnut Streets, Denver, has been increased in price from $48.50 to $54.50 because of increased cost of materials and labor.

Liberty Engine Gives Maximum Horsepower

Advisory Committee on Aeronautics Report Shows Advance of Power per Unit of Weight

WASHINGTON, June 10—The Liberty airplane engine, developing a maximum of 450 hp. at a weight of 825 lb., or 1.83 lb. per horsepower, is 50 per cent more powerful and 25 per cent lighter per horsepower than the average airplane engine in service to-day, according to a statement issued by the National Advisory Committee on Aeronautics. In March, 1918, the Liberty engine developed 432 hp. at a weight of 808 lb., or 1.86 lb. per horsepower. In May, following improvements, the Liberty engine developed 450 hp. at a weight of 825 lb., or 1.83 per horsepower. In 1917 the Liberty 12 was 65 per cent more powerful and 28 per cent lighter per horsepower than the average in service for that year.

The average fuel consumption of the Liberty engine to-day is 0.46 lb. per horsepower per hour.

The committee, in its statement, shows that the Wolseley engine in 1913 could obtain only 147 hp. at 1400 r.p.m. from eight cylinders, 5 in. bore by 7 in. stroke, or 18.375 hp. per cylinder. This is the same size cylinder as that used in the Liberty engine, which now gives 450 hp. at 1800 revolutions from 12 cylinders, or 37.5 hp. per cylinder, which is double the power per cylinder obtained in the Wolseley. The Wolseley weighs 4.9 lb. per horsepower as compared with 2.3 lb. for the Liberty at the same speed of 1400 r.p.m.

The statement explains that the first man-carrying airplane flights were made in 1903 with the Wright brothers engine, developing 12 hp. and weighing 152 lb., or 12.7 lb. per horsepower. In 1910, 7 years later, the average horsepower of airplane engines had increased to 54, and the weight decreased to 5.7 lb. per horsepower. In the following 7 years, 1917, the average power output had advanced to 243 hp. and the weight decreased to 2.8 lb. per horsepower. Again in 1918 the horsepower advanced with the perfection of the Liberty engine to 450 hp. for a weight of 825 lb., or 1.83 lb. per horsepower.

The average fuel consumption decreased from 0.8 lb. per horsepower in 1903 to 0.65 lb. in 1914. Since then it has slowly dropped to 0.55 lb. in 1918, and for the Liberty engine to 0.15 lb. The present Liberty engine consumption is approximately 0.46 lb. per horsepower per hour.

The table herewith shows the advance in the average power and weight ratio by years for the engines in actual flying use. The Langley-Manly engine, built in 1901, developing 52 hp. at 2.9 lb. per horsepower, was apparently 9 years ahead of its time in the matter of power output and 16 years ahead in the ratio of horsepower to weight.

	Year	Horsepower	Weight	Weight Per Hp.
Langley-Manly Engine	1901	52	151	2 9
Original Wright Bros.	1903	12	152	12.7
Improved Wright Bros.	1904	16	180	11.4
Improved Wright Bros.	1905	19	180	9.4
Redesigned Wright Bros.	1908	35	182	5.5
Average on market	1910	54	309	5.7

Liberty 12-cyl. (May)	1918	450	825	1.8

Bijur Interferences Not Allowed

WASHINGTON, D. C., June 8—The United States Patent Office has rendered a decision to the effect that Vincent Bendix is the first and original inventor of all the features and improvements which have made the Eclipse-Bendix starter drive the practical and commercial success that it now is. The decision is an outcome of a series of interference cases in the Patent Office in which interference suits were instituted by Jos. Bijur of the Bijur Motor Lighting Co., the Westinghouse Electric & Mfg. Co., through Frank Conrad, and the Northeast Electric Co., through Edward A. Halbleib. Under the decision, the claims of these concerns for priority of invention are not sustained, the decision being to the effect that they are not entitled to patents on the features claimed.

The decision not only sustains the Bendix patents but deprives Bijur, Westinghouse and Northeast of the right to employ in their devices the construction covered in the Bendix patent.

For a number of years the manufacture and sale of the Eclipse-Bendix drive has been carried on by the Eclipse Machine Co., its sale being handled through Brandenburg & Co.

Hundreds of thousands of this device have been built to date. During the past year, Bijur has been manufacturing a device which under these decisions would be considered an infringing device. Westinghouse and Northeast have not manufactured any device to date but have been purchasing the Eclipse-Bendix drive.

Knutson Heads Duluth Dealers

DULUTH, June 10—H. B. Knutson was elected president of the Duluth Automobile Dealers' Assn. at the annual meeting recently. Other officers elected were: Vice-president, Russell W. Sherman; treasurer, Mr. Foster; secretary, Phil Holgate.

May Combine Showrooms as Coal-Saving Method

Philadelphia Fuel Administrator to Prevent Dealers from Keeping All Salesrooms Heated

PHILADELPHIA, June 10—The probability of union showrooms for automobile Row this winter, to save coal—something entirely new for Philadelphia, if not for the whole country—is put forward by County Fuel Administrator Francis A. Lewis, who says he intends to issue an order very shortly which will prevent the North Broad Street dealers and agents from keeping all their showrooms heated during the cold months. Country clubs, other pleasure institutions and churches will come in for restrictive orders in kind, according to Mr. Lewis.

"Automobile dealers and agencies will have to maintain two, three, or possibly more union showrooms, or live in the cold during business hours," said Mr. Lewis.

"Private Consumers First"

This attitude has been taken, it was explained, in order to prevent Philadelphia homes this winter from suffering through a scarcity of anthracite, such as prevailed the last two winters—notably last year, when several incipient riots started in localities where yards had been emptied of coal. The county fuel administrator's slogan now is "private consumers first," and public, or semi-public institutions, except schools, hospitals and the like, will not receive what heretofore has been regarded as their normal supply until any threatened coal scarcity has been averted.

Dealers and agents seen regarding the "union showroom" proposition appeared skeptical, and in most cases said it was too hot just now to talk about shivering in merger showrooms next winter.

Willys-Overland War Profits Over $7,000,000

TOLEDO, June 8—President J. N. Willys stated at the annual meeting that the company's profits on war business should run between $7,000,000 and $8,000,000, or within 20 per cent of the 1917 manufacturing profits. There is little doubt that in the second quarter alone Willys will earn its entire preferred and common dividends for the year. Willys also stated at the meeting that for this new business separate departments and organizations have been created, so that there would be no factory or financing readjustments this year.

The company produced and shipped 1004 airplane motors last month and will ship as many during this month. A contract for 3000 gun carriages has been received by the company, deliveries on which will begin this quarter. It also has a contract totaling $10,000,000 for machining 8-in. shells, which it is peculiarly well able to handle.

Class B War Trucks Move Shipping Board

Haul 600 Tons of Office Equipment from Washington to New Home in Philadelphia

WASHINGTON, June 8—Hauling 600 tons of office files and equipment from Washington to Philadelphia, and returning from there with 600 tons of Quartermaster supplies, 140 Class B standardized war trucks are demonstrating the possibilities of both motor truck express and return loads.

The trucks under guidance of the Quartermaster department began the moving of the Shipping Board offices last week. The board, occupying thirty-four office buildings and employing 3000 workers, is moving to Philadelphia. The need for speed and the lack of time allowance involved by ordinary railroad freight transportation stimulated the board to seek the fastest shipment scheme. It called upon the army for aid with the result that the Class B war trucks operating in four convoys are performing the work.

The first convoy, coming here from Baltimore early Friday, May 31, arrived at the Shipping Board main office building at 5 p. m. It comprised thirty cargo trucks, two oil and gasoline tank trucks, a light Dodge repair car, a Dodge roadster and a Dodge touring car. Loading of the cargo commenced at 5 p. m. and was completed at 11 p. m. when the trucks moved out of the capital toward Philadelphia. They arrived at Baltimore at 3 a. m., took on spare parts, and left at 4.45, losing time in finding the right road out of the city. At 8 p. m. they reached Philadelphia, discharged the cargo and parked the trucks before midnight, making the complete job of loading in Washington, covering the entire journey and unloading at the destination, in less than 24 hours, work involving 4 to 8 days by the fastest railroad freight. Much time was lost by the first convoy owing to the drivers' unfamiliarity with the roads. Later convoys are cutting the time several hours. The running time for 167 miles was 15¾ hr., an average of 10 m.p.h., with a gross average of 7.6 m.p.h.

After resting at Philadelphia, the convoy took on a load of 100 tons of Army supplies for Camp Holabird, Baltimore, and started its return trip early to-day. Since it left Washington three other convoys have loaded and moved more of the office equipment. The second convoy left here June 1 at 8 a. m. The third left June 1 at 1 p. m. and the fourth at 8 a. m. to-day. The second and third convoys have already reached Philadelphia, discharged their cargoes, taken on Army supplies and started the return trips.

This plan of carrying the furniture to Philadelphia and returning with Quartermaster supplies will be continued for about 10 days, by which time it is expected that equipment belonging to more than 500 offices in Washington will have been transferred to Philadelphia, while more than 2500 tons of Army supplies will have been hauled from Philadelphia to Baltimore.

The trucks carry their mess with them and stop on the road for meals, the men being served quickly at the mess wagon to avoid loss of time. The gasoline tank wagons operate whenever necessary to maintain the supply of both gasoline and oil, and also save the time which would be lost in stopping for gasoline at cities along the route.

The log of the trip of the first convoy follows:

Leave Washington, May 31	11.00 p.m.
Arrive Baltimore, June 1	3.00 a.m.
Leave Baltimore	4.45 a.m.
Arrive Newark, Del.	2.10 p.m.
Leave Newark, Del.	2.40 p.m.
Arrive Wilmington	3.40 p.m.
Leave Wilmington	5.15 p.m.
Arrive Philadelphia	8.00 p.m.

New York's Record Registration

ALBANY, N. Y., June 8—New York state had 76,064 more motor cars registered from the first of the year to May 20 than for the corresponding period of last year, according to the records of the secretary of state's office. The increase has not been confined to any particular section, but has been general extending from the metropolitan district to the smallest hamlet and agricultural sections. Up to May 20 Secretary Hugo had registered 392,951 motor vehicles, exclusive of motorcycles, as compared with 316,887 for the correponding period of last year. The total number registered for last year was 411,567 and about 1400 cars are being registered daily.

Canada Puts Up Bars Against Automobiles

All Cars Costing More Than $1,200 May Not Be Imported Without a Special License

NEW YORK, June 8—Canada has definitely placed automobiles costing more than $1,200 in the luxury class. Under the terms of an Order-in-Council it is forbidden to import automobiles costing $1,200 or more f.o.b. the point of manufacture without a license from the Ministry of Munitions recommended by the War Trade Board. This virtually amounts to an embargo.

The Order-in-Council includes automomiles among nearly 1000 other articles which are classed as being non-essential during the continuance of the war. The action appears to have been taken primarily as a means to protect Canadian industries and not by reason of lack of transportation or for other reasons.

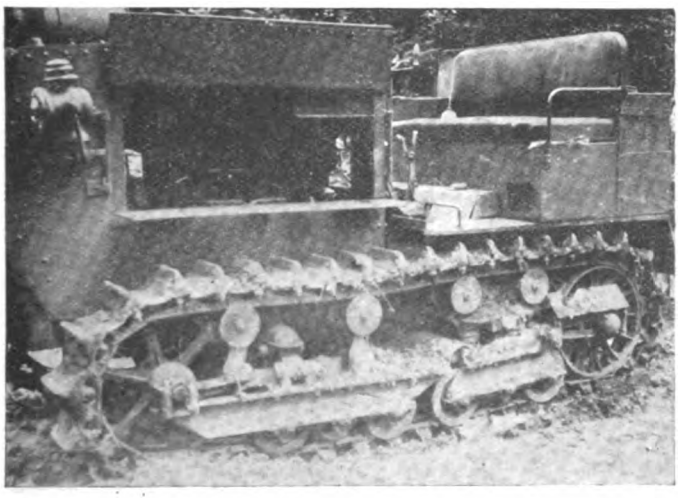
Canadian Importations

During the 10 months ended in April, 1918, Canada imported from the United States 11,700 automobiles valued at $9,098,439 and 849 trucks valued at $1,096,492. For the month of April Canadian imports from the United States reached 1815 automobiles valued at $1,574,821, and 142 trucks valued at $208,998. During the calendar year of 1917 Canada imported 16,438 American automobiles valued at $12,401,705.

Canadian import duties at present are very heavy. In addition to the regular duty of 35 per cent there is an extra import duty of 11½ per cent as well as a special internal revenue tax of 10 per cent.

New Series for United Motors

GRAND RAPIDS, June 10—The United Motors Co. will in five weeks start production on a new series of models, including 1½-, 2½-, 3½- and 5-ton capacities. The models will be ready for shipment in 60 days, according to the company. It is estimated that an output of 50 trucks a month will be maintained. The prices of the models have not as yet been determined.



When the trucks arrived at the Washington offices, the equipment was ready to be loaded

Hauling a 5-in. howitzer mounted on a gun carriage, the tractor had no difficulty in clearing lugs and climbing through trees

Urge Establishment of More Rural Expresses

Truck Committee of N. A. C. C. Is Working to Have These Lines Throughout the Country

NEW YORK, June 10—The National Motor Truck Committee of the N. A. C. C. has commenced active work to assist in the establishment of rural motor express lines throughout the United States.

As a starter the committee has issued a series of pamphlets giving in detail a list of services to be rendered by such lines, scale of charges, a simple cost sheet, suggestions for the preliminary survey of roads and canvass of prospective customers, operating plans and general suggestions.

District representatives are being appointed in all of the principal centers and the committee has undertaken to interest in the movement the 115 motor vehicle manufacturing members of the chamber and between 30,000 and 40,000 dealers.

Members of the association have been asked to write letters to 25 dealers each by way of increasing interest in the establishment of these routes, which will mean an increase in the number of trucks sold as well as serving a useful and patriotic service in increasing the distribution of food products.

Following are the names of men who have been requested to act as district representatives:

C. E. Griffin, Pres., Wheeling District Automobile Dealers' Ass'n, Wheeling, W. Va.

C. G. Powell, Secy. and Treas., Omaha Automobile Trade Ass'n, Inc., Omaha.

J. J. Gibson, Secy., Buffalo Automobile Dealers' Ass'n, Buffalo.

Paul LeHardy, Secy., Rochester Automobile Trade Ass'n, Rochester.

H. T. Gardner, Syracuse Automobile Dealers' Ass'n, Inc., Syracuse.

A. A. Ledermann, Pres., Utica Motor Dealers' Ass'n, Utica.

H. A. Bonnell, Secy. and Treas., N. J. Automobile Exhibition Co., Newark.

H. W. Bonnell, Secy., Milwaukee Automobile Dealers' Ass'n, Inc., Milwaukee.

B. R. Webb, Pres., San Antonio Automobile Trades Ass'n, San Antonio.

H. O. Brunton, Pres., Cincinnati Automobile Dealers' Ass'n, Cincinnati.

J. M. Gasser, Pres., Toledo Automobile Dealers' Ass'n, Toledo.

J. S. Fassett, Pres., Philadelphia Auto Trade Ass'n, Philadelphia.

W. C. Brown, Pres., Western Automobile Trade Ass'n, Denver.

Geo. D. McCutcheon, Pres., Atlanta Automobile Ass'n, Atlanta.

W. G. Tennant, Secy., Chicago Automobile Trade Ass'n, Chicago.

Bruce M. Wylie, Pres., Indianapolis Automobile Trade Ass'n, Indianapolis.

Dean Schooler, Pres., Des Moines Automobile Dealers' Ass'n, Des Moines.

W. H. Imes, Pres., Automobile Trade Ass'n of Kansas, Topeka.

Prince Wells, Pres., Louisville Automobile Dealers' Ass'n, Louisville.

H. B. Chandler, Secy., Portland Automobile Dealers' Ass'n, Portland, Maine.

Chester I. Campbell, Secy., Boston Commercial Motor Vehicle Ass'n, Boston.

H. E. Pence, Pres., Minneapolis Automobile Trade Ass'n, Minneapolis.

E. E. Peake, Secy. and Treas., Kansas City Motor Car Dealers' Ass'n, Kansas City.

E. V. Stratton, Hudson Motor Car Co., Albany.

F. W. A. Vesper, Vesper-Buick Co., St. Louis.

Frederick H. Caley, Hollenden Hotel, Cleveland.

A. L. Boorse, Pres., Birmingham Automobile & Accessory Ass'n, Birmingham.

J. Walter Drake, Hupp Motor Car Co., Detroit.

M. S. Bulkley, Autocar Sales & Service Co., San Francisco.

H. E. Mitchell, San Francisco.

W. S. Gilbreath, Detroit Automobile Club, Detroit.

Continental Receives Part of Government Order

DETROIT, June 8—Of the order for 8000 Class B motors placed by the Government, the Continental Motor Co. has received a considerable portion. Deliveries will begin from this plant by July 1.

Standardized Tractor Put Through Its Paces

Successful Demonstrations Held in Washington Show Ease with Which Feats Are Performed

WASHINGTON, June 10—There was held here last week a demonstration of the standardized 5-ton artillery tractor recently designed and completed by the Ordnance Department. Secretary of War Newton D. Baker, General Peyton C. March and many Senators, Congressmen and British and French army officials were present. The tests, which were successful, were held in a ravine in an outlying section of the city, where the mud was 12 to 16 in. deep.

The tractor, including the Liberty Class B truck engine with an overhead valve arrangement, is being manufactured by the Maxwell and Reo companies. It weighs 9000 lbs. and carries smooth chains for driving over pavements, and is so arranged that lugs can be attached to the driving chains in 15 minutes by 4 men, to enable it to pull through mud or obstacles. There are 14 lugs in contact with the ground at one time.

The engine develops 55 hp. and propels the tractor at from 2 to 12 m.p.h. Six thousand of the tractors have been ordered, and several have been completed and undergoing tests for some time. The one used in the demonstration to-day has more than 3000 miles of service to its credit.

During the tests the tractor, hauling a 6-in. howitzer on a gun carriage, climbed down and up a 45-deg. grade. In the climb up two tractors of the same type were used, the one, camouflaged, also exhibiting turning powers by revolving at high speeds in the brush and grass. Other tests included climbing through trees, over logs and through mud where the gun carriage wheels sank up to the hubs.

Return Loads Developments

Philadelphia, Detroit and New York Perfecting Their Organizations

PHILADELPHIA, June 9—Development of the Return Loads Bureau of the Philadelphia Chamber of Commerce has reached the point where 150 owners of motor trucks doing inter-city hauling have registered with the bureau and indications are that this city is to become the distributing point for an increasingly wide manufacturing and agricultural area. Philadelphia truck owners will be represented at the meeting of Return Loads Bureaus to be held in New York Thursday and Friday, the object being to co-ordinate the work of the various bureaus along the Atlantic coast and to adopt a uniform system of operation. The most important question to the Philadelphia truckmen just now is that of through traffic. It is expected that arrangements will be made whereby shipments from Philadelphia to Boston can be transported to New York by a regularly established line which will take them to New Haven, or Hartford; here by another transfer they can be placed on trucks bound for Boston. In this way it is assumed that thousands of tons of through freight can be handled at minimum expense by auto truck delivery. Short lines now confined to the transportation of merchandise from one city to another thus will be utilized in through traffic service under the proposed transfer system.

Detroit's Return Loads Bureau Meets Difficulties

DETROIT, June 8—The Return Loads Bureau is experiencing some difficulty in getting started. The response from the truck men has not been as expected. Only a few have expressed a desire to co-operate with the movement. A letter was sent to all the shippers in this territory advising them of the existence of the bureau and asking them to take advantage of its services. The letter follows, in part:

Complying with a request made by the Council of National Defense, a Return Load Bureau has been established in Detroit. Arrangements have been completed for an exchange of service to points in the State and to transit points in other States. The effort of the Bureau is to relieve freight congestion by a greater use of motor truck highway transport.

The Transportation Department of the Board of Commerce urges the largest measure of co-operation and use of this service.

The Bureau is in charge of John McNally . . . If you wish to send a load by truck to any point notify the Return Load Bureau and an effort will be made to obtain a return load for your truck. . . . No charge is made by the Bureau for its service at present. It will assume no obligation or risk, merely serving as a bureau of information, bringing together the truck and the person wishing to have goods moved. Rates are left to the shipper and truckman. Similar service is being established by boards of trade and chambers of commerce throughout the country, and the success of the idea seems to lie principally in the extent to which the service is used.

McNally states that the reason the return loads movement is not meeting with greater favor here lies in the fact that there are not enough cities in this immediate territory that have very much intercity freight transportation as compared with the eastern cities, where the idea is meeting with greater success. More large cities are contained within a certain area in the east than exist in this section in an equal area. This, according to McNally, accounts for the slowness with which the bureau is being organized here.

Pittsburgh Branch for Miller

PITTSBURGH, June 10—The firm of Stewart & Harper, wholesale distributers for the Miller Rubber Co., Akron, having been dissolved and the Miller tire business in Pittsburgh having assumed unexpectedly large proportions, the Miller Rubber Co. has established a direct factory branch in that city. It is managed by S. S. Stewart, formerly of Stewart & Harper, and is at 5968 Baum Boulevard.

Return Loads Meeting, New York, June 13

WASHINGTON, D. C., June 10—In conjunction with the Highways Transport Committee of the Council of National Defense in Washington, D. C., the Return Loads Bureaus organization in New York, Connecticut, Rhode Island, Massachusetts, New Jersey, Pennsylvania and Delaware will hold a one-day meeting in New York City on June 13 for the purpose of correlating the work of the bureaus in those states. The meeting will begin at 10 a. m., and will be held at the New York City Return Loads Bureau, which is located in the Merchants Assn. offices in the Woolworth Building.

The purpose of the meeting is to secure better co-operation from the different bureaus along the Atlantic seaboard. While most of the bureaus have been able to get loads going out of their own cities, they have not been able to get return loads for their trucks from other cities, and it is hoped that one result of the meeting will be some plan whereby greater incoming loads can be secured.

Overland and Curtiss Get New War Business

TOLEDO, June 10—It is reported that nearly $25,000,000 of new government business has been obtained by the Willys-Overland Co. and the Curtiss Aeroplane & Motors Co. the nature of which has not yet been disclosed. According to a statement made by John Willys, an average of 20 planes and 4 flying boats are being produced daily by the Curtiss and Overland companies. To date the plants have built between $5,000,000 and $6,000,000 worth of airplanes and flying boats for the United States and the Allies.

Durant Enters Saginaw Iron

SAGINAW, MICH., June 7—W. C. Durant and his associates have taken most of the additional $250,000 representing the increased capitalization of the Saginaw Malleable Iron Co., which now has a capital stock of $750,000. The present capacity of the plant will be doubled upon completion of a new foundry building, 400 x 136, connecting the present unit, making a structure, 875 x 136. Other auxiliary buildings will be erected, and two new furnaces will be added. The present working force of over 300 will be doubled, and the daily output of 65 tons of castings will be increased to 130 tons. Almost the entire plant is at present engaged in work for the ordnance department, supplying malleable castings for the head and base of the Stokes trench mortar shells which are being assembled at the Marquette plant. The following officers were elected at the annual stockholders' meeting: President and general manager, C. F. Drozeski; vice-president, W. J. Wickee; treasurer, George E. Hannum; secretary, Julius B. Kirby; assistant general manager, Donald A. Drozeski.

A New Type Super-Six

This is the Hudson Runabout Landau, distinctively a Hudson creation. The new car of the year.

It is just the model for the owner who frequently does his own driving, who wants a car of the cabriolet type, or an open roadster. Its wonderful riding qualities over rough roads make it the car for men who make many trips from one town to another.

No car built by any maker this year is quite as distinctive as this Super-Six. It is exclusively Hudson.

FRANKLY, we are not now in a position to add to either the Nash passenger car or Nash truck dealer organizations. However, when the entire volume of our production is again available to buyers, both these Nash franchises should prove most attractive to dealers who desire to profit from a large volume of sales of passenger cars and trucks of such high value as the Nash.

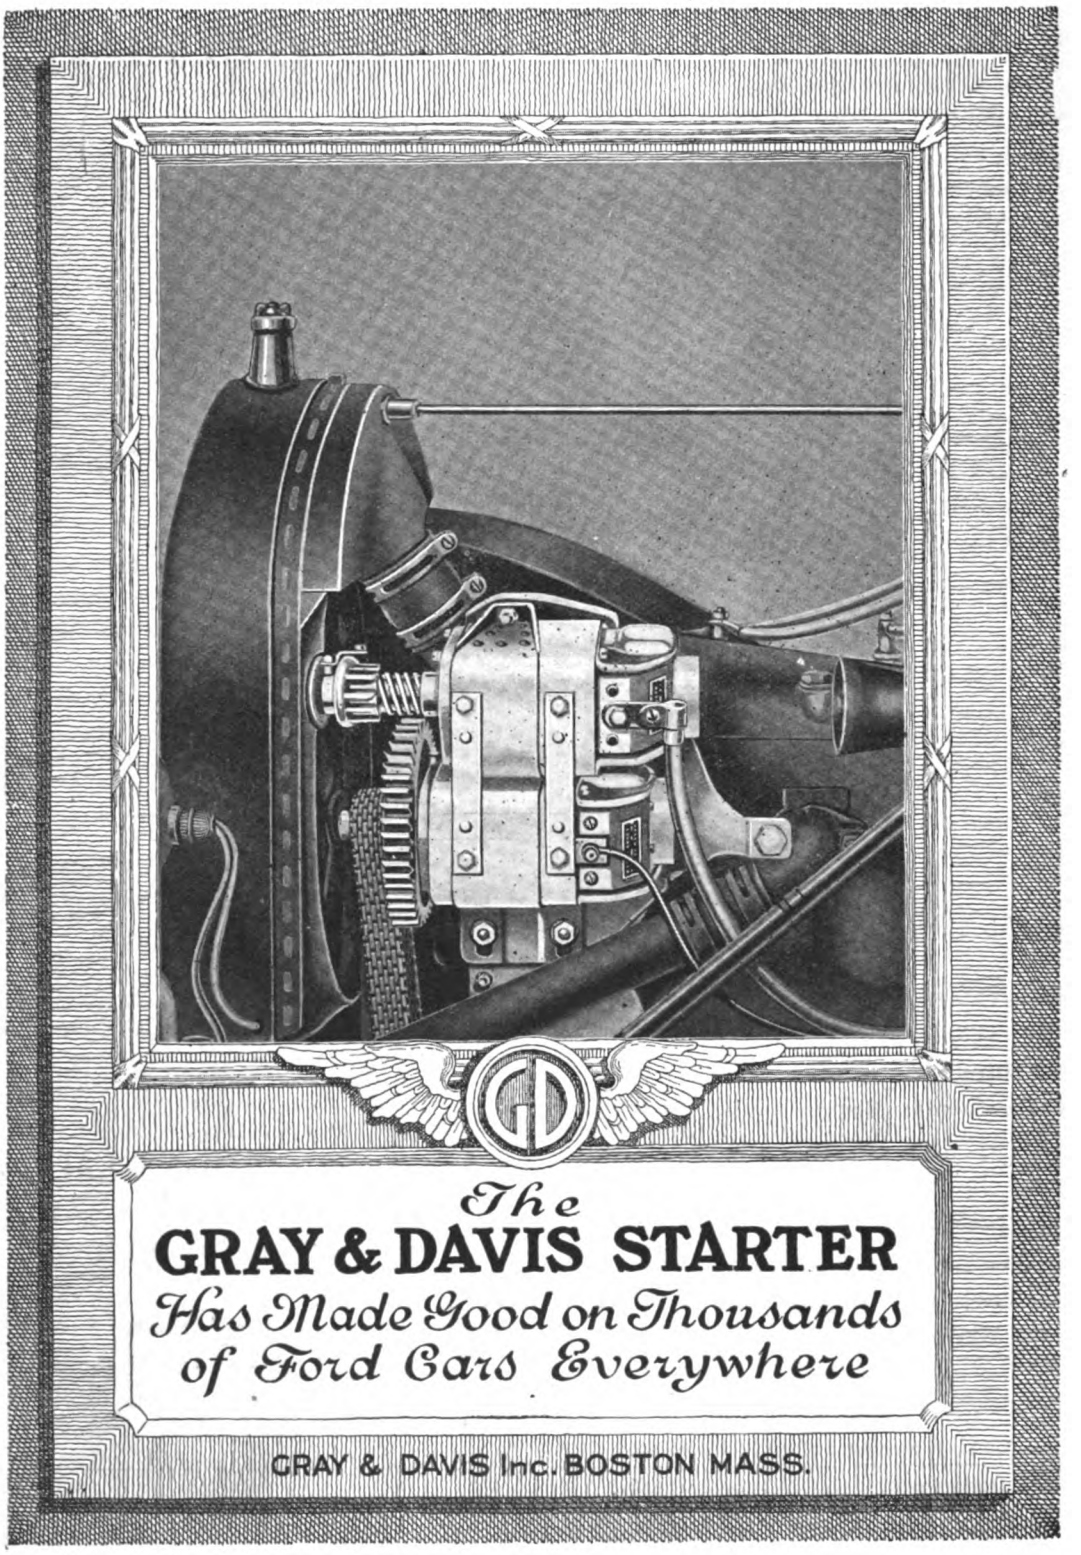
"NORMA"
PRECISION
BALL BEARINGS
(PATENTED)

In men and in mechanisms carrying burdens of responsibility, failure is the one unpardonable sin. The pleading of unpreparedness is no excuse—least of all, when a desire to save a little money lies at the root of that unpreparedness. To succeed—to be adequate—to meet responsibilities—are essentials beside which cost cannot be considered.



"NORMA" Precision Bearings—even at a slightly higher cost—are considered essential factors in assuring that dependability in service which the makers of ignition apparatus and lighting generators feel themselves obligated to incorporate in their products—upon which rests so heavy a burden of responsibility for the nation's success.

Jobbers Going Ahead With Their Fall Exhibit

Will Stage Automotive Trade's First Business Function at Same Time as October Convention

NAME MAY BE CHANGED TO INTERNATIONAL AUTOMOTIVE EQUIPMENT ASSOCIATION

Pair of Socks Brings $10,255.50 for Red Cross at Hot Springs Meeting

By Ray W. Sherman

HOT SPRINGS, VA., June 13—The National Association of Automobile Accessory Jobbers, which has been talking for some time about holding a trade exposition next fall, definitely decided, at its summer meeting at the Homestead Hotel, to go ahead with the project.

The convention and exhibit will be held in Chicago, Oct. 28-Nov. 2 inclusive.

The organization also began a move which likely will result in the change of its name to International Automotive Equipment Association.

Not the least of the achievements of the convention was the sale of a pair of Red Cross socks for $10,255.50. They were knit by Mrs. Ludwig Wolff, mother of Mrs. T. M. Brooks, Chicago. The highest bidder was Robert A. Stranahan, president of the Champion Spark Plug Co.

His actual investment was 40 per cent of the $10,255.50, he offering to put in two-thirds of all that has been contributed. Everybody who bid paid his money and was entitled to a pair of socks, but inasmuch as there was only one pair they were presented by Stranahan to the association.

George Woelfel, Jr., secretary to Commissioner Webster, sure did excell as an auctioneer.

The big topic, of course, was the automotive equipment exhibit to be held in Chicago, Oct. 28 to and including Nov. 2, at the same time that the convention is held. The association considered this exhibit one of the biggest forward steps it has taken since the organization was formed. The exhibit will be strictly a trade affair and will at no time be open to the public. No admission will be charged. Admission will be by card.

It is proposed to hold the exhibit at the same location as the convention and an effort will be made to have luncheon facilities at the same place so that the trade can spend the entire day at the meetings.

The Medina Temple in Chicago is most prominently mentioned as the place of the exhibit, although it has not definitely been selected.

While the details have yet to be worked out, the tentative plan is that the business sessions of the association shall be held in the morning, at which time the exhibit will be open to dealers. At noon the business sessions will end and during the afternoon the exhibit will be open only to jobbers and manufacturers. This will enable those interested to transact business with the least possible delay and confusion, in that all those in the building in the afternoon will

Digitized by Google

Commissioner William M. Webster and a bunch of mountain laurel

be known to be manufacturers or jobbers and their direct representatives. Nothing has been decided as to whether the exhibit will be kept open during the evening. This probably will be determined later according to the desires of the members.

There was considerable discussion as to whether the exhibit should be run along open or closed lines. There were some who wished to confine it to the members of the association, and an interesting convention fight seemed in prospect on this and certain other points, but with little difficulty harmony was effected and the majority and minority united on the open show basis. This means that manufacturers other than those belonging to the association can enter the exhibit. However, members of the organization will be given first choice, and because the membership is large, it is unlikely that there will be much space available for outsiders. Were any other plan followed, it was believed, there might be many members who would be unable to enter an exhibit which they themselves were helping promote. A great many applications for space have already been received, and indications are that the space allotment will be oversubscribed by a large percentage long before the exhibit opens.

Boost Trade Generally

The great advantage of the exhibit is, of course, that it will set the automotive equipment business ahead by several months. As things stand now jobbers are unable to issue their catalogs until after they have seen the goods that are displayed at the various winter shows. This causes the catalogs to be issued about April. Dealers will not stock up until the catalogs are in their hands, which means that spring and summer stocks which should be secured in the winter are not ordered until late in the spring. with the result that the manufacturers and jobbers have to carry a big peak load of production and stock during the winter months. If the idea of the exhibit proves successful the jobbers will be able to meet the manufacturers at the end of October and will be able to issue their catalogs about Jan. 1, which is the time they should appear.

There was also discussion as to whether the exhibit should be operated for profit or not for profit. The majority were of the opinion that it should not be a profit making enterprise and only such revenue being levied via the sale of space, etc., as will meet the expenses of the project, and leave a safe margin for the organization's exhibit fund.

Committee to Manage

The management of the exhibit has been turned over to a committee of three

Those $10,000 socks that were knit by Mrs. Ludwig Wolff and which brought a fine fat sum for the Red Cross at auction. That lady is Mrs. Wolff

manufacturers and two jobbers, who will supervise the affair and employ a manager. This committee consists of L. P. Halladay, L. P. Halladay & Co., Streator, Ill.; William K. Norris, McQuay-Norris Mfg. Co., St. Louis; George L. Brunner, Brunner Mfg. Co., Utica, N. Y.; R. R. Engelhart, Sieg Co., Davenport, Iowa, and Sidney F. Beach, Motor Car Supply Co., Chicago, president of the association. The first three are the manufacturing members of the committee and the last two the jobbers. The manager has not been chosen. The committee plans to hold its first meeting in Chicago June 26.

It was decided at the convention on Thursday morning that all the spaces that have been allotted in consequence of letters previously written Commissioner Webster's office will be disregarded and that new application blanks will be sent out. Applications will be returned in due course and then the spaces will be allotted in the matter of preference as per drawing by numbers out of the hat. This allotment of space will be taken care of by a drawing by the show committee.

May Change Name

That the name of the exhibit is "Automotive Equipment Trade Exihibit" is somewhat of a forerunner of a change in the name of the association itself. The members consider that the word "accessories" is a belittling term and indicates that the goods the jobbers sell are something that are not essential to the operation of cars and other automotive vehicles, whereas a majority of the merchandise jobbed in the trade consists of supplies and equipment that are needed in keeping cars in continued operation. For this reason the word "accessories" will likely be dropped and the term "equipment" substituted. The new name, as proposed, is "International Automotive Equipment Association." It will be accepted or rejected at the October meeting.

The word "automotive" is chosen because the jobbers are supplying the trade which deals with many other things than automobiles, tractors, trucks, including farm lighting outfits, gas engines and other automotive apparatus.

Also the association from its beginning has been more than a "national" organization. It has a strong and active membership in Canada and at its present session took in a member from England

W. I. Ralph, Motor World; Gregory Flynn, E. A. Cassidy Co., New York

Frank Chase, Frank Mossberg Co., Attleboro, Mass.

J. S. Spargo, Howe Mfg. Co., Chicago

who has branches throughout the British Empire. Because of this international character and the other phases of nomenclature mentioned, it is likely that the October convention will amend the constitution to change the name to International Automotive Equipment Association.

Change Annual Meeting

The experience of the association has been that it is difficult to hold a successful convention in the same city as either of the annual automobile shows, during the continuance of these shows, because members are constantly called away from the convention by business and proceedings are somewhat disrupted.

It was, therefore, proposed and carried that the annual meeting be held in the fall, and that the terms of officers be made to begin at that time. Under that arrangement the officers who are now serving and who took office last winter will serve less than a full year during 1918.

One of the members suggested that it is unfair for a jobber to place a blanket order with a manufacturer and then refuse specifications or shipping dates. This compels the manufacturer to purchase raw materials and make up all or part of the goods and hold them at his own expense while the jobber makes up his mind whether he is going to take them.

The association is to issue a monthly bulletin, the object of which is to give members information on the good work that is being done by the various local associations of jobbers in order that all the locals may operate to best advantage.

Ways and Means Trip

One of the things which has served to benefit the association is the Western trip made between Feb. 16 and March 16 by the committee on Ways and Means to Dallas, San Antonio, El Paso, Los Angeles, San Francisco, Portland, Tacoma, Seattle and Spokane.

Complaint was made that jobbers sometimes refuse to pay invoices because the goods have not been received, and it was pointed out that delays in shipment are not at all the fault of the shipper and that invoices should be paid according to the agreed terms regardless of any shipping troubles that might arise.

Free Samples

An abuse which hadn't been stepped on very hard until the present convention is that of manufacturers giving free samples and prize packages. These are given sometimes to the jobber and sometimes to the jobbers' customers, and virtually amount to a cutting of price and an unfair inducement to make purchases. The convention went on record as being opposed to this practice.

George Fritz investigating himself

A. J. Picard bawling himself out

Mention also was made of the efforts of certain groups of dealers, especially Ford dealers, to combine their purchases and get jobbing prices from manufacturers. This was classed as being "not a stable and reliable method," and manufacturers were reminded that the trade is not benefitted if they "let their eyes be dazzled by the bright light of quantity."

The importance of "selling" the association to dealers and to jobbers' salesmen was emphasized, and importance was placed upon the necessity for making jobbers' salesmen into an enthusiastic missionary band for the organization.

That Bill Collector

There were both interesting and serious sides to the assertion that some of the jobbers have resented the use of the association's collection bills upon themselves when they failed to meet their obligations to manufacturers for various reasons. One jobber is said to have paid his bill and to have cancelled all his orders because the association's collection machinery was used upon him. The majority were of the opinion that the jobbers who so acted are unfair and that any member should be permitted to make any legitimate use he sees fit of the collection department.

The members were very much interested in a universal closing plan that is being operated on the coast. The jobbers there have agreed to shut up their places entirely between 12 and 1 at noon, which permits everyone in the building to be absent at noontime and all to return together, causing what the jobbers state is a minimum disruption of the business day. They have also agreed on simultaneous vacations for their traveling men from Aug. 1 to 15, during which period dealers who desire goods will order direct, and the vacation period will be over with a minimum of confusion and dissatisfaction as to dates.

Bulletins by Locals

One of the local associations recently in endeavoring to put over a point of which it was in favor sent bulletins to the entire membership of the association. It was suggested that this should not be done without the approval of the commissioner's office and that whenever possible the machinery of the commissioner's office be used in sending out such information.

5,000 Members In 90 Days

National Automobile Dealers Association Begins Big Campaign

IT WANTS YOU

THE National Automobile Dealers Association has started a campaign to get 5,000 members in 90 days.

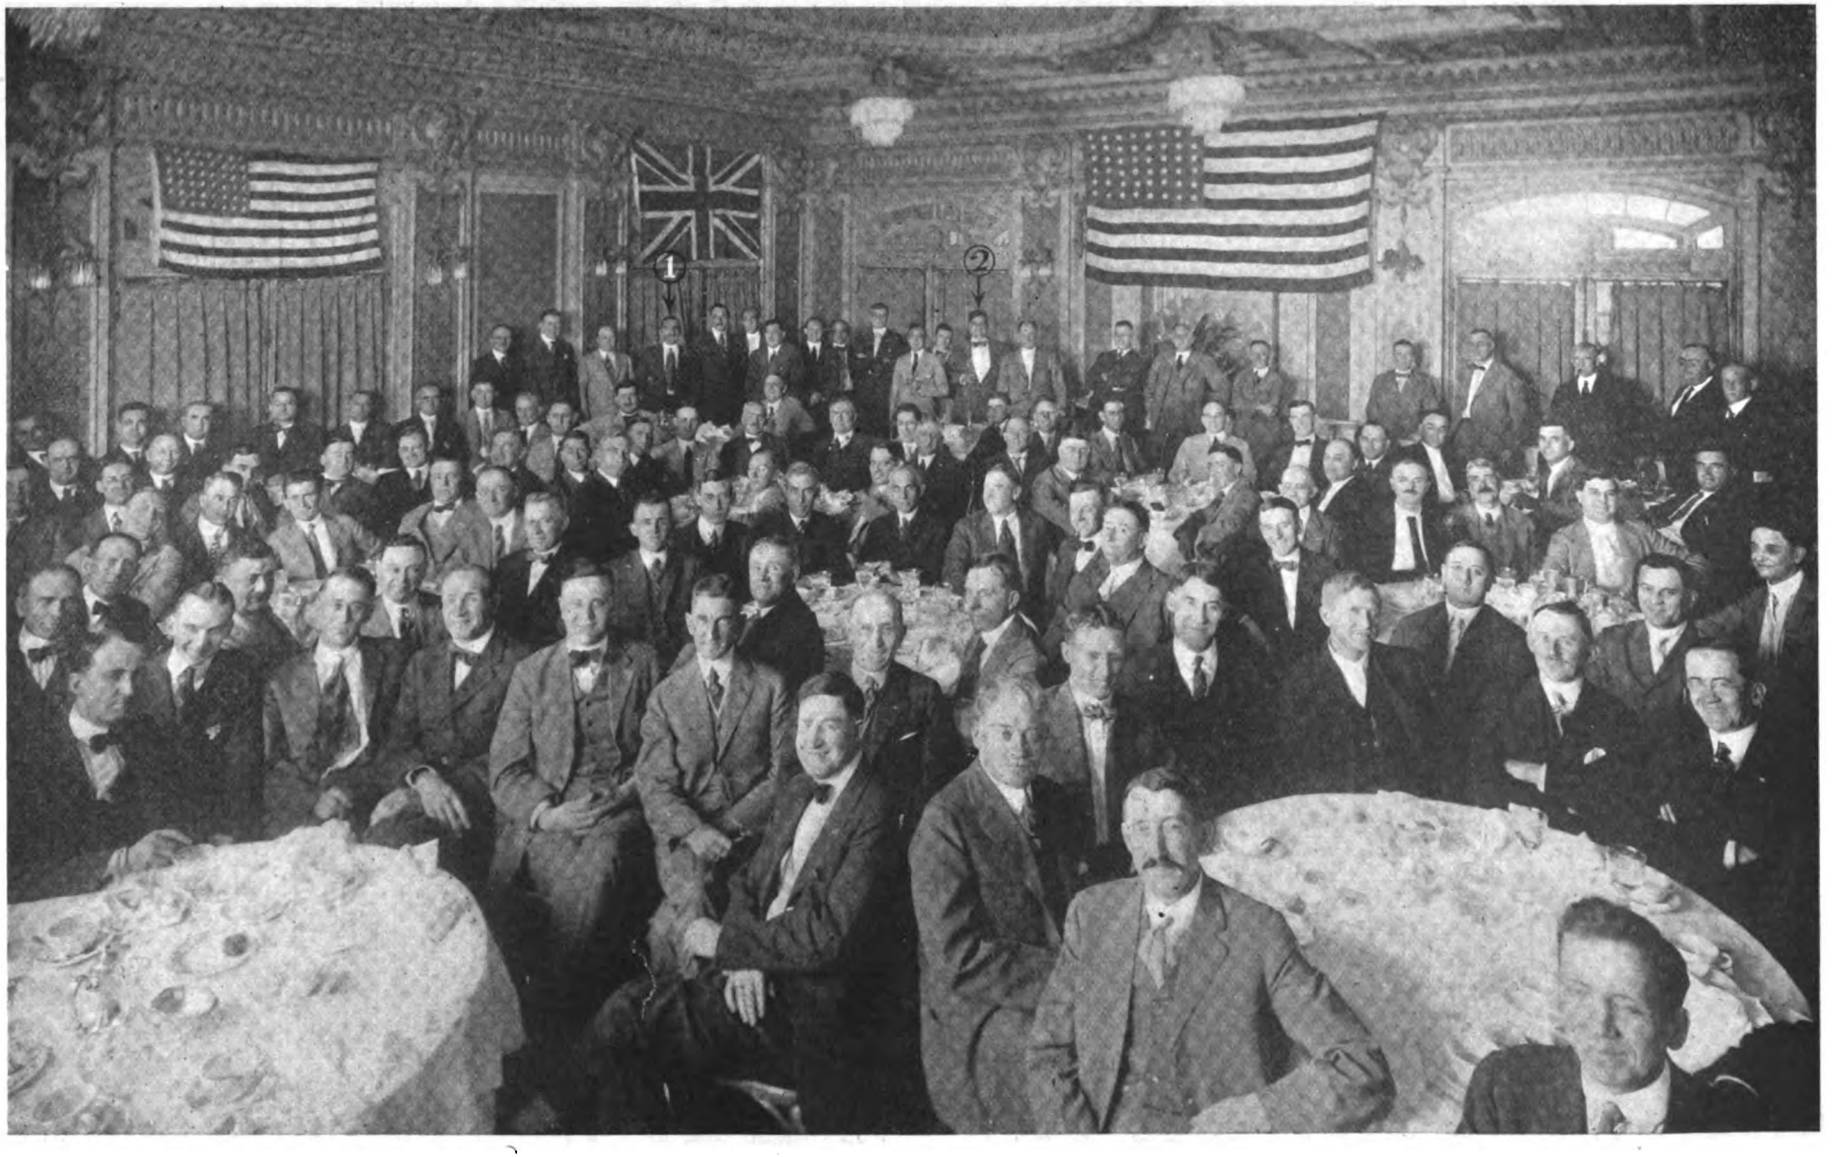
It held a meeting of delegates from nearly all the principal cities in the United States in Chicago last Friday and Saturday.

It has prepared plans which will give the association a representative in every county in the United States.

Every car dealer in the United States will be asked to join.

The work of handling this immense campaign has been placed in the hands of E. E. Peake, secretary-treasurer of the Kansas City Motor Car Dealers Association and president of the National Association of Automobile Show Managers.

Peake will spend only a small part of his time at his own office at 909 Gloyd Building, Kansas City, and will make headquarters at the office of President F. W. A. Vesper, 3550 Lindell Boulevard, St. Louis.



During most of the next ninety days both President Vesper and Executive Secretary Peake, with other association officers and supporters, will travel over the whole United States delivering addresses to dealers in different territorial centers.

All that is required for membership in the organization is that a man be a dealer in cars and pay $15, which covers an initiation fee and dues for the first year.

There is dire need for strengthening of the organization at this time, conditions that no one can foresee are likely to arise. (*Continued on page 16*)

National Automobile Dealers Association in War Convention

Following the adoption of the N. A. D. A. War Service Committee's conservation plans, the association launched into an intensive membership campaign which it is planned will bring 5000 or more members in 90 days or less. No. 1 is President F. W. A. Vesper, St. Louis, Buick distributer and a veteran of the trade. No. 2 is the new executive secretary, E. E. Peake of Kansas City, who has been placed in charge of the membership campaign. This is the most representative gathering of dealers ever held. The men are all leaders in their localities, many are local association officers and all have pledged themselves to get behind the big "5000 in 90 days" movement

Digitized by Google

There is a gross misunderstanding on the part of the public and officialdom in general as to the character of this business, and millions of dollars have already been lost to dealers because so many people have considered the car a non-essential, and have taken a swat at it on every possible occasion.

Considerable has already been done by President Vesper and the officers of the association in remedying this condition. They have spent a great deal of their own time and money in fighting the cause of the dealers.

They have reached the point where they feel the need of more backing—of greater numerical strength. And they should get it.

Inasmuch as this association is fighting for the interests of every dealer, every dealer should belong to it. The dues are nominal; $15 is a mighty small investment for the protection this organization can give. The one great need the association feels is membership.

If it is going to be a strong national organization it must have 5,000 members within the next ninety days.

It has got to get them, and get them quick! It needs you.

This means that every dealer who reads MOTOR WORLD should at once send his check to this association at the office of President Vesper in St. Louis—3550 Lindell Boulevard.

The Board of Directors of every association in every city should meet at once and select from the association their five fastest working men. These men should be constituted a Committee on Organization for the territory in which those dealers distribute.

The directors should then call a meeting of the whole association and arrange to sell them on the idea of this extended organization.

At this meeting the names of this committee should be announced.

This committee should then name a committee in every county in the territory, these committees to be made up of the livest, fastest working men. Men must be picked who will get results, regardless of what car they handle or how long they have been in business.

These county committees should then get to work and sell the organization to all the dealers in the county. This can be done through local meetings and personal solicitation. The county chairmen should turn their memberships over to the central committee in the distributing center, which should wire Executive Secretary Peake of the number secured and immediately forward the application blanks and checks.

In order to promote this work many meetings of dealers will be necessary. Cleveland is going to hold one to which all the dealers in Northern Ohio will be invited. Harrisburg, Pa., has one on the schedule. There is not a city represented at the Chicago meeting which does not plan such an affair. These meetings will be addressed by President Vesper or Executive Secretary Peake, or some other speaker who is familiar with the work that is being done.

The officers of associations in all cities should at once get in touch with Peake and arrange dates for meetings. An effort should be made if possible to arrange a circuit of meetings in different sections so that one man may cover as many as possible, going from city to city on consecutive nights.

No local association has the strength of numbers to make an effective fight against the conditions that are arising today. The only solution is this national organization. **Each local is wasting part of its own strength if it tries to fight alone. It should combine its strength with others and help create a machinery that can do real work.**

Inasmuch as every dealer is already participating in the benefits of this organization he should come into it and pay for work that already has been done and help support the big work that has got to be done during the next few months. The association will help every dealer even if he doesn't join, and it is only fair that he should join and contribute support.

This membership is an insurance policy protecting the dealer's business and costs less than three cents a day.

In addition to the critical situations that will be handled as they arise the organization also is going to take up uniform license laws, uniform headlight laws, business efficiency, protection against unjust taxation, co-operation between dealers and manufacturers and all other phases of business.

In addition to notifying President Vesper and Executive Secretary Peake of activities in this matter, MOTOR WORLD requests that information be sent to it wherever activity begins.

For twenty years this trade has wanted a strong association. **Today the opportunity for it is here.** The only essential is that dealers everywhere send to the association headquarters at 3550 Lindell Boulevard an application, plus a check for $15. **Don't wait for an application blank. Write out a check and send the letter.**

If there is anything MOTOR WORLD can do to assist anywhere to put the association over in any section you have only to tell us what it is and we shall do our best to assist because we believe this organization movement today is THE BIGGEST PIECE OF BUSINESS BEFORE THE AUTOMOTIVE TRADE OF AMERICA.

Drive-away Bureau

ASK FOR INFORMATION—AND—GIVE US INFORMATION

THIS department will be continued indefinitely. Its aim is to provide a clearing house for information as to routes, road conditions, hotel rates, garage rates, unfair conditions, new routes, etc. Motor World will make an effort to get any information you desire. In return, all dealers are requested to forward promptly any information they have regarding drive-aways. Send your information so it will reach New York not later than Monday of each week.

The "Inconsequential Objector"

How Two Drive-away Enthusiasts Handled Him

By K. H. Lansing

"I DON'T believe I want the car I ordered from you to come from Michigan to Philadelphia under its own power," said Mr. P. Essimist, dolefully, to Jack Smiler, salesman on Automobile Row, Quaker City.

Mr. P. Essimist pulled a long face and continued:

"I know just how it will be—mudguards bent, varnish off in gouges, tires punctured and patched up, maybe a bad jam or two on the body, a hole poked through the canopy—"

"In that case," said Smiler briskly, "we'd wig-wag for a gyp and wouldn't try to sell you the car. You said you wanted your machine as quickly as possible?"

"Yes," replied P. Essimist, "but—"

"Do you realize we can't even promise you delivery by freight or express in a matter of weeks?"

"Well," answered P. Essimist, "at that, I'd rather wait than have a second-hand car arrive, and in bad shape in the bargain, after I'd ordered a new one."

How Would You Like to Have It?

"How'd you like to get your car in bang-up, not banged-up shape, inside of 6 days?" Smiler stuck out his chin aggressively and walked two steps nearer P. Essimist.

"I suppose that would be good," said P. Essimist, "but what's the use of stating hypothetical cases? Let's get down to brass tacks and see whether freight or express would be the better means of getting that car here within a reasonable period."

"Just wait a minute till I call Skidmore, our service manager," said Smiler.

Then ensued the following rapid-fire dialogue between Smiler and Skidmore for the benefit of P. Essimist, who scowled and twiddled with his watch chain meanwhile:

"Skid, when does the next drive-away start from our factory in Michigan?"

"To-morrow at 8 a. m."

"If I wire this afternoon, can they add a car to the tour?"

"They can if they don't all have a stroke of paralysis."

"Will there be any careless drivers on the trip?"

"Not unless you call our expert chauffeurs careless."

"This gentleman has ordered a car from us and wants it as soon as possible. He prefers to have it come by freight, for fear the car will be hurt en route. He says depreciation is too great when a drive-away is employed and that his car will be virtually a second-hand machine when it arrives."

Don't Intend to Go Back to Express Shipments

And Smiler slowly half-closed his left eye—just a flicker, at Skidmore. This meant, "spout, old boy; now's your cue."

"If you want your car here within a reasonable time," began Skidmore, addressing P. Essimist, "and if you want it to arrive in first-class condition, you had better allow us to wire our drive-away leader to send your car along to-morrow. It will be here in 5 days at the outside."

"But I don't want a damaged car," protested P. Essimist. "I won't take one that's been all used up on the road. I know; it'll rattle and squeak and every other old thing."

"Pardon me," interjected Skidmore. "We now have many customers who would not permit us to ship a car by freight or express. They have learned their lesson. We, too, had your idea that there might be at least a little unnecessary depreciation, but we have been won to the drive-away, and WHAT IS MORE, WE INTEND NEVER TO GO BACK TO FREIGHT AND EXPRESS SHIPMENTS IF WE CAN HELP IT.

"I'll tell you why. First I'll state that we have been using the overland tour from factory to consumer since last February and DURING THAT TIME WE HAVE NOT HAD A SINGLE COME-BACK, OR COMPLAINT BECAUSE OF DAMAGE, OR NOISE, OR SQUEAK, OR RATTLING, or anything else. When we used freight shipments, I am free enough to admit that we did. But all that has been eliminated because of the very methods we use in drive-aways that never were used previously.

"Every car is gone over most carefully before we start. Everything is tightened up and our expert drivers only run a stated number of miles each day. The stops are frequent and at each stop each car is examined.

"A new car on such a drive-away is improved—it is limbered up to its maximum capabilities, stiff motors made to run sweetly and the entire machinery made to co-ordinate so that smoothness takes the place of newness. Did you ever know a shipped car to arrive in that condition? Without a drive-away, what factory is going to have each car ordered jockeyed by an expert driver before it is sent on?

Car Gone Over Thoroughly

"On arrival at point of destination the car is oiled and gone over thoroughly a second time, or whatever time it may be that it has seemed to need attention. Isn't that an advantage over shipping?

"Remember, that in shipping many cars have to be taken apart to be loaded. The doors of the cars often have to be removed and sometimes, even after the train has arrived, it is days before the customer can have his car, for in reassembling and unloading much time is consumed.

Digitized by Google

"This re-assembling often is done hurriedly, especially in the case of large consignments, in order to get through and deliver. Then parts are found to be loose, or squeaky and the customer spends much time and patience running back and forth to a garage or service station to have the car put in shape and usually an indicator would show that he travels at least 200 miles before the car will run right.

"After a drive-away, the man who brought it in can vouch for it as an individual performer. Often cars like this, known as especially proved 'sweet' runners are put away, when not ordered for any particular customer, for the manager, or for some one known as 'cranky.'

(Here just the vestige of a wink to Smiler, unobserved by P. Essimist, whose eyes had opened wider.)

Bring In Car in Perfect State

Skidmore hurried on, seeing he was scoring.

"And as for damaging the car. In addition to all possible care from expert chauffeurs, it is a fact that coal dust often gets so ground into a car that it is necessary to revarnish after a freight shipment. We never have had to revarnish after a drive-away, although some make a practice of it, not because of any damage, but to please customers. We bring our cars in in such condition that nothing of the kind is necessary.

"On the railroad trip cars, despite careful packing, do get banged around more or less; besides, one of the bugbears of the shipment lately has been the great number of parts stolen from cars in transit. Ask any factory that sticks to freight shipments.

"As to mud and stain: If it rains and there are pools and flooded parts of the country, our experts in drive-aways have such intimate knowledge of routes that usually some alternate road is taken in wet weather, where it will not be necessary to do any 'swimming.' Coal dust will seep through ripped canvas covers en route via freight. Did you ever see a machine that needed attention after this sort of thing? We have been converted; we want no more freight shipments—"

Drive-away Cheaper Than Freight

P. Essimist actually was interrupting.

"But how about the cost of a driven-in machine—what will be the excess in charges over the freight shipment?"

"We can quote you a lower figure on your machine, including everything, with a drive-away, than with a freight shipment," replied Skidmore, knowing now that his talk had shot home.

"You see lumber is pretty high now, and to block up a car properly—or at least as well as can be done so as to insure a minimum of scratches—will cost about $60 per car, to be distributed among the various customers as charges. You will avoid that, too, by the drive-away plan. Now let us wire our factory—"

"Oh, go ahead and wire 'em. I suppose the car won't be broken up any worse by an overland trip than by a lot of baggage-smashers," said P. Essimist with a grunt.

Then he turned on his heel and if he had looked behind he would have seen Smiler and Skidmore shaking hands.

Who Needs Good Drive-away Driver?

Editor Drive-Away Bureau—In looking over my last copy of Motor World I see quite an article in reference to drive-aways. I would like to get in touch with some one who would like to get a good driver for such a purpose.

As I have had seven or eight years experience driving many makes of cars and being over draft age and strictly honest and temperate, I feel competent to apply for such a position.—W. G. Coles, 110 Ashburton Ave., Yonkers.

P.S.—At present am employed as driver on White ambulance but expect to be free on July 1 if my resignation is accepted.

Will Drive for Expenses

Editor Drive-Away Bureau—I would be pleased to communicate with some Western dealer who is going to drive through from Flint or Detroit about June 15-July 15.

I intend to go to Los Angeles and would gladly drive a car through for my expenses. I can drive any car and have driven Buicks through for the Leyman Motor Co. of this city.—Proehl H. Joklon, 1648 Beechwood Ave., Louisville, Ky.

Discipline Essential in Drive-aways

PHILADELPHIA, June 15—"If automobile companies take the ground that they are always in the right in the matter of speed, number abreast and usage of the highways over which they pass in drive-aways," said an official of the Lincoln Highway Association, "they will work an injury to themselves and block their own progress. There is no greater friend of the motor car companies than I; their movements help keep the roads up properly, and pressure from them aids in bringing about reforms that otherwise might come very slowly through the regular channels. But there are certain offenders, occasionally, among motor car companies, that should be jacked up if for no other reason than that they bring discredit upon the fair companies who never abuse their highway privileges.

"Undoubtedly, overzealous road officials cause unnecessary trouble to overland tours in some instances; but undoubtedly, too, improperly conducted drive-aways from factory to distributing point do considerable damage, and their leaders ought to be locked up. Very likely the heads of the business would be glad to have them locked up, if they knew what was happening.

"Complaints have been laid from time to time that some towns in Pennsylvania make traps out of themselves to catch cars in transit to fatten borough treasuries through fines levied for trifling offenses or trumped up ones.

"This may be true in certain instances. But it is also true that loud complaints from drive-aways that they have been persecuted have been found without foundation. It has come to my attention more than once that Chambersburg, Pa., had been 'persecuting drivers.' I find that while there has been some prosecution, there has been no persecution. The town's position in my eyes has been vindicated.

"Certain western concerns have sent drive-aways over the route that might be called champions of carelessness. I have had to crowd into the gutter myself, near there, to keep out of the way of four automobiles driven abreast on the road in an overland tour. Such drivers of 'in transit' cars have no road sense and certainly no common sense. I shall so report to the factory whenever I come across a flagrant case of that kind. Right-minded automobile manufacturers and drivers should be in line with us on this attitude, if simply for self-interest."

Kansas City Dealers Resorting to Drive-aways

KANSAS CITY, June 15—All Kansas City dealers are getting some cars by freight, the conditions being much easier than a few weeks ago. Some, however, are running so far behind in deliveries that they are resorting to drive-aways to eke out their supplies. Briscoe is driving down five this week, partly to help relieve the freight congestion, and partly because these dealers of the Kansas City territory like the trip overland. The route from Jackson to Fort Wayne and Indianapolis, thence directly west to Decatur and Springfield and Jacksonville, is recommended. The road is worked along the route mentioned until it is said to be like a boulevard.

M. H. Nelson, service manager of the Howard & Murphy Motor Co., Hupmobile distributer, conducted a party of Hupp dealers of this territory from the factory last week. They followed the Blue Book route most of the way and found it excellently reliable, the trip through Indiana being especially pleasant. The party stopped at Toledo the first night, having started too late to reach a city further along the route, which would have given a better day-by-day schedule throughout the journey.

The next night stop was Huntington, a little town, and a poor place to stop if a larger town is available.

The third night stop was Paris, Ill.—again the fault of the schedule, which should have provided for Danville.

The fourth night was spent at Springfield, at the Leland Hotel; the fifth night at the Merchants' Hotel, Moberly, Mo., reaching Kansas City the next evening.

While Nelson suggests reaching Logansport, Ind., for the second night and Danville for the third, there is no serious disparagement of the small town hotels. They were somewhat cramped and service was not up to big city standards.

At all places fine garage service was available, even Huntington having a two-story fireproof garage.

The most serious thing to look out for on this route is the crossing of the Illinois River, about an hour out of Jack-

Digitized by Google

sonville. The river is crossed on a ferry, the barge holding three Hupps at a trip, operated by motor boat; service is satisfactory, with good landing at the then stage of the river. It is said that the river may be much higher, however, in which case the lowlands on the west bank may be flooded, interfering with the roadways, and possibly with the ferry landing on that side.

Following Blue Book routes through Indiana, the party struck the Ocean-to-Ocean highway 20 miles south of Danville, followed it into Hannibal—this highway being the best road through that territory, from all information the party received. At Hannibal the party drifted from the trail, picking up the Santa Fe Trail and finding various roads to choose from. The party took a few different routes across Missouri, but from reports of all it seems that the Blue Book route is as good as any.

Drive-away Routes to Quincy

QUINCY, ILL., June 15—The chief drive-away dealers in this city are the Overland Automobile Co, the Irwin Motors Co., Henry Geise, Bennett Garage & Machine Co., the Morris Adler Moller Co., Cutforth Bros., Spring Street Garage, T. C. Nichols Co., Beatty Garage, Oakland Motor Co., Vermont Street Garage and Massie & Sons. The Clough Reihm Co., Chevrolet agents, get their cars by steamboat from St. Louis, while the Johnson Plank Co. are getting their machines through by railroad.

Routes

Kokomo to Quincy—Kokomo, Danville, Ill., Springfield to Quincy. E. S. Bennett, of the Bennett Co., Haynes distributer, reports that the police officials at Galesburg, Ill., held them up on their first trip through that city for not showing license plates, but after making satisfactory explanation they were gracious enough to show them the best route through the city.

Flint to Quincy—Flint to South Bend, Ind., Joliet, Bloomington, Springfield, Ill., to Quincy. H. A. Geise, Buick distributer, reports above best route. Occasionally he gets a few cars from the St. Louis branch, which come through in empty coal cars from the north, that are returned to the southern Illinois coal mines to be loaded again and the automobile traffic men take advantage of the empties to load them up with cars and ship them through as a return load.

Indianapolis to Quincy—Pike's Peak trail from Indianapolis to Springfield, Ill., then Cannonball trail to Beardstown, Ill., and then the Yellow Band trail to Quincy.

Cleveland to Quincy—Cleveland to Fremont, Ohio, might stop at Valparaiso, Ind., where the drivers claimed the hotel raised prices on them. Joliet to Galesburg to Quincy.

Toledo to Quincy, Ill.—Toledo to Defiance, Ohio, to Logansport, Ind., Decatur and Springfield, Ill., to Quincy.

Racine and Kenosha, Wis., to Quincy—Both dealers went through Chicago, then Aurora, Princeton, Galesburg to Quincy, Ill.

Detroit to Quincy—Detroit to Toledo, Defiance, Ft. Wayne, Indianapolis, Springfield to Quincy.

Lansing to Quincy, Ill.—Lansing to St. Joseph, Mich., Michigan City, Joliet, Galesburg to Quincy, Ill. The additional cost per car, the dealers stated, ran from as low as $18 to as high as $65. No special hotels and in only two cases in forty drive-aways did the hotel people take advantage of the automobile men. As most of the drivers were instructed to park their cars with dealers of the same cars in the various cities no complaint was heard on this point. The only case reported where the police interfered was the Galesburg incident, mentioned before, and this was quickly straightened out. Most of the dealers favor drive-aways and several of them will continue to get their cars in this manner throughout the summer months, or until such time as the freight situation improves and they can get the cars through by railroad.

The majority of the dealers were unanimous in their statements that the roads were good as a whole, but whenever they got on Illinois roads and there had been much rain, the Illinois gumbo was the worst going on any of the routes.

Chicago Dealers Perfect Drive-away Organizations

CHICAGO, June 13—During the period when practically every passenger car which came into Chicago was a part of a drive-away certain of the motor car companies perfected traffic organizations for handing that department of their business. These organizations are still maintained, although their usefulness is greatly curtailed owing to the restrictions which have been put upon passenger car production and the consequent impossibility of getting cars in normal numbers. This does not imply that drive-aways of passenger cars from factories to Chicago have ceased entirely, nor even that they are of infrequent occurrence, for neither condition is the exact fact. Cars are still being driven, but in smaller numbers than was the case a few weeks ago, and the trips are not made with the same regularity. When the factory can make a delivery the Chicago branch is notified and a crew is sent after it. This necessitates the upkeep of the drive-away organizations.

The perfection of drive-away organizations varies, of course, but certain fundamentals are common to all drive-aways from the Chicago end. A feature common to all is the drive-away crew manager or captain. Invariably he is a man of experience and judgment and competent to handle men and to maintain discipline. He also must be reliable and trustworthy, since he is entrusted with considerable sums of money and must see to its economical and efficient disbursement. He must also be resourceful and able to meet emergencies. Upon his good judgment depends the degree of necessary departure, whenever occasion demands, from the rules laid down for the governance of drive-aways. In fact, he is the direct representative of the company, and upon him rests the responsibility of getting the drive-away through safely, in the shortest possible time and at the least cost.

Under the crew manager, and second only in authority to him, there commonly is an expert mechanician. His position usually is at the rear end of the drive-away. The crew manager, however, leads, so that he may be in instant readiness to meet all mechanical difficulties and accidents. Invariably the mechanician is selected from among the force employed in the Chicago service station. He must be thoroughly conversant with the mechanical construction of the cars and be competent to make road repairs quickly.

The drivers, who must be skillful and amenable to discipline, are, as far as possible, taken from the Chicago branches, from the service station and from the new car departments. Their responsibility is limited to obeying the rules and regulations laid down by the company, maintaining their places in the line and following implicitly the instructions of the crew captain. Sometimes in the rush of the drive-away season the Chicago branches have found it impossible to spare all the drivers needed. In such cases outside men are hired, but always there is a leaven of experienced company men with the drive-away to insure safety.

Detail regulations governing drive-aways differ with different companies. For instance, the Overland Motor Co. of Chicago invariably drives in fleets of twelve cars. The lead car is in charge of the crew manager, who determines the route and sets the speed. The mechanician drives the rear car. As nearly as possible, a uniform speed of under 22 m.p.h. is maintained. A distance of 100 ft. is prescribed between cars. The moderate speed and the regular spacing prevent accidents and allow the following car to escape the dust raised by the car ahead. It is customary for the Overland company to use only two or three regular drivers from among its own force with each drive-away, in addition to crew manager and mechanician, other drivers being hired on the outside.

Before the cars leave Toledo they are thoroughly inspected. The pistons are oiled and oil is put into the gasoline. At every stop it is the duty of the mechanician to inspect each car thoroughly. Before starting on the drive-away all cars are showered with cold water to harden the varnish and to wash off any particles of grease which may be adhering to any part. This also facilitates the operation of cleaning when the cars reach Chicago. All tops are put up and mohair tops are protected with muslin coverings from dust and dirt.

Few spares are carried. Aside from the tools of the mechanician, only a few extra tubes are carried. Garage service along the route is depended upon in case of serious trouble. This rarely happens, however. One damaged fender, for instance, was the only cost in drive-aways which brought 120 cars from the factory into Chicago.

The route from Toledo to Chicago follows the air line of the New York Central. Leaving Toledo, the route passes through Holland, Spencer, Swanton, Delta, Waseon, Pettisville, Archbold, Stryker, Bryan, Edgerton, Ohio; Butler, Ind.; Waterloo, Coronna, Kendallville, Brimfield, Wawaka, Ligonier, Millersburg, Goshen, Elkhart, Osceola, Mishawaka, South Bend, Lydick, New Carlisle, Laporte, Westville, Coburg, Valparaiso, Hobart, Gary and into Chicago via the Ridge Road and the Lincoln Highway.

Overland drive-aways commonly cover

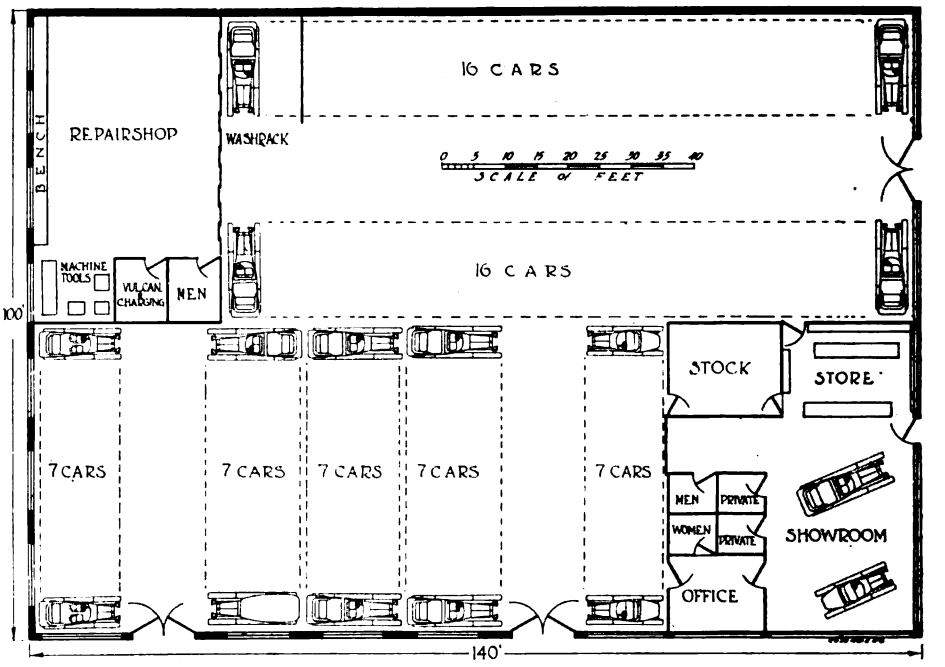
SCIENTIFIC CONSTRUCTION

GARAGE *SHOWROOMS* *REPAIRSHOPS*

We shall be glad to draw a plan for you or give you any other aid in your building, free of charge. But be sure to send full details, including a sketch of the plot, showing position of streets

Efficient Garage Arrangement



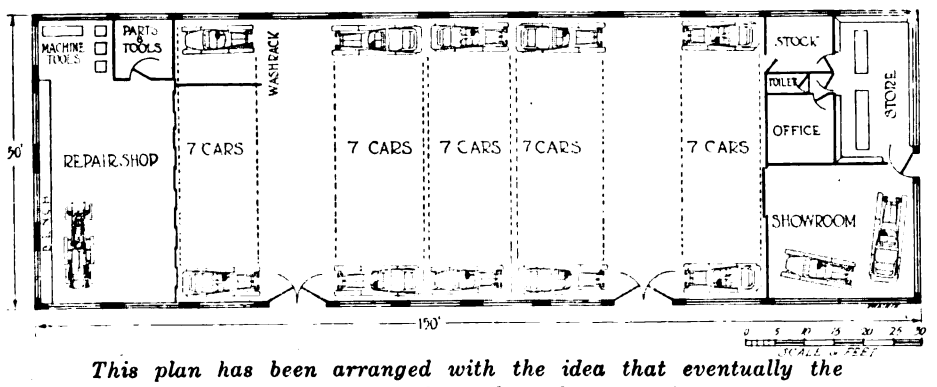
Editor Motor World: We are sending you plans for garage under separate cover. This building fronts to the north and is on the northeast corner of the block. The north street and the east street are both main streets. We expect to put our office and salesroom on the north. We handle Ford cars only.

We would appreciate an outline for the inside of the garage as to salesroom and workroom. We are contemplating putting our workshop right next to our office and stockroom. What do you think of this idea?—Rosenberg Hardware Co., Lexington, Neb.

There are two serious objections to your plan. One is the fact that you have not provided for an accessory display window, and the other is that the general arrangement of your building is such that you cannot utilize your garage space to best advantage. The plan we have drawn has space for 68 cars without parking any in the aisles, and this is many more than can be stored in your layout.

The showroom unit we have designed takes up slightly more space than yours, but this seems necessary. Anyway there should be no objection on this score because even with this space subtracted more cars can be stored.

We believe that a long, narrow showroom is not as attractive as a somewhat shorter and deeper one. The latter offers a better opportunity for attractively arranging the cars and permits more flexibility in placing them. At the same time the reduction in showroom window space is not sufficient to materially affect the value of the display as seen from the street.



This arrangement gives a well-proportioned salesroom, and the repairshop has been isolated so that customers will not wander into it and disturb the workmen

An accessory display window is of just as much importance to the successful conduct of your business as a car display window, and it is desirable to have the store adjacent to this window, thus making one unit. Therefore, we have placed the store directly back of the window. The store may have a partition separating it from the showroom or not, just as you like. In the plan there is simply a showcase along the border of the two rooms.

The stockroom shown on this plan is mainly for accessories and supplies. Ford parts may also be carried here, although you may find it more convenient to have these in a separate room nearer the shop.

We do not believe it is a good idea to place the shop right next to the showroom as you suggest, because the noise in the shop will be distracting to prospects in the showroom. Furthermore, it is good business to have the shop as far away from the business end of the building as possible, as the presence of prospects or owners in the shop is not desirable.

Another reason for not placing the shop adjacent to the showroom is that it would not be possible to obtain as good a building layout, particularly if it was necessary to furnish as good lighting facilities as the position we have selected provides.

This plan has been arranged with the idea that eventually the building will be enlarged and have three floors. It is not necessary to provide for an elevator shaft until the upper floors are to be put on, though the doors should be cut to avoid doing this afterward

Plan for Plot 96x112

Editor Motor World. Please send me plans for a salesroom, used-car room, workshop, office and storage space, same to cover plot of ground 96 x 112 on a corner, frontage 96 ft. It is the plan of the owner of this building to run same up three stories eventually, though for the present he will build only one story

Digitized by Google

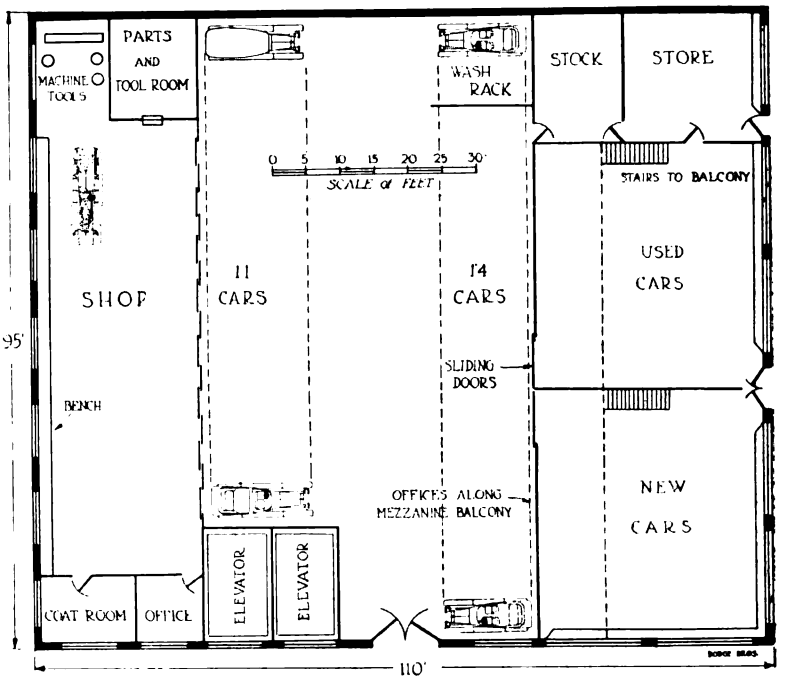
high. Obviously allowances will have to be made for elevators to carry cars to the second and third floors. A good accessory room as well as wash rack should not be forgotten.—A. E. Haughton, representing Dodge Brothers, Omaha.

Herewith is a plan drawn to your requirements. It does not seem to call for any explanation other than to say that it is not necessary to build the elevator shafts until the upper stories are added, thus conserving the floor space.

It would be well, however, to build the entrances to the elevators and install the doors so that when the addition is made it will not be necessary to cut a hole in the side of the building in order to make entrances to the elevators.

Equipping a Shop

Editor Motor World: I am sending herewith pencil sketch of location for garage for which I would like the most convenient plans for a public garage, in which will be handled gas and all accessories, room for two new cars, machine shop, plenty of light for the whole building, 50 x 150.



If not too much trouble would like suggestions for the best machinery and tools for the shop, for all classes of work in the automobile line, also the most up-to-date machinery, and where it can be bought. We have electric power and 80 lb. city water pressure.—F. M. Knight, Prairie City, Ore.

Herewith is a plan for a building which will enable you successfully to carry on all branches of the automobile business. Each department has been carefully proportioned to meet your individual needs.

In general it is against the policy of Motor World to recommend makes of tools. We believe, however, that you will find what you want at one of the big machinery dealers on the coast. Whether you buy new or used machinery, your selection may be limited because of reduced stock on account of the war.

You should have a drill press, emery wheel and arbor press. A forge and a lathe are also very desirable. It goes without saying that you should have the necessary tools and attachments to allow you to efficiently use them.

You should have an oxy-acetylene welding and carbon-burning outfit, taps and dies, pullers and a sufficient assortment of wrenches to allow you to do any job quickly.

F. M. Knight wanted a complete establishment with a well-equipped shop and plenty of room for car storage. The shop has been put along one wall to insure excellent lighting

This is somewhat of a fall display, but fall will be with us very soon. The arrangement is quite simple and much of its attractiveness is due to the simplicity. The Auto Tire Co., San Diego, planned the display, which consists entirely of Norwesco products

New Philadelphia Truck Bureau

PHILADELPHIA, June 14—The Motor Truck Owner's Assn. of this city has just formed a permanent bureau whose purpose will be to place the great volume of inter-city motor truck transportation into and out of Philadelphia on a systematic basis in order to stabilize the rates charged for such service. The new bureau will also serve as a return load organization and attempt to procure loads for vehicles passing through Philadelphia or hauling goods from it. It will also endeavor to secure permanent motor truck highways in the vicinity of Philadelphia and will render motor truck owners other service, including furnishing information as to routes, etc. The officers of the new association are William Arrott, president; H. W. Dale, vice-president; George I. Oberholtzer, treasurer, and G. C. Dale, secretary.

Alton Dealers Organize

ALTON, ILL., June 15.—The dealers in automobiles and accessories in this city have formed the Alton Dealers and Accessories Association. Officers elected were the following: President, H. T. Hortman; vice-president, L. T. Hudson; secretary, C. T. Yaekel; treasurer, E. C. Hoefert; directors, Christ Schuette, C. G. Luft and W. E. Winter. The association plans to standardize the automobile business of the city so as to give better service to the owners. It is also probable that service at nights and on Sundays and holidays will be abolished, except through one central station, as has been done in other cities.

The editor of this department is glad to answer questions. In sending queries, always include copies of contracts, notes, etc., to which you refer.

THE LAW

By George F. Kaiser

As It Applies to
Dealers
Repairmen
Garagemen

More "As Is"

Editor Motor World: As a subscriber to Motor World, I wish to avail myself of your kind services. I am in the garage business and about a week ago I saw an ad in the local paper offering a Saxon Six touring car for sale.

After having the car demonstrated to me and also driving it myself, I bought it and received a receipt worded, "Received from S. W. Powell $300 for one Saxon 6 touring car as is."

The man at the time said that the battery did not go with the car as the other battery was on charge, and would I bring back the battery in the car as soon as the other one was charged? I said: "You understand that I will return this battery provided the other one is all right and will take a charge and hold it for starting and lighting the car?"

He replied: "That's all right. The battery on charge that belongs to the car is in fine shape."

I went to get the battery in the course of a few days and found it would only take one-half a charge and would not turn the starter over.

I told them that when they gave me a battery that would work as well as the one I was using they could have it, but until such time I would hold the battery in the car. I might mention that they claim that the battery in the car when they demonstrated it to me belongs to one of their customers. I maintain that it is none of my business whom it belongs to —it was used to demonstrate the car as the other one would not run and it was essential to have a good battery in to make the sale, and the receipt—"as is"—was for the car as I bought it, with the battery in which started it.

They obtained a writ of replevin and when they came to get the battery they could not find it.

The case comes up in a few days and I would like to know if I am right in my contention or wrong if they are entitled to the battery. I want to return it to them, but if it is up to them to give me a battery with the car I want to know it also.—S. W. Powell, Detroit, Mich.

Answer—The car which you bought was not really sold "as is," for, as you state in your letter, the seller told you the battery which was then attached to the car did not belong to it and was not to become your property on the sale.

I think under the circumstances that if a replevin suit is brought against you for the return of the battery you will have to give it up. Of course, you might counterclaim for damages for the battery which was not delivered to you. Under the circumstances, as suit has been started, the only proper thing for you to do to protect your interests is to retain local counsel at once. Tell him all the facts fully and honestly and leave it to his discretion as to what course you should adopt.

What Is an "Omnibus"?

Editor Motor World: The inquiry and article in reply to H. Ascher in May 15 Motor World are of considerable interest to me as they apply to a question that has been in dispute for some time here. Will you submit the question to Mr. Kaiser for a decision?

1—Will Mr. Ascher be required to have an Omnibus License Plate on his car?

2—Does a person owning a common touring car have to have it registered as omnibus if they occasionally hire out the use of the car for a trip to some place specified by the person hiring same at a price agreed on by the parties concerned, the owner driving the car and having a chauffeur's license?

One reason for my asking these questions is that automobiles are now being used at funerals here and there are not omnibuses (in cars registered as such) enough to carry the friends attending the funeral, and the private owners are getting tired of furnishing a car and driver free and are refusing to go unless they can receive pay for the time spent and gasoline used, and they do not care to have their cars registered as obnibuses just to accommodate these people. What bearing do Chapters 2724 and 727, Laws of 1917, Amendments to Article II, Highway law, have on these questions?—Otis Doty, Canisteo, N. Y.

Answer—My understanding of the motor vehicle law as it applies to the registration of omnibuses is that an omnibus is a vehicle in which passengers are carried for hire. In other words, I think that even if a car and driver are rented out as horses and carriages used to be rented out by livery stables, that the vehicle will be considered an omnibus and that omnibus licenses will be required.

The New York law provides: "The term 'Omnibus' as used in this article shall include any motor vehicle held and used for the transportation of passengers for hire."

This definition is very broad and includes many vehicles which might perhaps have been properly excluded.

The usual dictionary definition of omnibus is "a large vehicle used for conveying passengers." Ordinarily we think of an "omnibus" as meaning the same as "stage," but our legislators thought different for they have provided a minimum fee for an omnibus holding "five passengers or less."

Rules of the Road

Editor Motor World: We are very anxious here to enact an ordinance that will assist the motorist in a proper understanding of the rules of the road and abolish the old-time method of jacking everybody up for everything and anything for fining them before the recorder. This has proven to us only a temporary means of stopping reckless driving. We wish to put on an educational campaign and have a standard ordinance passed that will enlighten the motorist for his own benefit and, instead of a fine, revoke his license for ignorance of the rules of the road until such time as he may become acquainted with them.

I would like to have a standard practice as to proper method of turning corners, meeting cars, passing cars from the rear, who has the right of way, hand signals backing cars, turning from one side of the street to the other, and many other things important to know. Would like to have diagrams on the subject.—J. G. Barnwell, City Manager, City of Rock Hill, S. C.

Answer—Before going ahead to prepare an ordinance, I suggest that you first make a critical examination of your state statutes relating to motor vehicles. You can get any information that you desire from your state highway commission, which is located at Columbia, S. C.

The following rules and regulations governing traffic on the public streets might be of help to you:

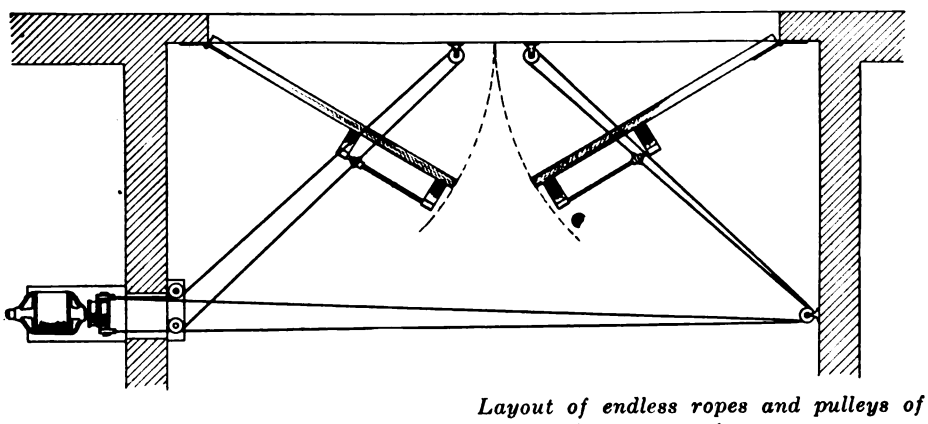
Vehicles shall keep as near as possible to the right hand curb. When other vehicles shall be overtaken they shall be passed on the left.

On turning corners vehicles must keep as near to the right hand curb as is practicable when a turn is made to the right. On turning to the left, vehicles shall turn around the intersection of the center lines of the two streets.

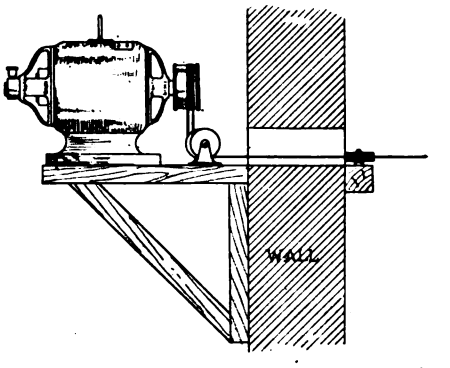
Vehicles crossing from one side of the street to the other must head the same way as the traffic on that side of the street.

When vehicles are proceeding on streets on which tracks are laid the vehicles must be stopped and remain stationary until the street cars have started again. No vehicles shall pass to the left of a street car.

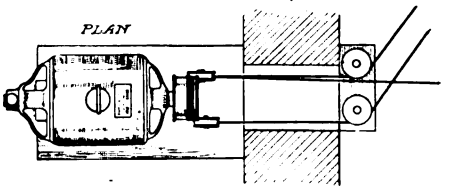
Digitized by Google



Further adjustment can be obtained by disconnecting the yoke at the front end of each of the two pull rods to either shorten or lengthen the rods.

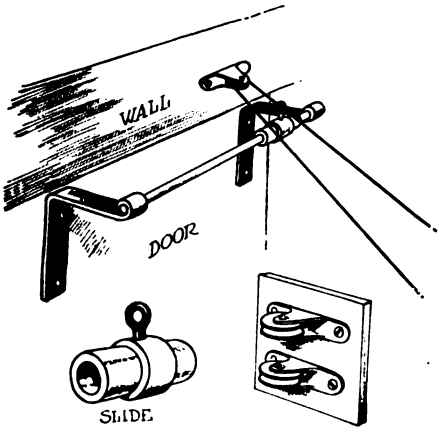


Make sure that the locking nuts are set up tightly after the proper adjustment has been made. This is essential.

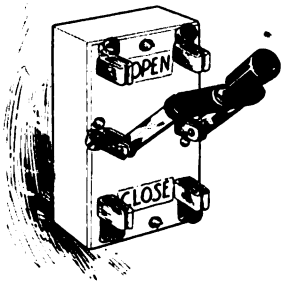


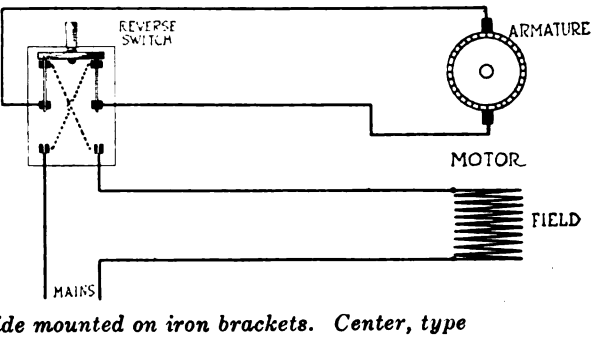
The only adjustment on the internal expanding emergency brake is that on the front end of the pull rod, which can be adjusted the same as the service brake pull rods.

The wheels should turn freely, but not too freely, with the brakes released and the gear shift in neutral. With brakes properly adjusted, either set should be capable of locking the wheels when the car is on the road.



Simple Electric Garage Door Opener





Layout of endless ropes and pulleys of electric door opener for garage as seen from above. Right, section through wall showing method of supporting motor on bracket and arrangement of drum on the motor shaft

Left, method of attaching endless rope to door by means of slide mounted on iron brackets. Center, type of reversing switch to be used. Right, diagram of connections of switch and motor. If two switches are desired the second one should be connected in parallel with the one shown, that is, wires should be led from the terminals of one to the corresponding terminals of the other

SWINGING garage doors may be opened from any point in the shop by means of an electric motor coupled up to a rope and pulley system. The motor is of the reversing type and the armature shaft is fitted with a drum over which the ropes operating the door are passed. One continuous rope runs from the motor to a pulley over the upper edge of each door half.

Connection is made between each of these ropes and a slide on the door, so that when the motor is driven in one direction the doors are pulled open, and when reversed the doors are closed. The motor used in this system should be about one-half horsepower and the reversing switch may be placed either in the office or in the shop at the rear, or, if desired, switches may be installed in both places. In this case it is only necessary to connect the switches in parallel, that is, a wire should be connected to each of the terminals of one switch and led to the corresponding terminal of the other switch.—American Garage, Detroit.

McCord to Market Heath Duplex Bodies Direct

DETROIT, June 14—The McCord Mfg. Co. will establish direct selling connections with distributers and dealers for the Heath duplex folding delivery body for the Ford chassis. This body is interchangeable with the tonneau of the Ford body. H. E. Westerdale has been appointed sales manager of the Heath duplex division of the company. He was formerly assistant sales manager of the Hupp Motor Car Corp., Detroit, and has been a branch manager for the Studebaker Corp.

Baird Distributes Collier Trucks

PITTSBURGH, June 14—The Baird Machinery Co., which deals exclusively in machinery, mill supplies, etc., has taken over the distribution of Collier trucks in a large portion of western Pennsylvania. The company is perfecting a dealer organization.

Government Commandeers Fader's Garage

WILMINGTON, DEL., June 17—The United States Government has taken over the garage of the Fader Automobile Co., at Newark, Del., as a training center for automobile mechanics, with Frank Fader as instructor. The company, which has the Ford agency for that town, will secure other quarters for the agency, but will discontinue the garage business for the summer months.

Repairshop Shortcuts

From Motor World Mechanics

No. 1709—EMERGENCY RADIATOR REPAIR

Cellular type radiators may be temporarily repaired by stopping up the ends of the leaky cells with ordinary chewing gum. Radiators of this type are exceedingly difficult to solder, and unless a person familiar with the work is available, it is best practice to repair it in the above manner. Radiators have been known to run from 1 to 2 months without further attention.—S. T. W.

No. 1710—BATTERY FLUSHER

A convenient way to flush storage batteries is to hang a wooden bucket on a hook that is long enough to hang on one of the rafters, or on a strong wire strung over the bench. Water is syphoned off with a rubber tube into each cell. A copper pipe bent into a U-shape is used to go over the edge of the bucket so that the flow of water will not be restricted by a kink in the hose.—H. S. Craven, Locomobile Sales Co., Hartford.

No. 1711—HACKSAW REST

When long pieces are being cut off in the power hacksaw, some sort of a rest is necessary to support the work. Such a rest is shown, comprising two adjustable uprights, connected by an iron pipe, or roller, held together by a tie rod, and sliding in a wooden base. Adjustment is effected by pinning the sliding upright in the required position. Such a rest is also useful in welding work, and when working on long pieces at the bench.—S. T. W.

No. 1712—ENGINE SLING

Multi-cylinder engines of V-type construction may be readily lifted from the frame on a sling made of two pipes, and four steel wire cables. The ends of the cables are looped, bound with wire and soldered, and may be slipped over the pipe, or the chain hoist hook.—S. T. W.

No. 1713—VALVE-PIN INSERTER

A device to insert valve pins in cramped places is made by cutting down an oil-can spout so that a valve pin will fit in the end without binding. A dent is made in the spout 3/16 in. from the end to keep the pin from slipping too far in the spout. Using the spout as a holder, the pin can be slipped in its hole.—Harry Hagen, Buffalo.

No. 1714—SOLDERING IRON STAND

Safety necessitates the use of some sort of a metal stand for electric soldering irons, as otherwise they may come in contact with some inflammable material, and cause a fire. The stand illustrated is quite satisfactory, the iron resting on two M-shaped pieces of strap iron, attached to a wooden base. The method of mounting the acid jar in the base should be noted.—S. T. W.

No. 1715—MULTIPLE EXTENSION BOX

Frequently, when working on a car, it is necessary to use an inspection lamp, a drill, and perhaps an electric soldering iron, and in exceptional cases only are there enough plugs and extensions at hand to permit this to be done. By the use of a multiple extension box, several leads may be taken off from one main line plug. This box consists of several extension plugs, connected in parallel, through a fuse to an extension cord. The cord is plugged into the line in the usual manner, and the box is carried to the job, providing the several required outlets.—S. T. W.

No. 1716—ADJUSTABLE SUPPORT

An adjustable work support that can be made different heights is made by soldering or brazing an old wheel flange to a piece of pipe in which the work support, forged from iron, slides. A thumb screw locks the support at the desired height.—Robert P. Ewer, Bangor Motor Co., Bangor, Me.

No. 1717—FILE HOLDER

It is difficult to remove material from a large flat surface with the ordinary file, and when this is necessary, a special file holder may be used to facilitate the work. In this holder, the file is held by brass cleats to a wooden handle, the ends of the file being squared off, and ground down so that the file teeth project beneath the cleats.—S. T. W.

$1 a Helpful Kink

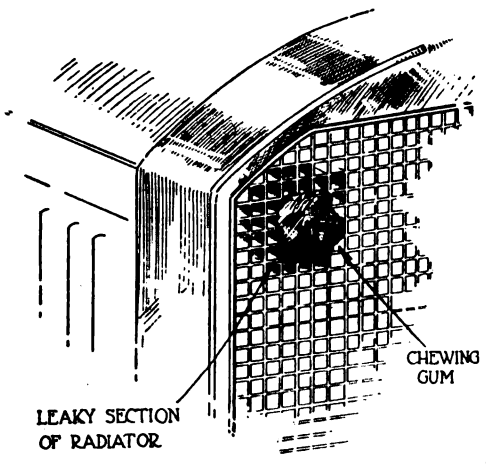
HOW often have you been compelled to rack your brain to overcome some difficulty? But when you did find a solution—what a satisfaction it was! Well, here's a chance for you to dig some of those life-savers out of their hiding places and put them to work for your fellow-craftsmen. Send them to Motor World. We will pay you a dollar for every one accepted for publication. The only requirements are these: 1—*Describe the short-cut briefly but clearly, in few words.* 2—*Send a sketch, in pencil or pen, no matter how rough; our artists will finish the job.* 3—*Write on ONE side of the paper only.* 4—*Sign your name and initials, the name of the company you are with and the town. Write plainly. If your name is unusual, print it in capital letters.*

Philadelphia Garagemen May Increase Storage Charges

PHILADELPHIA, June 15—Members of the Philadelphia Garage Association, which met for the first time with the new president of the organization, George G. Blind, in the chair, announced that they expected this fall, probably beginning Sept. 1, an increase of at least 10 per cent will be made in storage charges for cars; that charges also will be increased on repairs, and that on account of the high cost of labor and the difficulty in obtaining men to do the work, night washing of cars will be abandoned for the duration of the war. At present night washers demand and are being paid $25 a week.

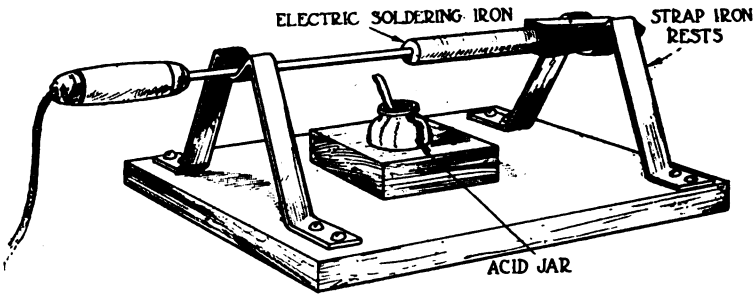
As early as next month, it was said, an agreement probably will be made by the members of the association to charge $14 a month, instead of $15, as at present, for storage on Ford cars.

Rates for storage on cars at present now range about as follows, types of cars being taken, for example, to show the range, the maximum being the Pierce-Arrow limousine, with 147½ in. wheelbase:



Pierce-Arrow limousine, live storage, $27 a month, dead $14; touring car, $22 a month. Packard, 135-in. wheelbase, $26; 126-in. wheelbase, $19. Dodge, limousine, $18 a month; touring car, $15. Other cars in proportion. The present charges for cars for a night's storage without special care, such as washing, range from $1 to 75 cents, according to size of wheelbase.

Preparations for the association's "sociability run" indicate that no less than 75 cars will be in line.



Moline Model D Is $1,385

MOLINE, ILL., June 14—The new four-cylinder Model D Moline tractor sells for $1,385 f.o.b. Moline, including a two-bottom Moline plow.

Editorial Observation

Gasoline Shortage Myths

WE constantly hear stories to the effect that there is a shortage of gasoline. *There is nothing to them.*

We hear more stories to the effect that gasoline will be taxed—one story had it that a prohibitive tax would be placed on it commencing July 31.

There is nothing to them.

Suppose, for a moment, that we examine into statistics. Let us find out the truth of the matter, and once and for all kill this gasoline shortage myth.

To-day, the refiners of the country are producing gasoline at the rate of *well over eight and one-half million gallons per day.* This is more than two million gallons a day in excess of the 1916 production.

To-day, the refiners of the country have 526,382,385 gal. of gasoline stored away for future use.

On December 31, 1917, the total amount of gasoline in storage amounted to 412,526,833 gal. Between the end of last year and the present these stocks of gasoline have increased 114,125,553 gal. *In short, we are producing far more than we are using up.*

Crude oil is the base from which gasoline is produced. During the month of March, which is the latest month for which United States Government figures are available, there were taken from the earth 26,239,662 barrels. Allowing 50 gal. to the barrel, this is 1,311,983,100 gal.

To get this down to figures that we can grasp, let us say that during March the refiners took an average of 42,332,050 gal. a day out of the ground. *This is* 2,000,000 *gal. per day more than was produced in March,* 1917.

The production of crude oil will go on increasing. Production of oil has been classed by the War Industries Board as highly essential to the Government's program for the prosecution of the war.

The United States Fuel Administration has stated that it will see that the oil industry is adequately supplied with all the steel it needs to push production and open up new wells. Oil is on the preferred list.

Further: The Government is to-day short of fuel oil. This is crude oil after the lighter distillates have been taken out, such as gasoline, kerosene, etc. Crude oil is too volatile to be burned under boilers in ships and for other industrial purposes.

In short, in order to produce the required quantity of fuel oil, the refiners must produce gasoline. They must go on producing it in ever-increasing quantities.

As for the tax: Leading oil men say that such legislation never will be enacted, and even if such a tax were levied it would be a very small one which would be designed purely to produce revenue and not to stop the use of gasoline.

Any prohibitive tax which was placed on gasoline would defeat its own object. It would curtail the use of gasoline and great stocks would pile up just as great stocks of kerosene piled up a few years ago.

For don't forget that the United States Navy and the navies of our Allies must have fuel oil.

And you can't make fuel oil without making gasoline.

But this is no time to waste gasoline. This is the time when *everything* must be conserved. Dealers must educate owners to the necessity of eliminating waste—to the need of using every drop. Kill all idle engines. There is no shortage now, but don't let us waste the fuel we have.

THE KAISER WATCHING THE FRENCHMAN WIN.

This picture, which was printed in the July 7, 1904, issue of MOTOR WORLD, *was prophetic, to say the least. Take a slant at Kaiser Bill when he was 14 years younger, but no less arrogant. He is watching Thery, a Frenchman, win the Bennett cup race which was run at Homburg, Germany*

Oldsmobile Adjustment

Editor Motor World: How do you adjust the bronze bearing for the connecting rods on the Oldsmobile, the eight-cylinder engine? They tell me it cannot be adjusted, and I do not see why, so I am writing to you for your aid. Do I take out the bushing and file it until it is the proper fit and then adjust the rods the way you said in Motor World? Will it work all right now if it is right? Can I do the same thing on all engines with that style of bearing?—Valmore de Lasalle, 180 Huntington Avenue, Providence, R. I.

Answer—We are glad that you did not hesitate to ask us for further information, as it is our desire to aid our subscribers in any way that is possible.

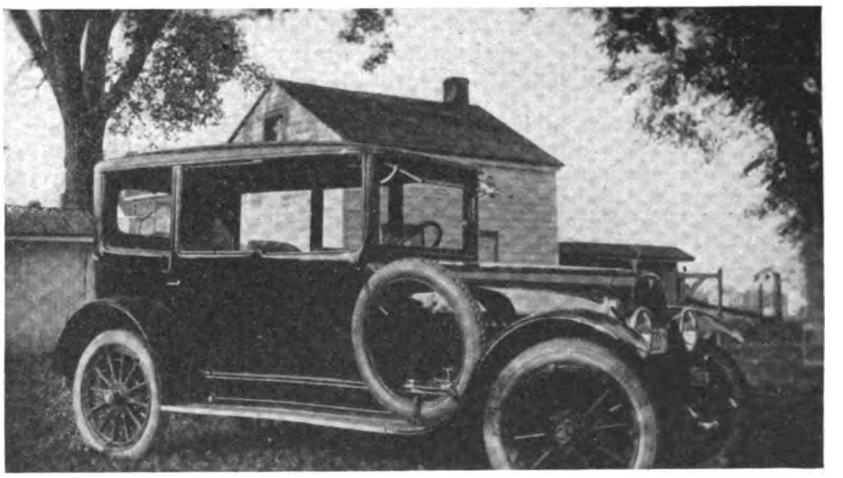
The bronze bearing on the eight-cylinder Oldsmobile can certainly be adjusted in the same manner that the bearings are adjusted on any cars. First the bronze bearing is adjusted to fit the crankshaft and then the blade and fork rods are fitted in the manner described in the Better Mechanics stories which you have. The main point in this work is to observe the clearances as given in the article.

This is exactly along the lines you suggest in your letter and is the way that the work should be done. The directions apply to all bearings of this type.

We have no special binding for the Better Mechanics stories and the short cuts. However, we have published a complete book of the short cuts and are at present publishing the Better Mechanics stories in book form. If you desire these, they can be obtained direct from our New York office.

14 Years Ago!

Editor Motor World:



"The Kaiser Watching the Frenchman Win" is the pathetic title of a cut line on page 543, Vol. 8, No. 15, of the Motor World, issue July 7, 1904. I ran across the interesting bit of history while looking through an old volume of the Motor World and thought you might desire to refer to it in a current issue.—The Pierce-Arrow Motor Car Co., W. M. Baldwin, Editor "Pierce-Arrow Salesman."

Columbus Tractor Expanding Plant

COLUMBUS, OHIO, June 15—The Columbus Tractor Co. has practically completed arrangements for several important additions to its plant, located on West Goodale Street. An option has been secured on a 10-acre tract of land adjoining the present plant and added factory units will be constructed. The company was recently organized with a capital of $1,000,000 to manufacture the Farmer Boy tractor and has taken over the plant and assets of the McIntyre Mfg. Co.

Farmers and Sedans

Editor Motor World: Talking about farmers and their sedans, how does this "Super-Six" look in the farm yard of J. W. Bliley, Chesterfield County, Virginia.—Sincerely, Les E. Bliley, Richmond, Va.

Les E. Bliley sent us this picture from Richmond, Va. Has any other reader of MOTOR WORLD *sold a sedan to a farmer? Send us a picture*

Getting In the Wheat

How Kansas and Missouri Dealers Are Giving the Farmers a Helping Hand

And How They Look After Service With Half Their Mechanics Gone

By Ben S. Brown

THE motor industry of Kansas and Missouri is making heavy sacrifices to get the wheat harvested this summer. Dealers and garagemen are responding to the utmost limit—and in many cases beyond the limit—to the call for harvesters.

No industry in Kansas City or in any of the towns in the two states has met the call for farm hands with more eager readiness.

There are many comments on this expression of loyalty by the motor car industry. In Kansas City especially it has been the big feature of the drive for farm help. High compliments have been passed upon the dealers and the service stations and their example has been used extensively in the stimulation of other industries in releasing employees for work on the farm.

In Kansas City, and in every large town of the two states, campaigns have been in progress the past 2 weeks to list men for farm work, one class of which can go at once and stay all summer, the other class being men and women now employed who will go if the emergency demands it. It is possible that many of the volunteers will not be called upon—if they are needed, they are ready to go. And their employers are ready to suffer the embarrassment of their absence.

We Must Save the Wheat

Business men as well as employees realize thoroughly that unless the wheat is saved, our boys will not have sufficient food—and there will be a serious setback in the agricultural industry of the district.

Missouri communities are taking care of their own farm labor demands. In nearly every town, local police officials and county officers are rounding up the idle labor and forcing them on to the farm. Numerous instances are related of farmers who have taken the loafers and found them able to help materially in the farm work, in many cases the entire local demand being cared for with such previously idle men and the necessity being obviated of calling men from their steady business. Missouri probably will not call upon people outside the state for harvest help.

In Kansas, however, several thousand outside helpers will be needed. The volunteers from Kansas City, Missouri, probably will all be sent to Kansas if the need arises.

Motor car dealers in numerous Kansas towns are planning to send their employees into the fields during the day, if needed. But whether the men go into the fields or not, the service shops will be closed with other business houses, during the day—and will keep open at night, for making repairs on motor cars and farm equipment, or answering calls.

The campaign for enlisting farm labor in Kansas City is said to be unique. Several hundred men worked, calling on every business house, soliciting competent farm help for service for two weeks or all summer. Employers generally were generous in allowing the men to sign; many urged all who could do farm work to go, however much their absence would interfere with firm work.

Nearly 4000 Men Secured

Nearly 4000 men were secured who could spend the entire summer in harvest work. There were about 2000 former farmers who would leave their city jobs for 2 weeks or more, going anywhere they were sent. The other 2000 were mechanics and clerks who were the last resort, and who would go if the emergency demanded, though they would not be of great service under ordinary circumstances, and were badly needed in their city jobs.

Each man enlisted was classified. This classification is of great value, and constitutes one of the most important features of the campaign. There are several hundred mechanics, for instance, men who have not volunteered on the reserve service as experts for the government work.

It is expected that they may possibly be called upon to go into the harvest districts, not to work on farms in the wheat fields, but to serve in the places of local mechanics who have gone to the farms. For it is realized that the small-town mechanic is nearly always familiar with farm work, and that he would be very useful to the farmer in his capacity as mechanic. But his work in the town shop could be well done by the city mechanic.

The loyal generosity of Kansas City motor car dealers is well illustrated by a few specific instances.

Albert E. Hoyt, manager of the Kansas City retail store of the Chevrolet Motor Co., informed the solicitors that he would close his service station for the month of pressing harvest demand, if the insistent call came. All his service shop men enlisted; some are not farmers, however, and may not be called out.

J. Frank Martin, manager of the Buick branch at Kansas City, donated the service of three men for 2 weeks' service, paying their salaries while they are gone; two are warehouse men, one a mechanic.

The Ford Motor Co. contributed 10 per cent of its working force during the harvest season, and assisted in securing the enlistments of this number. The men will go from the assembly plant in groups, so that not more than 10 per cent will be gone at a time, and no group for longer than 2 or 3 weeks. The other employees enlisted also—for they agreed to work overtime to get the work done while the 10 per cent were away.

The Garford Motor Truck Co. will close down in Kansas City establishments, and everybody will go to the fields, if the emergency call comes.

The Greenelase Motor Car Co., Cadillac dealer, arranged that 40 per cent of its mechanical force should be absent on the farms during the season.

The General Motors Corp. of Missouri permitted six of its mechanics to sign up.

Six mechanics of the Doughterty Motor Co., Republic truck dealer and distributer, signed, these being specified for tractor work.

Allen & Jackson Motor Co. arranged that four mechanics would go one period, to be followed by four more.

All but one of the mechanics in the Grant Motor Sales Co. enlisted—the one knowing nothing about farms; the salesmen also enlisted.

Three men enlisted from the McDowell Motor Co., Paterson dealer.

Three mechanics signed from the Cole agency. In all these, and numerous other cases, the men are given vacations (usually without pay) for such farm work, and their positions will be there for them when they return. Many salesmanagers and salesmen have enlisted; and there are numerous instances where mechanics

The RETAIL NEWS

MIDDLE WEST

E. S. Merrill has taken the agency for the Auburn car at Decatur, Ill., and will open a salesroom and service station on South Franklin Street.

W. L. Childers has opened a repair station at 504 Jersey Street, Quincy.

E. C. Long has opened a salesroom for Packard and Franklin cars in Quincy, Ill.

The Morris Adler Moller Automobile Co. is moving into a new salesroom and service station at 223 North Sixth Street, Quincy. The company will have a complete plant and equipment and will sell Dodge Brothers and Maxwell cars.

Pfanschmidt & Marshall have opened a battery and supply station at 427 Vermont Street, Quincy, and have taken the agency of the Pan American car.

The Baldwin Service Station has moved to new quarters at 1109 Kentucky Street, Quincy.

Cutforth Brothers have opened a service and repairshop under the style Market Garage at 914 Hampshire Street, Quincy.

Eric J. Gustafson has opened a service station and repairshop at 413 South Winnebago Street, Rockford, Ill.

E. H. Cohoon & Co. have opened a service station on Church Street, Rockford, Ill.

W. Wilcox has opened an accessories store and tire shop at 901 East State Street, Rockford, Ill.

John Dee, Rock Island, Ill., has sold his interest in the Paige and Saxon agency to Cole Finch, Buick dealer. Finch will move to 1612 Third Avenue shortly.

The Jennings Auto Sales Co., Springfield, Ill., has taken the agency for the Fordsom tractor.

J. B. Bliss and **B. C. Bruce** have opened a salesroom at 206 East Monroe Street, Springfield, and will handle the Stearns Knight.

The Howard Cranfill Co., South Bend, has succeeded Farneman & Cranfill, accessories and tire dealers. Howard Cranfill is president and William Bender, Jr., treasurer of the new company.

The Don M. Harris Co., Detroit, has taken the agency for the Acason truck.

Frank S. Wright has opened a used car store at 1372 Grand River Avenue, Detroit.

A. M. Allen, Flint, Mich., has been appointed distributer of the Harroun car for Genesee County, and has opened quarters in the Gillet Bldg.

John Kramer, Fowler, Mich., has purchased the Weber Garage and will engage in repair work. He has the agency for Ford cars.

Wickham & Nash, Gladwin, Mich., have dissolved partnership. Mr. Nash will continue the garage business.

The Boomhower Auto Supply Co., Grand Rapids, which also has stores in Muskegon, Battle Creek and Marshall, has opened a branch at 106 Division Avenue. A full line of accessories and a complete stock of Diamond tires will be carried. A chain of 7 stores have been established in the middle west. Perry E. Nichols will have charge of the Grand Rapids store.

The Universal Garage, Hastings, Mich., and **Hurd's Garage,** Nashville, Mich., have been appointed sales and service agents for the Fordson tractor in Barry County.

Prof. Keuny, Muskegon, Mich., has taken over the garage business of George Farhenback.

A. T. Smith, St. Johns, Mich., has been appointed distributer of the Fordson tractor.

L. H. Sackett of the Sackett Motor Car Co., Columbus, has taken the central Ohio agency for the Smith Farm-a-Truck. The territory includes Columbus and 10 counties. He has moved his salesrooms to the former location of the Smith agency at 165 North Fourth Street. The Sackett company also has the central Ohio agency for the Elgin.

The Throne Auto Co., Toledo, Haynes and Chevrolet distributer, has opened its enlarged and newly-finished sales and display rooms at 1013 Jefferson Avenue. In addition to the Jefferson Avenue quarters, motor service has been established in the garage building at Monroe and Thirteenth streets.

The Hooper Motor Co., Youngstown, Ohio, has secured the agency for the Fordson tractor.

George Hicks has opened a tire and vulcanizing shop at 107 West Maple Avenue, Beaver Dam, Wis.

The Lauterbach Sales Co., Cedarburg, Wis., has been formed by John Lauterbach to take over the representation of the Ford car and Fordson tractor in that city and vicinity. Mr. Lauterbach was formerly manager of the Cedarburg branch of the Schumann Motor Co., Menominee Falls, Wis., Ford dealer.

The Mitchell Auto Sales Co., Madison, Wis., has been organized by W. R. Bentley and G. E. Teckmeyer to represent the Mitchell in Dane County and a part of Columbia County. Headquarters have been established in the Ritter Garage, 220 North Henry Street, Madison.

PACIFIC COAST

J. J. Reeves, Overland and Willys-Knight dealer at Auburn, Cal., has opened salesrooms and a service station.

Verne M. Ford, Auburn, Cal., has resigned from the firm of Ford & Son and has opened salesrooms for the Dort and Mitchell in the Odd Fellows Bldg.

J. B. Clark has opened a branch of the Western Auto Supply Agency of Los Angeles at 1028 Jay Street, Sacramento.

Douglas Boswell, dealer in Best Tractors and G. M. C. trucks, has moved from 1312 U Street to 1227 Seventh Street, Sacramento.

The Sacramento Valley Tractor Co., Sacramento and Chico, Cal., has opened salesrooms for the Monarch tractor and Denby truck at 1208 Eighth Street, Sacramento.

The Savage Tire & Supply Co. has moved to a new building at 1308 K Street, Sacramento.

G. P. Louthain, formerly part owner of the Lincoln Highway Garage, Sacramento, has opened a salesroom and service station on K Street for the Oldsmobile.

The James S. Remick Co., Sacramento, has moved to larger quarters at Tenth and Jay Streets.

The Bowman Auto Supply Co., Sacramento, has moved from Tenth Street to larger quarters at Tenth and Jay Streets.

Vail & Smith have purchased the Phoenix Garage, Sacramento.

Burt Warren, purchasing agent for the city of Sacramento, has formed a partnership with G. W. Richards to conduct a vulcanizing plant and Diamond tire salesroom. An office has been taken at Fourteenth and Jay Streets.

The H. A. Seller Co., distributer of Signal and Stewart trucks, has opened a branch salesroom at 1308 K Street, Sacramento.

The Flynn Motor Car Co., Stockton, Cal., has been consolidated with the Chandler agency of A. E. Hunter. The new firm will be styled Mecum, Flynn & Hunter. The organization will occupy a new building on K Street.

The Portland Tire & Truck Co., Portland, has taken over the agency of the Lee truck equipment for Oregon and Washington.

The Gates Co., Seattle, distributer of Perfection tires, has taken over the Queen City Garage at 420 Queen Anne Avenue. The new quarters include a repair plant and small plant for manufacturing the Tyre Tyte for pneumatic tires.

The Northland Tire Co. has opened quarters at 1125 Pike Street, Seattle, as local distributer for the Automobile Tire Co.

James Cunliffe, Seattle, former manager of the truck department of the Seattle Automobile Co., has taken over the agency for the Kor-Ker tire treatment and puncture cure. A salesroom and filing station have been opened at 1112 Western Avenue.

The Summit Motor Car Co., Seattle, has been organized to succeed the Metz Co., with William Bradshaw as president and D. H. Hotchkin, secretary and treasurer. The Summit company has been appointed Northwest distributer for the Saxon, and will continue to handle the Metz cars.

Manley Thompson Bros. & Davidson, Tacoma, distributers of Ford cars, have moved to a new location at 1302 Fawcett Avenue. The old quarters at Ninth and Tacoma Avenues will be retained for accessories and supplies.

T. M. Kirk, owner of the Wapato Garage, Wapato, Wash., has sold his garage to Frank Cast, who will conduct the business, and make extensive additions to the garage.

Warren Brothers, Wenatchee, Wash., have taken the agency for the Diamond T trucks.

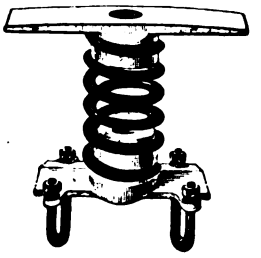
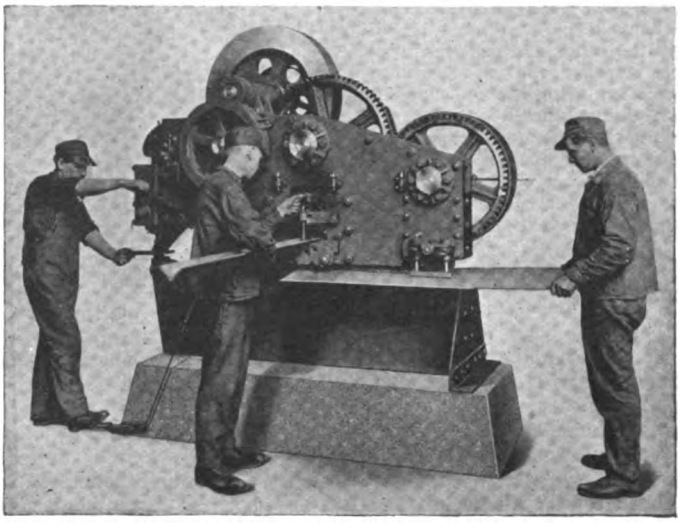
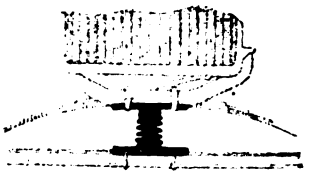
Accessories



WASCO GARAGE HEATING SYSTEM

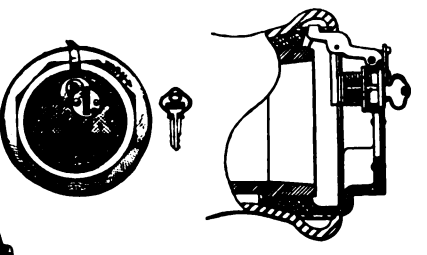


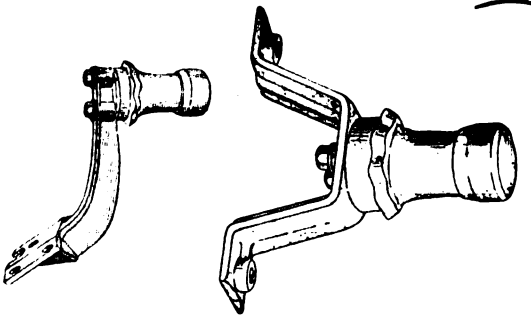
A hot-water garage heating outfit which includes a coal heater with automatic regulator, a radiator measuring 1 ft. 1 in. x 7 ft. 3 in. for each car that is stored in the garage, and all necessary piping and connections cut and threaded to fit. The same heater is used no matter what the size of the outfit, and any number of radiators can be used, up to ten. Complete lengths of the systems range from 9 ft. 9 in. for a one-car system to 82 ft. 3 in. for a ten-car system. The automatic regulator regulates the temperature by the expansion and contraction of water in the bottom of the expansion tank. Prices are: One-car system, $65; two-car, $84; three-car, $105; four-car, $126; five-car, $140; six-car, $161; seven-car, $182; eight-car, $203; nine-car, $224; ten-car, $245.—W. A. Schleft Mfg. Co., Inc., Syracuse.

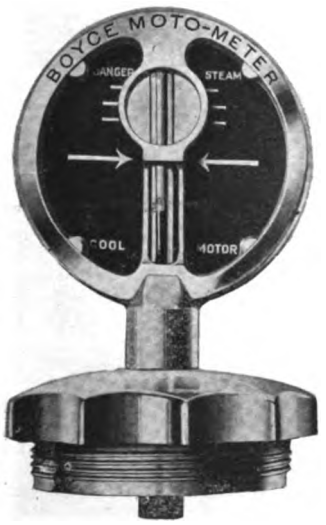


PLUNKETT SHOCK ABSORBER FOR FORDS

This coil-spring shock absorber for the front spring of a Ford car consists of an upper and lower plate, each plate having an extending boss with exterior spiral grooves which hold the coil spring. The boss of the upper plate has a bore into which the nut and king bolt of the spring set. It is held by the spring clips. The lower plate is attached to the axle with U-bolts. Price, $6.50.—William H. Plunkett, 36-40 Brooklyn Avenue, Brooklyn, N. Y.





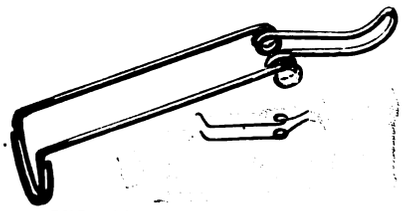


UNIVERSAL SLITTING SHEAR, PUNCH AND BAR CUTTER

A combination slitting shear, punch and bar cutter, built of steel plate instead of the usual iron castings, reducing weight without sacrificing strength. The machine will slit plates of any width or length, will punch sheets, channels, I-beams, or other sections, cut angles and tees, either square or mitered, and by inserting special knives will cut channels, beams, and other rolled sections. The machine is operated either by foot treadle or hand lever, and the three sets of knives can be operated independently or at one time. The capacity of the machine is as follows: Shear, plates ⅝ in. thick, flats 3 x ¼ in., T-iron 3½ x ⅜ in., round 1½ in., square 1¼ in., I-beams 6 in. x 12½ lb., channels 6 in. x 10½ lb.,; punch, 1-in. hole in ⅝-in. plate. The machine requires 5 hp., and the high-speed shaft runs 350 r.p.m.—Buffalo Forge Co., Buffalo.

BOYCE MOTO-METER FOR FORDS

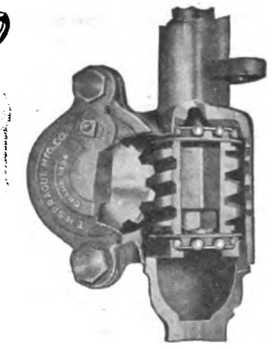
A Moto-Meter for Fords, made especially to fit the car, and complete with a nickeled radiator cap. It registers the temperature of the air and steam above the level of the water in the radiator and indicates by means of a visible thermometer whether the engine is overheating, running normally, or running too cool. Price, $2.75.—Moto-Meter Co., Long Island City, N. Y.



HOUK THIEFPROOF HUB CAP

This is a special hub cap, which locks a Houk spare wheel to the carrier dummy hub. Each lock has a special key, and the cap cannot be removed without releasing the latch with the key and using the Houk wire-wheel wrench, which presses down the latch and unlocks the hub. Prices: No. 3, $5.50; No. 4, $6; No. 5, $7; No. 6, $8. The numbers of the caps correspond to the numbers of the wheels.—Wire Wheel Corp. of America, Buffalo.

CARRIERS FOR HOUSE WHEELS



Spare-wheel carriers for House quick-change wire wheels are made for all Ford models. They are malleable iron, enameled black, and include a bracket, a dummy hub attached with bolts, and a malleable-iron, nickel-plated hub cap. The carrier for the touring car or sedan is bolted to the rear spring clip, the carrier for the roadster being fastened to the body with bolts which are furnished. Touring-car and sedan carriers sell for $10, roadster carriers for $9.—Wire Wheel Corp. of America, Buffalo.

Digitized by Google

FERNALD STEER-AID

A device fashioned of tempered steel wire, that is slipped in back of the steering knuckle and the other end snapped over the steering rod to eliminate rattle and bring the wheels back to a straight position. Used on Fords and other light cars. One pair used to the car. Finished in black japan, and packed one dozen pair in a carton.—Fernald Mfg. Co., North East, Pa.

SPRAGUE WORM GEAR FOR FORDS

A worm steering gear for Fords, which consists of a worm wheel keyed to the bottom of the steering column and mounted on ball bearings, this worm engaging a worm wheel which operates the steering arm. The gear reduction by pinions regularly on the Ford is rendered inoperative by removing the pinions and driving a spider over the gear and pinion shafts. The gear case which houses the worm and worm wheel is attached to the crankcase under the heads of the cap screws and bolts, no machine work or drilling of holes being necessary. A drag link with spring sprockets is supplied with the outfit, which is complete with all necessary bolts and nuts. Price, $15 retail, $12 to dealers, and $9.50 to jobbers.—E. H. Sprague Mfg. Co., Twentieth & Harney Streets, Omaha.

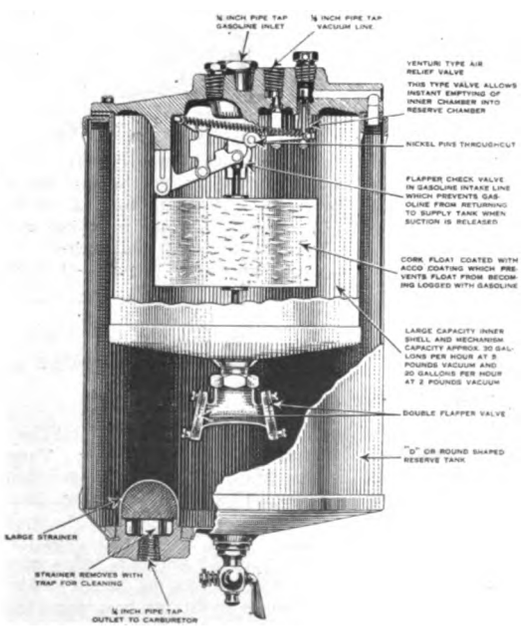
FERNALD DOOR ANTI-RATTLER

A spring device to prevent rattle in car doors. The base, which is screwed into the door jamb, is of heavier metal, and a clamp around the middle holds the spring. The spring forces the door over against the opposite jamb.—Fernald Mfg. Co., North East, Pa.

RAIN-A-WAY WIND-SHIELD PAD

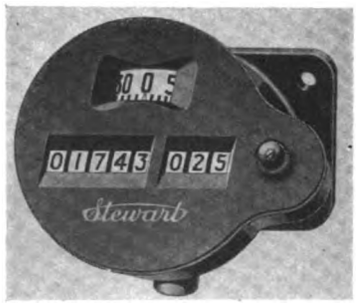
A felt pad treated with a solution, the pad being rubbed over the wind shield to prevent the accumulation of rain drops. Price, 25 cents.—Badger Mfg. Corp., Milwaukee.

Four New Stewart Products



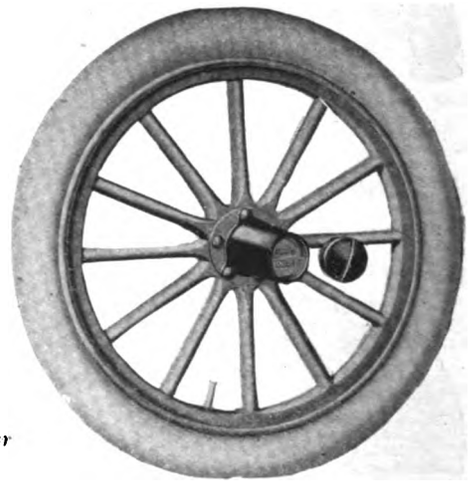
The Stewart-Warner Speedometer Corp., Chicago, has brought out four new products, a truck speedometer, speedometer and instrument board for Fords, a hub odometer for Fords and an industrial vacuum tank for heavy duty work.

The Stewart Model 131-M truck speedometer was designed for government use to withstand severe jolts and vibrations on army trucks. The speedometer is enclosed in an aluminum shell and the face of the instrument is set at an angle which makes the figures easy to read from the driver's seat. It has a 30-mile capacity rotating speed dial, 100,000-mile season and 100-mile trip register with a reset knob set parallel to the face of the instrument. It is attached to the dash by four wood screws. The price is $35.



The De Luxe speedometer and instrument board for open Fords has a 3-in. dial face, 100,000-mile season and 100-mile trip register with reset device. The reset knob is at the side and parallel to the face of the instrument. This model has an offset odometer in which the dial is sunk and beveled around the odometer. The figures appear at an angle, which makes them easy to read without tipping the instrument. The board is finished in black, the speedometer has a nickel flange and no bend is necessary at the top of the shaft. It sells for $20.

The hub odometer for Fords is installed by removing the regular hub cap, putting on the odometer and placing the new hub cap over it, the flanges being secured under three of the Ford wheel flange bolts. The odometer is enclosed and hermetically sealed in a case, making it oil, dust, mud and moisture proof. It registers to 100,000 miles, forward and backward movement and repeats. The mileage cannot be changed without removing the hub cap and a flange is provided by which the hub may be wired and sealed. The price is $12.



The vacuum system especially for use on heavy duty engines, trucks, tractors and stationary engines has a greatly increased capacity and accelerates the flow of gasoline. It is made in two sizes, one with a round shell of 3¾ pints capacity and one with D-shaped shell of 5 pints capacity. A flapper check valve in the gasoline line at the top of the tank prevents the gasoline from receding when the suction is released, thus keeping the gasoline line always full. The air vent is of venturi type and the inner chamber has a double flapper valve, allowing the chamber to be emptied quickly. The float is cork, heavily coated with Acco coating. There is a removable strainer in the gasoline outlet. A pet cock at the bottom will draw off water or gasoline for priming or cleaning.

Jobber's Convention

(*Continued from page* 7)

Finances are in excellent condition. There are total assets of $41,616.84, of which $35,000 is invested in bonds, including $14,000 of Liberty's.

All Members Equal

It is not unlikely that at the fall convention the manufacturing members will be placed on the same basis as jobbing members, and will be known as regular members instead of associate members, as at present.

Under the present arrangement jobbers pay whatever assessment is necessary for the running of the association while manufacturers generally pay only a fixed sum, about half that of the jobbers. When conventions are held the delegates of jobbing members receive their expenses and are paid $5 per half day session for sitting through each complete session. The manufacturers receive no expenses.

Figures submitted by the commissioner disclosed that from the first of the year until May 1 manufacturing members have paid in $18,600, whereas jobbing members after their expenses had been rebated to them had paid in $19,273.29. On a dues basis the membership is about equal, but it nevertheless was considered best by the majority that the manufacturers be placed on the same basis as the jobbers. This would result in more manufacturers being present when the roll is called each time and the attendance would be larger. As it is now, the jobbers hurry to get into the meeting before the doors are closed for roll call, while the manufacturing members take their time for coming in because they have no incentive such as the $5 bonus to get them in on time. This change, and also the changing of the association's name, cannot be made without an amendment. It will be voted on in October. A straw vote showed that a decided majority is in favor of a change.

At the French Lick convention the association voted an assessment of $100 a member to defray the expenses of the Sherman Law Prosecution which was started nearly a year ago and which has yet to come to trial. Four members failed to pay the 50 per cent of the authorized assessment that has thus far been asked and have been suspended. They are: Atlas Auto Supply Co., Chicago; Asbestos & Rubber Works of New Jersey, Camden, N. J.; American Hardware Corp., Corbin Screw Division, Hartford, Conn.; U. S. Light & Heat Corp., Niagara Falls, N. Y.

Wholesale Only?

What may prove a rather important point, if it comes up at the October meeting, is the suggestion made in the present convention that any jobber who is applying for membership must be exclusively wholesale. The amendment would not be retroactive and would not compel the elimination of the retail departments operated by present members. There are those, however, who believe the jobbing trade is moving toward an exclusively wholesale business, a number having already discontinued their retail departments.

Rising Cost of Business

Monday afternoon the jobbers went into the question of the rising cost of doing business. This was taken up at a session of the jobbers alone at a time when the manufacturers were holding a separate meeting. One of the questions raised was the manner of handling the sales expense of the automobiles that are used by jobbers' salesmen.

Clarke G. Powell, Omaha, owns his cars and requires the men to send in the day's expenses each night. An account is kept for each car. He does not allow a flat sum for car expense because it might tend to encourage the men to eliminate some of their side trips in order to cut expenses. A disadvantage is that salesmen are permitted to have the cars overhauled on the road, and when the company is paying all the bills there is a temptation not to keep these economical. Churchill, Electric Appliance Co., New Orleans, said he found it did not pay to travel men unless they were going further than a radius of 100 miles. He said the men should own their cars and have allowance for upkeep.

Fred Campbell, St. Louis, put three men out in cars a year ago, the company owning the cars. The cars went to pieces in a short time and were laid up much of the time. While the cars enabled the men to make the smaller towns the arrangement, he considered, was not entirely satisfactory. Since then two men have been operating in their own cars for which Campbell pays expenses and reasonable depreciation.

There is some question as to whether it is possible to put expenses on a mileage basis. Campbell is trying cars out at $4.50 a day, although this arrangement is experimental.

Dean of the Tisch Auto Supply Co., Grand Rapids, this year sold the cars to the men and allows them $30 a week for car upkeep alone. The sum first allowed was $35, but the men said this was $5

Digitized by Google

too much, so it was reduced. Thirty dollars a week is allowed for hotel expenses and the men are paid on commission. Settlement is made every six months.

How Hess Does It

Hess of the Equipment Co., Kansas City, used to buy Fords, Buicks and Oldsmobiles and the men sent in expenses. Jan. 1 the cars were sold to the men at $25 a month. A flat sum is allowed for expenses. For expenses three men got $150, two $135 and others $140; with the exception of two men, they are all on salary basis. Last year the expense allowance was $125, but this year it was necessary to make it greater.

W. W. Low, Electric Appliance Co., Chicago, said the Ford is the only car for salesmen. He has found that a car will last about 27 months, after which it can be turned in plus $125 or $150 for a new car. The men buy the cars. Low finances their purchase at $25 to $50 a month and the company stands the depreciation, unless it is due to careless handling. If a man buys any other car than a Ford, his car expense allowances are made on the Ford basis, he being allowed $10 a month for gas and oil.

Suter, Milwaukee, put in a good word for the salesmen, saying they are honorable men, although sometimes not so regarded by an employer. He uses eight cars, of which he owns two; the others belong to the men. No record is kept of their expenses, the men are simply required to turn in business at a certain percentage of cost, and if they can't be profitable salesmen they are not retained. No attention whatever is paid to their expenses.

Dine's Arrangement

H. M. Dine, Dine-DeWees Co., Canton, Ohio, pays the men on a percentage of profit basis. This encourages the men to sell the more profitable lines. The men are paid 25 per cent of the gross profit under a tentative arrangement, with settlements made twice a year. On this basis the men are drawing very good salaries and are bringing in good business.

Elyea of Atlanta pays a salary and a sliding scale on sales. The company owns the cars and rents them to the salesmen at a rate which covers the depreciation.

Charles E. Justus,, Justus & Parker, Columbus, pays the men a percentage of the profit and not a percentage of the gross business. The men get a drawing account of $225 to $275 a month and 25 per cent of the gross. In April this figured as 6¼ per cent sales expense.

H. M. Dine said he also gave the men all orders that came in from their territory no matter how the orders were sent in, his idea being to give each man the full benefit of all the sales and promotion work he had done. A larger commission is given on business from distant territories because the mail and telegraphic orders will be fewer. Returned merchandise is deducted at the end of the month, as are lost accounts. The man loses his commission only and not the entire amount of the loss.

There was a debate as to whether salesmen should carry both the cost and the selling price. Suter said his salesmen had been with the house for from 19 to 37 years, and that each man can figure up at the end of each day what he earns, because he carries the cost and sales figures. One month one man made $847.

Hess said that 6 per cent on the gross is equal to 20 per cent of the profit. It was voted that the association compile data on this subject.

Ex-President Charles E. Faeth said that he paid on the volume of business

BRUNNER GOLF TROPHY

Presented for convention competition by George L. Brunner of the Brunner Mfg. Co., Utica, N. Y. It was won last fall, the first time, at French Lick, by Harold M. Cooper, Marshalltown, Iowa. It was won at Hot Springs by W. W. Low, Electric Appliance Co., Chicago, who won a tie against Jack Stiles, Liberty Accessories Corp., St. Louis, and Edward Pegau, Western Automobile Supply Co., Omaha. It must be won three times for permanent possession. It is sterling silver and is a combination fruit bowl and vase 18 in. high and 16 in. across and lies in a mahogany case

and that it was unfair to give cost figures to the salesmen. The men are paid a salary and expenses and at the end of the year are given an extra bonus, which makes their total sales expense equal about 7 per cent. Twenty to twenty-five men operate in cars which they own themselves. Higher commissions are allowed in difficult territories. The use of cars brings in increased business. One member said there is little loss in turning in used Fords because they are at a premium in that part of Texas where he operates.

Slow or Quick Goods

A rather involved discussion followed the question whether jobbers should handle long profit slow goods or short profit quick goods. After a protracted session on this subject most of them seemed to be in favor of the quick moving goods although there was no definite conclusion.

On moving slow stocks the consensus of opinion was that jobbers should give their competitors a chance to take the goods off their hands before cutting prices or using any other force methods to move over stocks. This plan is used in Canada and other sections. Some jobbers give salesmen an extra 5 per cent on hard stocks.

The members seemed to agree that it does not hurt a competitor to cut prices on a stock that is not selling.

A small package shipment is one of the problems in rising costs because the profit on the package sometimes does not cover the cost. President Beach adds 10 cents for service and guarantee of delivery on orders under $10 and over that amount charges 5 cents for guarantee of delivery. Clarke Powell suggested that this matter be taken up in the association's advertising in Motor World.

There was some doubt as to how jobbers are going to take care of their catalog prices because of the increases in cost that are rapidly being made through railroad rates, passenger fares and other things. Several of the members said they were issuing letters and bulletins giving corrections in prices, and that this was the only way it could be handled.

Buyer the Price Man

In figuring how to decrease the expenses and increase the profits Clarke Powell said he had turned the pricing of all orders over to his buyer and that prices have been raised 5 to 20 per cent, notification being made through a form letter. McCullough of Philadelphia is issuing a monthly price bulletin giving changes.

President Beach, Chicago, is sending letters to his salesmen on the same subject. He also is now adding 50 per cent gross profit instead of 33 in order to provide a sure margin.

When railroad rates were raised 15 per cent in Canada, J. Ernest Millen added 2½ per cent to his prices. Revisions are made daily.

Hess, Kansas City, is now adding 5 per cent extra.

MacWilliam, Hyslop Brothers, Toronto, endeavors to have a minimum gross profit of 33 1/3 per cent. It was stated by the jobbers that there are several lines with advertised prices on which raises cannot be made, and the suggestion was made that it might be advisable, temporarily at least, for all manufacturers making prices on their goods because this makes it difficult to handle necessary increases.

Trade Acceptances

The trade acceptance once more came up for consideration, and it was urged that more make use of it. Some are using it quite generally, others are using it on slow accounts and some claim they have difficulty using it at all.

It was reported that the Federal Reserve Bank in Dallas has issued an order against the financial paper of jobbers on the ground that they are engaged in a non-essential business. The board of directors was instructed by the convention to investigate this matter thoroughly and ascertain the true situation and its causes.

As to collection fees on trade acceptances, some said 10 cents a hundred and

Engineers See Wonderful Liberty Plane Demonstration

French Aces Put American Machines Through Their Paces for S.A.E. Members—1200 Attend Dinner

DAYTON, June 17—The twelve hundred persons who attended the Orville-Wright dinner in connection with the summer meeting of the Society Automotive Engineers to-night heard the greatest after-dinner speeches ever heard at an S. A. E. meeting. The dinner was the greatest compliment that could have been paid to Orville Wright and when he rose to acknowledge the honor the applause was more vociferous and prolonged than any ever accorded any other member of the society. It resembled that given at a national political convention.

The dinner was a classic in airplane history and developed into one continuous round of applause for the Liberty engine, the De Haviland battleplane with its four machine guns and the general air program that has been carried out and is being pushed ahead.

The twelve hundred diners were in fine fettle for the meeting having passed the entire day looking at the Liberty engine and all of its parts in the pavilion where the meeting is being held. Not only had the members examined the engine and all of its parts as well as the De Haviland plane and all of its parts but just before dinner they witnessed the greatest exhibition of war flying ever seen in America when ten of the greatest flyers demonstrated specially for the members over triangle park.

French Aces in Exhibition

Two or three flyers, aces in the French army, took part. The flying convinced everybody that the Liberty is the greatest flying engine and those who looked at it along with nine other war engines exhibited from England, France and Germany were convinced that it is a better production job than any of the others, and its behavior shows that it produces more horsepower with less weight than any of the others.

The speakers table was lined with notables. Ranged on either side of President Kettering who acted as toastmaster. The list included General Wm. C. Kenly, the newly appointed head of aircraft training operations in this country; Howard E. Coffin, Col. E. A. Deeds, F. G. Diffin, Orville Wright; the guests of the dinner, C. M. Manly, Lieutenant Miozzi, representing Italy; Col. J. G. Vincent and S. S. Bradley of the Manufacturers Aircraft Association; Director Stratton of the Bureau of Standards.

The dinner brought out a wonderful fund of information. Our training planes are flying 220,000 miles per day. Our standardized De Haviland battleplanes with Liberty engines are so standardized that recently when one shipment arrived in France the fuselage was taken out of one crate and the wings out of another and in less than 2 hours from arrival at the flying field the plane was assembled and flying. The wings would serve for any fuselage. General Pershing was so pleased with the matter that he cabled his congratulations to Washington.

What Germany Plans

Germany is preparing to win the war with airplanes and is working to produce tens of thousands of planes and we must work for greater production. France and England have practically reached their maximum in airplane production and we must take up their load. Douglas Fir is now as good as spruce for airplanes and so there is no wood shortage. We have developed a fabric for covering the wings, from Sea Island cotton which is as good as Irish linen and so the shortage of linen is no handicap.

General Kenly was introduced by the toastmaster as one of the human being in charge of aircraft matters who had witnessed the early flights of the Wrights 10 years ago and who has followed the development of our aircraft work ever since.

General Kenly paid his best respects to Orville Wright and it was in appreciation of the work of the Wright Brothers that he attended the meeting.

True to war department ethics, General Kenly obeyed the instructions of not saying anything on any subject relating to aviation. He told of the impression the De Haviland battleplanes with Liberty engines made on the naval flying field on Long Island where previous to the arrival of the Liberty engines the flyers had been using slow boats. The coming of the Liberty engines put a new thought in Navy aerial work into all of the students. Its great power shooting the planes up into the elements, as the boys tried its speedy climbing qualities.

Lieutenant-Colonel Jesse G. Vincent answered the eternal question of "how fast is the Liberty engine" by drawing a comparison from the automobile field. The case is the same as that of an engine that can be used in a racing car that will travel 105 m.p.h. and putting the same engine in a truck and gearing it down so that it will travel not over 15 m.p.h.

If you put the Liberty engine in a light plane it has speed up to and over 135 m.p.h. but if you put it in a heavy day or night bombing plane, and perhaps use two of the engines, its speed will not be over 90 or 100 m.p.h., but it will carry great loads and travel long distances with them.

Colonel Vincent gave a clear outline of the work of the four flying fields in the city of Dayton. The first or Wilbur Wright Field is strictly a training field for cadets as well as specializing on machine gun courses with three different types of machine guns.

The McCook Field is the Government Experimental Station and is under the direction of Colonel Vincent and Major Howard Marmon. This is the National Headquarters for testing aviation work and where the standardizing of all kinds of apparatus is carried out so that production on a large scale is possible. McCook Field is equipped specially for research and standardization work.

The object of those in charge of McCook is to foster experimental work throughout the country and to take designs and standardize them so as to work for the best interests of the nation.

The general plan at McCook Field is to standardize one design after another and to alter design as necessary in order to get them suitable for the fastest production.

The third field is known as the South Field and is a privately owned one in which the experimental work of the Dayton-Wright Company is carried on.

Germany Not Weakening

F. G. Diffin, who was one of the society's delegates to the International Airplane Congress in London last January and February, is of the firm opinion that as a nation we underestimate the fighting strength of Germany and that so long as the Kaiser has 6,000,000 fighting men there is no thought of any internal revolution in Germany and that we have a long and hard fight ahead of us.

Diffin is a firm believer in producing airplanes in such great quantities that we will outnumber the Huns, who are now preparing to build planes in tens of thousands. It is foolish to think of Germany as in a state of exhaustion. The strength of Germany impressed Diffin more than anything else in his visit. Germany appreciated years before the war started that the war in the air would be the determining factor and she accordingly prepared.

To-day England and France have

Digitized by Google

reached the maximum of their airplane production or nearly so and America must take their places. The side that puts the greatest number of planes up will win. On land the best that can be looked for in the war is perhaps a deadlock. It is a long way to Berlin. Our people must be better educated to air planes. A great wave of education over the world is necessary. The biggest part of our people do not know the airplane and look upon it as an entertaining feature at a country fair.

Diffin was amazingly impressed with the whole-hearted hospitality that the mission received in England where it visited all of the factories and was shown everything that the Britishers had to show. There was no holding back of information or secrets but everything was made available.

Dr. Stratton, director of the Bureau of Standards in Washington, declared that the Society of Automotive Engineers had done more than any other engineering society in war work and he knew of no other society in which the members worked so well together.

After following the aircraft program from its development he thought the proper program had been followed by selecting one or two designs and building them in large quantities. He thought that those who had the aircraft matter in charge went to the correct people at the start and it was fortunate that the automobile industry was called on to do the work. It was fine to pick out the industry that could do the work and then stick to its program.

To have adopted every design that came along last year would have been criminal and to-day the nation should be glad that we selected a few designs and have stuck to them. England said that no aviation engine could be put into production under a year, but we put the Liberty engine into production in 8 months.

Director Stratton regretted the fact that Congress is so ignorant of our aircraft achievements but passed the blame on to the people by declaring that the people elected Congress and if the right men were not there to-day the people should see that they are not elected again. Congress does not know what is going on in our factories to-day and it should go to these factories and see and then it would not pay so much attention to rumors and the falsehoods that are flooding the land. The society members know the truth and they should tell it to everybody.

Jobbers Convention

(*Continued from page* 36)

others a minimum of 25 cents, the same as on drafts. It was suggested that an effort be made to secure a standardized practice on this point among banks, some of which are said to be charging all the traffic will bear.

Charles E. Justus sent out 75 trade acceptances as a trial and 30 were returned filled out. All of which were paid on time. That there is a great need for educational work regarding the acceptance is indicated by the statement of one jobber that one of his customers signed and returned the acceptance and sent with it a check for the face of the paper.

Emil Grossman classifies his customers in two divisions. Those who pay on a basis of 2 per cent in ten days are in class one and all others receive trade acceptances.

Vesper on the Job

One of the features of the convention was an address by President F. W. A. Vesper of the National Automobile Dealers' Association, who told of the size of the automotive business, and impressed upon the delegates the pride they were entitled to hold in their trade. Vesper urged constructive work, the elimination of waste and the need for war service work such as has been done by the National Automobile Dealers' Association.

The state vice-presidents who have charge of dealer organization work reported progress in quite a number of states. Alabama has a convention in Mobile July 8 to 16, to which jobbers are invited. Florida is geographically divided into three sections and has trouble organizing. Montana has promoted the Midland Empire Automobile Trades Association and held a meeting March 15. Texas held a dealers' meeting at San Antonio recently. Colorado is assisting the Rocky Mountain Automobile Trades Association. There is a possibility of organization in Michigan. Ohio is doing well. Missouri is quite active and is to have a meeting in July. In New Jersey the state association has recently undertaken a campaign of activity. California has a strong association with 2500 members. Others active are Washington and Canada.

As war service work some of the Ohio dealers and jobbers are teaching men to be mechanics so that they may serve in the army. It takes 60 days to teach a man. It is expected 1000 mechanics will be turned out by Jan. 1.

It was resolved that the jobbers' association endeavor to get the headlight law in various states enforced. When the laws were enacted large stocks of lenses were purchased and the goods moved slowly because the laws have not been enforced.

In order to get a maximum attendance at the sessions it was proposed that an amendment be introduced depriving a delegate of his railroad fare in case he does not attend all the sessions.

W. W. Low said his salaries had increased 20 per cent. John Shuford, St. Louis, said six months ago the overhead was 22.4 per cent, and that while business has increased 33 1/3 per cent the overhead has gone up to 26.5. His average gross profit is figured at 30 per cent.

Former President Sidney B. Dean of Nicols, Dean & Gregg, St. Paul, was present in his uniform of an army lieutenant. He is in the purchasing department of the Signal Corps at Washington.

Hanging on the walls of the convention room were the service flags of the jobbers' association of 14,876 stars and of the Canadian auxiliary of the association with 1254 stars.

A standing committee, known as the legislative committee. was appointed Thursday. The committee consists of Messrs. Faeth, Norris, Strannanhan, Lester, Dean and Commissioner Webster. They are particularly instructed to cooperate with the United States Chamber of Commerce in working to effect a repeal of the Sherman law. However, while this is a special assignment it is nevertheless a fact that the committee is to be a regular and standing committee.

Two nice souvenirs were given. Robert Dunlop of the Shaler company arrived Tuesday with a trunkful of fine canes—which went fast. The Splitdorf company gave decks of gilt-edged playing cards.

The convention was the longest ever held by the association. It began Wednesday, June 5, with committee meetings. The general sessions opened Monday, June 10. The sessions were originally scheduled to end Wednesday, June 12, but were extended two days, to the 14th. However, the business was ended easily by Thursday and the convention adjourned Thursday at noon with the auctioning of the $10,255.50 socks and the singing of "America."

Newerf To Distribute J. & D. Tires On Pacific Coast

NEW YORK, June 18—W. D. Newerf, a pioneer tire man of the Pacific coast and head of The W. D. Newerf Tire Co., Los Angeles, has just concluded arrangements to become Pacific coast distributer for The J. & D. Tire Co., Charlotte, N. C. Newerf will move his headquarters to San Francisco and will distribute J. & D. products throughout all territory west of Colorado, including the Pacific coast states, British Columbia and the Hawaiian Islands.

He was coast distributer for the Goodyear company from 1904 to 1911. From 1911 to 1915 he distributed the Miller Rubber Co.'s tires on the Pacific coast. Since 1915 he has done an extensive tire jobbing business throughout the Pacific territory. Under the new arrangement he will operate under the corporate name of The W. D. Newerf Tire Co.

N. A. D. A. on Trail of Rumor Peddlers

Will Make Fake Story Carriers "Prove It or Shut Up!"— War Convention Held

CHICAGO, June 14—Combatting rumors is going to be one of the chief occupations of the National Automobile Dealers' Association, which to-day held a war convention at the LaSalle. A systematic campaign is to be undertaken to down the persistent rumors that dire things are going to happen to the automotive industries almost any day. President F. W. A. Vesper asserted that these rumors have done millions of dollars damage to the dealers.

Linked with this fight against rumors concerning the industry there is concerted opposition to rumors that are adverse to governmental activities. President Vesper told of the success of the much maligned Liberty motor, and suggested that when anyone made a malicious or derogatory remark he be made to "prove it or shut up."

As an example of the foolish rumors that are going around one was cited that there was going to be a tax of 25 cents a gallon on gasoline that was used in automobiles.

Plans were outlined for putting into effect the war conservation measures recommended by the association's War Service Committee, of which President Vesper is chairman. While the intention of the committee was not that all garages should close nights and Sundays, they nevertheless have closed up in some cities in co-operation with the entire trade. In San Antonio no gasoline is sold on Sunday. One or two men are kept around garages to handle the floor and such emergency jobs as can be brought in and handled by one man. In Des Moines the town is closed pretty tight nights and Sundays.

Harry G. Moock, commissioner of the Rocky Mountain Auto Trades Association, said the Federal Tire house there had found that it cost 30 cents a mile to give tire service on the road.

Samuel A. Miles, manager of the New York and Chicago shows, explained to the dealers the method of handling rural express business, and urged that dealers sell trucks to such expressmen and get the service going in their section, as it relieves the railroads of a good deal of short haul work and encouraged the farmers to increase their food production, the rural expresses making it possible for the farmer to get goods to market easily and at a good profit.

The association voted in favor of the imposition of "a just and equal tax upon all motor cars and that we oppose any system or scheme for the taxation of automobiles which is discriminatory.

"Further, be it resolved that the president of the association appoint a committee of five, of which the president shall be ex-officio chairman, to treat with the committee or committees of congress and other governmental authorities having in charge the subject of the taxation of motor cars, and that we empower this committee to act for and on behalf of this association in all matters affecting the interests and rights of automobile dealers."

Further resolutions follow:

"Resolved, That it is the imperative and patriotic duty of every dealer, who has not already done so, to put into execution at once the conservation recommendations of the Commercial Economy Board."

"Resolved, That dealers' association and individual dealers extend the fullest possible co-operation in the establishment of the system and systems of rural express routes as proposed to the association by Mr. Samuel A. Miles.

"Resolved, That a vote of thanks be extended to the Chicago Automobile Trade Association for their sincere hospitality and highly enjoyable entertainment."

The Chicago association was a most popular host. It dined the dealers at the South Shore Country Club Friday evening and saw to it that every visiting dealer got all the golf and baseball he wanted.

Violate War Service Rule

ST. LOUIS, June 17—Two instances of violations of the "war service regulations" have been reported to President Schlecht of the Automobile Manufacturers' & Dealers' Association, and he has sent to the entire membership a letter calling attention to the fact that there were no dissenting votes when this rule was adopted. Also, that there is a power that can enforce these rules. Two car agencies that are not members of the association have been open for the selling and repair of cars since the night closing rule was adopted. Attention of these firms has been called to the fact that the regulations were adopted for a patriotic service and not for selfish interest

Belt Power of Tractors

IN considering the belt power of a tractor as a supplementary source for economical employment on the farm some consideration is necessary as to the locality, the preponderant character of the crops, the amount of belt power required and as to whether the demand for belt power will conflict in time with the demand for draw-bar power. For instance: In the wheat fields of the west the approved time for plowing—whether it be in the winter wheat districts of Kansas or the spring wheat districts of the Dakotas—happens to be just when threshing operations are at their heaviest. In other words, the peak load for both draw bar and belt comes at the same time. This is typical of a variety of combinations and complications which arise in tractor operation and which must be taken into consideration in fitting the tractor to the job.

Probably Will Curtail Coal For Car Industry

Neither Garfield Nor the Administration Have Issued Orders as Yet, However

WASHINGTON, June 17—Although neither Dr. Harry A. Garfield, Fuel Administrator, nor the Fuel Administration have issued definite orders regarding the quantity of coal which is to be allotted to the automobile industry, it is not improbable that a definite program of curtailment will be adopted. It was stated at first that the Fuel Administration had definitely decided to limit the amount of coal allotted to the automobile industry to 25 per cent of the quantity consumed during the 1917-1918 period.

Questioned by a representative of Motor World, Dr. Garfield specifically denied having issued any such order. It seems, however, that he has made a statement to this effect and within the past week he has verified such remarks. Following is the text of the statement which Dr. Garfield has made public:

Fuel Administrator Garfield to-day confirmed the statement he made on Monday in regard to the curtailment of fuel for the manufacture of pleasure automobiles. He stated that the general question of curtailing this industry is now in the hands of the Steel Section of the War Industries Board. The Fuel Administrator, however, feels responsible to limit the amount of fuel used in the manufacture of pleasure automobiles to whatever extent the national situation demands. Fuel Administrator Garfield made it plain even if steel is available for a larger production, he will be compelled to limit the fuel for the manufacture of pleasure automobiles in the season 1918-19 to not over twenty-five per cent of that consumed for this purpose in the season 1917-18.

In his statement Dr. Garfield first places the responsibility for curtailing output with the War Industries Board, which has jurisdiction over steel priorities. He says, in brief, that he believes that there will not be sufficient steel for the war needs of the United States and its Allies as well as to provide for normal or even a slightly curtailed production of motor cars. He continues that even in the event there should be sufficient steel for both war needs and to build passenger cars, he would feel "compelled to limit the fuel to the manufacture of pleasure automobiles in the season of 1918-19 to not over 25 per cent of what they consumed for this purpose in the season of 1917-1918."

Up to the present time no list of industries which are to be given priority in coal deliveries has been made public. However, the fuel administrator has such a list under consideration, and in the meantime has permitted it to become known that coal will be distributed in the following order:

A. Railroads.

B. Army and Navy together with other departments of the Federal Government.

C. State and County departments and institutions.

Digitized by Google

D. Public utilities.
E. Retail dealers.
F. Manufacturing plants on War Industries Boards' preference list.
G. Manufacturing plants not on War Industries Board's preference list.

Domestic consumers are not classified but will rank with roads.

The responsibility for the distribution of coal subject to this preferential list will be vested in the State Fuel Administrators.

The War Industries Board, will, in the main, decide which consumers will have preference in securing coal, but the United States Fuel Administration is assisting by request in the compilation of the complete preference lists. Distribution of coal to consumers in the first two classes will be handled from Washington and shipments to vitally important plants not in the first two classes will be supervised by the Government.

The War Industries Board will issue a questionnaire to every manufacturing plant using more than 500 tons annually, which, when compiled, will be the guide for the establishment of preferential lists.

Detroit Regional Munition Commission Begins Survey

DETROIT, June 17—Allan A. Templeton, regional director of the War Indemnities Board, has appointed J. Hubbert Cullen, industrial secretary of the Board of Commerce, and B. F. Emory to assist him in starting the first work called for by the War Industries Board. This work includes a survey of the entire district and the filing of complete information on all industries not now engaged on war work, but capable of conversion, industries partially engaged on war work and industries entirely engaged on this character of work, but whose contracts expire within a short time.

In every county in the State branch organizations will be established that will work whenever possible through the local chambers of commerce. All preliminary information will be obtained through them. Cullen has been working along this line for some time and is thoroughly familiar with the industrial situation. He has already lined up the industries of Detroit so the local commission will confine its time largely in rushing the State work to completion and renewing the industrial survey recently made in Detroit.

Eastern Agent For Hayes Wheels

NEW YORK, June 17—Castle & Kyte, general sales agents for the Wire Wheel Division of the Hayes Wheel Co., Detroit, have appointed the Hayes Wire Wheel Sales Corp. metropolitan distributers of the Hayes wire wheel. The new firm will be located at 842 Seventh Avenue. Alan C. McDonnell is president and Harry H. Jonas treasurer. All orders from the metropolitan district for wheels, parts of tools will hereafter be filled direct from the New York showroom, where a complete stock will be kept on hand, thus eliminating delay in awaiting shipments from the Middle West.

Show Managers Say Shows Should Go On

Break in Chain Would Mean Loss to Industry—Miles Says National Shows Are Almost Certain

CHICAGO, June 15—That discontinuing the automobile shows next winter would be injurious to the interests of the automotive trade and the country generally was the opinion of the National Association of Automobile Show Managers which met to-day at the Hotel LaSalle.

The members, representing most of the principal cities in the United States, voted that business must "keep the sign over the door" and that the shows must be held if possible, even though there be no great amount of cars to sell at the time they are held.

It was conceded that conditions may arise that may alter the situation, but, barring any such events, the show circuit of last winter will be continued in about the same order as during previous seasons.

Samuel A. Miles, manager of the New York and Chicago shows, representing the National Automobile Chamber of Commerce, said that the manufacturers were unalterably opposed to closing the New York and Chicago shows. Their attitude is that the shows serve to preserve the good-will that the industry has created for itself, that they bring dealers and manufacturers together, that business conditions are stabilized, that morale is strengthened, and that the interests of the respective territories generally are benefited by the various expositions.

The show managers considered making the dealer shows of next winter more educational and instructive than ever before, following along the lines of the dealer meetings, the first of which was held in Cleveland, others being held in Minneapolis, Kansas City, St. Louis, Boston and other cities.

Indianapolis, for a fall show, is renting three tents where it has used one before. Other associations are signing leases for their buildings. The Twin Cities have had to give up the Overland Building, where their enormous automotive show was held last winter, and are casting about for another structure. Government activities have taken many of the buildings that heretofore have been used for shows. Louisville formerly used an armory but cannot have it now. The majority of the show managers and association officers present expressed as their belief that every effort should be made to find buildings of some kind in case the show managers cannot secure the structures they have used during past years.

It was recognized that in some cases with few cars to sell and with conditions adverse, the shows may be little more than an empty shell, but it was considered very necessary that there be no break in the series of shows else the entire industry will have been given a setback from which it might take years to recover.

It was suggested that the show managers meet again in the fall to plan in detail the constructive educational work that began last year. Many plans were considered last winter, but their success was not apparent until the show season was so far advanced that the ideas could not be put to use in more than a few cities.

School Moves, Abandons Flying Field

DETROIT, June 17—The National Training School has moved its airplane and automobile departments to new quarters at 761 Cass Avenue. The airplane department has abandoned its idea of acquiring a tract of land for flying purposes having been stopped by the government from making this move owing to the fact that the proposed purchase of land is too close to the government flying field. Steps are being taken to establish a flying field near St. Louis. The school has raised the price of its ground course from $50 to $65. A class of thirty-five students was graduated June 1. The majority of the men joined the Royal Flying Corps, others went into the American Corps and a few became employees of the Packard and Fisher Body.

Personnel Changes at King

DETROIT, June 17—Wallace C. Hood has resigned his position as sales manager of the King Motor Car Co. J. B. Siegfried, general manager has opened an office in Washington to co-operate with the Detroit factory. George C. Gurney has gone to California to take the position vacated by I. B. Mears, recently resigned.

Government To Control Labor

WASHINGTON, June 17—Employers of more than 100 workers will have to secure labor through the United States Employment Service of the Department of Labor after July 15, 1918. The employers of less than 100 workers can use the facilities of the United States Employment Service if they desire. The use of outside agencies, advertisements or solicitors by employers of more than 100 workers will be prohibited under severe penalties. Application for workers can be made either to the Washington or local branches of the United States Employment Service.

The extraordinary labor conditions in the munition factories of the country have obliged the Department of Labor to take control of the situation. After the 15th of July any employer with more than 100 workers who desires to add to his organization will have to secure his

Digitized by Google

help through the various agencies of the United States Employment Service, or he may submit a plan of his own to the Employment Service and possibly obtain a permit or license to follow his own plan if it is approved.

In all probability employers will for some time be allowed to use their own plans when approved by the Employment Service, as it is expected that the compulsory procurements of labor through the Employment Service will not be completely effected immediately. It will have to be worked out in detail, which will probably take several months.

Hanch Heads All Purchasing

WASHINGTON, June 18—C. C. Hanch, vice-president of the Studebaker Corp., South Bend, Ind., has been appointed chief of the Automotive Products Section of the War Industries Board succeeding Harry L. Horning, whose resignation was recently accepted. Hanch will have complete charge of the purchases both by the Allies and the U. S. Government of all automotive products including motorcycles, trucks, ambulances, trailers, passenger cars, tanks, tractors, armored cars, airplanes, stationary gas engines and all automotive accessories. The motor transport service of the U. S. Army, which controls the military truck purchases, the motor equipment section of the Ordnance Department which buys the tanks and tractors and the many purchasing agencies of the Allies will lay their contracts before Hanch for final supervision before placing them.

Fewer Models for Overland

TOLEDO, June 17—Willys-Overland, Inc., will discontinue the manufacture of two or three models according to next year's program as a war economy and efficiency measure. With the start of production in September or October, the Model Four, the new low-priced car, will be made the leading model of the company. The company has been eliminating models every month; it is now producing sixteen.

The price of the new car is not yet determined but it is stated that it will be a little higher than $500. The company reports that all dealers have been notified of another price increase in its present models. This is the second advance since April. The new prices which have not been fixed as yet will take effect July 15.

Despite newspaper reports to the contrary, the Willys-Overland Co. is not planning the construction of a new automobile manufacturing plant in Canada for the production of the new little car. The company has a plant in Toronto where it builds the Sunbeam and when the little car is ready for production the same building will be used by the company to assemble it; no other structure will be built for this purpose. According to officials of the company, two models of trucks will be brought out by the first of next year. These will be of 1 and 2-ton capacities.

Higher Railroad Rates Boost Sales of Trucks

Omaha Expects Big Increase in Return Loads Bureaus and Rural Express Routes

OMAHA, NEB., June 15—A considerable increase in the use of motor trucks for short freight hauls and the early establishment of Return Load Bureaus in Omaha and Council Bluffs promise to be early developments of the increase in railroad freight rates ordered by Director General William G. McAdoo.

Already truck lines for bringing to market every kind of farm produce are running into Omaha and Council Bluffs from every direction within a radius of at least 50 miles. Thus far this season over 75,000 head of hogs have been brought to the South Omaha livestock market in this manner; the first to be brought in this way was hauled to market last fall. A single day's deliveries of hogs brought in by truck amounted to 1306 head. Young cattle are also being brought in largely in this way, while merchandise for stores in towns near here is already being hauled in considerable quantities on the return trips, but this feature has not been systematized or extensively developed as yet.

Chambers of Commerce of both cities, however, are working hard on the matter, and meetings are already being arranged at which details of the Return Loads Bureaus will be worked out along lines already found effective elsewhere.

Road conditions, particularly in Nebraska, are the chief stumbling block in the way of the movement, and the commercial bodies will give this feature special attention before proceeding, with the object of stimulating road work of a permanent nature, funds for which are readily available if but little effort is made.

Co-ordinate Trucking and Waterways

WASHINGTON, June 18—The first comprehensive co-ordination of inland waterways and motor truck transportation starts this week at Troy, N. Y. The Harvie Transport Co., operating a 5-ton motor truck from Troy to North Adams and Wilmington, Mass., and Bennington, Vt., is hauling freight or express delivered at the docks in Troy by the Troy Evening Line, which operates between New York City and Troy.

The plan includes store-door collection from the shippers at New York by a motor truck express company in New York City and store-door delivery by the Harvie company to the consignee.

It is expected that four 5-ton trucks will be operated by the Harvie company within 30 days. A combination of rates has been established equal to the regular express rates. This marks the first step for a co-operative transportation by the Highways Transport Committee and the Inland Waterways Transportation Committee. Raymond Beck of the Highways Transport Committee is handling this plan from the motor truck end, working directly with the Department of Agriculture which controls the waterways transportation.

Read the Story on Page 14

Hold Up Steel Shipments

WASHINGTON, June 17.—Temporarily all steel shipments are withheld from non-war industries. There is official authority, however, for the statement that there will be frequently, during the war period, considerable quantities of steel and pig iron for consumption by non-war industries.

Despite the announcement made last week by the War Industries Board that the new priority system would have no effect upon steel shipments, which, it was said, would continue as in the past few months, it is evident that steel will be completely withheld from manufacturers of non-war products for the time being. MOTOR WORLD has had reports from several manufacturers stating that steel has been refused, with the advice that a priority certificate order would be issued only if the steel was intended for war work.

Within the next week a definite announcement will be made by the War Industries Board on the steel situation, and what steel non-war industries may expect. The War Industries Board is in an uncertain position. Officials are frank in their statement that they do not know fundamentally of the steel crisis, and are indefinite as to what action will be taken. There will be a conference between the War Industries Board and the Steel Industrial Committee on June 21, following which a definite statement will be made.

Ford To Begin Boat Production

RIVER ROUGE, MICH., June 17—Production of submarine destroyers at Henry Ford's plant, west of Detroit, will begin this month. The huge plant has been erected in slightly over 100 days, and everything is in readiness for the launching of the first boat. According to present plants one complete submarine destroyer will be made each day at the plant.

Harroun Price Advances

WAYNE, MICH., June 17—The Harroun Motors Corp. will increase the list price of its car from $895 to $995, June 30.

Prominent Tradesmen Assume New Duties

Resignations and Promotions Place Workers in New Places

Charles B. Wilson, president of the Wilson Foundry & Machine Co., Pontiac, will assume the added duties of assistant general manager of the Curtiss Aeroplane & Motor Corp., Buffalo, in charge of production.

W. W. Burke, former sales manager of Gray & Davis, Boston, and sales manager of the starter department of the American Ever-ready Works, Long Island City, has joined the Pierce-Arrow Motor Car Co., Buffalo, as sales representative.

O. R. Hardwell, who was assistant advertising manager of the Chalmers Motor Co., Detroit, several years ago, has been appointed manager of the Overland Sales Co., Galesburg, Ill. He has been district manager for the Cleveland company in Iowa for some time.

E. H. McCarthy has been appointed manager of the Orders and Deliveries Department of the Hyatt Roller Bearing Co., Tractor Bearings Division, Chicago.

Henry H. Hower has been appointed production manager at the New London, Conn., naval base. He was a former official of the Ohio State Automobile Association, and was division manager of the Willys-Knight department of the Willys-Overland Co., Toledo, previous to taking up war work. He was also later advertising manager for the F. B. Stearns Co., Cleveland.

Finley R. Porter, formerly chief engineer of the Mercer Motor Car Co. and afterwards designer of the F. R. P. cars at Port Jefferson, L. I., has joined the government establishment at McCook's field, Dayton, Ohio, as airplane engineer in charge of engine development.

E. A. Bowman has relinquished his interest in the Bowman-Gould Co., Detroit, successor to the E. A. Bowman Co.

H. B. Cunningham, for several years connected with the S. R. Blocksom Motor Co., Philadelphia, Stutz distributer, has been elected general manager of the Automobile Co. of Philadelphia, 674 North Broad Street, Philadelphia. Cunningham is in charge in this territory for the Westcott.

Allan A. Templeton, former president of the Detroit Board of Commerce, and president of the Detroit Seamless Steel Tubes Co., has been made director of the Detroit Industrial zone. He will have general supervision of the production of war materials in this zone.

James G. Roe, who was formerly connected with the advertising department of the Hupp Motor Car Corp., Detroit, and later with E. A. Nelson, Detroit, mechanical engineer, has enlisted in the tank division of the United States army.

H. H. Brand, former secretary and treasurer of the Ohio Electric Car Co., Toledo, has joined the American Magneto Co., which recently moved to Toledo from Monroe, Mich.

E. C. Gavin, for nearly 10 years general superintendent of the Chicago Rubber Clothing Co., Racine, Wis., which is a large manufacturer of inner tubes, has resigned to assume the management of the Chippewa Rubber Co., Eau Claire, Wis., of which he is vice-president.

James Couzens, formerly connected with the Ford Motor Co., and now Police Commissioner of the city of Detroit, has been appointed chairman of the Wayne County Coal Committee to succeed Edgar B. Whitcomb, who has been asked to resign.

R. R. l'Hommedieu, long connected with motor car advertising on the Pacific coast, is editor of *Motor Way*, which is the house organ of the F. J. Linz Motor Co., National and Liberty dealer, San Francisco.

P. J. McCullough, who has been engaged in work for the development of the U. S. Army Air Service on the Mexican border, has returned to his work as superintendent for the Park Automobile Co., St. Louis.

Carl R. Jones, branch manager for the Bearings Service Co., in St. Louis, has enlisted in the navy and **L. H. Ware**, assistant manager, has been promoted to the management.

Wesley Deem, former production manager of the Columbia Motors Co., Detroit, has been appointed production manager of the Lane Motor Truck Co., Kalamazoo, Mich.

Fred A. Wade has been appointed purchasing agent of the automobile division of the Studebaker Corp., with headquarters at Detroit. He will take up his new duties July 1, having resigned as superintendent of purchases of the Buick Motor Co., Flint.

J. B. Sweeney, formerly with Theodore F. MacManus, Inc., Detroit, advertising agents, has been appointed assistant advertising manager of the Paige-Detroit Motor Car Co., Detroit, succeeding A. W. Schalbach.

Bert Miller, former general foreman of the heat-treating department of the Studebaker Corp., Detroit, has joined the ordnance department of the Harroun Motors Corp., Wayne, Mich., as superintendent of heat-treating.

W. A. Haynes has been appointed manager of the automotive division of the Detroit office of the Westinghouse Electric Co., succeeding Major Hawxhurst, resigned.

Smith Heads J. & D. Tire

CHARLOTTE, N. C., June 17—At the meeting of the Board of Directors of the J. & D. Tire Co., W. F. Smith was appointed president and general manager, and E. M. Downs was made vice-president and factory manager. R. L. De Lisser remains secretary of the company.

Pacific Coast Kissel Branches Under One Head

William L. Hughson Co. Also Will Operate as Coastwise Distributer for Kissel, Federal, Doble Steamer and Ford

SAN FRANCISCO, June 17—William L. Hughson, who has been president of the Pacific Kissel Motor Car Co. at San Francisco, with branches in six of the larger cities on the Pacific Coast, has taken over the entire Pacific Coast organization and representation.

The new company is to do business under the style William L. Hughson Co., and will operate as coastwise distributer of the Kissel Kar, Federal truck, Doble steam car and Ford. The change in name in no way alters the personnel or policy of the company. Hughson is president of the San Francisco Automobile Trades Association and a director of the Motor Car Dealers' Association of San Francisco.

Ford Enters Senatorial Race

DETROIT, June 17—At the request of President Wilson, Henry Ford has agreed to become a candidate for United States Senator from Michigan. In many quarters the news is received joyfully while comment in other parts runs along a disapproving vein. Among these the opinion is that Ford should remain at the head of his various companies and not assume any added responsibilities. His multifarious duties are enough to keep him busy and his move to take part in a senatorial race is severely criticized. In the majority of cases his candidacy is viewed with favor.

Sunderman Moves Office to Newburgh

DETROIT, June 17—The offices and engineering force of the Sunderman Corp., formerly located here, have been moved to Newburgh, N. Y.

Wisconsin Dealers Go on War Service Basis

Salesrooms Are Closing Early and Sundays and Every One Seems to Like the Idea

MILWAUKEE, June 17—The motor car trade of Wisconsin is now on a hard and fast war basis and all recommendations of the war economy board with respect to early closing of salesrooms, repairshops, garages, etc., are being strictly enforced throughout the state.

Although Milwaukee went on the new war basis on June 1, it required about 2 weeks' time to inform the trade in the interior relative to the rules and to allow them to readjust their business. Alfred Reeke, Milwaukee, state representative of the war service committee, and Bart J. Ruddle, secretary of the National Automobile Dealers' Association, have spent most of the period since June 1 in traveling through the state, addressing meetings of dealers in various communities, and otherwise providing for strict observance of the new regulations.

An instance of the unselfish attitude of organized distributers and dealers in Milwaukee is the plan of the Milwaukee Automobile Dealers, Inc., to inform the motoring public where service is available after regular hours in case of distress. As already noted, five emergency service stations are being established in the city of Milwaukee, where 24-hr. service will be available. Each of these stations will be equipped at the expense of the M. A. D. with a large illuminated billboard, and the highways leading into the city will be placarded so that passing motorists may know where to seek aid when necessary during the evening or night time. The expenditure will be made purely for the convenience of motorists.

All tire dealers and tire repairshops in Milwaukee at a meeting last week agreed to observe the new rules and close promptly at 6 p. m. and on Sundays and holidays, beginning June 15. Until then nearly every tire dealer of importance gave 24-hr. service.

At Fond du Lac, Wis., the war economy program resulted in the organization of the trade for the first time. Fifty-two out of 56 dealers and garagemen in the county met to learn about the rules and formed the Fond du Lac County Association of Automobile and Accessory Dealers, electing these officers: President, F. A. Johnson, Fond du Lac; vice-president, Peter Entringer, St. Cloud; secretary, T. W. Meiklejohn, Fond du Lac; assistant secretary, W. H. Kerr; treasurer, H. A. Shiels, Fond du Lac.

Des Moines Adopts War Service Hours

DES MOINES, June 17—Twenty-two Des Moines garages and repairshops have formed an agreement to close their shops at 6 p. m. each week day and all day Sundays and holidays. The early closing is being advertised on a co-operative basis by the twenty-two shops as a war measure. No repair work or accessory sales will be made after 6 p. m. daily but there will be employees sufficient to handle the storage cars.

Illinois Gets 750 Fordsons

CHICAGO, June 17—An allotment of 750 tractors has been made to Illinois by Henry Ford & Son, Dearborn, to be delivered direct to farmers at the factory price of $750 plus $25 for freight and delivery charges. The distribution for the state will be handled by the Rue Motor Co., Chicago, distributer for the Fordson. The company will hold a 2-day demonstration at Aurora, Ill., Monday and Tuesday of the next week at which Governor Frank O. Lowden and Henry Ford will be present.

Missouri Registers 163,201

ST. LOUIS, June 17—The sale of 1918 license plates in Missouri began Feb. 1. The report compiled up to June 1 gives this number of sales: 163,201 owners' plates; 1503 dealers' plates; 3140 motorcycles; 16,786 chauffeurs badges; 3901 transfers. The St. Louis office report (included in the above) is: 30,165 owners; 8263 chauffeurs; 1055 motorcycles.

Another Tractor Plant for General Motors

JANESVILLE, June 17—The General Motors Co., Detroit and New York, has selected Janesville, Wis., as the location of a third plant for the manufacture of the Sampson farm tractor, according to excellent authority. The corporation has acquired a site of 125 acres in Spring Brook, a suburb of Janesville, and intends to erect a complete new plant costing about $100,000, it is stated. Work is to begin as soon as arrangements can be made for the preparation of plans and the award of contracts. On the same authority it is stated that the General Motors Co. has acquired the Janesville Machine Co., manufacturing farm tillage tools and other agricultural implements and machinery, to co-operate with the new tractor plant in providing complete outfits in combination. The Janesville Machine Co. will enlarge its line of products to include power farm machinery which is in greatest demand for use with tractors. The company will continue to be operated as a distinct enterprise and will not lose its identity. J. A. Craig, general manager, will act in the same capacity for the new tractor industry, it is said.

The Sampson tractor is now being manufactured at Pontiac, and Oakland. The demand for tractors, however, is so large and growing so rapidly that the two plants are able to fill only a part of orders. The proposed third plant at Janesville is to be the largest of the group.

Janesville is one of the largest manufacturing cities in Wisconsin and is particularly well located with respect to railroad facilities. Both the Chicago and North-Western and Chicago, Milwaukee and St. Paul roads maintain large division headquarters at this point.

Ohio Tractor Dealer Has Sold 1,000 Fordsons

Fordsons Have Been Placed Throughout the State in An Energetic Campaign

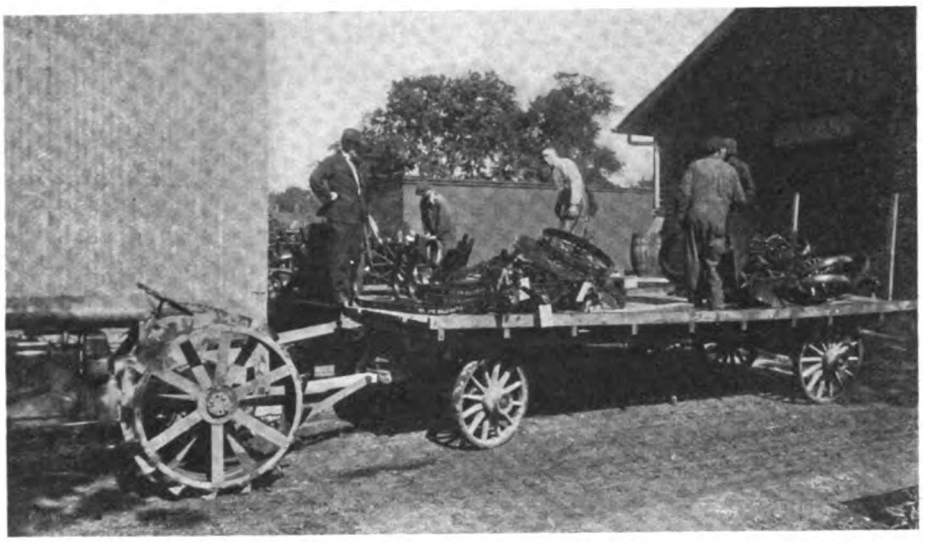
COLUMBUS, OHIO, June 15—The Bryant Tractor Co., which has moved into permanent quarters at 171 North Fourth Street, distributer for Fordson tractors for Ohio, will have closed out its 1000 tractors before July 1, according to E. H. Bryant.

One of the features of the distribution of Fordson according to Bryant is the fact that Putnam, Paulding, Van Wert and Allen counties, where other tractor salesmen had failed to place farm tractors, absorbed a large number of the Fordsons. The soil in those counties is said to be such that tractors could not be used to advantage but the Fordson disproved that idea. Tractors have also been placed in the hill counties of Ohio in large numbers and demonstrations of hill plowing were eminently successful.

Bryant estimates that he can place 8000 tractors in Ohio if able to get such a number from the factory. A careful survey of the state shows that such a number could be sold in the state without great trouble.

The Bryant Company is making almost daily demonstrations of the use of the Fordson. The company has six experts traveling the state at all times making demonstrations and showing purchasers how to operate the tractor.

The Bryant Tractor Co. is now working out a plan of selling tractors on time and to that end the assistance of the board of directors of the Federal Reserve Bank in Cleveland has been secured.



It was found that many country banks were not lenient in making loans or discounting paper given in the purchase of tractors. Attorneys are now preparing a note which will be used in making sales on the partial payment plan. Many banks have signified their intention to discount these notes at the usual interest rate.

It is estimated by E. H Bryant that fully 3500 acres has been placed under cultivation in Ohio as a direct result of the sale of the Fordson tractors He has heard where one farmer planted 200 acres in corn because of the plowing done by a recently purchased tractor Others put in more crops than they could have done otherwise and taking it all in all the benefits have been enormous, despite the fact that the distribution of tractors did not start until late in the spring plowing season.

Chevrolet Coast Production Touches 1200 in May

OAKLAND, CAL., June 15—During May the Chevrolet Motor Co. of California turned out more than 1200 complete touring cars and roadsters, as well as a number of FA passenger cars and light delivery vehicles.

Digitized by Google

T. W. Meiklejohn, Fond du Lac, Wis., has designed a special hitch for attaching a trailer to a Fordson tractor. From the rear of a stub tongue a flat iron brace extends forward and downward and is engaged at its front end with a short flat iron brace which extends perpendicularly downward from the front end of the stub tongue. The hitch to the tractor draw bar is made at the junction of the two braces. The tractive effect is to take the weight off the front wheels of the trailer and transfer it to the drive wheels of the tractor, thus increasing the tractive power.

GETTING IN THE WHEAT

(*Continued from page* 30)

working by the hour signed up, taking their chances on getting work when they come back.

Motor car dealers took the same position as many merchants—that they would give every possible chance to a man who was generous enough to go out into the harvest fields to help in this emergency.

What Will the Dealer's Do?

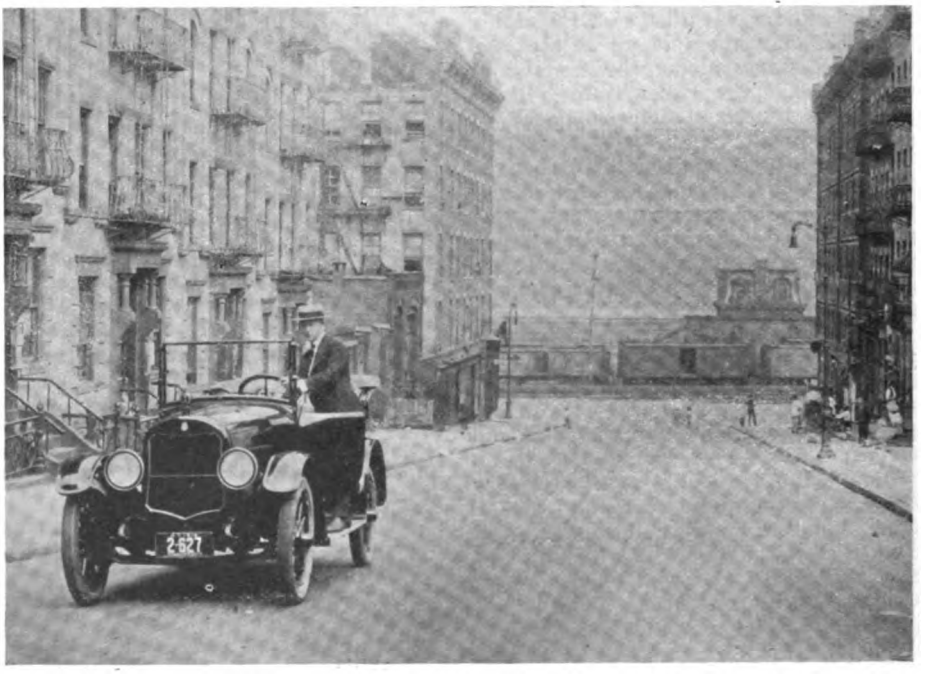
What are the dealers—and the owners—going to do while the service shops are closed, or hampered with shortage of workers, during the harvest season?

The Bruening Bros. Co., Apperson dealer, has already closed its service department. All the men volunteered for work, after Bruening announced that if they would all go, the shop would be closed as the firm's contribution to the harvest emergency. It will be re-opened July 15.

"We will do no work in the shop except on our own cars, getting used cars into shape to sell," said Henry Bruening. "We will have enough men at our downtown headquarters to care for inspection service to owners, which will not be interrupted. Owners who want any work on their cars, we will direct to another service station, telling them the facts, that we are closed for the harvest season."

"The owners will have to make some sacrifices, too," said another dealer. "They will have to wait, unless they can get into some of the other service shops."

The Harry A. Lee Garage, Studebaker service station, will receive much of the work on cars of dealers whose plants will be handicapped. Lee himself has sent five mechanics to the harvest.



"We are hoping that car owners will now get into the habit of allowing us some time for handling their jobs," said the manager of the garage. "This is the propitious moment for a general campaign on car owners, to get them out of the idea that they can get their cars attended to the minute they are brought in. If owners would make arrangements ahead of time for attention, we would be able to handle our work easily, even with our labor shortage, and the pressure of work expected. We hope for the co-operation of dealers in educating the owners to such scheduling."

Many dealers see in this emergency, the golden opportunity to get away from free service, as well as to educate the owners in closer attention to their cars. Some of them lean strongly to the plan of monthly inspections as a means of keeping cars in condition without the necessity of expensive repairs.

The Bruening Bros. Co., has maintained the inspection system for nearly 3 years, and it has proved a splendid means of keeping cars in running order with a minimum of repairs. The company gives 12 months' monthly inspections to every new owner; and seventy-five per cent of the new owners take advantage of it, bringing their cars in on a definite date each month.

Many instances are related of owners who, regular in the inspections, have not had any trouble whatever—and of others who, missing one inspection, have trouble within the following 30 days. That the owners, even under former free-and-easy conditions wherein owners pay little attention to their cars, understand the value of inspections, is indicated in this fact: that 25 per cent of the Apperson owners whose inspection service period has expired, are now paying $7.50 per month for a monthly inspection. In no case does the company do any mechanical work on the car, merely readjusting.

It has been suggested that garages as well as dealers might establish inspection service, so that owners might forestall trouble with their cars. Garagemen do not warm up to this suggestion, however, their chief objection being their confidence that the owners would not want to pay out money for service until something happened to the car that prevented its running.

NOW comes a new and unique demonstration developed by the King Car Corp., distributer of the King in New York City. The prospect is taken to the foot of a test hill. The motor is brought to a stop with the gears left in high. Then the switch is turned on and the demonstrator leaves the car and starts the motor by pulling the rear wheel over slightly. The car immediately moves away in high gear and the demonstrator, standing on the runningboard, guides it half way up the hill at 2 m. p. h. At the half way point, he returns to his seat behind the wheel and accelerates until he is making 25 m. p. h. at the top.

"Maxim" Is to Sell Trucks and Tractors

Munitions Corporation Has Secured Distribution of Dart and Will Handle Other Products

NEW YORK, June 17—The Maxim Munitions Corp., which was formed in 1915 to take over the inventions of Hudson Maxim, practically all of which are warlike in character, will enter the motor truck and farm tractor field. In addition to using its present extensive representation and connections to obtain wide distribution throughout the United States for a line of motor trucks and a a medium priced tractor for two or three plows, it also contemplates entering the export field aggressively.

The Maxim company is understood to have completed arrangements with the Dart Motor Truck Co., Waterloo, Ia., for the sale of its 1-, 2- and 3½-ton trucks throughout the Eastern territory. The truck will be sold through the Maxim organization as the Maxim-Dart.

In the farm tractor field it is planned to have a present manufacturer, already well equipped to produce tractors in quantity, manufacture a machine to special specifications which can be sold as the Maxim farm tractor.

The company will do both wholesale and retail business in each of these lines and its plans already have progressed to a point where a Broadway salesroom, with a service station adjunct, has been opened. This is located at 1651 Broadway, corner of 51st Street, and has been placed in charge of C. K. Thomas, who will have supervision over this territory, which has been designated the Metropolitan Sales Division.

The Maxim Munitions Corp. is capitalized at $10,000,000 and has close affiliations with a number of influential and widely known manufacturing industries. J. W. O'Bannon is president and chairman of the board of directors, the other officers being vice-president and secretary, Esmond P. O'Brien; treasurer and secretary, B. F. Taylor; treasurer and assistant secretary, B. F. Taylor; assistant treasurer, Harry Strachan

The main office of the company is at 120 Broadway, New York, and its principal manufacturing plants are in New Haven and Derby, Conn., and Watertown, N. Y.

Moon Push Organization Work

COLUMBUS, OHIO, June 15—Victor Moon, commissioner of the Ohio Automobile Trade Association is busy arranging and attending meetings in various parts of Ohio where there is much enthusiasm shown in the affairs of the organization. A meeting is scheduled for Youngstown June 18 and 19.

Kenosha Plant For Winther

KENOSHA, June 17—The Winther Motor Truck Co., originally organized at Kenosha, Wis., but operating in a leased factory group at Winthrop Harbor, Ill., just south of the city, has completed arrangements for the erection of its proposed new plant in Kenosha. The company is executing extensive contracts for military trucks and requires greatly increased facilities.

Price Changes

NEW YORK, June 17—The following changes in price have been made during the past week:

	New Price	Old Price
Reo, 4 cylinder, 2 and 5 pass.....	$1295	$1225
Studebaker, SH-4-40, 2-pass.....	1125	1050
5-pass.	1125	995
Sedan	1685	1525
EH-6-50, 2-pass.	1585	1450
4-pass.	1585	1395
5-pass.	1585	1395
E-G-6, 5-pass.	1985	1795
Sedan	2185	1950

Office for Indianapol's Association

INDIANAPOLIS, June 17—The Indianapolis Automobile Trade Association has opened a permanent office at 338 North Delaware Street. Assistant Secretary John D. Orman is in charge. There is a meeting room, and it is proposed to fit up club rooms.

Chicago Dealers Perfect Drive-Away Organization

(*Continued from page* 19)

this route in two days, Elkhart, Ind., being the end of the first day's drive, and Chicago being reached the second day. Garage accommodations are recommended at Bryan, Ohio, and at Ligonier and Goshen, Ind. Between Bryan, Ohio, and Butler, Ind., there is a stretch of 12 miles which is bad in rainy weather, but which ordinarily is in fairly good condition.

The Dashiel Motor Co., Chicago distributer of the Dodge Brothers cars, has a drive-away organization similar to the one previously described. It operates under essentially the same regulations and in the same manner. Dodge Brothers cars destined for drive-aways first are gathered into a special drive-away garage at Detroit, where they are subjected to a rigid inspection and prepared for the trip. In the way of spares practically nothing is carried except a few chains and tubes. The route followed closely parallels the line of the Michigan Central Railway through Michigan as far as Kalamazoo. This route is preferred because the grades usually are easier along a railroad line, and because the most practicable route is followed from town to town.

The route from Detroit to Kalamazoo is as follows: Detroit, Dearborn, Wayne, Denton, Ypsilanti, Ann Arbor, Dexter, Chelsea, Grass Lake, Jackson, Sandstone, Parma, Albion, Marengo, Marshall, Ceresco, Battle Creek, Kalamazoo. From Kalamazoo the route runs through Paw Paw, Lawrence, Hartford, Watervliet, Coloma, Benton Harbor, St. Joseph, Bridgman, Galien, Three Oaks, New Buffalo, Mich., Michigan City, Ind., Gary and into Chicago by the usual route.

Congress to Class Truck as Essential

It Will Not Be Taxed in Next Revenue Bill Unless Other Necessities Are Taxed Too

WASHINGTON, June 15 — Congress will, in the new revenue bill, recognize motor trucks as being 100 per cent utilitarian. Motor trucks will not be taxed in the next revenue bill unless other necessities are taxed. They will not be classified in the new bill with such luxuries as cosmetics, chewing gum and other similar commodities, as they were in the first war revenue bill. These forecasts are based upon the reception accorded the presentation of George M. Graham before the Ways and Means Committee this week. Graham appeared as the chairman of the Motor Truck Committee of the National Automobile Chamber of Commerce.

The trend of Graham's talk was that truck makers do not object to being taxed, do not object to an increase in the present tax, but do strongly disapprove of classification of motor trucks with luxuries.

At the outset of the address Congressman Claude Kitchin, chairman of the committee, expressed his sympathy with Graham's plea. In fact, every Congressman who questioned Graham displayed complete approval with the view that motor trucks are purely utility vehicles.

The presentation included descriptions of the uses of motor trucks and told of the 6000 war trucks which have been driven overland carrying spare parts and other supplies from the Middle West to points of embarkation. In addition Graham told of the Return Loads Bureaus, of the Rural Express Routes, how production of food is augmented by the trucks, and how railroad congestion has been reduced through the introduction of motor trucks for short hauls.

Coming before congressmen who are exasperated and wearied by requests for tax reduction, asking for no such reduction in motor truck tax and demanding only a fair classification of trucks as utility vehicles, Graham secured the sympathy of every Congressman. At no time during the presentation of his statement was there a word of disapproval, and there were frequent nods of accord on the part of the members of the Ways and Means Committee to his frank statements.

La Crosse To Make More Plows

LA CROSSE, WIS., June 17—To meet the enormous demand for plows, principally for use with tractors, the LaCrosse Plow Co., LaCrosse, Wis., will erect a large shop addition, 80 x 191 ft., part two stories high. Contracts have been awarded and work will be pushed so that the additional facilities may become available before the beginning of fall.

Car Tax Proposals Discussed Before Ways and Means Committee

Alfred Reeves Argues Case for N. A. C. C. —Emphasizes Importance of Passenger Car as Transportation Medium—Deprecates Its Classification with Cosmetics and Other Non-Essentials—Congressman Gardner Opposes Further Production of Passenger Vehicles

WASHINGTON, June 17—Facing an attitude which from the first has been hostile to the automobile industry, General Manager Alfred Reeves of the National Automobile Chamber of Commerce last week appeared before the Ways and Means Committee of the House of Representatives in a discussion of further proposed taxes on the motor car industry.

Reeves presented a carefully compiled brief, which is printed elsewhere in this issue, and in addition was required to answer questions of the Ways and Means Committee for more than an hour.

The hearing made plain that while Chairman Claude Kitchin apparently believes in the necessity of the motor car and the essential character of the industry, greater revenue is necessary, and it seems likely that the motor car industry must contribute its share.

In presenting his case Reeves pointed out the unfairness of classing with cosmetics, jewelry, perfume and other like products an industry of the utilitarian value of the automobile. He fairly established the necessity of the modern motor car by stating that if all motor cars were removed from the city of Washington the street car system would break down miserably. Members of the committee agreed with him.

His talk was to the effect that automobile production should be encouraged on the ground that it is a necessity rather than be crippled by additional taxation. Reeves cited that many of the automobile manufacturers have failed in business, which was given as an example of the injustice of the tax. He made the statement that the great use of passenger cars by farmers, doctors and business men was an indication of their essential nature.

The congressmen in general took the ground that an added tax would not prove a prohibition in the use of automobiles.

Chairman Kitchin told that at the hearings last year the Packard Motor Car Co. stated that it would suffer seriously if the tax were passed, and despite the tax is doing bigger business than ever. He also stated that the tax on Packard cars amounted to $75, and showed that the Packard company had increased its price from $850 to $1,000, asking why the increase had been made and if the public could stand such large increases why it could not also afford a doubling of the tax.

Most of the congressmen were under the impression that the passenger car makers were also the truck makers, and were therefore being compensated for any loss in normal business by the war truck orders.

They wanted especially, however, to know if it would not be wise to curtail the industry by a high tax so that the workers and materials could be devoted to war work. Further, they inquired as to the amount of labor now devoted to passenger car manufacture, the kinds and amounts of materials used, the uses of the passenger cars, the amount of war work being done by automobile makers, the percentage of war work as compared to passenger car work, etc.

In a final summing up Mr. Reeves told that the buggy business, which formerly amounted to the production of 1,125,000 buggies per year, had decreased to less than 200,000 annually, and showed by this that the automobile replacing the buggy is doing utilitarian work. He went into detail following questions regarding the number of automobiles in the various states, and showed that Iowa has one automobile to every six people, and proved that passenger cars are being used to a very great extent by farmers.

Statement Made by Alfred Reeves Before the Ways and Means Committee

"The original tax under war revenue act of Oct. 3, 1917, of 3 per cent on automobiles, grouping them with piano players, talking machines, jewelry, perfume and chewing gum was doubtless placed on the theory of taxing articles that were non-utilitarian.

"The automobile industry, the third largest manufacturing industry in the country, deprecates the placing of automobiles with the articles enumerated, because during the past decade, both passenger and freight vehicles have entered so largely into the personal and business use of our people, that they must be considered articles of great utility.

"These time-saving vehicles have so increased our efficiency that their disuse or any marked decrease in the number in use would be nothing short of a disaster at this time when the speedy movement of persons and commodities is of such vital importance.

"It is hoped that no favorable consideration will be given to any plan of taxation that will discourage the purchase and use of motor cars, which are such great factors in our fast moving American life.

"The making and use of automobiles should not be discouraged because:

"1—The industry ranks third in manufacturing importance. Employs more than 800,000 people, who with dependents would populate several of our States; pays annual wages approximately equal to all the gold in circulation in the United States; employs capital of more than $1,250,000,000, exceeding by $250,000,000 the capitalization of all the national banks; produced finished products of nearly $1,000,000,000 in 1917. An important part of the war program is, and should be, the maintaining of industry to the fullest possible extent.

"2—The passenger mileage of automobiles exceeds that of the railroads by more than 10,000,000,000 passenger miles; they carried 3,000,000,000 more persons than the railroads carried in 1915; the value of this passenger mileage at 2 cents per mile would have been $900,000,000.

"It would be impossible to adequately replace this service under present conditions by any other former transit. A recent investigation developed that the farmers in Livingston County, Ill., bought 73 per cent of their automobiles as a necessary part of their farming equipment, 25 per cent for both business and pleasure. And 2 per cent for pleasure alone of 2,000,000 of the automobiles in use are owned by farmers. Nothing could be more disastrous to-day than to interfere with the efficiency of the farmer. Dr. H. A. Garfield, fuel administrator, rules automobiles to be public utilities. Herbert Hoover buys new car, although giving up chauffeur driving vehicle.

"3—No automobile is exclusively a pleasure car. The most expensive machines are used more or less in a utilitarian way. There can be no danger that so-called pleasure use of automobiles can be permitted to become wasteful of gasoline, because Mr. Requa, oil director of the Fuel Administration, has ample power to enforce any rules necessary to conserve fuel.

"4—There are 5,000,000 passenger automobiles in use to-day; probably 850,000 per year will wear out. If production is not kept up residential suburbs would become to a considerable extent impracticable, tending to greater congestion in cities; local and suburban transportation facilities would be inadequate; suburban and farm values would decrease tremendously; the efficiency of farmers would be impaired very greatly.

"5—Automobiles are the greatest economizers of time of farmers, doctors, contractors, builders, salesmen and men engaged in all business.

"6—They increase efficiency of individual when farm labor is scarce; physicians are assuming the practice of doctors who have gone to France and manufacturers are called on for increased production. There are 150,000 doctors in the United States.

"7—Railroad service has been curtailed, and many valuable hours will be lost by business men if use of the automobile is curtailed.

"8—Automobiles have been used most liberally in the campaigns for sale of Liberty Bonds and War Saving Stamps, to raise war funds for the Red Cross and Y. M. C. A., in recruiting and in many other ways connected with war activity. To discourage the sale of automobiles will make these activities less efficient.

"9—Further reduction of manufacture will force out of business a large proportion of the 27,500 dealers and 25,000 garage owners, whose livelihood is derived solely from sales and care of motor cars and accessories and who are located in every town and hamlet in America.

"10—Eleven big companies made 85 per cent of the cars in 1917; more than 200 manufacturers produced only 15 per cent of all the passenger cars made.

"These are the ones who will suffer most from any increased taxation, because their profits are smallest and they are unable to secure war contracts to keep their plants in operation. There are bound to be many failures among them. Forty-nine failed or went out of business since last October.

"11—With growing scarcity of foods, the use of the automobile instead of the horse should be encouraged. Every horse continued in use represents 5 acres of land and the necessary labor to produce oats and hay and other feed diverted from the production of human foodstuffs.

"12—The automobile is one of the greatest utilities we have and renders a passenger car service exceeding that of the steam and electric railroads combined. By no stretch of imagination can it be classed with intoxicating liquors, cosmetics and so-called non-essential luxuries.

"13—To replace the cars that are worn out an annual production of about 850,000 cars is necessary, the average life of an automobile being figured at approximately six years. Production thus far in 1916 was at rate of only about 1,000,000 a year.

"14—A tax on this article with any thought of arresting its production seems unwarranted; the question of how many machines should be produced is one of materials and labor, and production should be maintained on a basis consistent with these conditions. This is a matter entirely apart from taxation and is being dealt with by another arm of the government, the War Industries Board.

"15—It is unfair to compare the motor vehicle industry of this country with that in European countries. England has only 260,000 passenger cars and imports all her gasoline, whereas as in this country we have seven States each which has more than 260,000 cars (New York leading with 451,000), while gasoline production here is almost 7,000,000 gallons a day, according to the Bureau of Mines report.

"16—It is a great economic mistake to reduce this output and disarrange organizations important to the prosecution of the war more than our own conditions as to material and labor make it absolutely necessary. The

Digitized by Google

more restricted because of these reasons the greater misfortune.

"17—Holding great automobile organizations for war work seems vitally important at this time and scores of the automobile plants are now doing government business, with many other companies asking for similar work.

"The government should add no undue burdens to this great industry; it should be maintained as fully as economic conditions will permit in order that such a vital and large part of our community may be in position to participate in government loans, income and other taxes and in other ways.

"It is to be regretted that the automobile industry as a whole is sometimes judged by the glittering successes of a few companies. Probably no other business presents the same mortalities during the past eight years, our lists showing 760 companies that failed or went out of business during that period. Since last October, when the new revenue bill was passed, there have been forty-nine companies that failed or went out of business. The 450 manufacturers of motor vehicles and the 825 manufacturers of motor vehicle parts and accessories and the 52,000 motor vehicle dealers and garages, with their more than 800,000 employees, constitute an important part of our manufacturing business labor community. Greater loyalty to our present cause exists now here and it is their earnest desire to pay for any equitable tax in their power that is considered necessary for the prosecution of the war. If it is considered necessary and wise to raise revenue by a manufacturing tax on essential articles, with which the motor car must be classed, there will be no complaint or objection, but it would then naturally follow that the quota necessary would be so distributed over a wide variety of articles so as not to be so burdensome on any one.

"With their business dwindling owing to advanced price due to increased cost of labor and material and of which this tax also forms a part and with a realization keener than others owing to their close contact with the subject that motor vehicles are vitally essential to our national efficiency, the manufacturers ask you to now reconsider and come to an appreciation of the point that an economic error is being made in grouping motor vehicles with non-essential articles for revenue raising purposes.

"It has always been felt that a great injustice was done to the motor truck when it was included in the last war revenue bill with perfumes, sporting goods and musical instruments and subjected to a tax of 3 per cent. There can be no argument on the statement that motor freight vehicles should be taxed only under a plan of taxing articles of use and necessity. The motor truck has so demonstrated its ability to operate not only in motor trucking field, but as a long haul substitute for inadequate railroad facilities and for marketing farm produce that this has become self evident.

"In its consideration of tax measures by the members of the Ways and Means Committee it is hoped that the tax on the automobile manufacturer will not be increased to a point where it would disturb the making or use of the motor car, which is now such an important factor in adding to the efficiency of the nation because of its ability to transport men and materials in the shortest possible time and to the needed relief of the railroads."

War Conditions Eliminating Free Service

Many Kansas City Dealers May Teach Owners to Take Care of Cars—Others May Institute Inspection System

KANSAS CITY, June 15—War conditions are helping to eliminate free service on motor cars, but are also helping to develop a substitute far more profitable and satisfactory to the motor car owner.

This is the conclusion of many Kansas City dealers. There is some difference of opinion as to just what this substitute will be—but no difference in the general character of the development. The evolution is in the direction of closer attention to their cars by owners, so that the cars may be kept running more consistently without the necessity of extensive overhauling.

There are two "schools of thought" in Kansas City for motor car dealers as to how motor car owners can be best assisted toward the most efficient operation of their cars, with the minimum of expense for repairs and overhauling. One "school" believes earnestly in the education of the owners; the other school advocates the establishment of schedules for inspection of cars at short intervals, at a suitable charge, so that owners need not bother with any details of readjustment except possibly the very minor ones.

The educational project is already being worked out by the Motor Car Dealers' Association, the Automobile Club of Kansas City, and the individual dealers.

The Motor Car Dealers' Association is planning promotion of the educational idea as a feature of its general program in pursuance of the projects suggested by the National Association. It is in the position of co-operating also with other general educational enterprises through which it is hoped the owners will get into the habit of studying their instruction books and taking advantage of the facilities for information on their cars offered by the various dealers.

The Automobile Club of Kansas City has for the past three months been paying considerable attention to educational features. The programs of the monthly meetings have been largely devoted to lectures and demonstrations on engines and car parts by experts. This sort of program has proved highly popular among the members and an announcement of a lecture draws a larger crowd than even the most eloquent orator on general subjects.

E. J. Sweeney, proprietor of the Sweeney Automobile and Tractor Training School, delivered a talk recently on the owner and his motor car. Sweeney told the owners that they should not expect nor try to become expert mechanics on automobiles, but that they could profitably learn many of the details of their cars, knowledge of which would cut down tire expense, and help them to avoid serious depreciation in the car.

A. Bannowsky, superintendent of the Rahe Automobile Training School, delivered a lecture recently before the club, explaining many of the mechanical ills of cars which owners should know about. Other recent programs of the club have had supplemental features of instructions to car owners. These meetings have always been lively with many questions.

A. E. Hutchings, president of the Automobile Club of Kansas City, one of the leaders in all war enterprises of the city, has been highly gratified by this interest among the members in the technical meetings. He and the officers feel encouraged to proceed with an educational plan which will back up the suggestions of the War Industries Board leading to a reduction in demands on mechanics.

"An educational committee would be a valuable adjunct to the club," said Hutchings. "The Executive Committee has this matter on its budget for its next meeting, and will probably appoint a committee to work out a program and decide upon the extent of instruction that should be extended. Possibly we will get out tracts to members, as well as arranging for demonstrations and instruction at meetings."

The club's monthly bulletin is featuring suggestions to motor owners on the care of their cars. The second floor of the Automobile Club's building can be cleared of cars, and here two or three hundred members could see demonstrations on two or three cars; such demonstrations probably will be put on.

Tractors for Seeding

WHILE the tractor is being used to some extent both for seeding operations and for grain harvesting, the proportion of machines put to these tasks regularly is surprisingly small. That there will be an extension of tractor use for such purposes in the future, as soon as certain things come to pass, admits of no doubt.

One will be the designing and construction of large capacity seeding machines which shall be especially adapted for use with the tractor, and another will be the development of a thoroughly satisfactory binder hitch which shall be more universally adaptable than is anything of the kind now on the market. There is an enormous field for the development of special power farm operative equipment and for attachments and hitches. This just has begun to occupy the attention of farm implement manufacturers. The very insistency of the demand will stimulate design and expedite production, and it may be anticipated that the line of specially designed power machinery will grow rapidly. *It is an end much to be desired.*

California Car Dealers Gloomy Over Outlook

Generous Distribution of Storage Stocks to Sub-Dealers Results in Shortage and May Cause Loss

LOS ANGELES, June 15—Announcements from Washington have been followed by a feeling of gloom among the distributers and dealers in southern California.

Anticipating price increases, distributers for weeks have been notifying subdealers to order as many cars as they could care for and usually the advice was heeded. The distributers thereupon cut deeply into their storage stocks to supply the dealers and the result is that they stand to be losers. One distributer, whose contract calls for the shipment of 30 cars per month has not received a shipment from the factory in three weeks. His stock has been cut into deeply and unless the manufacturer comes to his relief quickly he will be out of cars and compelled to buy back from sub-dealers to fill his own retail orders.

Distributers are doubtful if advancing prices will help them out much. Although it means additional profit on cars in stock, if public sentiment fosters the idea that it is not patriotic to buy motor cars in face of the attitude of the government toward them, there will be a corresponding reduction in the demand. Already consumers here are being made to think by a checking system operative at all gasoline supply stations under which every gasoline purchaser is asked the use he makes of his car. The check was ordered by the Fuel Administration, it was said.

A canvass of the dealers showed that practically none has taken steps to safeguard his investment against the future. All seem to be holding out hope that a change will be brought about before the worst comes.

The tractor field is not making an appeal, owing to local conditions and dealers believe that the demand for tractors in more agricultural localities than Southern California will exceed the supply, so that a tractor agency here would afford little relief. At this time there is but one passenger car dealer in Los Angeles who also sells a tractor.

Some of the dealers have stated they will operate their establishments as garages and repairshops. One is now planning to install a paint and top-making department. He does not believe that the private use of cars will be curtailed seriously and figures that the more old cars there are in service the better business will be in these branches. He also contemplates putting in a large stock of parts of various makes of cars to help in the repair business.

The most optimistic dealer is the pessimist of the past. His line of cars has not been in big demand and he has accumulated a large number of storage. With the supply of more popular cars exhausted he expects to step into the breach and "get on the map" in a way that did not appear possible under normal conditions.

No Gasoline Tax

WASHINGTON, June 15—Reports that a high tax on gasoline used for passenger cars and motor trucks will be placed in effect in July or August are untrue. These reports published by papers throughout the country are the result of a speech made in congress advocating such a tax.

There has been no bill prepared for such a tax, and even if this tax were to be placed in effect it would be incorporated in the new proposed taxes which are just now being discussed by the Ways and Means Committee, and which will probably not be placed in concrete form and passed by Congress for several months.

Rates for Renting Vehicles to Government

WASHINGTON, June 15—The rates for renting automobiles, motorcycles, traction engines and motor trucks by government contractors under the cost plus system is shown in the cost plus regulations to be as follows:

	Per day
Automobiles	$2.00 to $8.00
Traction engines	2.00 to 15.00
Motorcycles	0.25 to 1.00
Motor trucks	1.00 to 25.00

Fuel, lubricants and labor are not included in the above.

To Sell Herz Products

NEW YORK, June 15—The Pro-Mo-Tor Corp. has been formed for the purpose of exploiting the products manufactured by Herz & Co., New York. The new company will organize an advertising and selling campaign, and has elected officers as follows: President, Russel A. Cowles, president of the Ansonia Clock Co.; vice-president and general manager, Gustave L. Herz; treasurer, Edward S. Rothschild, president of the Public National Bank of New York, and secretary and counsel, Mark Eisner, United States Collector of Internal Revenue of New York.

Fifth Avenue Store for Silver

NEW YORK, June 14—C. T. Silver, Inc., metropolitan distributer of Kissel and Apperson cars, will open a branch salesroom at 509 Fifth Avenue on July 5. It is Silver's idea that the high class clientele to which he caters will be best reached by a salesroom in such a location.

Rowe Moves to Lancaster

LANCASTER, PA., June 14—The Rowe Motor Mfg. Co., which produces motor trucks, has moved its entire organization from Downington, Pa., to this city.

New York State to Show Off Tractors

Has Schedule of Demonstrations During Coming Summer in Farm Localities

ALBANY, June 17—The New York State Food Commission, of which Calvin J. Huson is director, has arranged to hold a number of farm tractor demonstrations in different parts of the state during the coming summer. The schedule includes the demonstrations at Watkins, Schuyler County, on June 26, and another at Stanley, Ontario County, on July 4. The dates and locations of other demonstrations have not been definitely determined, though it is planned to hold demonstrations in the following counties in this order:

Cayuga, Onondago, Oswego, Wayne, Monroe and Orleans. In addition there will be a demonstration in Orange County on Aug. 1, and another in Columbia County on Aug. 15.

The commission has arranged with the manufacturers of the Titan, Fordson, Case, Cleveland, International, Emerson-Brantingham, Avery, Moline and Bates tractors to have machines and representatives on hand at all of these various demonstrations, and it is hoped also to lengthen this list considerably, which probably will be made to include the Happy Farmer, Huber, Waterloo Boy, Sandusky and others.

Demonstrations will be run off under a set program and in each case will commence at 10 a. m. and continue practically all day. Each tractor company will be allotted a plot of ground of equal size and as nearly as possible of similar character and condition. This is to be plowed and fitted. At various stages of the demonstration the machine will be stopped and an expert from the factory will explain the construction, working and maintenance of it. After the plots have been plowed and fitted an apportunity will be given for various drawbar exhibitions, such as the hauling of cabbage planters, manure spreaders, seeds drills, etc.

The demonstrations are not to be competitive in any sense but are intended to be supplemental to the tractor schools which were conducted throughout the state last winter by the New York State Food Commission and to give practical information to farmers in the use of tractors and such accomplishments as go with them.

St. Louis Gets Tire Thief

ST. LOUIS, June 17—More than $50,000 worth of stolen tires were recovered this week from the basement of a grocery store which was advertising "second" tires as a side line. Every tire in stock was a first. The grocer involved several railroad yard employees in his confession. Thefts of tires and other accessories from warerooms and freight cars have become more frequent recently, as the police lines are being closed on the car thieves.

Big Tractor Demand in Missouri Wheat Belt

Unprecedented Harvest Acreage and Scarcity of Labor Stimulate Sales in Missouri River Towns

KANSAS CITY, June 15—An unprecedented demand for tractors for wheat harvesting is being experienced in the Missouri River bottoms between Kansas City and St. Louis this year. With wheat that will make up to 35 bushels to the acre, tractor dealers are finding difficulty in securing enough tractors to meet the demand for motive power for drawing grain binders.

Wheat being particularly heavy this season, the work of harvesting will be augmented and horse-drawn binders will have an uphill task. One binder propelled by a 9-18 or 10-20 tractor will make three rounds of a wheat field, while a binder drawn by four and five and even six horses makes two rounds of the same field, and the tractor can put in longer hours than the horses can, and besides any number of horses or mules put to a binder must be relayed at least twice a day because of the intense heat and humidity.

Immense acreage of wheat in the bottoms has given rise to big tractor sales at Hardin, Norborne, Carrolton, Keytesville, Booneville, Jefferson City and all other Missouri River towns. Scarcity of farm labor to handle horses is another reason for tractor sales on an increased scale, dealers in these sections say. These same tractors will be utilized in late July and August to break the same ground for the 1919 wheat crop.

Missouri has 2,250,000 acres in wheat this year as compared with 1,125,000 acres in wheat last year, and much of the increased acreage must be handled with tractors owing to the scarcity of farm labor, as well as to the scarcity of horses that are able to stand up under the heavy harvest work and long hours of the present harvest season.

Most of the tractor dealers in the Missouri River bottom land country stocked tractors early and they are reaping the benefits of their provision as they secured early deliveries and made sales from tractors stocked. The tractors that meet the largest sales are of the I. H. O. 9-18 type.

These tractors are too small to take the place of heavy rotary power for operating threshing machines, as they have to be of the all-work type to go over the bottom lands which are generally soft from rains and the heavier tractors can make but little progress under such conditions, while the small types go ahead surmounting all difficulties.

Good Used Car Demand on Coast

LOS ANGELES, June 15—The used car market here is on the boom. It is the consensus of opinion that with prices of new cars constantly increasing many purchasers will prefer high-grade used cars. Prices of used cars are being advanced rapidly on new cars. Some of these have been marked up as much as $200 in 2 months in order to keep pace with new car prices. This is possible, however, only where there is a steady demand for the cars.

There is such a sense in the security of the used car market in the future that many exclusive dealers are advertising extensively that they will pay spot cash for those they select. The new car dealer who a few months ago refused to take trades now welcomes the opportunity to get in stock as many cars in good condition as he can. This has resulted in a marked tightening up on the condition of cars accepted, however, and so-called liberal allowances are a thing of the past.

Fordson Wins All-England Championship

DEARBORN, MICH., June 14—According to a telegram received by F. Myers, tractor representative for Henry Ford & Son, in county Holland, England, the Fordson tractor serial number F 69 had won the All-England championship for the period ending April 6—this in spite of the fact that the tractor lost 5 days, the competition for the tractors starting before the Fordson arrived. The tractors worked on four separate farms.

During the 3 weeks and 2 days it was in commission, the tractor plowed, cultivated, etc., 470½ acres and the amount earned was £142 18s. The paraffin consumption was 2 6/7 gal. per acre. The tractor was worked by two soldiers who have been trained in the county and who previous to this had no experience in the working of tractors. They worked 12 hr. a day, including Sunday. The championship shield received by the men bears the inscription "National Food Campaign Champion Tractor of England and Wales." The championship shield will be held for 1 month.

San Diego Dealers Organize

SAN DIEGO, June 15—Sixteen of the leading dealers of San Diego have formed the San Diego Motor Car Dealers' Association. At a recent meeting the election of officers resulted as follows: President, E. P. Sample; vice-president, J. F. McKnight; secretary and treasurer, J. L. Joyce; directors, L. C. Maire, E. G. Davies, G. M. Alexander, C. W. McCabe, W. S. Smith.

The first accomplishment was to bring such pressure to bear on the city council that an ordinance designed to prohibit parking a car on the street in the effort to bring about its sale was defeated. The ordinance was amended so that any established dealer with a regular place of business could stand cars in front of the premises occupied by him.

Support was accorded the enactment of a new civil rights law under which all dealers use the same methods in doing business and are assured protection against fraudulent purchasers.

Los Angeles Car Dealers Turning to Motor Trucks

Passenger Car Shortage Compels Interest in Commercial Vehicle—10 Combination Dealers

LOS ANGELES, June 15—One of the most probable effects of the situation now confronting the passenger car dealers of this city will be to make them give more earnest consideration to the motor truck. In Motor World of May 29 appeared an article pointing to the passenger car dealer as the best truck dealer in which it was said: "The most logical truck dealer is the passenger car man who already has his sales and service organization and knows the automotive field."

To date "and knows the automotive field" has been the big stone in the highway to success of the combination passenger car and truck dealer here. Some of the most successful dealers in the passenger car field will admit they do not know the truck branch of the business. In the past, they have been identified with such quick-selling passenger cars that they have attempted trucks as a side line and have not gotten away with it. They have not taken the time to learn the field.

Trucks, on the whole, are slow sellers. Quick returns have been asked by passenger car dealers so no less than seven leading distributers in this city who have taken on truck lines in the last 2 years have subsequently dropped them. Included in this group are such dealers as Don Lee, Ralph Hamlin and Greer-Robbins, three of the ten most successful passenger car men in this part of the country. Each had the agency for a line of good trucks and all passed them up for the reason they could not divide their energies.

There are ten combination dealers here now. Three of them handle trucks made by the manufacturers of the same line of passenger cars they represent. One houses the trucks in a separate building and markets them through a distinct selling organization having no connection with the passenger cars. There are eleven exclusive truck dealers and three who have truck attachment agencies exclusively. Among these, the bulk of the business goes to those who are financially strong enough to carry their own paper.

Wire Wheel Repair Co. in New York

NEW YORK, June 15—A new note has been struck in the automobile business by the Wire Wheel Repair Co., 146 West Fifty-fifth Street, this city. It is the specialization by a completely machine-equipped and well-stocked organization to meet the demands and emergencies that arise out of the use of wire wheels. Alan C. McDonnell is president of the company.

Detroit Territory Needs Steel

DETROIT, June 15—None of the industries in this territory has received any official notification from Washington advising the supply of steel and iron would be cut off as a result of the action taken by the War Industries Board in agreement with the American Iron and Steel Institute. It is already understood by the industries that the entire steel supply of the nation is under absolute government control by priorities and this new order, if such has been issued, is interpreted by them as none other than the same thing.

The steel shortage began to be felt in April as evidenced by the decrease of production. All the manufacturers, however, did not suffer at the same time. Those whose supply of steel was great were able to maintain their production for some time before a decline in output was made manifest.

Viewing the situation as a whole the downward curve of production is not very marked, as some of the manufacturers have been able to maintain the same output for some time and those whose production of necessity was decreased do not show a very great percentage of reduction.

The Ford Motor Co. is still maintaining a production of 1550 cars a day; the output of the Olds Motor Works is now 100 cars a day where the company's production 2 months ago was 120—this decrease, it will be noted, is not very marked; the Willys-Overland Co. is turning out 425 cars a day—this reduction began only since June 1; production averaged 450 cars a day the month previous; Reo has maintained an output of eighty cars daily for some time; daily production of Packard is fourteen, which is the same as it has been for several months; Buick's daily output averages 300 cars; Cadillac, Chalmers, Maxwell and Hupp production has been at the same figures for some time.

While the passenger car manufacturers have felt some shortage of steel, the truck manufacturers in most cases have been able to increase their output; this is due to the fact that the government is encouraging the manufacture of trucks rather than endeavoring to curtail it. The call for trucks is coming from all quarters; nearly all manufacturers have orders for ten trucks for every one they can supply. Approximately 50 per cent of the trucks shipped are being used for war work directly or indirectly. This percentage is made up as follows: for ship yards, for use in transporting supplies to them, for use on the farms and for express lines in intercity transportation.

20,000 Goodyear Tires a Day

AKRON, OHIO, June 15—The Goodyear Tire & Rubber Co., now turning out 20,000 tires a day, is more than 2½ months behind in its tire orders. Total sales for the 6 months ending May 1, the first half of the fiscal year, exceeded $66,000,000, showing an increase of 40 per cent over the corresponding period of last year. A year ago the company had 300 women in its Akron plants; it now employs 3000 women there and that number will be increased to 5000.

Government Committee to Help Push Good Roads

WASHINGTON, D. C., June 14—The Government Highways Committee has been organized here. It comprises representatives from the War Industries Board, Fuel Administration, United States Railroad Administration, the Highways Transport Committee, the Department of Agriculture and the Motor Transport Service, U. S. Army. The chief object of the committee will be co-operation with the various states of the Union to better secure the construction of necessary highways. Logan Waller Page, Director Office of Public Roads of the Department of Agriculture, will head the new committee. Roy D. Chapin will represent the Highways Transport Committee. Lt. Col. W. D. Uhler will represent the Army. Other representatives will be appointed later this week. The many members represented in this committee expect to clarify many difficulties. The Fuel Administration will pass upon asphalt for example, the War Industries Board on cement, stones, etc., the Railroad Administration on transportation, the Office of Public Roads and the Highways Transport Committee on necessary commercial highways, and the Motor Transport Service on the military highways. The committee is now in a tentative form. A meeting will be held Wednesday, June 12, at which time the complete committee will be organized and its business defined.

92 Per Cent of Liberty Engines From Detroit

DETROIT, June 15—Detroit is producing 92½ per cent of all Liberty engines contracted for and at least one-third of the battleplane supply. according to a statement issued by the Detroit Real Estate Board. It is estimated that 19,000 Liberty engines will be completed in Detroit before Sept. 1, the contract time. It is also estimated that within 4 months Detroit will be producing not less than fiftv complete battleplanes daily. Automobile manufacturers are gradually working into a state of complete war work production in view of the edict that steel is to be issued only to war industries.

Government Plant for Airplanes

WASHINGTON, June 15—Organization of the United States Aircraft Corp. by the Director of Aircraft Production is proposed in a bill introduced last week by Chairman Chamberlain of the Senate Military Affairs Committee. The corporation would direct production of aircraft and equipment or materials therefore. It would be formed under the laws of the District of Columbia, with a maximum capital stock issue of $100,000,000. It would have the power to produce, purchase, manufacture or sell aircraft, aircraft equipment or materials therefor, and to build and operate railroads in connection. The government would control the majority stock. The corporation would be dissolved within 1 year after peace is signed. Enlisted men or commissioned officers would be detailed by the Secretary of War to work together with civilians, under the direction of the Director of Aircraft Production.

The Secretary of War would be authorized by the bill to transfer to this corporation any interest of the government in existing trucks for aircraft equipment or materials, and the title to lands, plants, railroads or equipment used in connection with the production of aircraft in which the United States has any interest.

Robert C. Hupp

NEW YORK, June 15—Robert C. Hupp whose death was announced last week in Motor World as having occurred at Cumberland, Md., was not the Hupp who has been intimately connected with the automobile industry for a number of years. He was an uncle of the same name but had never been connected with the automobile industry. Robert C. Hupp is at present living at Forest Hills Cardens, L. I., N. Y.

Moutier Leaves for Camp

PEORIA, ILL., June 15—Bertram G. Moutier, one of the proprietors of the Crown garage, will enter the service of the government as expert accountant at a large military repairshop at Camp Holabird, Md. He was given a farewell luncheon by the members of the Peoria Auto and Accessories Association at the University Club.

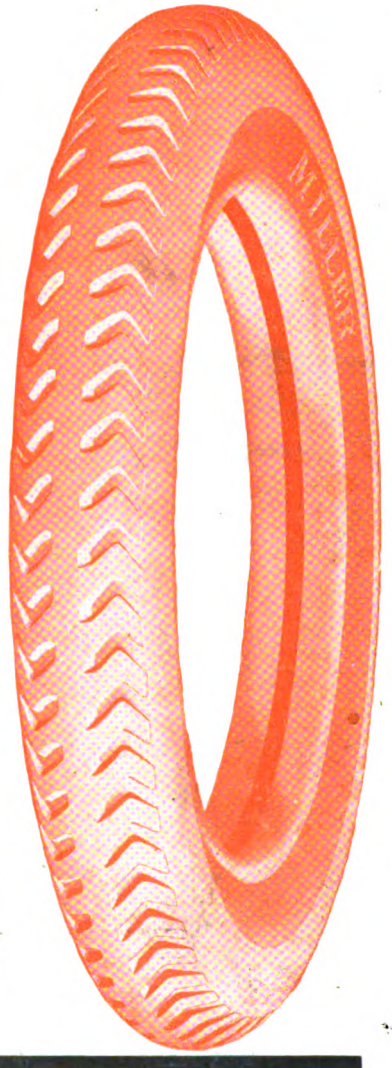
The Biggest Factor In Tires To-day Is Miller Uniform Mileage

"Uniform Tires are winning hosts of users"



This is what motorists long have wanted—tires that run the same under like conditions. For who could tell when he bought a tire whether it would go 5,000 miles or fail at 1,000?

Miller Uniform Tires bring a revolution; 99 in 100 outrun standard guarantees.

Such uniformity has been the aim of all tire makers for years. Miller achieved it by training tire builders to be champions.

Now motorists are reading all about these Uniform Millers and they are turning to Miller Dealers at a surprising rate.

Opportunities are open for aggressive dealers in numerous localities. Write at once for our attractive proposition and a free copy of the Miller Analysis of Tire Trade Conditions. A remarkable survey of the tire business resulting from months of field investigation. Send for a copy while they last.

All These Accidents Could Have Been Prevented by

The UTILITY SURE GRIP PEDAL for FORDS

Hundreds of Fords meet with accidents because the driver's foot slips off the pedal. The regular Ford clutch and brake pedal are small and smooth. Every driver knows that his foot often slips off the pedal and the danger of accident when this happens, and he knows too the certainty of a bruised ankle caused by the pedal springing up. The Utility Sure-Grip Pedal transforms the small, smooth Ford pedal into a regulation size, safe pedal. A flange at the side and a rubber gripping surface absolutely prevent the foot from slipping off the pedal, even when shoes are wet.

Why Take Chances?

It is foolish to run the risk of an accident when it costs only one dollar to supply a safeguard. In crowded traffic a slip of the foot from the pedal may mean jamming into the car ahead or smashing into a street car. This inevitably means at least an argument and perhaps later on a law suit. Is it worth taking chances when one dollar represents a safeguard?

A car is lucky if it comes out of the slightest accident with nothing more than a smashed fender—and this means a repair bill of more than one dollar—the price of a pair of Utility Sure-Grip Pedals.

Price Only $1 PER PAIR

DEALERS

The Utility Sure-Grip pedal has been demonstrated to a large number of accessory dealers, Ford dealers and Ford owners—**and there has not been one objection suggested.** This is very significant to dealers who are looking for a really popular and fast selling article.

Send for a sample pair and the agency for your community.

Hill Pump Valve Co.

Archer Avenue and Canal Street

CHICAGO ILLINOIS

District Offices: New York, 149 Church St.; Seattle, L. C. Smith Bldg.; San Francisco, 149 Montgomery St.; Kansas City, Rialto Bldg.

One Dollar Prevents Accidents

One dollar—the price of a pair of Utility Sure-Grip Pedals—absolutely prevents all accidents due to the foot slipping off the Ford pedal. No Ford driver can afford to take chances when the cost of prevention is so small.

Utility Sure-Grip Pedals are made of high grade pressed steel beautifully finished in black baked enamel and equipped with a heavy pad of highest grade rubber edged with metal. They can be attached instantly—no holes to drill—no special tools required—one nut to tighten and the job is done. **Once they are installed they absolutely cannot slip off.** Like all other Utility products manufactured by this concern, Utility Sure-Grip Pedals carry an unqualified guarantee of satisfaction. Send the coupon now.

Reliability

is the first requirement in every article of equipment on your car. You want to know that each fitment is going to wear well and function accurately. For that reason your equipment list should include the

CORBIN-BROWN SPEEDOMETER

The Corbin-Brown is reliable because its design is simple and correct; because only high-grade materials are used in its manufacture; because all parts are amply strong.

An important comfort feature is the Corbin-Brown Maximum Speed Hand. This extra fitting registers your highest speed and stays at that point until you reset it to zero, which can be done in an instant.

With the Maximum Speed Hand you do not need to take your eyes from the road to watch the speedometer while driving at a fast pace. Your speed record stands for inspection at your convenience.

Support the Association That Is

FIGHTING YOUR FIGHT

The National Automobile Dealers' Association Wants Your Membership and Support

5000 MEMBERS IN 90 DAYS

MEETINGS SCHEDULED	
New York	July 1
Philadelphia	July 2
Pittsburgh	June 27
Detroit	July 1
Indianapolis (All Indiana)	July 9
Harrisburg, Pa.	June 28

THE National Automobile Dealers' Association is asking for the support of every dealer in the United States.

The association jumped into the breach last fall when affairs were in a chaotic condition and has done for the dealers of America what no other agencies had been able to accomplish.

To-day—June 26—President F. W. A. Vesper and a committee are before the Ways and Means Committee at Washington telling Congressmen the truth about taxation of motor cars.

About a year ago this association was instrumental in getting the proposed 5 per cent tax reduced to 3 per cent.

It has been working, working, working ever since for all the dealers in the country, and has been able to effect a co-operative 50-50 arrangement with the Government's Commercial Economy Board which will let the dealers make their own war-time adjustments instead of having these forced upon them.

During the past months the association officers have been so busy with war business matters that little attention has been paid to rounding the association into shape.

But now the officers feel the need of stronger backing if they are to continue the work. They need—

Digitized by Google

Dealers of the New York City Territory:

FRED VESPER, who has championed the cause of the motor car dealers of America at Washington and elsewhere for nine months, is coming to New York Monday, July 1, to tell what the government wants the dealers to do.

He has a big message. He will tell things that haven't been printed—and probably won't be printed.

He will outline the plan that has been agreed upon by the government and a War Service Committee of which he is the head, and which plan affects the business of every dealer in the country.

In addition to telling you of this work he is going to ask your support.

For the work he has done you owe him your attendance at the meeting, even if you do nothing but listen to his story.

The meeting will be held at 12.30 noon, Monday, July 1, at Reisenweber's Restaurant, Eighth Avenue and Fifty-eighth Street.

This is not something that can be delegated to an assistant. This meeting should be attended by the head of every car-selling establishment in New York, Brooklyn, the Bronx, and every town within 100 miles of New York.

Notify at once by telephone or wire Manager Charles A. Stewart of the New York association at the Hotel Woodward, Broadway and Fifty-fifth Street, how many from your company will attend. Phone Circle 450.

above all other things—MEMBERSHIP. An association made up of only a few men has no influence—and influence is going to be needed

Wherefore, President Vesper and the directors have instituted a membership campaign drive, and that they may devote their time to matters in Washington and to their own businesses, have engaged E. E. Peake, secretary-treasurer of the Kansas City Motor Car Dealers' Association and president of the National Association of Automobile Show Managers, to follow the campaign through.

To let the dealers everywhere know what the association has done, is doing and plans to do, meetings are being held in various centers, to which the dealers are invited from the surrounding country. These meetings are to be addressed by President Vesper, Executive Secretary Peake and other officers.

Meetings have been arranged in New York, Pittsburgh, Detroit, Harrisburg, Indianapolis, which includes all the Indiana dealers, and Davenport, Iowa, and numerous other cities have meetings nearly fixed. A circuit of meetings will be staged in Ohio, there will be one in Philadelphia, one in Boston, one in Minneapolis and others in the other cities, both large and small.

Some cities have already sent in their total membership as members in the N. A. D. A. or have said this action would be taken at the next meeting. These include Detroit, San Francisco, Syracuse, Utica, Youngstown, Waterloo, Iowa, St. Joseph, Mo., and, in addition, others which had given their memberships before the 5000-in-90-days campaign began. These include Chicago, Kansas City, Minneapolis, Denver, Louisville, Des Moines, Atlanta, Memphis, Milwaukee, Oklahoma City, and others.

The association has many of the big city dealers. It must have them all. And in addition it must have the small town dealers. It must have representation everywhere, else it will not be a NATIONAL association.

It requests the dealers in the distributing centers to name a committee of its five fastest working men. These men are to name a chairman and a committee of the five livest men in every county. These county committees are to get all the dealers in the county to support the association.

All that is required is that each dealer send a letter of application with $15—$5 for membership fee and $10 for dues—and thereafter the dues are but $10 a year.

President Vesper says: "This association needs YOUR membership to help it safeguard YOUR business." It is a business insurance of less than three cents a day.

Dealers everywhere should at once get the machinery for membership in their sections into motion.

Get in touch at once with President F. W. A. Vesper or Executive Secretary E. E. Peake at 3550 Lindell Boulevard, St. Louis.

While waiting for the meeting to be held, or for your territorial committee to get to work send in your letters or application blanks and checks for $15 to headquarters now.

Nothing is gained by waiting. Members are what are wanted. The membership roll is beginning to swell. The biggest cities in the United States are in—and coming in every day.

Get action right away. Don't "wait for Vesper or Peake." A few men have been carrying the load for months. Let the rest of us get under now and hop it over in a real American automobile way.

This is the BIGGEST BUSINESS BEFORE THE AUTOMOTIVE TRADE OF AMERICA TO-DAY.

Vesper and Aides on Way to Washington

To Meet Ways and Means Committee of House and Present Dealers' Story

ST. LOUIS, June 24.—A committee representing the N. A. D. A. will appear before the House of Representatives Ways and Means Committee Wednesday to discuss a proposed tax of motor cars, gasoline and accessories. The appointment was obtained from Chairman Claude Kitchin of the committee by President Vesper, following a discussion of the situation by the motor car dealers in Chicago a week ago. At that meeting the appointment of the committee was authorized.

President Vesper took the question of a hearing up with Chairman Kitchin, and on Thursday received notice that the motor car dealers would be heard June 26. President Vesper has received pledges from the following to be present. They represent several phases of the selling organization: F. W. A. Vesper, president of the N. A. D. A., St. Louis; E. E. Peake, executive secretary of the N. A. D. A., Kansas City; Walter D. Meals, Cleveland; E. W. Steinhart, Indianapolis; H. B. Harper, Philadelphia; C. C. Coddington, Charlotte, N. C.; N. A. Reddick, Scotland Neck, S. C.; H. C. Finchel, Winston-Salem, N. C.; J. S. Donovan, Boston.

Preliminary Meeting in New York

NEW YORK, June 25.—Preliminary to meeting the Ways and Means Committee of the House of Representatives in Washington to-morrow, President Vesper of the N. A. D. A., and other members of the special committee, are holding a preliminary session in this city to-day. The committee will leave for Washington to-night.

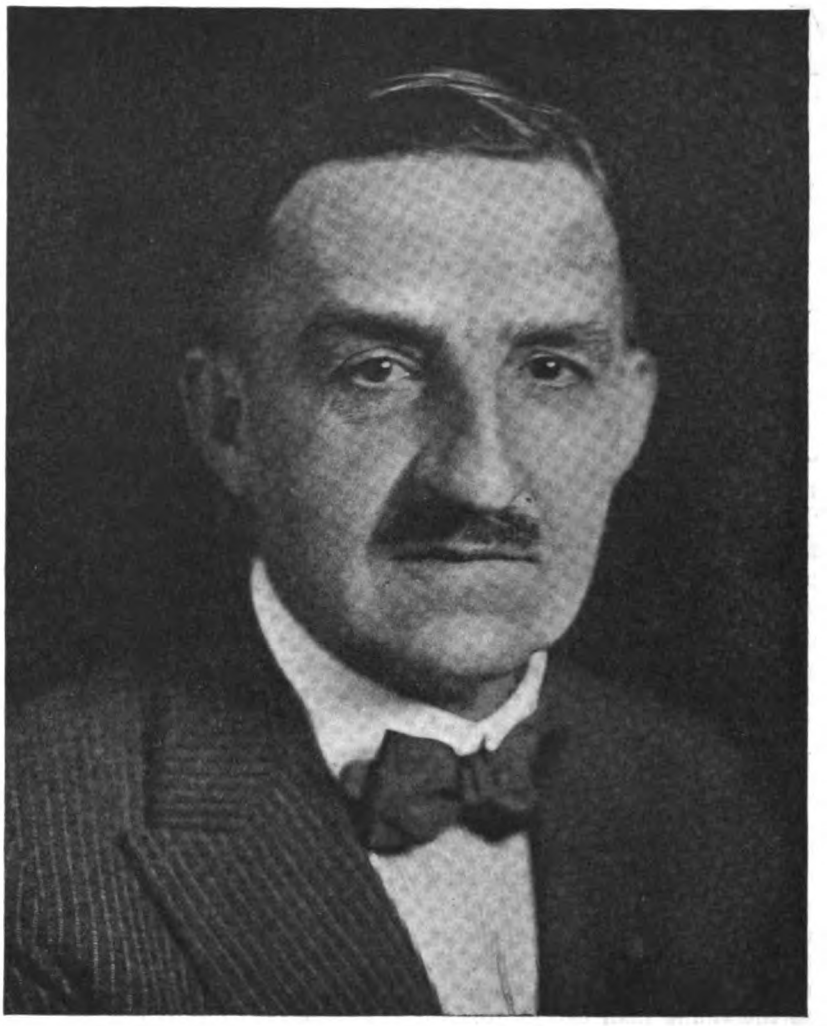
From Washington, Vesper and Executive Secretary Peake will go to Pittsburgh for an association meeting Thursday night, and from there to Harrisburg for a meeting Friday night. They will remain in the East until next week for meetings in New York, Philadelphia, and other cities.

Many Cities Joining

ST. LOUIS, June 24—The following local motor car dealers' associations have been enrolled 100 per cent in the N. A. D. A. during the past week:

Utica, N. Y.; Rochester, N. Y.; San Francisco; Springfield, Mo.; Waterloo, Ia.; Seattle, Wash.

Cincinnati and several other cities have reported the prospect for 100 per cent membership soon but the final reports have not reached President Vesper's office.



The exact membership to date has not been made public but it is no secret that it has passed the 1500 mark and the enthusiasm is growing. For the first few weeks after President Vesper took charge there were hardly any associations that came in 100 per cent and the new members were obtained chiefly as the result of solicitation of local dealers by St. Louis distributers and the distributers in other cities who were early members of the N. A. D. A.

Then the work began to reach the associations in the various cities and now there are members on the rolls from almost every state and every day small town dealers are sending in their memberships with an expression of a desire to do their part in the great work of consolidating and protecting the motor car business.

It also is expected that the campaign began by E. E. Peake, the recently named executive secretary, when well under way will bring results rapidly. The influence of Peake's work already has been felt.

Despite the missionary work done so far, it was learned at the Chicago meeting that many officers of local associations were until then not entirely familiar with the plan and the early accomplishments of the N. A. D. A. President Vesper has known that this was the case and he realized after the Chicago meeting that the opportunity for reaching these men had come co-incidentally with the emergency that caused the meeting in that city.

Since that meeting, although but one week has elapsed; the influence of the spirit shown there has been felt in the membership applications.

F. W. A. VESPER

President of the National Automobile Dealers Association and Buick dealer in St. Louis, who leads a campaign for 5000 members in 90 days

SALESMEN Made to Your Order

Salesmen are hard to get. Hiring a topnotcher is almost an impossibility — yet Champion has 67 of them, and this story reveals the company's man-building secrets.

A YOUNG man who looked as though he might be from almost any walk in life sat in the anteroom of the Champion Spark Plug Co.'s offices in Toledo.

He was in the waiting room looking over magazines, trade papers, catalogs and other things, and the young man thought that he was being required to wait because the man he was waiting to see was too busy to see him. The young man was partly right and considerably wrong, because the waiting period he was undergoing was a part of the observation being made of him as an applicant for a position on the selling force of the company.

Now and then, while the young man waited, Sales Manager F. B. Caswell took a look at him. Once in a while the young man looked up. At no time did he smoke cigarettes or do any of those things which might prejudice his prospective employer against him.

"He has an alert eye," said Caswell.

"What do you mean?" inquired the man addressed.

"Oh—just look at his eye," replied Caswell. "It is hard to explain what I mean, but if you will watch this young man you will notice that his eye is very alert. It is quick. He is observing. I think he is a fellow who will take hold quickly and grasp our ideas and become a good man. He doesn't seem to be a type of man on whom we will have to spend a lot of time and attention. If he is all right otherwise, I should say he probably could do good work for us."

Hiring men is not done by hit-or-miss methods—which too often are hit-AND-miss. One of the first tests, after a man seems to be satisfactory, is that he undergo a complete examination by one of Toledo's best physicians.

Once upon a time the company found it had taken a man with a serious physical defect—and from that day the examination method was applied. The report turned in by the physician covers about every possible point. If there are remediable defects such as bad teeth the man is overhauled—and every six months he is inspected and overhauled again. Bad teeth and their accompanying indigestion and bad breath have cost industry thousands of dollars through lost sales—and the loss has been as much the salesman's as the company's.

Y. M. C. A. Memberships

Furthermore, the company sees to it that each man is given every opportunity to keep himself physically and mentally fit. A Y. M. C. A. membership is given to each man. He has the association's gymnasium privileges in each city he makes, and is requested to report frequently on his condition on a Y. M. C. A. Physical Report such as is shown with this story.

Each man is also provided with a card of Busy Man Exercises which enables him to exercise in his room. Thinking he was unobserved one morning on a train, Caswell exercised a bit between two of the as yet unmade berths of the car. But a woman saw him and rushed to the porter to report that there was a crazy man aboard.

Each Man Studied

A study is made of every man—and the men are taken from the most varied walks of life. Caswell sets a high standard and requires that his men be men of integrity. This last statement is made as introductory to the next, which is that one day Caswell was in one of America's famous summer resorts where sight-seers often go to see the roulette wheels spin. Back of the wheels stood a young man. Caswell watched the man, and the man watched Caswell.

When things got dull Caswell engaged the man in conversation—and to-day this young man is one of the most successful men on the Champion sales force.

What was there about the young man which attracted this sales manager?

The principal attraction was that the young man seemed to know human nature. He had been back of the roulette wheels for only a short time, and had taken the position simply because he was out of a job, and this was the first one that turned up and provided the money that he needed.

F. B. CASWELL

Sales Manager of the Champion Spark Plug Co., who sold Champion plugs on the road when he was the only salesman the company had and he sold the whole output. He looks a trifle gruff in this picture — but he isn't. Ask any one of his 67 champions

The experience that he had gained there had developed a previously existing ability to size up human beings, and this Caswell, the student of men, soon discovered. The young man readily embraced the opportunity to go with the Champion company, and his name isn't mentioned because he isn't at all desirous of dragging into his every-day affairs the fact that he once spun the pill in a hardwood saucer in one of America's famous gambling establishments.

From Many Fields

Other men have come from the real estate field, and from fields too varied to mention. About the only man who hasn't made good, according to Caswell, is a man who used to be a barber. The fact that he was a barber is not the reason he didn't make good, but he may have acquired a money-borrowing habit while he was at the same time separating people from their hair and whiskers.

He borrowed money—everywhere. He borrowed money from all the people he came in contact with in the Champion organization. He borrowed it from the trade, and he got to be such a borrower that his borrowing ability over-balanced

Digitized by Google

his sales ability and they had to let him go. A second offense at borrowing money from anyone means dismissal.

In these days when everyone is wondering where they are going to get good salesmen, the story of how the Champion company gets its men may be of interest. It doesn't go out into the field and hire salesmen. *It goes out first and hires the man.* If the man happens to be a salesman, all well and good, but *the first requirement is that he be a man,* and if he has manly qualities and good fundamentals, and is physically fit, the making of a salesman isn't regarded as a difficult job.

Building Every Day

This building and rebuilding has gone on for several years until to-day the organization that Caswell watches, guides and directs consists of 67 men. Most of them are young men. Practically all of them have good habits. They are all becoming better men every year. They are all selling more of the Champion products every year, and the system has been operated with such success that to-day the Champion company is one of the largest corporations in the United States and leads its field in production.

There are certain steps a young man takes when he applies at the Champion plant for a position, but no matter what step he is taking he is watched and observed all the way through. No matter how much he may try, it is very difficult to cover up any inherent bad qualities. They are found out by those little observation points that the man himself doesn't know about. They are known only to those who are observing him.

The young man in question, at the beginning of the story, sat for a while in the waiting-room. A man is placed there to see what he does. If he idles his time and smokes cigarettes while waiting, it is considered a bad point. If he picks up the company's catalog or some of the trade papers or other worth-while material there and begins to read it, it is considered a good point. A man can do much to hurt or help his cause by what he does during the first few minutes he has to sit in the waiting-room.

After that he meets some of the people connected with the firm, and goes through the immense factory. Then he is taken to the engineering department, and to the advertising department. He then has a session in the sales department. The goods are explained to him. One day is spent in Detroit, one day in Chicago, and days at other factory headquarters points. The policy of the house is outlined, and work is done that is fundamental to his success upon the road.

If he comes through these preliminary stages in good shape, he is sent out on the road in company of a man—one of the experienced men of the sales organization. He is kept out on the road for a week or two, and then he is given a turn on the road all by himself. After this first road experience he is called into the factory and the sales manager checks him up on the extent to which he has retained the ideas which were conveyed to him during the preliminary period.

One of the tests is of the mettle and even disposition of the man. Sometimes when he calls to see the sales manager he is kept sitting on a bench *all day long.* If he loses his temper, becomes discouraged and presents a poor appearance when he finally gets in to see the sales manager, he has revealed a point that must be remedied before he can be a successful salesman. He is taught that he must never lose his temper, that long waits must not get on his nerves and that he must always be master of himself.

Men who have had chemical or a newspaper training are considered as having the fundamentals of good salesmanship in that they have been taught investigation. The chemist has been taught to analyze materials and find what is in them. The newspaper man has been taught to analyze situations and to dig to the bottom of everything for all the facts there are in connection with it. This quality in a salesman is considered highly desirable.

"Most men," states Caswell, "analyze, but they don't go far enough." He cites as an example: He was leaving a hotel in Detroit, one day, and requested one of his salesmen to meet him at the ferry at a certain time with a bag. He intended to pick up this salesman and the bag and go to the railroad station. The salesman, however, for some reason or other thought that, after the length of time he had waited, the sales manager might not show up, so he took the bag and went on to the railroad station.

The result was that there was confusion and delay, and he very nearly missed connection on the train.

"The average man," says Caswell, "analyzes, but he doesn't go to the last link in the chain. He doesn't go far enough. He doesn't depend sufficiently upon his own initiative and responsibility.

Some Lack Loyalty

"Some men," he states, "lack what may be considered loyalty or else plain common-sense. They do not attach sufficient importance to the relations that exist between themselves and those by whom they are employed. They are put out in charge of territories, but do not assume the responsibilities of a territory manager. They are lacking and *they consider themselves* 100 *per cent efficient if this lack is not discovered by the house.*"

One Champion man years ago had just been married. His home was in Indiana. His territory was in Iowa. He was not supposed to jump to his home town every week end, but, being young and still somewhat enthused with the novelty of domestic life, was prone to leave his territory uncared for and run home whenever he got a chance.

One day Caswell was in Marshalltown, Iowa. He told this particular man that he would meet him at a certain time in Grinnell. On the last passenger train on which the engagement could be kept Caswell failed to show up, so the young salesman promptly jumped the territory and went home. But he hadn't become

(*Continued on page* 49)

Busy Man Exercises

from

TOLEDO Y. M. C. A.

1. Raise on toes, raising arms to overhead, inhaling and exhaling.
2. Swing arms in large circles.
3. Hands on hips—squat as low as possible.
4. Arms overhead, bend from hips keeping knees stiff—touch floor.
5. Legs spread, knees stiff—touch floor behind feet, twisting body.

LYING ON BACK

6. Raise both legs high, keeping knees stiff.
7. Legs straight in air—bring knees down to chest and then straighten legs.
8. Keep heels on floor—raise body to sitting position.
9. Lying face downward, hands at side of chest—push body up until arms are straight, then lower to floor.
10. Stationary run—breathing.

Start out doing each exercise a few times, increasing the number of times each day until doing each 15 to 20 times.

Take these exercises upon arising in the morning or before going to bed at night. Never exercise immediately after meals. Take a cool shower or sponge bath and brisk rub with towel after exercise.

Be regular in all your habits: meals exercise, sleep, drink plenty of water and keep the bowels open.

DON'T OVER-DO YOUR EXERCISE, and don't stop after a short trial, but keep them going month after month.

One Day's Work — 364 Tractors Sold

By way of preparation, Meiklejohn staged an exhibition including the Fordson tractor and an Oliver plow in the lobby of one of the most prominent hotels in Fond du Lac, Wis.

The Plan That Helped Meiklejohn Put It Over

WHEN Henry Ford & Son, Dearborn, Mich., suggested to T. W. Meiklejohn, president and manager of the Service Motor Co., Fond du Lac, Wis., Ford distributer, that he act as the medium through whom 500 Fordson tractors be put into the hands of the farmers of Wisconsin at factory cost, and thus at no profit to him, he did not hesitate, but took the first train for Detroit.

He asked Ford what he was expected to do and whether any of the other state distributers had done anything notable which might serve as a model for him. Ford explained to him what it was he wanted him to do in Wisconsin and said that one state distributer had secured orders for 35 cars of tractors within a single week. This certainly was going some, and while Meiklejohn did not hesitate in expressing his willingness to undertake the distribution in his state he did so with a mental reservation that he would have to hump if he beat the 35-car-a-week record.

He admitted to himself that that was some stunt and had set a pace which it would be hard to equal and still harder to surpass. However, he was a man who was willing to try anything once; so, saying nothing about his perturbation of mind to Ford, he started back to Fond du Lac to make plans which would at least equal in results his co-state distributer.

So well did he plan, and so responsive was the enthusiasm which he succeeded in arousing among his fellow Ford dealers in the state, that on the day of his first demonstration, May 11, at Fond du Lac, he actually took orders for 52 cars of tractors, or 364 tractors in all, and got the money for them in advance. This was something like $324,000, for each order for a tractor included also an order for an engine plow to go with it. Two clerks from the Commercial National Bank in Fond du Lac were busy all day in a room at the Palmer Hotel receiving, receipting for and entering the checks.

Henry Ford Bawled Him Out

And Henry Ford, entirely ignoring the orders for 52 cars, "bawled him out," because at the demonstration Meiklejohn had failed to invite competing tractors to display their prowess alongside the Fordson. Now, what do you think of that?

Realizing that he had some job on his hands when he got back from Detroit, the first thing Meiklejohn did was to resign from the Service Motor Co. in order to devote his entire time to the tractor business. He opened an office in the Palmer Hotel, sent to Milwaukee for Ira W. Mabie, who was wholesale manager at the Ford branch at Milwaukee, to join him, and at once the two opened a campaign of publicity.

First he determined to arouse the interest of the Ford dealers of the state and secure their co-operation. He wrote and had printed some convincing literature, which he mailed to every Ford dealer in every county in the state where a tractor be considered at all practicable. This literature explained the patriotic motive behind the projected distribution of 500 Fordson tractors to as many farmers at factory prices and without profit to state or local distributer, emphasized the necessity for equipment to increase the Wisconsin farm food products, explained the plan upon which the tractors were to be distributed and told the dealers what they would have to do in the way of financing a shipment in case they decided to assist. Mr. Meiklejohn, knowing there was inspiration in numbers, decided upon a big demonstration of the Fordson tractor at Fond du Lac on May 11 and issued an invitation to all the Ford dealers to be present on that occasion.

The Chamber of Commerce of Fond du Lac, scenting an opportunity to get into the band wagon for the glory of the city, of its own initiative and at its own expense, at once had printed a poster, 24 x 36 in. in size, in red, white and blue, an-

Digitized by Google

nouncing the demonstration and endorsing it, which within a day after its appearance shared wall space all over the state with Liberty Loan and Red Cross posters. Incidentally it may be mentioned that the official endorsement of the Fordson distribution by the Chamber of Commerce of Fond du Lac is the only official endorsement of any kind which Meiklejohn received. Except for a letter of appreciation from Governor E. L. Phillip of Wisconsin, the state took no official cognizance of the matter.

Hotel Exhibit Staged

In the way of local preparation for the event Meiklejohn secured space in the lobby of the Palmer Hotel for the display of a tractor and plow, covered the walls of the lobby with banners of patriotic and business import, swung an immense banner across the street between the hotel and the opposite side, engaged a band or two and then sat down to wait with what patience he might for May 11.

Meantime the other tractor dealers in Fond du Lac, numbering something more than half a score, alarmed at the elaborateness and effectiveness of Meiklejohn's preparations, incensed because of the endorsement of the Chamber of Commerce and enraged at the prominence given to the tractor occupying its dais in the lobby of the hotel, got together and entered a protest. The Chamber of Commerce bluntly informed the protestants that of all the tractor dealers in Fond du Lac Meiklejohn was the only one in the whole bunch who had been a regular and consistent member of the Chamber of Commerce and the only one who had kept up his annual dues continually; hence he was entitled to some consideration, especially when he was engaged in a patriotic movement which would redound to the glory of the town. The proprietor of the hotel told the committee that if any one of them had a machine which would attract as many visitors into the lobby of the hotel as did that one which already was there to bring it along and room would be found for it. Thus the protest died aborning and the day of the demonstration drew nigh.

Demonstration Drew 3500 Farmers

Between 3500 and 4000 people attended the demonstration. In inviting the dealers to come Meiklejohn had insisted that each bring at least ten farmers with him. Some of them exceeded this limit—one brought 47. So the crowd, while abundantly leavened with dealers, was preponderately a farmer crowd.

In every way the demonstration was a success. The Fordson tractor was shown plowing, harrowing with disk and with spring tooth harrows, demonstrating its hauling capacity and its road speed, and so forth. Nothing was left undone to make every visitor entirely satisfied that he had seen what the tractor would do under familiar farm conditions.

So successful was the demonstration and so well pleased were the farmers who attended that the Ford dealers present saw at once that a popular move on their part would be the buying of a car of tractors for their respective communities. In anticipation of such a result Meiklejohn had made previous arrangements with the bank to have clerks at the headquarters at the hotel to facilitate matters. The selling of 52 cars already has been mentioned as the phenomenal result of this demonstration.

While in all essential features the plan pursued by Meiklejohn in handling the Wisconsin distribution is the same as that followed in Ohio, Iowa and some of the other states, still it presents distinct features of difference in some respects. For instance, Meiklejohn has made it conditional that every farmer who purchases a Fordson tractor shall also purchase an Oliver No. 7 plow. This is a condition which has been imposed by no other state distributer.

Farmer Pays the Charges

Again, the farmer, when he signs an order for a tractor, agrees to pay not only the freight from Dearborn, Mich., but also an unloading charge of $5 and a service charge of three $5 amounts. The unloading and service charge, aggregating $20, goes to the dealer, and from it he gets what compensation he can for his trouble and expense, since on the tractor, at $750, and on the plow, at $140, he makes no profit whatsoever. In cases where the dealer sells a Lean harrow in addition to the plow he receives 20 per cent on the price of the harrow, $146.

Before a dealer is recognized as a possible local distributer he must deposit in the Commercial National Bank at Fond du Lac a certified check for $6,230. This check is made payable to T. W. Meiklejohn, but is held in escrow by the bank until the dealer receives seven tractors and seven plows.

Will Concentrate on Tractors

Meiklejohn has gone into the tractor business permanently. As stated previously he has resigned all connection with the Service Motor Co. and will organize another company for the sale of the Fordson tractor and Fordson equipment. He is at present building a warehouse, 40 x 200 ft. in size, which will be used exclusively for this business. The warehouse is on a building site given him by the railroad, and which affords ample room for future expansion. As soon as the distribution of the original 500 allotment is completed he will begin making contracts with dealers for territory for future trade. It is significant that he will confine his efforts principally, if not exclusively, to the Ford dealers in Wisconsin. As Meiklejohn will handle in a wholesale way the operative equipment already approved by Ford and all that ultimately will receive his approval, and inasmuch as this same equipment will be sold by the dealers whom Meiklejohn appoints, the result will be the development of a distinct class of automotive dealers in the state.

"We are going to give better service than any other tractor concern in the state," says Meiklejohn. "This will apply not only to our local trade but to our trade throughout the state. For instance, we have issued positive instructions to every dealer who has bought a car of tractors not to make a delivery nor attempt a demonstration until we can get there to show him and to instruct his farmer customers. In the very beginning we had a few dealers try to get across with a demonstration without such instruction and they fell down. We do not intend to have a repetition of such a mistake."

Alton Dealers Organize

ALTON, ILL., June 21 — The Alton Automobile and Accessory Dealers' Association has been organized here with 14 member firms. The following officers were elected: President, H. T. Horstman, Alton Auto Co.; vice-president, L. T. Hudson, Wagner Motor Car Co.; secretary, C. T. Yaekel, accessory dealer; treasurer, E. C. Hoefert, Dodge Bros. Motor Car Co.; directors, Christ Schuette, Bluff City Auto Co.; W. E. Winter and C. G. Luft.

Meiklejohn's service men travel in Ford coupes and take the service right to the farmer's backyard—which is what the man is doing in this picture

Farm Comfort *and* Dealer Profit

How One Farm Lighting Dealer Follows the Sale of Farm Lighting System by Those of Vacuum Cleaners and Washing Machines

IF someone were some day to move into the salesroom of an automobile dealer a lot of washing machines, vacuum cleaners and other household apparatus of that kind, a dealer might be rather indignant to see his ornate establishment so cluttered up with wares of this kind.

This may have something to do with the frame of mind of so many dealers considering the handling of farm-lighting systems and the appliances that go with these electrical outfits.

That Aversion

The farm-lighting outfit, as an article of merchandise to be sold by automotive dealers, is of course a new product, and there has been in some cases a natural aversion to it on the part of men who have spent years in the business of selling motor cars.

To sell a truck is not such a new enterprise because it is merely an adaptation of the gasoline vehicle, but when it comes to ringing in such a thing as a farm-lighting system the dealer perhaps is not to be blamed if he insists that he "can't quite see it."

Even if he is willing to admit that the farm-lighting system is a logical article of merchandise and is something that is especially needed in these days when motor cars and allied products are not as plentiful as they used to be, he probably would not be willing to admit that it is possible or feasible or desirable for him to go into the sale of vacuum cleaners, electric pumps, bread toasters, and all those other electric rinkey-dinks that are sold in electric supply stores.

But that these electrical goods can be sold by the automotive dealer and sold with a good margin of profit has been demonstrated during the past two years and a half by C. A. Clark of the Repass Automobile Co., Waterloo, Iowa, who has been a distributer of the Delcolite for that period. Sales of this farm-lighting outfit have been particularly good in that prosperous section of Iowa in which Clark is located. Furthermore, he has been in the business long enough that his experiences and methods are a pretty good guidance to the distributer who is about to set out in his new field.

At the beginning Clark endeavored to merchandise the farm-lighting system on the same basis that he sold his motor cars. He placed his agencies with all the small dealers throughout his territory, and endeavored to promote the proposition in that way.

However, he found that the merchandise was of a somewhat different character. Motor cars had been on the market for years, and no matter how little enterprise a dealer had he could sell some cars because the public wanted them and came in to buy them. But in the case of the farm-lighting system it was a new product, and it largely had to be sold to the public. People did not flock into the stores in great quantities and demand these goods as they did in the case of motor cars. This meant that a great deal of pioneering had to be done.

Pioneering Needed

Clark endeavored to teach the dealers to do this pioneering, but found that he wasn't making progress such as he wanted. Therefore he determined that he would jump into this pioneering work himself and eventually get the business up to the point where the dealers could handle it with somewhat near reasonable efficiency.

He adopted the specialty man arrangement. He assigned one of his men to the selling of farm-lighting systems and sent him out through the territory with a farm-lighting system in a car. This salesman went around among the farmers, dug up prospects, secured all his own leads, and sold the systems. Sales have been good and the business has been highly profitable. An arrangement was made with dealers, giving them a commission amounting to five or ten dollars, provided they would notify the distributing agency whenever they ran across a prospect for farm-lighting system. Then the special man made the sale.

Clark found that wherever he sold a system it developed other sales, and when he gets the territory sufficiently filled with these systems it will then be possible for the dealer to handle the goods with profit.

The biggest forward step he has taken, however, and one which demonstrates the possibility of expanding the field, is the manner in which he has been selling electrical goods. The farm-lighting system sells for about $500, and in practically every case he has in addition sold an electric pump and a vacuum cleaner. The pump, of course, is used to send water through the plumbing in the house and to the barn and is perhaps the first great necessity that the farmer sees in connection with the farm-lighting outfit. The barns of course are wired, which makes it possible later on to sell the farmer electrically operated machinery to be used in his farm building. An ordinary job of wiring costs thirty-five to fifty dollars, not counting the fixtures.

Then a Vacuum Cleaner

Generally after a lighting system has been in use for some time the special salesman will begin to concentrate on the sale of some electric specialty such as a vacuum cleaner. He takes one of these cleaners in his car, goes to a farmhouse, carries the cleaner into the house, shows the housewife how it operates — and leaves it there. In practically every case when he comes back later to look after the sale he finds that the sale is already made and all he has to do is collect for it. He finds that very few housewives who have used a vacuum cleaner in a farmhouse will part with it.

He is also expanding his business to include other electrical specialties of that kind. Of course the farmer doesn't enthuse overmuch over such things as electric toasters, but the housewife will always buy an electric flatiron.

S. A. E. Meeting

Great Rumor Killer

Engineers See at First Hand Truth About Liberty Motor and Other War Achievements

Confidence Established and Pride Aroused in America's Wonderful War Engineering Progress

EVERY DEALER SHOULD READ THIS STORY

CHARLES F. KETTERING
President, Society Automotive Engineers

DAYTON, OHIO, June 19—The greatest rumor-killing enterprise since the war began was the two-day summer session of the Society of Automotive Engineers held at Triangle Park Monday and Tuesday.

To the engineers who gathered it was a war engineering conclave, but to those who have not been familiar with engineering developments the meeting was an eye-opener as to the progress that America has made in her war work.

Men who came with their minds filled with the conflicting rumors about the Liberty motor saw this motor side by side with nine other airplane engines, and a comparison point by point made the Liberty motor stand out as the greatest achievement of its kind in the history of the world.

Military tractors crept over trees 7 in. thick and hauled guns around with ease. Many types of war engineering machinery were displayed. Speakers told of the progress that American energy and initiative have effected. The result of the meeting is a wonderful stimulant to every man of the 1200 who attended the sessions.

Throwing the spotlight on these real activities, coupled with the government's recent announcements as to army progress, has put confidence and stability where before was only wild and demoralizing rumor.

Great Automotive Show

The scene of the meeting looked more like an automotive show than an engineering meeting. Nearly three-quarters of the big convention pavilion in the midst of the 450-acre private park was filled with airplanes, engines, parts of wings, propeller-making machinery, and there were so many farm tractors and war trucks and artillery tractors outside that the exhibit end took up half of the time of the convention and proved one of the biggest and most successful innovations ever introduced by an engineering society.

ORVILLE WRIGHT
The first person to make a sustained flight in a heavier-than-air machine

The Liberty engine headed a line of ten aviation war engines—the greatest display of such engines ever grouped together in this country. Alongside of it stood the Rolls-Royce, its British rival, and next in line was the Renault, another rival from the other side of the ocean. Then the line continued with two models of the Hispano-Suiza, the Mercedes, the Benz, the nine-cylinder Rhone and others.

Two-thirds of the main floor of the auditorium was taken up with four complete airplanes, the list including the De Haviland battleplane with its four ma-

Major Chas. M. Hall

chine guns and Liberty engine and the first plane ever flown with an engine—namely, the Wright, which flew on Dec. 17, 1903—the French single-man fighter Spad, and lastly the German Rumpler.

Squeezed in was a fuselage of the De Haviland plane with Liberty engine and all of the equipment used on a fighting plane. A platform specially built along each side allowed members to look into the details of the plane, handle its parts, see every detail and get first-hand information.

But the list of exhibits included much more. Along one end was a table covered with every part of the Liberty engine from the smallest bushing up to the cylinder casting and the crankshaft. Back of the table stood a soldier with fixed bayonet, and, while any person could handle the parts, feel their weight and examine into every detail, no one was permitted to take out a pencil to make a sketch or a ruler to measure a part. Cameras were barred.

Along another wall were all of the parts of the De Haviland plane, from a skeleton wing, showing every piece and every wire, to wheels, landing gear, control parts and wing beams. Every piece was tagged and its use stated.

Outside at one end of the pavilion in a huge tent erected for the purpose was a Defiance propeller-making machine installed by the Dayton Wright Airplane Co. The big factory machine had been moved from the Miamisburg factory specially for the S. A. E.. and it worked from morning to night, driven by a special electric motor just as it would have worked in the factory. It was on war work and it worked at war speed.

While the sessions were not in progress the members stood watching this machine shape propellers for the De Haviland battleplane, and when it completed its task skilled workmen did the final shaping and forming just as their fellow workmen were doing in the factory. It was a great object lesson in manufacture and an excellent stimulant for the engineers.

Outside was the ordnance exhibit of three different sizes of creeper-type artillery tractors that constantly demonstrated each afternoon, showing how they go through woods trailing the

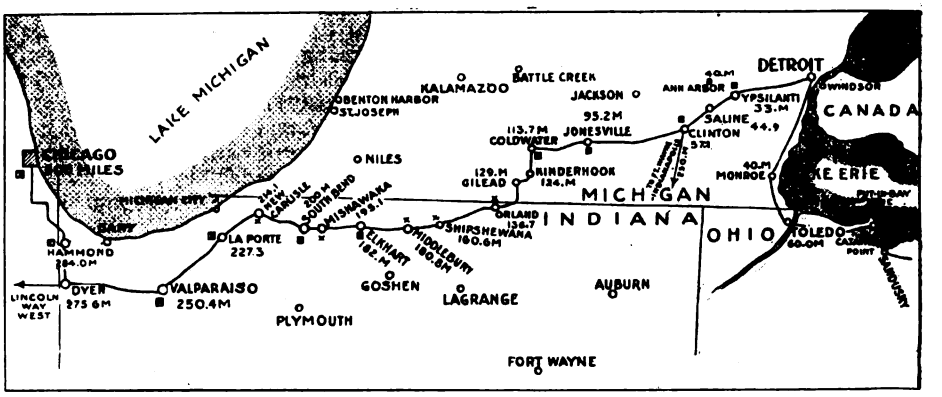
Drive-away Bureau

ASK FOR INFORMATION—AND—GIVE US INFORMATION



THIS department will be continued indefinitely. Its aim is to provide a clearing house for information as to routes, road conditions, hotel rates, garage rates, unfair conditions, new routes, etc. Motor World will make an effort to get any information you desire. In return, all dealers are requested to forward promptly any information they have regarding drive-aways. Send your information so it will reach New York not later than Monday of each week.

Maxwell Logs Shortest Route Between Detroit and Chicago

Forty-five to Sixty Cars Driven Away Weekly—Only One Stretch of Bad Road Encountered—White Arrows Guide Drivers

THE Maxwell Motor Co. has logged a route from Detroit to Chicago which is used every week to carry from forty-five to sixty cars from the plant. It is claimed by the company to be the shortest route between the two cities and further claimed that only 40 miles of bad road are encountered—this just west of Coldwater, Mich., where the road leads over sandy hills and makes it necessary to reduce progress to about 10 m.p.h. White arrows have been marked along the route at every turn of the road, making it comparatively easy to follow. The route of the logged road follows:

12.7—R. R. crossing.
14.1—Dearborn, straight through.
17.6—Inkster, straight through, danger R. R. crossing.
19.2—R. R. crossing, passing Eloise Hospital.
20.8—R. R. crossing.
21.5—R. R. crossing, passing through Wayne.
22.2—Under R. R.
23.2—Caution speeders, Dead Man's Curve.
29.7—R. R. crossing.
30.2—End of pavement, gravel roads.
32.0—R. R. crossing.
33.1—Left over R. R. bridge, then right, follow trolley into Ypsilanti.
34.8—Center of Ypsilanti, straight through to
35.0—Go left with trolley and follow same to Saline.
41.2—Dangerous R. R. crossing down hill.
44.9—Through Saline, straight ahead down hill, crossing bridge.
45.6—Go left at fork.
57.0—Straight through Clinton (Clintonian Hotel and Garage on right).
57.1—R. R. crossing.
62.7—Left up hill.
64.7—Lake on left and summer hotel on right, straight through.
65.2—Straight through.
65.4—Sand Lake road on left, go straight ahead.
66.5—Brick house on right, straight ahead.
66.9—After curving left up hill turn right at white house.
67.3—Pass road on left, and later, small lakes on right and left.
69.0—Pass school and road on right.
69.5—Pass school and roads on right and left.
70.6—Cambridge Jct., small hotel on left, straight through.
71.4—Pass road on left.
71.9—Pass Brooklyn road on right.
74.9—Pass road on left and road right at brick school.
76.2—Cross road, Cement City on right, go straight ahead, passing under R. R.
78.6—Through Somerset, small hotel on left and garage on right, straight ahead.
80.2—R. R. crossing.
80.4—Pass road on left, then through Somerset Jct., straight ahead, avoiding all left and right hand roads.
85.6—Through Moscow, R. R. crossing; small hotel and garage, straight through.
87.6—At large Hillsdale sign, and white house, take left hand road.
89.2—At church and long shed on right, keep left.
90.8—At Mills' general store, straight ahead.
92.4—End of poor roads.
95.2—Jonesville, straight through.
95.3—And 95.6 R. R. crossing, stations on right, straight through.
101.9—Allen, straight through. (Garage and hotel accommodations.)
107.1—Quimby, straight through. (Garage and hotel accommodations.)
107.6 and 108.0—R. R. crossing.
111.3—At Maxwell sign, curve right into Coldwater on Chicago Avenue.
113.7—Center of Coldwater, Arlington Hotel on right, straight through one block to Clay Street.; 113.8 here turn left.
114.2—R. R. crossing on left, straight ahead.
124.0—Kinderhook cross road, straight through.
124.5—Lake on left, curve right, and at 124.9 curve right away from lake.
126.0—Pass lake and at 126.6 pass church.
129.0—East Gilead, turn left between store and white church.
130.7—Curve around lake.
131.6—Red barn on far right, turn right.
136.7—Orland, Ind., straight through (small hotel and garage).
137.6—At big trees, turn left.
137.9—At red stable and white house, turn right.
144.5—Brighton Village, straight through.
146.8—Jog slightly left and right at brown house.
150.2—Danger, R. R. crossing immediately

Map of route from Detroit to Chicago logged by the Maxwell Motor Co. From forty-five to sixty cars are transported over these highways every week

Digitized by Google

beyond, turn right one block, then left, passing through town of Howe, straight through.
151.7—Farm house ahead on right, turn left crossing bridge farther on, then turn right at 152.4.
154.8—Bear right and curve left, passing around small pond.
155.6—Turn left.
156.0—Curve right.
157.0—Turn right, passing school at 157.3.
157.8—White house ahead on right and big tree on left, turn left and at 158.0 turn right.
159.3—Turn left.
159.5—Cross R. R., then turn right.
160.6—Shippshewanna (to the right), straight ahead.
166.9—Pass between cemeteries over two small bridges into Middlebury. (Garage and hotel accommodations.)
167.4—Straight through at main street, one block beyond at yellow house take angling road to left, passing school and crossing R. R. at 167.7.
171.3—Slight jog to left and right.
180.4—Curve right.
180.8—Turn left on Middlebury Street trolley line, crossing bridge 181.3.
181.5—R. R. crossing.
182.0—Oakland Avenue, turn left, passing large school on left and under R. R. at 183.2. (Note—This is a detour while main route is being paved.)
184.6—White house and school on left at cross roads, turn right off of concrete road, road becomes rough for a few miles.
188.7—At cemetery on right (main road joins from right, this would be end of detour). Go straight ahead over bridge.
189.1—Curve right over dangerous R. R. crossing, then turn left through Osceola.
191.8—End of paved road, rough to 193.4.
191.5—Mishawaka, straight through with car line, follow same for several miles curving left into South Bend on Washington Street.
199.8—Washington Street and Michigan Avenue (Oliver Hotel), turn right on Michigan Avenue about two blocks to Lasalle Street. 200.0 mi. here turn left and follow the official Lincoln Highway markers, red, white and blue bands painted on telephone posts. The roads are macadam and concrete all the way to Chicago.
201.2—R. R. crossing.
209.0—R. R. crossing.
213.6—Very dangerous R. R. crossing, three railroads to be crossed, lookout for fast trains.
214.1—Through New Carlisle.
217.4—Take left hand road. (Right goes to Michigan City.)
223.5 and 226.1—R. R. crossing.
227.3—Center of LaPorte, straight ahead.
227.8—Flour mill on left, turn left on J Street three blocks, then right on Fourth Street.
228.1—Avoid left hand paved road, go straight ahead on angling macadam road.
228.8—R. R. crossing.
237.9—Pleasant View Farm, turn left.
239.4—At white house, turn right, passing through Westville.
239.6—R. R. crossing, station on right, straight ahead.
240.0—Danger, left and right under R. R.
240.1—Take left hand road.
242.7—Under R. R.
246.7—Danger, R. R. crossing.
250.0—End of road, right, then first left into Valparaiso.
250.4—Valparaiso court house on right, straight through, curving right along R. R., caution to turn left at 251.1 over narrow R. R. bridge (straight ahead goes to Wheeler).
251.7—R. R. crossing.
265.7—R. R. crossing through Merrillville.
267.1 and 269.2—R. R. crossing.
275.6—Center of Dyer, bank on far right, turn right, leaving the Lincoln Highway, follow Maxwell's white arrows on telephone posts.
275.7—Cross R. R., then first right, then first left, crossing R. R. 275.9.
277.3—R. R. crossing.
279.0—R. R. crossing, immediately beyond, turn left short distance, then right on wide macadam road, straight north for many miles, passing straight through Hammond.
280.5—School on right, ridge road, straight ahead.
283.1—R. R. crossing, straight ahead on Calumet Avenue, Hammond, crossing many dangerous R. R. crossings.
285.4—Straight ahead on wide boulevard. (Note—Solid tired vehicles not allowed.) (Turn to left to go around boulevard.)
288.6—R. R. crossing.
289.9—Edelweiss Cafe on left, Veneva Hotel on far right, turn left on Indianapolis Avenue with car line. R. R. crossing at 291.5 and 291.6.
292.1—Curve right on Ewing Avenue, passing under R. R. crossing.
293.3—Curve left over drawbridge and immediately beyond turn right on Mackinaw Avenue, South Chicago, along steel mill.
294.3—R. R. crossing.
294.7—Left short distance, then right with trolley on Branndon Avenue. (Note—One block to the left picks up the Boulevard system at large church.) (On right, this route avoids the Boulevard.)
295.3—End of street, left on Seventy-ninth Street.
295.6 and 296.1—Trolley crossing, straight ahead to
297.3—Cross Stoney Island Boulevard, then curve right on South Chicago Avenue, an angling brick street with car line.
299.5—R. R. bridge on the left, bear right up South Park Avenue to Sixty-third Street. Elevated R. R. 300.0 mi., here turn left on Sixty-third Street.
300.5—Turn right on Wabash Avenue, follow same about 5 mi. directly north to the center of Chicago 305.0 mi.

Buyers Urged to Drive Cars from Factory

BLOOMINGTON, ILL., June 25—C. U. Williams urges every buyer of a car to drive his own car overland from the factory, and, as this knocks $50 from the price, many patrons are doing so. While they are not saving very much, if they figure their time is worth anything, yet the idea appeals to a good many and the plan might be adopted by other dealers who are facing the drive-away problem.

Williams believes that there is a right and wrong way to handle drive-aways and, when he found that he could not depend upon the railroads, evolved a plan to get cars from the factory to the garage with the minimum of expense and damage.

He found that the principal damage to cars affected the varnish. Manufacturers are prone to deliver cars fresh from the paintshop. This is a serious mistake, in Williams opinion. The paint and varnish should be given sufficient time to dry before being permitted to go on the road. If this were insisted upon, the damage would be vastly reduced.

Fifty per cent of the cars driven overland by Williams had to be re-varnished. Damage to cars would also be reduced if there were good roads all the way. Unfortunately for the Illinois dealers, the roads in this state are not so good as those of Indiana and Ohio. As soon as the state line is crossed, there is a marked difference in condition of the highways.

Williams has placed his drive-aways in charge of his daughter, Miss Francoise. She has made forty trips during the past year between Toledo and Bloomington and has met with extraordinary success.

She drives the leading car and assembles the string of cars in squads of five. The driver of the head car of each squad is designated as captain and these five cars always keep together. In case there is trouble to any car of the five, the other four are stopped, while the remainder of the squadron goes on. This gives five drivers to look after the trouble.

If the break is not too serious and can be repaired, the squad moves on. In case of a broken axle or something that can not be repaired, the car damaged is cut out and stored until the new part can be obtained, the driver going home with the other members of his squad. This has happened but twice in the past year, however, most of the trouble relating to tires. One extra tire is carried for each five cars.

A schedule is arranged which is strictly adhered to. Two days are required to drive from Toledo, O., to Bloomington.

On the first day, a speed of 25 miles per hour is adhered to, the theory being that with cars fresh from the factory, there should be a slower movement. The drive-away extends from Toledo to Fort Wayne, Ind., for the first day, and from Fort Wayne to Bloomington via Watseka, and Chenoa, Ill., the second day. No change in this schedule is permitted, except in case of rain or muddy roads.

While Miss Williams has piloted as many as twenty-nine cars in a drive-away, the number usually ranges from fifteen to twenty-five.

The latter number is preferable. The most satisfactory route with the best roads, between Toledo and Bloomington, extends through Hicksville, Fort Wayne, Logansport, Remington, Watseka and Chenoa. Cars are required to keep 200 ft. apart during the day time and 100 ft. at night. A code of signals has been evolved which all must respect.

Arm or horn signals are used during the day and lights at night, the latter being flashed on and off alternately. In case of fog, the horn is blown. This is advisable when reaching crossroads or turns. No driver is permitted to stop his car without signaling to the men behind.

Williams has found that it costs about $5 to clean up a car after it has been driven overland from the factory. The dirt gets into the varnish, dust being the greatest trouble. In case the car must be re-varnished the expense, of course, is much greater.

The captain must regulate the speed and this is governed by the condition of the roads largely. If it is expedient, the speed for the second day's run can be in-

Digitized by Google

creased to 30 to 35 miles per hour. No spurting is ever permitted. A steady gait is maintained from the time of leaving the factory until the destination is reached.

Miss Williams has piloted 1000 cars between Toledo and Bloomington in the past year, which is believed to be a record. Of these, 116 were driven during the month of March alone and when roads and weather conditions were not of the best. Great care is exercised in the selection of the squad leaders and they are held responsible for the five cars under their control. By strictly enforcing the rules laid out and seldom varying from the schedule as previously outlined, Miss Williams has met with unusual success and has reduced trouble and loss to the minimum.—E. E. Pierson, Bloomington, Ill.

Car Deliveries to Rochester Improve

ROCHESTER, June 15—Within the past 2 weeks there has been a decided change for the better in the delivery of motor cars to this vicinity, and several of the larger distributers have announced that they are now getting all the cars they need by rail. Among these concerns are the Overland-Rochester Co., C. L. Whiting, Buick distributer, and A. L. Boyce, distributer of Chevrolet cars.

E. D. Creed, president of the Overland-Rochester Co., reports that since June 1 his company has had no trouble in getting cars shipped from the Overland factory at Toledo. Deliveries are better from Toledo than from Detroit, he says, because of the fact that Toledo is the center of so many trunk line railroads. He ordered a number of cars only 10 days ago and are now on the road.

C. L. Whiting, Buick distributer, perhaps has made more factory drive-aways than any other Rochester dealer, because of the fact that since last fall he has been unable to get any but closed car deliveries. Up until June 1 he had driven about 500 Buicks to Rochester, over the Canadian route, but since that time has been able to obtain deliveries.

Whiting describes the Canadian route as much shorter and safer than the Toledo-Cleveland-Buffalo route, especially during the winter and spring. The route followed was from Flint to Port Huron, crossing the river at Sarnia, and then to Woodstock, London, Hamilton, Buffalo and Rochester. This trip saves about 200 miles, Mr. Whiting said, and by leaving the factory at 8 a. m., the cars usually reached Rochester on the evening of the second day.

The roads are good all of the way from Woodstock, and at Hamilton the improved roads are reached, and are excellent from that point through to all points east. Although there was some traffic trouble reported along this route during the spring. Whiting had no trouble with any of his cars or drivers. The traffic trouble was mostly caused by boisterous or drunken drivers, he states, and all along the route he found the authorities very fair toward all careful drivers. Garage charges on this route vary from $1 to 50 cents a night.

Hotel accommodations are excellent, either in Woodstock, Hamilton or Buffalo.

William G. Heiber, Grant distributer, has recently made several drive-aways from the factory at Cleveland. He reports the road in excellent condition with the exception of the 16-mile stretch of dirt road between Ashtabula and Silver Creek, which might bother heavy cars n wet weather. He advises that dealers coming over this route endeavor to make Buffalo at night, in order to secure the best hotel accommodations and garage privileges.

Wilmington Increases Drive-aways

WILMINGTON, DEL., June 24—Local additions to the drive-away fleet are reported, in view of the fact that the demand for motor cars is growing and the railroad congestion is not improving sufficiently to give relief.

Cars were driven in last week by John P. Cahill & Co. (Dodge), Diamond State Automobile Co. (Paige), Sweeten-Wilmington Co. (Franklin and Hupmobile), and F. B. Norman & Co. (Ford), while the F. H. Taylor Co. (Haynes) is awaiting word of the readiness of a dozen cars it wants at the Kokomo factory.

Instances have developed here where purchasers have volunteered to go to the factory and drive the cars in themselves.

Turning Inquiries Into Sales

THE automobile editor of a prominent newspaper in the Middle West walked into the store of a large accessory concern in his city the other day and asked for some spark plugs. They were not forthcoming. It was the way he asked for them.

"Bill," he asked, "I wish you would give me half a dozen spark plugs."

The dealer was a little doubtful about the word *give*, but he met the request with an evasive query of his own.

"I can let you have any kind you want," he qualified.

"You don't seem to get me," answered the newspaperman. "I said *give*."

"Wass the idea?" was the suspicious rejoinder.

"Well! I tell you, Bill; yesterday afternoon while I was in here, waiting for you, a motoring party pulled up. I never saw 'em before, and neither did that tall, skinny clerk of yours. Through the open window I saw a big touring car, equipped with everything from a wireless mast to portable beds. In short, my dear William, it was a *touring* car in every sense. The driver, doubtless owner as well, came in. He wanted to know the best road from here to Smithburg. Instead of selling him the information, our thin friend gave it to him."

"Must be thick this morning," answered the dealer, "what *is* the fourth dimension?"

"The fourth dimension," replied the other, "is that I saw an express wagon pull up here about two weeks ago with about 100 Automobile Blue Books."

"But the guy didn't *ask* for a Blue Book."

"Certainly not. But if he ran out of gas, would you take pity on him and slip him a few gallons out of your divine philanthropy?"

"No," agreed the dealer, "I'm beginning to get you now——."

"Not yet, but you will. You go out of that door and I'm going behind the counter. You come in and pull that line of gaff on me."

"Oh, cut the comedy," impatiently replied the dealer, "can't you tell me?"

"I could, but I won't. If I'm going to make some money for you, you've got to learn it my way."

The dealer looked sheepishly about, but it was still early in the day, and he complied.

"I want to know if I can trouble you for the best road from here to Smithburg," he said after his entrance.

"With pleasure," answered the pseudo clerk, and reached for a copy of the Automobile Blue Book from a rack on the counter. "The road is easy," he said, as he glanced at the printed page. "You go down Fontaine Avenue here till you come to Jackson Street. Turn right at Jackson Street and follow trolley tracks until you pass the bank at the left; then diagonally across railroad tracks and straightaway with telegraph poles. At four corners turn sharp left on turnpike till you come to new State Road, turning right again at Gray Brick Church——."

"Wait a minute," interrupted the dealer, entering into the spirit of the wordplay. "Has that book got all that information?"

"Oh, yes," answered the imitation clerk, "and if you set your mileage at the city square, just down the street, it will tell you by your speedometer exactly where you are and your turns are all marked by mileage."

"How much are they?" asked the "customer."

"Three dollars," was the reply, "and you find thousands of miles of just this kind of touring information, with points of interest, not to mention hotels, service stations, garages——."

"*Enough.*" And the dealer laughed. "You're absolutely right."

And then, when the newspaperman finally took his leave, "Blow in to-morrow; I'll slip you an ad. for Sunday's automobile section about the Blue Books. It's worth it."

Taking the Red Ink Out of Service

How the New York Federal Truck Dealer Pulled His Service Station from the Wrong to the Right Side of the Ledger and Made the Service to the Customer More Satisfactory Than It Was Before

By J. HOWARD PILE

FOR years the Morton W. Smith Co., Inc., New York, distributer of Federal trucks, took it for granted that any expenses incurred above receipts in the service station were more than made up for by the advertising value of good service. In other words, after a truck had been sold it continued to be more or less of an expense to the agency through service.

About a year ago it was thought that perhaps the expenses of the station could be cut down without impairing the service to the owner, and W. W. Wright, a wiry, energetic man crammed full of efficiency ideas and shop shortcuts, was made superintendent and was given free rein to stop leaks, introduce systems and improve things generally.

During his incumbency shop methods have improved, inspection service has been successfully carried out and *more work has been done at less expense. The change resulted in a profit of nearly* $200 *a month in the service station instead of a loss of a like amount, which existed previously. Efficiency, system and working for the customer's interest have therefore saved the agency about* $100 *a week.*

And it is practically impossible for a customer to sustain a kick on service rendered or charges made.

When Wright took hold of things, he found so many leaks, so much wasted time and so much misdirected effort that he started a list of things that he needed changing.

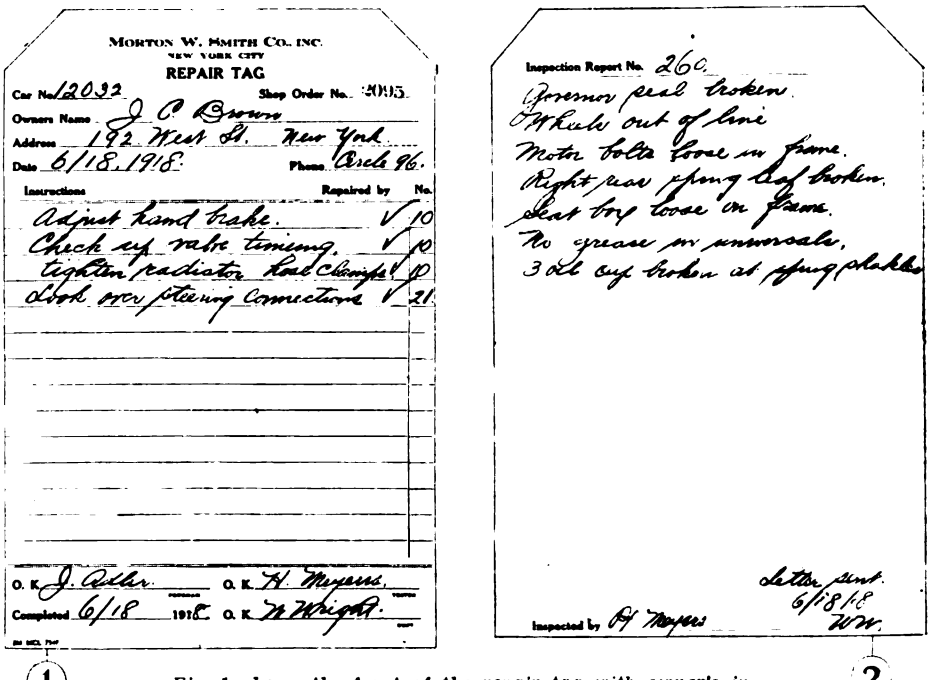
He found that the station was being billed for between 50 and 60 gal. of kerosene a week merely for washing parts. He remedied that leak, and reduced the consumption to about 6 gal. a week.

He found that many taps, dies, reamers and expensive special tools were disappearing all the time, and that not only was this costing the station $500 or $600 a year, but when you wanted a tool, just as like as not it was not there, and someone had to be sent out to get a new one. Wright put in a tool stockroom and checked all the tools taken out and reduced that bill to practically nothing.

He found that the mechanics seldom took the trouble to charge up oil and grease to a job. They simply went over and helped themselves, and neglected to chalk it up. Result—loss to the station. He fixed that.

He found that about the only records kept of the jobs were entries by the foreman in a copy book. If a customer was given a quotation on a certain operation and then later phoned in and said: "You might as well fix that brake and that steering gear and put some oil in the rear axle," and about nineteen other things, then when he came around for the truck and raised a howl and said: "Why you said that job would only be $12," then the station had no records to show, and often it was necessary to compromise, and the agency was out the amount that was cut off the bill.

Wright fixed that.



He devised forms that make such an occurrence impossible, and insure fair and square dealing for both the customer and the station. It is not possible to overcharge the customer and it is *not possible to undercharge him.*

Shop Records and Routine

When a truck is sent to the shop for repairs, adjustment or overhauling, it is taken out on the street—provided, of course, it is in such condition that it will run—with a shop inspector.

No matter what instructions the driver or owner may give as to the work he wants done, a superficial test and examination of the truck is made and a report made out on the back of the repair tag.

A specimen report is shown in Fig 2, and in this particular instance the OWNER specified the following repairs: Adjust handbrake, check up valve timing,

tighten radiator hose clamps and look over steering connections.

The INSPECTOR, Meyers, on taking the truck out on a test, found that the governor seal was broken, wheels were out of line, engine bolts loose on the frame, one of the right rear spring leaves broken, the seat box loose on frame, no grease in the universals and three oil cups broken off the spring shackles.

Before work was started on this truck, the repair tag was turned over to the superintendent, who compared the owner's instructions with the findings of the tester.

Finding that there were several things the matter with the truck that the owner had not ordered fixed, he called the owner on the telephone. Letters are written if time permits. The following is the kind of letter that would be written:

Dear Sir:

Your Federal truck No. 12032, now in our shop for repairs in accordance with your instructions, has been inspected and we find that the following things need attention:

The governor seal has been broken and the truck has been run at high speed. When your truck was in here last November we found the seal broken and called your attention to it. This should be sealed and kept sealed or the truck will run down rapidly.

The front wheels are out of line. This will cause the front tires to wear out rapidly.

The engine bolts are loose in the frame, causing a knock. If they get much looser, the engine may drop or be strained.

One leaf in the right rear spring is broken. If this is not replaced soon, other leaves will break and later the whole spring will give way.

The seat box is loose on the frame.

There is no grease in the universals. This shows carelessness in lubricating the truck, and if these are not greased immediately, rapid wear will take place, and they will have to be overhauled.

Three oil cups are broken off the spring shackles. It is impossible to oil the shackles with these cups gone, and rapid wear will take place if they are not replaced.

To keep your truck in the best possible shape, these details should be attended to at once. If you cannot spare the truck long enough to have these repairs made at this time, we suggest that you either allow us to do the most important things now and send the truck in later for the balance, or send the truck in next week. *Yours very truly,*

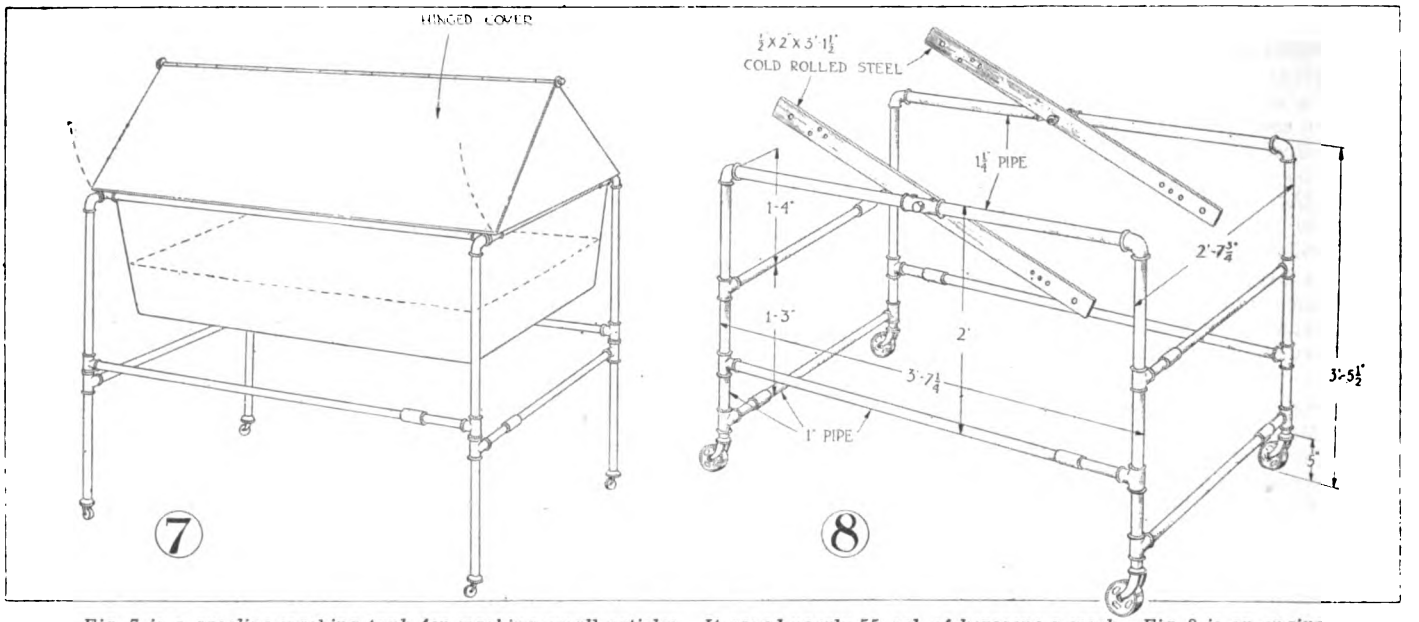

Fig. 7 is a gasoline washing tank for washing small articles. It saved nearly 55 gal. of kerosene a week. Fig. 8 is an engine stand made of pipe and fittings. An engine can be held in any position and can be tested on the stand

items are added to the front of the repair tag and either the owner or the driver signs for them on another form shown in Fig. 3.

The repair tag accompanies the job and as each repair noted on the tag is completed, the mechanic puts his number in the column at the extreme right opposite the instruction.

Check-up Prevents Errors

In the present instance Mechanic No. 10 has completed the first three repairs and Mechanic No. 21 has attended to the steering connections. When the job is turned over as finished by the mechanics, the foreman takes the repair tag, goes over the list of things ordered done, sees that they have been done and then puts a tick mark after each one, and signs his name at the bottom of the tag.

A tester then takes the truck out again, and if things are working all right, he signs at the bottom of the tag, the tag goes to the superintendent, who examines and signs it. The job is then ready to be turned over to the owner or driver.

It is to be noticed here that any other defects found in the truck which were not observable in the brief road test are entered on a form shown in Fig. 6. More will be said about this later.

Repair Order Forms

Figs. 3, 4 and 5 are on two sheets of thin white paper. Fig. 3 is the front sheet, Fig. 4 being on the back of it. Fig. 5 is on the other sheet, and the back of this sheet is blank. A piece of carbon paper duplicates what is written on Fig. 3 on Fig. 5. The repair tag and the two sheets all bear the same shop order number.

On the form shown in Fig. 3 are entered the name and address of the owner, the truck number, the date the truck was turned into the shop, and the instructions given by the owner or driver. Either the owner or the driver must then sign the sheet.

The sheet with Figs. 3 and 4 on it then goes to the agency accounting department, where the materials and labor are entered on it from the shop time cards and the stockroom requisitions. The costs are made up and the bill made out from this form.

Fig. 5 goes to the shop superintendent, who files it in a flexible-back binder while the job is in the shop, and when it is finished the owner or driver signs this form and it is then put in a permanent file for future reference.

After the job is finished, the inspection report shown in Fig. 6 is analyzed and another letter written to the owner, calling his attention to any minor repairs or adjustments located while the truck was in the shop. This letter is not always confined to repairs needed, but may call attention to abuses, such as careless driving, lack of lubrication, overloading, running in car tracks, etc. If the owner has not brought the truck in within a reasonable time after this letter is sent to him it is followed up with another letter.

Prevents Loss and Argument

It may appear at first glance that there is considerable red tape to this system, and that it could be simplified greatly, but there is this to say about it: It informs the owner exactly what shape his truck is in, tells him whether his truck is being properly driven and cared for, and as repair work is always estimated, and not charged for by the "material and labor" plan, it tells him exactly how much it is going to cost to put it in good shape.

The system protects the service station from unwarranted kicks by customers. If a truck is sent into the shop to have the front wheels aligned, and the tester finds out that the worm wheel in the axle is chewed up from lack of lubricant, then the owner is notified.

If he pays no attention to it, and the truck is put out of commission by the total failure of the worm wheel, and he says, "Why didn't you fix that when the truck was in the shop before?" the station has all the records to show that the owner was warned and that he did not send the truck back as suggested and paid no attention to the warning.

Trucks Come Back

It is interesting to note, however, that the cases of owners not heeding the warnings are few and far between. It may, of course, be some little time before they can spare the truck to have the repairs made, but they generally come back.

The result of this is that the trucks are kept running in better shape, the owners get better satisfaction from the trucks and, as a rule, troubles are found and remedied before they become serious enough to lay the truck up. The only drawback to the system so far is that such inspections and recommendations can only be made when a truck is brought into the station for some purpose. It is expected, as soon as conditions will permit, to have several men afield on motorcycles to inspect and report on any Federal trucks they find on the streets. This plan has been tried out by the Federal agency in St. Louis and has been very successful.

Spare Parts a Convenience

Another convenience to owners is spare parts, such as axles, radiators, wheels, etc., which have been made up from parts that have been salvaged from the shop.

For instance, if an owner comes in with a wrecked radiator, one of these spare radiators can be put on his truck and the truck can be running again in an hour, and the owner can use this radiator till his own radiator is repaired, which may take several days. A nominal charge is made for the use of these parts, based on the number of days used.

Extra magnetos are carried in the

Digitized by Google

same way. While the "rental" charge on these spare parts brings in a small amount of income, it is really put on to get the spare parts back as soon as possible so that they can be ready to use on other trucks that may need them.

The practice is to make no charge for the spare parts during the time that it takes to repair the damaged member and to start the "rent" from the day the owner is notified that the part is repaired and ready to be put on his truck. If he knows that he will have to pay $1 a day for every day after that he uses the spare radiator, he will not wait for weeks to get his own radiator put back on the truck.

Shop Efficiency

Every effort is made to get the greatest efficiency out of the mechanics. A man who is especially good on engine work is kept on engine work all the time as far as practicable. The same policy is used on other parts of the truck. A colored porter is available for keeping the place cleaned up, cleaning the shafting, straightening up things and helping move things around when wanted. This allows mechanics to go on with their work without being interrupted by details that the porter can attend to.

While the building is small for the amount of work turned out, and only one floor is occupied as the shop and stockroom, yet things are arranged to get the greatest possible use out of the available space. One corner is shut off from the rest of the shop by a wire screen partition with a door in it.

This little room has two short benches, vises and tool cabinets, is near the windows and is used exclusively for engine work, such as scraping bearings, overhauling and rebuilding. Before the engines are brought to the room they are washed off on the washstand by a less experienced man, and then brought to the room on a portable crane and placed on one of the engine stands shown in Fig. 8. All necessary tools and wrenches for engine work are right in the room, handy to the mechanic, and he can go ahead and tear down the engine and build it up again without leaving the room except to get new parts from the stockroom.

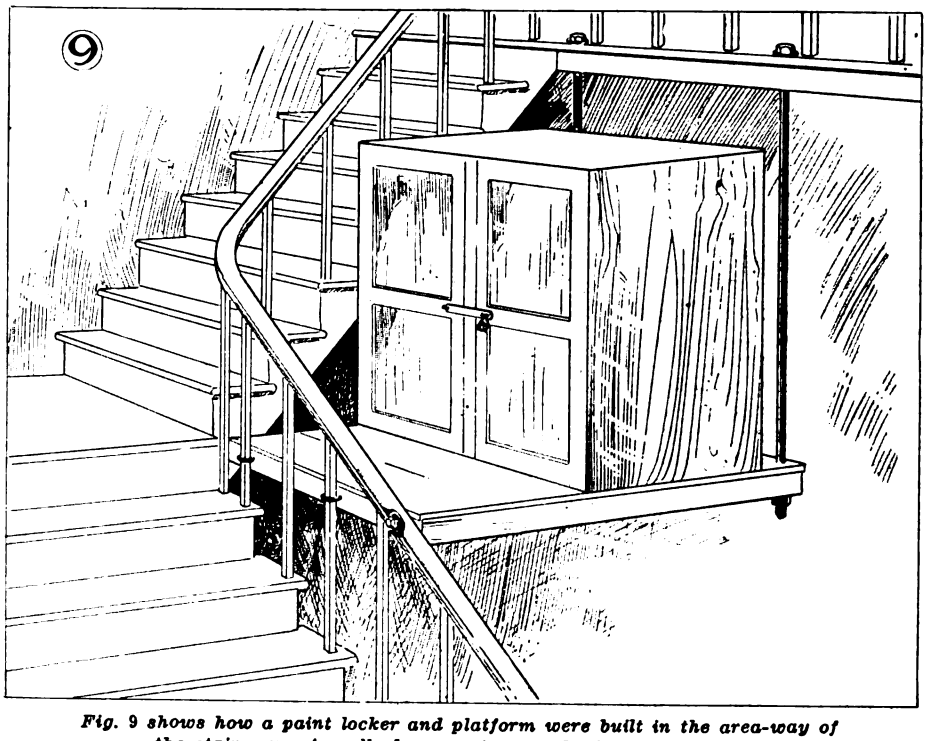

Fig. 9 shows how a paint locker and platform were built in the area-way of the stairway. A padlock prevents unauthorized use of paint

The engine stands were designed by Wright and built in the shop out of standard pipe fittings. They have removable castors in the bottom of the legs, and the stand can be turned around in any position to get the best light. When the engine is fastened in the cradle it is possible to turn it right side up or upside down as desired, and lock it in that position.

When the overhauling is done, the castors can be taken out of the legs, a radiator attached to the stand, and the engine can be tested right on the stand, the exhaust being piped outside. After testing, it can be run to the chassis on the portable crane, and there is not much chance of it coming back after it gets in the chassis.

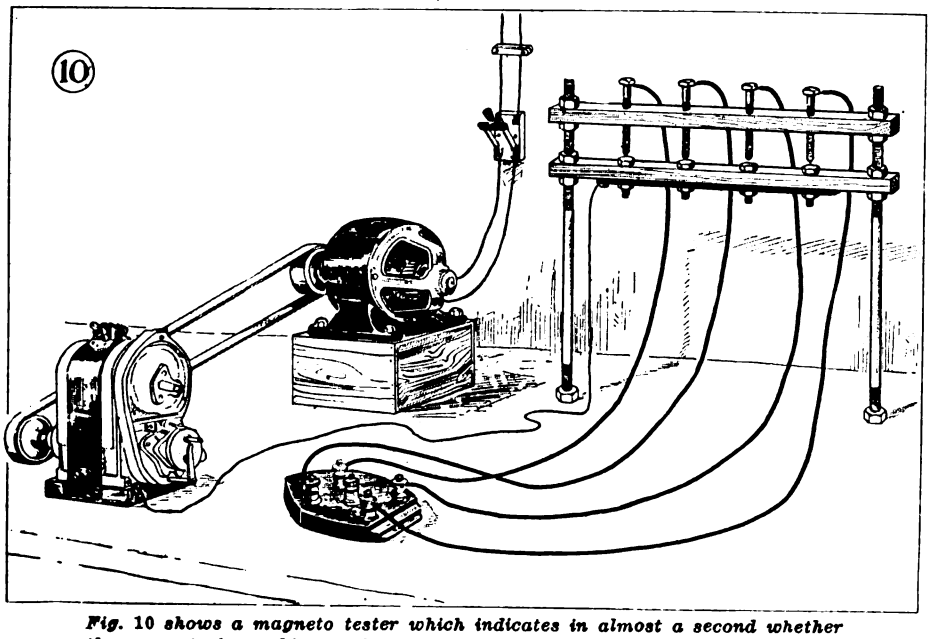

Fig. 10 shows a magneto tester which indicates in almost a second whether the magneto is working. The method has something on spinning an engine to see if it sparks

Saves 50 Gal. of Kerosene a Week

An economical and simple device is used for washing the oil and grease from parts. An ordinary oblong galvanized sink, with drain cock in the bottom, is mounted in a frame made of iron pipe and fittings. Castors allow the tank to be easily moved about, and a hinged cover which allows either side to be lifted up keeps dust and dirt out of the tank. A wire tray made of wire screening is suspended in the sink and is used to hold the smaller parts. The truck is shown in Fig. 7.

With this tank, the shop uses less than 6 gal. of kerosene a week compared to 50 or 60 gal. when the old method of cleaning off the parts at the drain with a paint brush and a pail of kerosene was employed. The tank, therefore more than paid for itself in a week.

No Tools Are Lost

A small tool stockroom has been constructed out of wire screening and is placed in a part of the shop that was behind a pillar and consequently not available for trucks, nor for any other purpose.

In this room are kept all the special tools, such as special wrenches, hub wrenches, C-clamps, taps, dies, reamers, jacks and drills. The tools are grouped together in a logical manner, axle tools being in one place, wheel tools in another and so on.

Each tool is either hung on one or more nails on the wall or is in a compartment in a long box which looks like a case that holds printer's type.

Digitized by Google

The place where each tool belongs is neatly labeled with the name of the tool that belongs there, and when a tool is taken out the mechanic must leave a brass check with his number on it, the check being hung on the nail or placed in the compartment, and not removed until the tool is returned.

Although the tool room is only about 6 ft. wide and 15 ft. long, there are tools in it representing a cost of considerably over $1000.

Under the old method of allowing these special, and in many cases expensive, tools lying around, the cost of replacing lost or otherwise strayed tools was $500 or $600 per year.

With the new method no tools have had to be replaced in the past year except those which were used so much that they wore out.

A boy takes care of the toolroom and in addition serves out oil, grease and waste as it is needed. Everything is always in perfect order, and if the tool wanted is not in the room the brass check tells where it is.

Time Saved Testing Magnetos

On a small bench in the toolroom is a magneto tester which was made in the shop. It consists of a small electric motor operated by current from the lighting circuit, a magneto clamp and an arrangement of spark gaps representing the gaps in the spark plugs.

The apparatus is shown in Fig. 10. The motor is mounted on a wooden box and is started and stopped by a switch on the wall. A magneto base and clamp the same as is used on the engines is fastened to the bench so that the magneto coupling and the motor pulley are in line. A small flat belt drives the magneto.

The spark gaps are made from two strips of wood held apart and held to the bench by two iron rods, threaded so that nuts hold the rods to the bench and also space the wood strips. Through the top strip four holes are bored a little smaller than the pointed cap screws that go through them, the cap screws cutting their own thread in the wood. To the tops of these screws are attached the high-tension wires from the magneto.

Directly beneath these four screws are four smaller bolts grounded to one another with a strip of metal and grounded to the magneto with a wire. The gaps are adjustable by turning the cap screws. The gap should be set at about 1/16 in. When the magneto is driven by the motor, sparks should be observed at each of the gaps if the magneto is working properly.

Oil and Grease Charged to Jobs

A small room in one corner of the shop which contains the toilets is built only half way to the ceiling and the space on the top of this was previously wasted.

Oil and grease barrels were on the floor of the shop, open to anybody, and consequently a lot of oil was taken out that was never charged to the jobs. This oil and grease is now kept on top of this room, and as the only way to get up there is by a stairway in the tool room, every bit of oil is measured and every bit of grease weighed by the tool room boy, and charged to the job.

The barrels are placed on top of the room by means of a long skid. One end of the skid has hooks which go around a pipe at the edge of the top of the room, and the other end goes down to the floor. A barrel is placed on the lower end, and then the end is hoisted up with a block and tackle till it is above the level of the platform, when the barrel rolls down and is put where it belongs.

Use for a "Hole in the Air"

Room is at such a premium that even the areaway in an unused stairway to the basement has been utilized for a paint locker. The stairway may not be blocked up, on account of fire regulations. Therefore a platform was suspended as shown in Fig. 9 and there is sufficient room for the locker which holds paint, and a little platform to stand on. The locker is provided with a lock.

A very commodious stockroom is located in the front part of the shop, just in back of the office. A window and counter are located on the side of the stockroom near the door to the street for the convenience of owners and drivers buying parts to take with them. Brown paper and string are at hand to wrap the parts up in.

In the back end of the stockroom is another window with counter for the use of the mechanics desiring parts for the jobs they are working on. The idea of two windows is to prevent delay to the mechanics who would be compelled to wait their turn if they had to get the parts at the same window as the customers.

A maximum and minimum system is used in the stockroom. The maximum is determined as the greatest number of a certain part that it is estimated should be kept in stock. When the minimum number, below which it would be dangerous to go is reached, an order is put in to the factory for a sufficient number to bring the stock up to maximum again.

Parts Kept in Separate Bins

The parts are all kept in separate bins with their requisition numbers and descriptions on labels so that they can be easily seen. The parts that are most frequently called for are placed in the most accessible places. The bins run high up on the walls and are reached by a traveling ladder, similar to those used in some shoe stores.

As there is not sufficient demand at night for parts, the stockroom is not kept open, but a sufficient quantity of much used parts kept in the watchman's locker, and each morning the stock clerk checks up the parts used the night before, puts the requisitions with his others and replenishes the stock of parts in the locker.

There is not a great amount of machinery in the place, there not being such a large amount of this kind of work done. As the machinery is only in use a small portion of the time, it is driven by an electric motor suspended on a platform from the ceiling. When not in use the current is turned off.

A traveling crane hangs from an I-beam over the part of the shop where the chassis that are being repaired are placed. For hoisting in any other part of the shop, the portable crane is used.

Profit and Service

Service has been the prime object sought, and the matter of profit has been held secondary to service, but by stopping leaks, making mechanics do only skilled work and leaving ordinary work to those less skilled and less highly paid, making things work smoothly and checking everything up so that the boss won't have to say, "Jim, why in hell didn't you fix that rear wheel bearing on McCutchen's truck when it was in here?" the maximum service to the owner has been accomplished with a minimum of expense and so the service station shows a profit and not a loss.

Philadelphia Wins Golf Match

PHILADELPHIA, June 24—The Philadelphia Automobile Trade Association won the first of three intercity golf matches being played at the Whitemarsh Valley Country Club, taking six of the two-ball duels, having a rather wide margin in their favor in each one. W. Webb, of the Philadelphia team, with a card of 83, carried off the gross score prize, while James Clark, of New York, with a gross of 89 and a handicap of 17, took the net score honors with a total of 72. Webb also had the edge when it came to the special prize for the man taking the fewest number of putts, using but 32 on the full 18 holes. Victor Van Alstyne, New York, beat W. J. Fassitt, Philadelphia, by a comfortable margin. He also was runner-up for the low net total, with 74. W. H. Reynolds, the Aronimink star, now in the auto business, won his individual match, but had trouble with his putting and did no better than 85, three strokes behind Webb.

Uses 14-Page Newspaper Ad

SYRACUSE, N. Y., June 20—In order to emphasize the stability of its business, the H. Barcroft White Corp., handling the Nash and the recently acquired Locomobile, monopolized the entire 14-page automobile section of the Syracuse Herald, Sunday, June 9. The section was made up of both editorial and advertising matter and covered every phase and department of the company's activities. It is one of the largest if not the largest automobile ad ever run in this section of the country.

Ford Dealers Adopt War Service

ST. LOUIS, June 24—The Ford Dealers' Association has voted to adopt the N. A. D. A. War Service Schedule. Several of the Ford dealers are members of the Automobile Manufacturers' and Dealers' Association, and those have already adopted the war service schedule, which eliminates night and Sunday work. The other Ford dealers now come in.

THE LAW

By George F. Kaiser

As It Applies to
Dealers
Repairmen
Garagemen

What Is an "Exclusive Territory"?

Editor Motor World: I have the agency for a certain car in Venango County. This is the third season I have sold the car here, with the understanding that I was to be protected against anyone else selling in my territory. While the car company's contract prevents me from selling cars outside my territory, it does not prevent another agent from trespassing in this matter other than that his contract probably binds him to his territory the same as mine.

About a year ago the agent in question wanted to sell these cars in a little town in my territory, but near the county line adjoining his territory. After repeated requests I gave him permission to sell there on a fifty-fifty basis. He sold two or three cars, but I could not get any settlement from him for my share of the commission, so about six months later I notified him to refrain from selling these cars in my territory. He ignored this matter and since then I have taken the subject up with the company and the distributer through whom I handle these cars, and also with the distributer through whom he sells, but with no results. I will appreciate any suggestion, advice or opinion by early mail.—Subscriber.

Answer—Before anyone can give a proper opinion in a case of this kind your contract with the manufacturers must be carefully scrutinized. From your letter it would seem that the company could prevent the other agent from coming into your territory if it desired to, as the other man is undoubtedly restricted to certain territory just as you are. Of course your rights to 50 per cent of any commission on sales made with your consent depend on your agreement with the other dealer, and you can institute suit if you desire on your contract with him.

In one case a dealer had an agreement with the agent, giving him certain exclusive territory and allowing him 18 per cent discount on the list price, which was $900. The dealer deposited $250 and bought one car for $803 and received back $25 of his deposit. He found out thereafter that another party had sold a car in his territory and he demanded $162 as his commission.

When the agent refused to pay him this amount and cancelled most of his best territory, he brought suit for the $162 and the $225 remaining on deposit.

The court held that as the contract assigned a specific territory to him for a specific time, and as the territory was exclusively his for that time, he alone had the right to make sales therein. If he had made the sale he complained of he would have been entitled to $162 for his services, so when the agents allowed another to make a sale which properly should have been made by him, the dealer became entitled to his commissions according to his agreement.

In a case like this your local attorney should be retained immediately to handle matters for you.

Garage Signs to Prevent Fraud

Editor Motor World: What kind of sign should I put up in my garage to hold a man liable for taking a car out before paying a bill charged against him? A man left a car in my garage with instructions for me to do certain work on it, and I told him at the time that I didn't "trust." What can I do in such a case?—S. J. Oakes, West Enfield, Me.

Answer—It is a misdemeanor punishable by imprisonment for not exceeding 3 months or a fine of not exceeding $100 to defraud a garageman in your state. Garagemen must post the following law in a prominent place in their garage, however, before the act becomes effective:

PROTECTION OF GARAGE KEEPERS

(Revised Statutes, Chapter 128, Sec. 5)

Sec. 6. Defrauding owner of garage; printed copy of this section to be posted in garage. Whoever puts an automobile in a public garage or other place where automobiles are stored for hire, and without having an express agreement for credit, procures supplies, accessories or accommodation for himself or said automobile, and with intent to defraud the owner or keeper of said garage, removes or causes to be removed any such automobile from such garage without paying the reasonable charges due for repairs, supplies, accessories and accommodation furnished thereon, shall be punished by imprisonment not exceeding three months or by fine not exceeding one hundred dollars. In order for the owner or keeper of such a garage to obtain the benefits of this section, a printed copy thereof must be posted in some conspicuous place in said garage.

If a garageman has possession of a car he may hold it as security for his repair bill.

Equipment for Waste Gasoline

Editor Motor World: May I trouble you for information as to what concerns here in New York manufacture an appliance for taking care of "waste washing water and gasoline," which is required by the building code of Brooklyn, in garages?

I am drawing up plans for a row of ten small garages (private) to be placed on a corner lot measuring 25 x 100.

I believe the above mentioned appliance is called a form of trap which is set under the concrete floor of the garage.

I would also like to be advised as to the merits of this form of investing idle capital, or whom I might consult on this latter subject.—William Olsen, 626 Forty-sixth Street, Brooklyn, N. Y.

Answer—Motor World has handed me your letter of the 8th inst. with a request that I answer your inquiry direct.

If you only intend to put up a private garage, and are not going to put up a large public garage, you need pay no attention to the ordinance which provides for the installation of an "oil separator." This ordinance, by the way, was repealed some time ago. Personally I think very well of your plan to invest your idle capital in this way.

Fell Over Tow Rope

An interesting case regarding a person's liability for personal injuries while towing a broken down car was recently decided in New York.

It was held that where a man stumbles over a tow rope in crossing a street and is run over and killed by the automobile which is being towed there may be a recovery even if the chauffeur of the first car signalled with his horn, provided the injured person received no warning of the presence of the tow rope.

In May, 1915, while a man was crossing a street in New York City a motor car came toward him. The chauffeur blew his horn and the man stopped. The car passed at the rate of 3 to 4 miles per hour and, while a second car was 10 to 12 ft. behind, he attempted to pass between the two cars and stumbled over a tow rope which was about 1½ ft. from the ground and was run over and killed.

In a suit for damages for the man's death, the court decided that it was reasonable for a jury to bring in a verdict for damages on the theory that warning of the tow rope should have been given.

Repairshop Shortcuts

From Motor World Machanics

No. 1718—REPAIR TAG CLIPS

Spring clips for holding repair tags and papers are made from sections of clock springs, holes being made in one end with a nail set and the clips fastened to the wall or board with screws through the holes. Clips from 2 to 4 in. long are most useful and the clips are bent so that the end that holds the paper is rounded out to prevent the sharp edges from catching and tearing when the paper is withdrawn.—Charles H. Willey, Concord, N. H.

No. 1719—VISE EQUALIZING JAW

A device for gripping irregular shaped work in the vise jaws is made from three pieces of metal, the top or jaw piece being half-round iron or brass to grip the work. This piece is supported by a little pillar made of bar stock with the ends turned down to fit holes in the top piece and in the spring which clamps over the jaw guide.—Charles H. Willey, Concord, N. H.

No. 1720—DRIP PAN FOR SHAFTING BEARING

An oil drip pan for shafting bearings is made by cutting a 5-gal. oil can in half diagonally and using the half with the screw top on it. The pan is suspended under the shafting bearing with wires from the corners of the pan going over the bearing. The screw cap is used for draining out the accumulated oil.—Charles H. Willey, Concord, N. H.

No. 1721—REMOVING DENT FROM A GASOLINE TANK

A dent can be removed from a gasoline tank by plugging the vent, thus making the tank air tight, filling the tank with water and then applying about 20 lb. air pressure through the feed pipe. A leather or wooden mallet is then used to tap gently around the outer edge of the dent. The pressure will force the dented part out in a few minutes.—Scott S. Bond, Gulfport, Miss.

No. 1722—FUNNEL STOPPER

A funnel stopper to prevent waste of oil and other liquids is made from a cork, a metal strip and a rod. The strip is secured to the top of the funnel and has a hole in the center through which passes the rod, formed into a ring at the top end, and threaded at the lower end. A cork to fit the hole in the funnel spout is screwed on the lower end of the rod. When the tank which is being filled is full the cork is pushed down and the funnel is lifted out with its contents saved.—Charles H. Willey, Concord, N. H.

No. 1723—VISE FOR DRILL PRESS

A vise for a drill press table is made by removing the stud of a machinist's vise and planing off the bottom at right angles to the jaw faces, using a planer, shaper or four jaw chuck in a lathe. The base of the vise is bolted to the table a little distance from the center so that by moving the face plate and arm on the press the vise can be placed under the drill.—W. C. Disbrow, Jr., New York City.

No. 1724—TUBE RACK VULCANIZER

A rack to hold up the ends of tubes while they are being vulcanized is made by boring rows of holes in a board and placing wooden pegs in the holes. One row of holes is arranged over each tube clamp and the holes can be about 1 in. apart so that different size tubes can be hung on them. The board is either hung from the ceiling or fastened to the wall, depending on the location of the tube plate.—C. H. McLean & Son, Newton, Iowa.

No. 1725—REMOVING VALVE CORE

To remove a valve core when the top nut on the core comes out without bringing the rest of the core puncture a hole in the tube 6 or 8 in. from the valve base, insert a motorcycle spoke which has been set upright in a vise and push the point up through the bottom of the valve stem. Work the valve stem up and down against the end of the spoke and the core will come out through the top of the stem. The hole in the tube is then vulcanized.—C. H. McLean & Son, Newton, Iowa.

No. 1726—CEMENTING PATCHES FOR VULCANIZING CASING

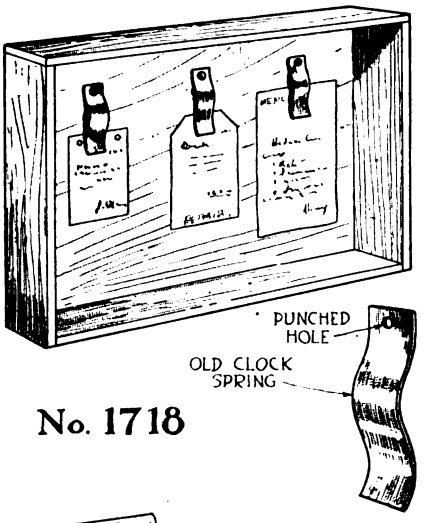
Frames 20 x 14 in. are made from plastering lath, four rubber bands are cut from old tubes and four fish hooks with the barbs removed are hung in each frame, one to the corner, using the rubber bands. The patches are hooked in the frames and then cemented. The frames have cup hooks in the top, and as soon as a patch is cemented, the frame is hung on a wire strung over the bench. The frames are hung up in the order in which they were cemented and they are used in the same order.—C. H. McLean & Son, Newton, Iowa.

No. 1727—MARKING COMPOUND FOR BEARING SCRAPING

A compound to replace Prussian blue for marking the high spots on bearings when scraping them is made by mixing lamp black in machine oil. Dry lamp black is mixed with very thick, clean oil and allowed to stand for several days, when the surplus oil is taken off the top. The compound then stands for a few more days and the process repeated. The result will be a thick, black paste which can be put in a shoe blacking can. When the bearing is rubbed with this compound and the shaft rotated as usual, a distinct black mark is made on all the high spots, and this mark cannot be rubbed off with either waste or the fingers, and does not disappear till it is scraped off.—Charles Dannhauser, New York City.

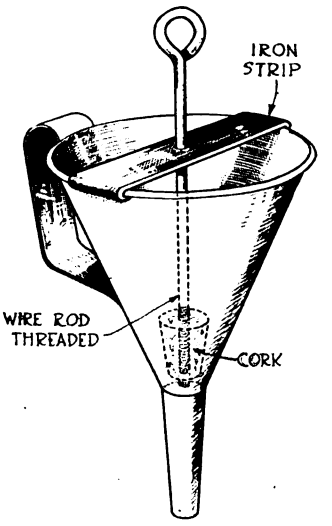
$1 a Helpful Kink

HOW often have you been compelled to rack your brain to overcome some difficulty? But when you did find a solution—what a satisfaction it was! Well, here's a chance for you to dig some of those life-savers out of their hiding places and put them to work for your fellow-craftsmen. Send them to Motor World. We will pay you a dollar for every one accepted for publication. The only requirements are these:



1—Describe the shortcut briefly but clearly, in few words.

2—Send a sketch, in pencil or pen, no matter how rough; our artists will finish the job.



3—Write on ONE side of the paper only.

4—Sign your name and initials, the name of the company you are with and the town. Write plainly. If your name is unusual, print it in capital letters.

Editorial Observation

Prove It or Shut Up!

NO one ever will be able to know how many thousands or millions of dollars the automobile industry has lost because of the wild rumors that have filled the air since America entered the war.

Incalculable damage has been done, and the industry has been powerless to prevent it.

Furthermore, there is a big and growing opinion in this industry that it has been "picked on." Perhaps this is a penalty for bigness. However, it seems to be a fact that the minute a rumor is born concerning this or that dire happening to this industry the news is flashed broadcast and the damage is done.

Denials are useless. It sometimes requires time to get to the root of things and ascertain the facts. The damage is done when the rumor is first flashed.

Whenever a public speaker wishes to mention salesmanship and merchandise he, nine times out of ten, lights on automobiles as his first choice. It probably is the first thing that comes to his mind because it is the article of merchandise he sees the most of every day, with the exception of wearing apparel. We are glad the motor car is so firmly intrenched in the public mind, but we are sorry this intrenchment has been made to work an injury.

So sensitive have automobile men become on this point that the word "pleasure car" is to them like a red flag to a bull—that is, to most of them. *There are a few who still use the term.*

So serious is the rumor situation that it is one of the bases of one of the big enterprises right now of the growing National Automobile Dealers' Association. At its meeting the other day in Chicago it set out to kill unfounded rumors regarding both the industry and the nation at large.

It passed a resolution which is good *if made effective,* which is to the effect that every automobile man, when confronted with a rumor, should ask the peddler of rumors if he can prove it. If he can't, request him to go into the silences. In other words: *"Prove it or shut up!"*

One day a rumor was told as fact by a man who ought to know concerning a certain war situation. The next day a statement from Washington headquarters in the daily newspapers said no such thing existed.

Rumors are about that are entirely at variance with the story of the geography of the Western front as it is chronicled daily in the newspapers.

The Red Cross has been slandered, the army has been maligned, everybody and everything that amounts to anything has been lied about until there are enough lies, if pro rated, to send the population of the whole world to eternal damnation.

We all seem to be a bit wishy-washy on this rumor subject. We let any self-assertive man make any old statement and get away with it. We seem to be afraid of our shadows.

But if we saw this same self-assertive man guiding a squad of armed Germans to our homes would we stand complacent and let him get away with it?

This rumor peddling is just as much an offense against us as direct aid to Germany. It hampers our war program. It affects our national morale. It is part of the insidious propaganda that delights the heart of the Prussian war lord. And WE let folks *get away with it.*

The next time you hear a man make a derogatory statement concerning our country and its affairs question him about it. If you don't want to ask him "Can you prove it?" do it this way:

Say: *"You know, I have been informed that a story quite similar to this is part of a certain propaganda that is intended to hamper our war activities. The government is very anxious to trace it and, if possible, learn its source. I shall appreciate it very much if you will tell me where you got this information."*

If the man gives you the name of the man who told him PASS IT ON TO THE DEPARTMENT OF JUSTICE. Carry it through. Don't back down. Take out your notebook and set down the name. Act as though you meant business—and MEAN IT.

Furthermore, don't be a rumor peddler yourself. Don't say "pleasure car." *There are men in this industry who still say it. Some of them were saying it on the veranda of the Homestead at the jobbers' convention at Hot Springs.* How can we expect others to drop the term when we don't drop it ourselves?

This industry needs some organized stiffening of backbones. We should clean our own house, forget "pleasure car," quit peddling rumors—and then insist that every other rumor peddler

PROVE IT OR SHUT UP!

Letters from Readers

THIS page is for the use of MOTOR WORLD readers with something to say. Letters on subjects of interest to dealers, garagemen, repairmen and jobbers are always welcome.—EDITOR.

To Work Ten Hours

Editor Motor World: It might interest you to know that the employees of our mechanical departments at an organization meeting held the evening of the 7th inst. unanimously voted to work 10 hours during the summer months.

It can readily be seen that this sort of thing will materially reduce the number of men necessary to employ as well as hold down overheads and facilitate the work. It is a sure thing that a man can do more work in that extra hour by working straight through on a job than if he put in the same amount of time but left the car at night and put in the tenth hour the following day.

I consider this a very loyal and patriotic move on the part of our employees and trust the example will bring about like steps in other automobile repair houses.—Cadillac Motor Co. of Denver, P. E. Chamberlain, General Manager.

Here's Sunshine for You!

Editor Motor World: Generally speaking, Winnipeg is in a flourishing condition, practically every class of business doing well.

The sale of cars is surprisingly good, and in our case shows a decided increase over previous year's business.

We have experienced quite a few exciting times, between the war tax, threatened embargo and railroad conditions, but we have not only weathered all these storms, but are forging ahead successfully.

The imposition by the Canadian Government of the 10 per cent war tax on all cars slowed up sales for a while, and has no doubt affected the sale of the more expensive models, but people will get over this in a very short time, and it will be just like a general increase in price.

The threatened embargo, we see by to-day's paper, has become a reality, the Government prohibiting the importation of cars valued at $1,200 f.o.b. place of manufacture. We are not just sure whether "valued at" means factory list or wholesale price. In any case, it will make a big difference to a good many dealers.

Our country business has been very good with the smaller cars, but so far there is no indication of any brisk trade in the more expensive models. We have handled over 1000 Chevrolets in the Province of Manitoba since the beginning of our contract year.

A good part of our territory had poor crops for two seasons, which accounts for a good deal of this condition, and gasoline around 40 cents a gallon has a whole lot more to do with this tendency to buy smaller cars. Whatever the cause there is no doubt the farmer is buying the lighter and cheaper class of car, even though he has the money for something more expensive.

The big problem here has always been to get the dealers in the country to carry some cars during the winter months, so that they are prepared for the spring rush. This season, by reminding them of previous years' experience, a certain amount of education and assistance, we succeeded in getting out more cars in the winter months than in any previous year. The result is of course bigger sales and a reduction in the loss of business usually sustained through inability to fill orders.

The labor situation is a serious one, and is likely to get worse as the war continues, and yet we think we can see some good arising out of even this condition. By the use of a service coupon book of a definite value, according to the price of the car, and by educating our customers to take better care of their car, by closer attention to lubrication and storage battery, there is a marked reduction in the amount of service we are called upon to give, and a consequently greater satisfaction to the car owner.

Some time ago the dealers and distributers got together and agreed to cut out selling gasoline and oil and service work after 6 o'clock and on Sundays. This was quite a new thing, but has worked out splendidly for all concerned.

Last week the Breen Motor Co. started another innovation by closing their whole establishment at 1 o'clock on Saturdays. We advised all our customers of our intention to do this, and the garage was just as quiet on Saturday afternoon as it is on Sundays. Our experience in this direction might be useful to a good many other dealers and distributers who are worried by what they think is the necessity for being on the job day and night.

The value of the automobile and truck was very vividly demonstrated during the recent strike of the telephone and street railway employees. This strike a few years ago would have paralyzed the city's business, but, due to the large number of cars and trucks now in use here, and the splendid manner in which their owners used them in the public service, business went on, we might say, almost as usual.

In addition to our garage and office building, workshop and downtown showroom, we are compelled to get some more commodious office space.

For this purpose we have taken the corner store which was used as a cafe and lunch counter and are fitting it up as an office. Even with these various permanent buildings we find it necessary to rent two or three warehouses for storing cars during the winter months.—Breen Motor Co., Limited, Wm. White, Winnipeg, Man.

Puritan Not Affiliated with Abbott Corp.

Editor Motor World: Our attention has just been called to several articles appearing in the newspapers to the effect that the jigs, dies, patterns, etc., as well as the good will and repair parts of the Abbott Motor Co. were purchased by the Puritan Machine Co., which concern would furnish repairs for Abbott cars from Detroit.

We have not seen this in your publication but we thought it best to advise you at this time of the true status with regard to the Abbott company.

All jigs, dies, patterns, etc., of the Abbott Corp. (which corporation was successor to the Consolidated Car Co., Abbott-Detroit Motor Car Co., Abbott Motor Co., etc.) have been taken over by a new corporation, the Abbott Motor Car Co. This concern was formed to take over this material and also the entire service and repair department of the Abbott Corp.

The Abbott Motor Car Co. handles exclusively all repairs for Abbott cars. The Puritan Machine Co. did not purchase any of the service department or service department material of the Abbott Corp. In fact they have absolutely no connection in any way, shape or form with the Abbott company.—The Abbott Motor Car Co., Geo. B. Simon, Cleveland.

New Plant for Perma-Loc

PHILADELPHIA, PA., June 24—The Perma-Loc Mfg. Co., Wilkes-Barre and Scranton, Pa., which manufactures and assembles a variety of automobile accessories, has purchased for $35,000 the plant of the Wyoming Valley Cutlery Co., Wilkes-Barre, and will immediately take it over to manufacture the Perma-Loc heatless tire patch and line of accessories. New officers and directors of the company have just been elected as follows: President, F. S. Kuschel; vice-president, George Weaver; secretary, Frank Guppy; treasurer, G. B. Myers. C. A. Hanopp, Boston, and Frank Weaver, Wilkes-Barre, also were elected directors. F. M. Harrington, formerly in charge of the general sales office in Scranton, will be general manager, and the sales office will be moved to Wilkes-Barre, branches being established in Philadelphia, Pittsburgh, Scranton and Altoona, Pa., and Boston.

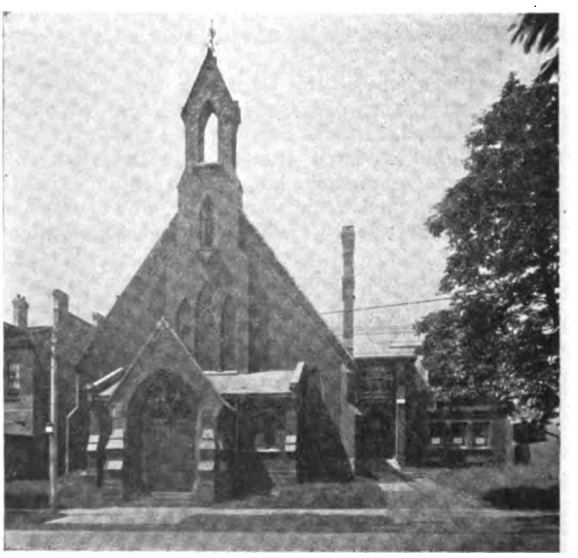
Where Hyslop Bros.
Job Accessories in the Dominion



To handle the Hyslop business a large office organization is necessary. The furniture and fixtures are modern and the offices are efficiently arranged

The Hyslop building was among the first concrete buildings erected in Toronto and a close study of the interior views shown here will reveal the lack of confidence that early builders had in concrete. There are beams in the ceiling strong enough to hold all the goods Hyslop will job in many years. The company had its beginning as a bicycle house and still retains that business, which thrives and prospers. The building is modern, light and well ventilated and is one of the fine layouts in the automotive equipment trade

On the ground floor Hyslop maintains what might be called the retail store but which is largely used as a display store for visiting dealers. The large space in the foreground is the Cadillac salesroom. Hyslop distributes that car in all Canada east of Winnipeg

When crowded for warehouse space Hyslop rented an abandoned church. The exterior looks like a church, but the interior has some resemblance to war-zone treatment

G. E. Varner, Buffalo, Minn., has bought the Depot Garage from F. A. Thomas.

George Volz has opened a repairshop in Crookston, Minn.

Harry Peterson, Lake Park, Minn., has bought a half interest in the Pioneer Garage with Gilbert Haudegard.

Andrew Regenscheid has opened a repairshop in Le Sueur Center, Minn.

H. G. Bjornsrud has opened a repairshop in Mabel, Minn.

I. D. Thomas, Mankato, Minn., and **Artis Busby**, Vernon Center, Minn., have leased the Motor Inn Garage at St. Peter, Minn.

The Long Motor Co., 1400 Hennepin Avenue, Minneapolis, has opened quarters and is conducting a used car business.

J. L. Grass has opened a repairshop in Owatonna, Minn.

Reuben Kaplan, Owatonna, Minn., has bought the repairshop of L. P. Peterson.

C. E. Gravel, Pierz, Minn., has bought the Thenies Garage.

O. W. Liljegren, Parkers Prairie, Minn., has taken over the interest of John Magnuson in the Parkers Prairie Garage.

E. M. Brines, Rushmore, Minn., has bought the interest of his partner, A. I. Metcalf, in their garage.

H. J. Greenwalt, Stillwater, Minn., has leased his garage to W. W. Morse of Minneapolis.

The Paramount Auto Exchange, 173 East Sixth Street, St. Paul, has moved to larger quarters at 257 West Seventh Street.

C. P. Miller, Waterville, Minn., has taken over the Wendelschafer Garage.

Grant Ross, Wesbrook, Minn., has bought the Peterson & Ludvigson Garage.

William Trudgeon has opened a tireshop in Butte, Mont.

The Lewistown Auto Co., Lewiston, Mont., has been sold to the Hendricks Auto Co., Moore, Mont.

J. F. Fitzgerald has opened a tire shop in Stillwater, Mont.

T. Miller, Alliance, Neb., has bought the interest of James Keller in the Miller-Coursey Garage.

L. A. Newman, Auburn, Neb., has sold his garage to W. Gutzmer, Newton, Kan., who will take on the Hupmobile as an additional line.

F. O. Wixon, Beaver City, Neb., has opened a repairshop.

W. F. Brune, Chappell, Neb., has opened a repairshop.

W. C. Korell and W. Kannow, Culbertson, Neb., have bought the Central Garage from Edgar Buzzell. The new firm will be styled Korell & Kannow.

Rice & Reynolds, Exeter, Neb., have leased the repairshop of the O.L.D. Garage.

John Atwood, Fairmont, Neb., has bought the White Auto Co. garage.

W. G. Mercer, Fremont, Neb., has bought the Fremont Garage.

H. F. McOstrich, E. F. Zimmerman and E. L. Roberts have bought the garage of E. E. Davis, Gothenburg, Neb.

The Haws Motor Co., Hastings, Neb., is moving to a new garage.

The Hastings Motor Co., Hastings, Neb., is moving to new quarters on Lincoln Avenue.

T. H. Reid, Holbrook, Neb., has sold the Reif Garage to H. G. Miller and it will be conducted under the style Reid Garage Co.

Clyde Maddox, Kearney, Neb., has sold his interest in the Kearney Tire & Rubber Co.

George Kroening, Lawrence, Neb., has bought the interest of Mint Marshall in the Lawrence Garage.

The Buckstaff Auto Co., Lincoln, Neb., has moved into new quarters at Eleventh and Q streets.

The Morris Motor & Tractor Co., Lincoln, Neb., has opened an office and salesroom at 1229 P Street. The new company was incorporated for the sale of tractors, and will handle the Frick.

W. M. Fyffe, McCook, Neb., have bought a half interest in the Red Willow Auto Co.

Arnold & Blain, Minatare, Neb., have bought the West Side Garage.

Digitized by Google

Ezra Carey has repurchased the garage of John Petring, Nebraska City, Neb., which he sold a year ago.

Weber & Talbot, Nebraska City, Neb., have bought the Motor Inn.

Whitall & Best, Norfolk, Neb., have bought the garage of E. Engle.

A. N. Durbin and Walter Kochen, North Platte, Neb., have bought the interest of J. L. Souder in the Durbin Auto Co.

The Jones-Hansen Cadillac Co., Omaha, has opened a branch house at Lincoln, Neb.

R. C. Peterson, Omaha, has bought the Dill Motor Car Co., 2209 Farnam Street. The firm's new style is R. C. Peterson Motor Car Co.

The Auto Electric Service Co., Omaha, will move into the quarters vacated by the H. Pelton Auto Co. when the latter moves into the new building it has under construction at Twenty-first and Farnam streets.

E. Carey, Peru, Neb., has bought the Peru garage.

Kleopfer Brothers, Riverside, Iowa, have bought the Ford garage.

A. W. Baughman, Rockwell City, Iowa, has bought the City Garage.

The Peterson Auto Co., Seward, Neb., has bought the Franklin garage.

Raymond Patterson and **Leo Stahlman,** Stanton, Neb., have bought the garage of A. V. Johnson.

H. C. Bjerrum, Staplehurst, Neb., has bought the Staplehurst Garage.

E. Nelson, Wymore, Neb., has opened a repairshop.

H. C. Graves has sold a half interest in the Day & Night Garage, York, Neb., to C. C. Beck.

Otto Stremikes, Bantry, N. D., has bought a half interest in the Sam Taylor Garage.

G. F. Noble, Beach, N. D., has bought the L. L. Parsons machine shop.

Adolph Sauer has opened a repairshop in Fessenden, N. D.

Olaf Kongslie, Fortuna, N. D., has sold his garage to P. J. Quarne.

Charles Goffe, Hannaford, N. D., has bought the garage and repairshop of L. B. Moore.

The McGregor Garage, McGregor, N. D., has been sold to J. L. Moore of Ray, N. D.

Leo Wysoski has opened a tire repairshop in Minto, N. D.

Andrew Wald has opened a tire repairshop in New England, N. D.

The Park River Motor & Machinery Co., Park River, N. D., has succeeded the Groven Garage.

Merritt Williamson, Bonesteel, S. D., has bought the W. N. Redmon garage.

The Egan Motor Sales Co., Egan, S. D., has bought the Davis Garage.

Harris & Brougham have opened a repairshop in Groton, S. D.

D. Z. Zmith, Humboldt, S. D., has bought a half interest with J. Schwarten in the Humboldt Tire Repairshop.

Peter Schekel, Lake Andes, S. D., has bought the George and Louis Schekel interest in the Lakeside Auto Co.

Harold Lyle, Manchester, S. D., has bought the Henry Michel Garage.

N. O. Toulin, Mobridge, S. D., bought the M. Sorensen Garage.

Elmer LaGrange, Mobridge, S. D., has bought a half interest in the A. H. Brown Garage.

The W. E. Stevens Co., Main Avenue and Eleventh Street, Sioux Falls, S. D., has bought the Jacquith Motor Co. and has become exclusive distributer of the Republic truck in South Dakota and adjacent territory in Minnesota and Iowa.

PACIFIC COAST

R. R. Sobey has moved the Midway Garage to new quarters in Galt, Cal.

George Brothers, Grass Valley, Cal., have added an accessory department and have taken on the Dodge Brothers car.

H. E. James has opened a vulcanizing shop at Grass Valley, Cal.

John Champion has purchased the Alpha Garage, Nevada City, Cal.

The Fruitvale Garage, Oakland, Cal., has moved to new quarters at 3241 East Fourteenth Street.

Edward Taylor has purchased the Lincoln Garage, Oakland, Cal.

John Heck, formerly associated with the Central Garage, San Diego, has bought an interest in the San Diego Tire & Vulcanizing Co.

J. B. Wallihan has taken over the garage at 868 Sixteenth Street, San Diego, and will conduct it under the style Stanley Garage.

C. R. Newby has taken over the Maxwell Agency at San Diego.

The Hibner-Alexander Co. have opened a new agency for Cadillac and Paige cars at Broadway and Fifteenth Street, San Diego.

B. W. Dixon has opened salesrooms in Stockton, Cal., for the Allen and Briscoe cars and Vim truck.

M. D. Dolson and **R. W. Davis** have opened a repairshop on East Channel Street, Stockton, Cal.

D. W. Russell has purchased the interest of C. H. Broadhurst in the tire store at 245 East Channel Street, Stockton, Cal. The business will be conducted under the style Keith & Russell.

W. R. Delay, Velie distributer in Medford, Ore., will go to Portland to take over the business of D. C. Warren of the Warren Motor Car Co., who has entered government service.

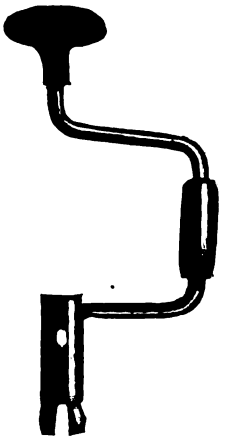
Accessories

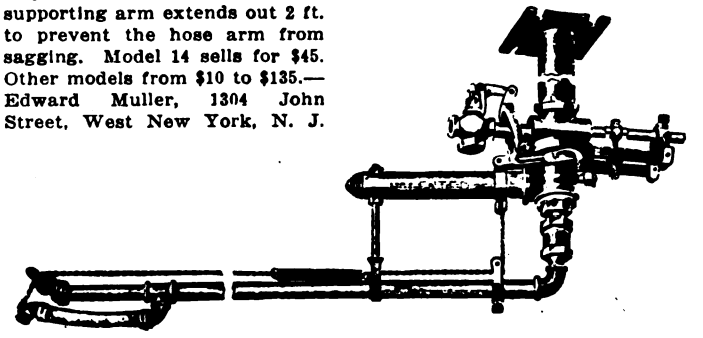
GREER SAFETY-RELEASE CLEVIS

A tractor hitch that automatically uncouples the plow from the tractor when rocks, stumps, or other obstruction are encountered by the plow. The main body of the clevis attaches to the tractor with a bolt, and has a slidable adjustment hook that catches the end of the coupling hook. The other end of the coupling hook is held by a U-bolt which passes through the end of the main part of the clevis and is held in position by two coil springs. When the pull becomes excessive the springs are compressed as the U-bolt moves backward, and when pulled far enough back the coupling hook slips out of the adjustment hook and uncouples the plow. Adjustment hook can be set for different drawbar pulls. Weight, 17 lb.; price, $8.50.—Erwin Greer Automobile Co., 1519-1521 Wabash Avenue, Chicago.



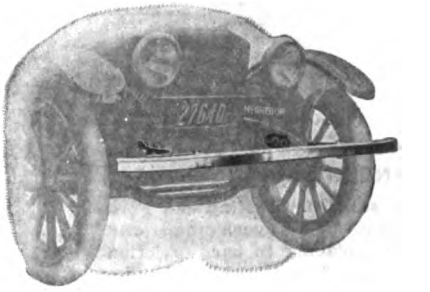
STADCO SPARK PLUG WRENCH

A double-ended spark-plug wrench, in which each end has two size openings, making four sizes in all. It is claimed that these four sizes will fit almost every spark plug made. Price, 25 cents. Packed 1 dozen in a box.—Stadeker Metal Specialty Co., 358 West Madison Street, Chicago.



UTILITY UNIVERSAL RIM WRENCH.

A brace wrench in which the jaws are conical and slide into the cylindrical barrel, thus allowing the jaws to grip any size nut. Finished in nickel and black enamel, and small enough to go in the tool box without folding. Price $1.50.—Hill Pump Valve Co., Archer Avenue & Canal Street, Chicago.



MULLER OVERHEAD WASHER

In this overhead washer the water is controlled by pulling on the hose. A slight pull turns on a little water, and the valve is held in that position by a ratchet till more water is needed, when a stronger pull will turn more water on. An upward lift of the hose releases the ratchet and shuts the water off. The hose arm, which swivels all the way around, is 6 ft. long, and a supporting arm extends out 2 ft. to prevent the hose arm from sagging. Model 14 sells for $45. Other models from $10 to $135.—Edward Muller, 1304 John Street, West New York, N. J.

GATES VULCO-CORD FAN BELT

A fan belt standardized into nine sizes, which will cover all car requirements. It is endless, does not stretch, made of 10-ply cord, and holds under a light tension. Each belt is identified by a paper label which gives the number of the belt and the models and makes of cars that it will fit.—Colorado Tire & Leather Co., Denver.

DETROIT ENGINE GOVERNOR FOR FORDS

An engine speed governor for Fords which replaces the roller and roller arm in the timer. The device has a weighted member which, when the speed reaches 1400-1600 r.p.m. is thrown out by centrifugal force, pulling the roller away so that it does not touch the contact, consequently cutting off the ignition. When the engine slows down, the roller goes back to normal and makes contact. Drivers cannot tamper with the device or alter it. Price $5.—Detroit Motor Governor Corp., Detroit.

McGREGOR COMBINATION SPRING BUMPER

A spring bumper with a rigid bar of channel, diamond, round or tee shape. The spring members are the brackets, and are formed of high carbon-steel spring stock, shaped in a curve to absorb the blow. The bumpers are made to fit all makes of cars, except Ford, Chevrolet, Jackson and Franklin, special bumpers being provided for these makes. Furnished in black, nickel, or black with nickel trim, at prices from $8 to $12, depending on style of bars and finish.—U. S. Auto Bumper Co., 115-117 East Thirtieth Street, Chicago.

HARWARD PISTON RING

The Harward ring is a one-piece concentric design with an interlocking and underlapped joint. In the outer periphery of the ring there are a number of shallow grooves which slightly overlap and serve to carry a supply of oil, thus providing constant and thorough lubrication and operating as an oil seal. An eccentric groove is cut in the inner surface of the ring, though it leaves the full edge bearing surface on both sides.—Harward Mfg. Co., 3939 Magnolia Avenue, St. Louis.

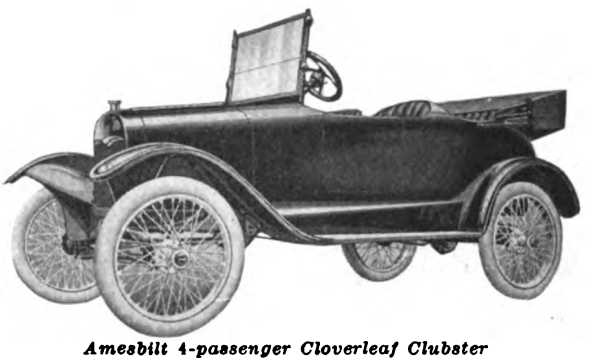
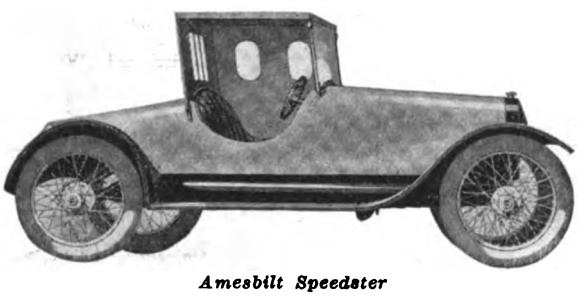
Amesbilt Bodies for Fords



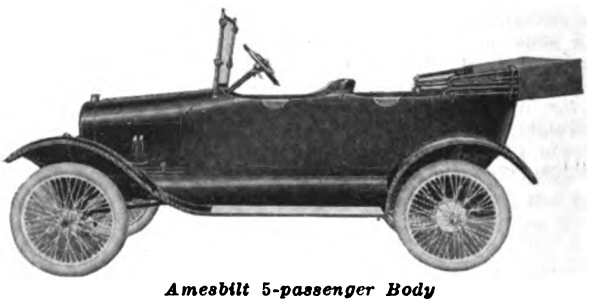
Three styles of bodies for Fords—a speedster, a five-passenger body and a four-passenger cloverleaf clubster—are made by the F. A. Ames Co., Inc., Owensboro, Ky. These bodies are complete with hood, radiator shell, fenders, skirts, runningboards, windshield, top and curtains and are supplied with all necessary fittings ready to attach to the Ford chassis. The frames are selected hardwood with mortised, screwed and glued joints reinforced and ironed. The sheet-metal covering is 20-gage cold-rolled steel, the crown fenders being of the same gage and material. The hoods are streamline with bullnose radiator shells. Upholstery is of mule-skin.

The speedster has a tapered and racy appearance, the rear deck being pointed. The body sets lower than the regular Ford body, has ample leg room, deep cushion and the back is upholstered and has coiled springs. No doors are used, the body being cut out at that point in a curve from the back of the seat and blending into the cowl line. A square-cut khaki cloth top and curtains are provided, which are quickly removable and can be folded into the rear tool compartment. The windshield is cowl-fitting and ventilating. The regular Ford gasoline tank is used. The standard color is a rich red, but other colors can be had for a small extra cost. Price, $140.



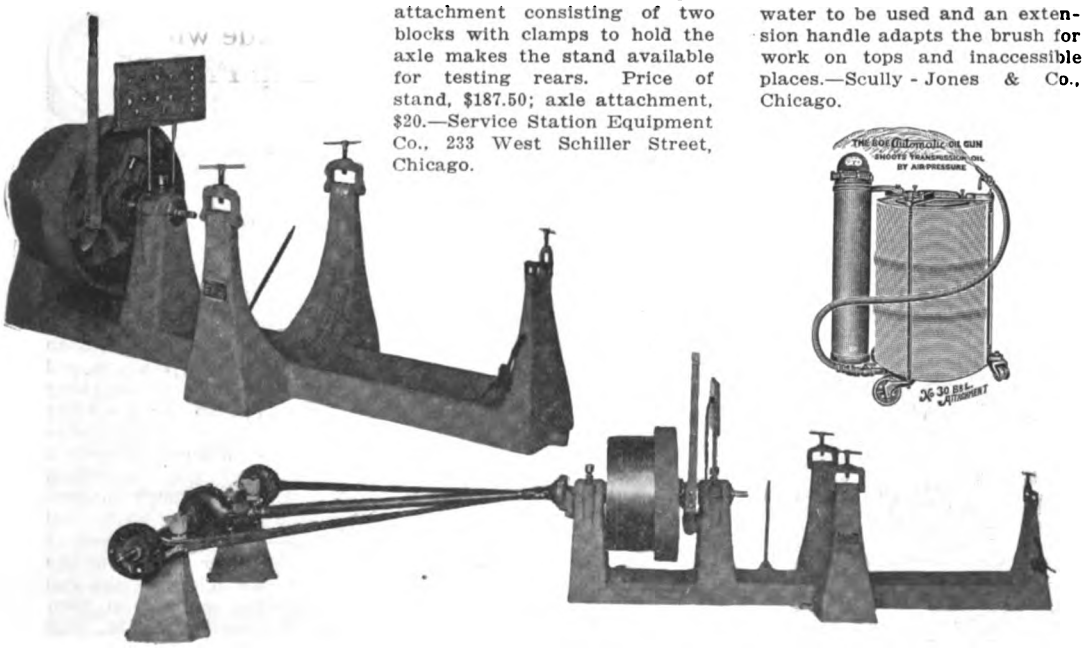
The five-passenger body is also streamline in shape, sets low, has four doors with concealed hinges and a 20-in. opening in each door. The top is a one-man mohair with Jiffy curtains and dust hood. The ventilating windshield fits the cowl and is clear vision. A 15-gal. gasoline tank is fitted to the rear of the body by tank braces and feed to the carbureter is by Stewart vacuum system. The weight is 500 lb. (950 lb. crated), and standard color is a rich glossy black, though other colors may be had as extras. Price, $260.

• The four-passenger cloverleaf clubster has divided front seats and has the same equipment as the five-passenger, except that the regular Ford tank is used and there is no vacuum system. The aisle between the front seats is 7½ in. wide.



The standard finish is glossy black; other colors are extra. Price, $240.

Amesbilt 4-passenger Cloverleaf Clubster



Amesbilt Speedster

Amesbilt 5-passenger Body

AMERICAN MOTOR TEST AND RUNNING-IN STAND

A stand for testing the Ford engine after overhauling and before placing in car. Friction clutch and pulley belted to line shaft permits engine to be driven till it limbers up, when the clutch is thrown out and engine runs under its own power. Three quick-acting clamps hold engine down and a regular Ford coil box is mounted on board. Coils and timer are connected up with wires which run through the base. A rear axle running-in attachment consisting of two blocks with clamps to hold the axle makes the stand available for testing rears. Price of stand, $187.50; axle attachment, $20.—Service Station Equipment Co., 233 West Schiller Street, Chicago.

WATER SPRAY WASHING BRUSH

A circular bristle brush with hose connection at the center through which the water is sprayed. An aluminum valve forms the handle of the brush and controls the flow of the water. An opening in the bristles allows a direct stream of water to be used and an extension handle adapts the brush for work on tops and inaccessible places.—Scully-Jones & Co., Chicago.

BOE AUTOMATIC OIL GUN WITH BARREL ATTACHMENT.

An automatic grease and oil gun which delivers grease or oil through a hose to the point desired by means of air pressure. A dial on the tank measures the amount delivered in either pints or pounds. The barrel attachment is provided with a truck on castors, and when the gun is empty it is refilled from the barrel by air pressure. Furnished complete with fittings either a 25- or 55-gal. barrel, $45.—H. M. Boe Co., 2416 University Avenue, Minneapolis.

A TRIBUTE FROM CANADA

By J. Ernest Millen

AT the recent Hot Springs meeting of the National Association of Automobile Accessory Jobbers, J. Ernest Millen of Montreal did much to bind the hearts of America and Canada together when he presented a Canadian flag to the association. Only the words that Millen used could express the feeling he intended to convey, and the attention of the whole trade of Canada and "the States" is called to them. They follow:

YOUR Canadian associates count it a privilege to emphasize their union with you, not only in business relations but in those larger issues that pertain to the nationhood of free peoples. I do not believe that you fully realize the change that has come over the relationship between your country and our empire within the last twenty-five years.

I well remember the first few trade conferences I attended in this country and the thinly veiled feeling of animosity that was evident when Great Britain was discussed, but the Spanish-American war changed all that and you began to understand that Great Britain was your national friend and ally and that you together stood as the bulwark of true democracy. That feeling has been growing more cordial and intimate ever since, and was fostered by such far-seeing statesmen and patriots as Mr. Choate, Viscount Bryce and others, to whom both nations owe a great debt.

To-day we are "brothers in arms" and are so regarded by our foes. Thursday's "New York Times" in an article telling of the splendid deeds of your Sammies said that the Huns feared the Canadians most of all fighting men, and that they now recognized your boys were the same as ours.

In those terrible epoch-making days of the spring of 1915 when Canadians made historic the names of Ypres and Festubert I happened to be in Detroit when the grim details of those awful struggles came in, and it brought the lump into my throat to read those words of praise in the "Detroit Free Press," where they referred to the Canadians as "Our Boys," and a new feeling of kinship came into my heart and it seemed perfectly right that you should call them "Your Boys," not because hundreds, perhaps thousands, of your own boys had enlisted as Canadians from the "Provinces of Virginia, Alabama or Massachusetts," but because you were one with us in heart even then, though you did not all know it.

Saturday's news showed us your marines are living up to their motto: "We fight first." It does our hearts good to know that you are with us heart and soul, and that instead of 500,000 men from this side of the ocean five million men or more if needed will fight the battle for freedom and righteousness.

In a letter I received a week or so ago from my boy "Over There" he says: "I think we ought to make the grade within a year or so at most and wallop Fritz. I have been telling you that for the last three years, haven't I? I am bound to be right some time, though."

God grant that we may, gentlemen, with your help, whether it takes one year or five. And the ties thus sealed in blood shall never be parted.

Gentlemen, on behalf of the Canadian Auxiliary I have much pleasure in presenting the association with this Canadian ensign as a token of our comradeship in arms and our joint high purpose to **WIN THE WAR.**

Wartime Conservation

Teaching the Car Owner to Help Himself

BRISCOE *SERVICE*

WE have been advised of your purchase of a Briscoe and we are sincerely glad to welcome you into the Briscoe family.

Your "good will" was a part of the purchase price of your Briscoe, and while that part has not yet been paid, you can do so by a boost to your friends; we shall do our best to warrant your good will—and your "boost."

If you did not receive an instruction book in your tool box, kindly write us at once. Remember that an oil can, a monkey wrench and a screwdriver, if properly used, will keep your car out of the repair shop.

If, at any time, there is anything you do not understand about the car, kindly write our service department.
With best wishes, we remain,

THE SERLIS MOTOR COMPANY
SERVICE DEPARTMENT
1602 Grand Ave. Kansas City, Mo.

NO. 1

BRISCOE
SERVICE Card
NO. 3
IMPORTANT!!! Read Carefully.

WHEN the National Automobile Dealers' Association recommended that dealers cut their service expenses by teaching car owners how to do more in taking care of their own cars, the Serlis Motor Co., Kansas City, put the plan into operation by sending out this series of five educational cards and will follow them with other instructions. Attention paid to these cards by owners will save the dealer many an hour of petty service. The cards are 3⅝ x 6¼ in., and all of different colors. The front of the cards, carrying the address and stamp, is shown at the top center of the page, labeled No. 3.

BRISCOE *Service*

HAVE you put water in your storage battery? It must be either distilled or clear rainwater. *Read your instruction book immediately about this;* otherwise, your batteries may run down, making your motor hard to start, ignition bad, etc. Water in a storage battery is just as essential as in the radiator.

Go over your ignition wires and connections occasionally to see that all connections are tight. Especially, see that ground wires and the terminals on the storage battery are tight; if loose, you will have difficulty or cannot run the car at all. The spiral shaft on the starter should be kept lubricated so the starting pinion will engage easily.

IGNITION SWITCH—Always shut your ignition off when stopping; don't depend upon the automatic throwout—it is for emergency purposes only, in case you do forget.

Read and follow your instruction book; it will add 100% to the life of your car!

THE SERLIS MOTOR COMPANY
SERVICE DEPARTMENT
1602 Grand Ave. Kansas City, Mo

NO. 3

BRISCOE *SERVICE*

ARE you carefully oiling your car? Wherever there is friction, there must be lubrication to prevent wear. Remember, parts in an automobile move with great speed, and lack of lubrication will cause rapid wear and this will result in looseness.

Read your oiling chart in the instruction book today and follow it religiously.

TIRES—Buy a tire pressure gauge and keep your tires inflated to 70 lbs. pressure. It will add wonderfully to your tire mileage; also, tire companies will not guarantee their tires unless kept at 70 lbs. pressure in 3½" tires.

Read and follow your instruction book; it will add 100% to the life of your car!

THE SERLIS MOTOR COMPANY
SERVICE DEPARTMENT
1602 Grand Ave. Kansas City, Mo.

NO. 2

READ carefully your instruction book about proper care of your clutch—very important.

This will be the last of our little reminders. We have endeavored to help in making your ownership of a car pleasant — and to merit your "good will."

We would appreciate, in return, your writing us on space below, just how you like your Briscoe, and if you have any friends you would like to see Briscoe owners, we would appreciate your telling us that, too.

We shall welcome your writing us at any time we can serve you.

Don't lay this letter aside—show us we have your good will and appreciation by writing us at once.

THE SERLIS MOTOR COMPANY
SERVICE DEPARTMENT
1602 Grand Ave. Kansas City, Mo.

NO. 5

BRISCOE *SERVICE*

HAVE you gone over your car to tighten all bolts and nuts? If not, put this card in your pocket as a reminder to do so at once. With your car tight and well lubricated, you will get real joy out of your car and also add 100% to its life. Look up the chart in your instruction book today and follow the instructions.

Keep the spring clips extra tight; if spring clips are allowed to become loose, the springs will break; if tight, you will have no trouble.

Read your instruction book now as to the adjustment of front wheel bearings and see if they need adjustment at this time. Also remove hub cap from rear wheel and tighten nut as much as possible to force wheel firmly on axle shaft.

Force 5 grease cups full of grease into the Hyatt bearings on rear wheels —this is very important.

Read and follow your instruction book; it will add 100% to the life of your car!

S. A. E. Meeting Great Rumor Killer

(*Continued from page* 16)

French 75-mm. guns or other field pieces, and crush down trees 7-in. in diameter, go over fences, ride over fence posts and cross ditches. It was an eye-opener to all notwithstanding familiarity with these tests through movie reels. It was the real war stuff with all parts camouflaged as if in action.

In addition there was the class B war truck, the new four-wheel-drive truck known as the Militor, and numerous other war trucks equipped as machine shops, etc.

In the same field were half a dozen farm tractors that gave constant performances, the list including the new Case, Fordson, Parrett, new four-cylinder Moline, Cleveland and others. Many engineers had never seen these machines plowing before.

Overhead Curtiss JN-4 training planes were constantly soaring, and for the special edification of the meeting ten to a dozen planes flew over and back in battle formation. A few minutes later, when these were out of the way, a group of battleplanes gave an exhibition of flying.

When Substitution is Good

One of our engineering accomplishments of the past year is exemplified in the work of substitution of new materials for older ones, of which we have a meagre supply. Due to the Irish situation we had not enough linen for the planes, but we have developed a brand of Sea Island cotton which is now serving as well as linen and we have it in great quantities.

When the shortage of spruce came up we turned our attention to Douglas fir, and to-day it is as good as spruce and our necessary supply is assured. We have fortified ourselves with a supply of castor oil by planting the beans. We have developed the manufacture of our dope and other chemicals, and if we have to use metal for parts we are ready to use it satisfactorily.

The meeting was a war contrast with that of a year ago held at the Bureau of Standards in Washington. Then we consulted on what to do. We looked for avenues of war activity:

To-day we examined the war products that the automotive industry has given the nation in the last year. Hundreds saw these for the first time and the examining of them served as an engineering stimulant that will result in greater production of American design.

President Kettering declares that every engineer must study aviation, must dream it, and think it in order that American brains may evolve something new that will place us ahead of the Hun in the air.

Director Stratton complimented the automotive industries when he said that no other industry was so well fitted to take up aviation work and that those who had the work in charge a year ago went to the proper industries to get the work done.

In addition to the foreign and American airplanes Triangle Park was given a very war-like appearance by the exhibit of the Ordnance Department. This included practically a complete line of the vehicles furnished by the department to the United States Army. These were put through a series of performances paralleling what would be met under difficult war conditions, and the engineers were greatly impressed by the spectacle of heavy creeper types of tractors pulling guns and limbers through a small jungle and over steep, slippery grassy slopes. The tractors brushed aside the saplings some 5 in. in diameter, pulling their guns over them as if they were nothing but reeds.

Army Tractors on View

On exhibition were tractors of 2½, 3, 5 and 10 tons capacity, an artillery repair truck, equipment repair truck, light repair truck, reconnaissance and machine gun car, self-observation car, a 3-in. gun trailer and a 10-ton trailer. These were all camouflaged and in their war paint gave a very business-like appearance to the exhibit.

The tractors performed in a manner which showed the immense mobility of the motorized field artillery. A small forest at the end of the field in which the undergrowth was so thick that a tractor and gun were swallowed up and out of sight after they had traveled 15 ft. offered no difficulties whatever. The tractors pushed the trees down in front of them, first bending them over and then crawling directly over, leaving them crushed to earth behind.

An exhibition furnished by the Signal Corps gave a further touch of war to the meeting. In this a fuselage of a plane containing a Liberty engine was set up on the field and the propeller mounted in place. A machine gun synchronized to fire through the blades of the propeller was fired to exhibit to the members the method of timing the machine gun fire.

The 3-ton tractor is a new machine of the four-wheel-drive type just developed by the Ordnance Department to meet the demands of the field artillery in France for a tractor capable of moving guns long distances at a rapid pace. This will take care of transportation of this nature on good roads where the services of a track-laying type are not required. This uses a Wisconsin engine of the type used in many other departments so that the advantage of interchangeability is secured. The vehicle can be used as a four-wheel steer when acting as a tractor or two-wheel steer when acting as a truck by simply interchanging axles. This model has been adopted as the standard four-wheel-drive type of this capacity for the army.

The 2½, 5 and 10-ton tractors are the track-laying type. The lightest is designed to replace a six-horse team and is very fast. It is primarily intended for hauling wire-laying reels across the country at high speed, and it is believed that it will ultimately replace the horse as a means of transporting the 75 mm. field guns.

The 5-ton is intended for hauling guns of medium weight at speeds of 6 m.p.h., although in emergencies the tractor can make 10 or 12 m.p.h. The preliminary designs for this vehicle were only decided upon on Nov. 24 *and in 6 months a completed tractor was developed and exhibited.* These tractors are armored to withstand shrapnel and machine gun bullets. The 10-ton is similar to the 5-ton, but will take care of twice the load. All of these were made to go through performances which parallel actual working conditions.

Lastly came a demonstration of the firing of two machine guns synchronized with a Liberty engine in a De Haviland plane so that the shots passed between the propeller blades. This demonstration was accompanied by an explanation by President Charles F. Kettering.

These exhibits were in themselves worth many times over the cost of the trip to Dayton and the time expended. It enabled war apparatus to be seen in different factories. The exhibits were opened for one hour each morning and at noon and from four each afternoon until seven.

Exhibits Always Crowded

Every exhibit was filled at these hours and when the sessions were on and addresses being given the exhibits were all closed.

It is not surprising that with such an exhibit of war production of the last year that every session should have been attended by 300 to 600 members who sat to the end and carried on spirited discussions.

With such a setting new ideas literally bubbled forth from the members and hundreds of new ideas on how well we are carrying out our war program were carried away. *Those doubting Thomases on the Liberty engine went away singing its praises. The engine itself and its parts carried conviction, and its performance in the air added the keystone of faith in it.*

One orthodox engineer, after studying the long line of ten engines for nearly an hour, expressed his faith in the Liberty engine in comparison with European types by declaring:

"I never thought the Liberty was so simple and such a good manufacturing job before."

It was the fact that his eye could travel from one to the other and back that led to that conclusion. That engineer is now a Liberty engine booster. The exhibit got a lesson under his skin that hours of discussion could not have injected. So it was with every other exhibit. The exhibits literally represented a new order of things.

It is not surprising that with such an

Digitized by Google

atmosphere there should have been uttered by speakers at the Orville Wright dinner and at the other sessions so many expressions that deserve permanent places in automotive engineering history.

President Kettering, a past master in epigrammatic art, was the vivacious leader; in fact, he was literally effervescing all the time. He wound up the meeting with a sermon on farm tractors by declaring that we are in the ox-cart stage of the automotive industries, and that we must build better tractors for the farmers and stop over-selling them. Tractor success is one-half engineering and one-half psychological. We should paint our instruction books on and chain our tools to the tractor.

Our program of the last year in aviation came in for a tidal wave of praise. Howard E. Coffin, recent head of the Aircraft Production Board, attended most of the sessions and was the star speaker at the Orville Wright dinner. He is as firm a believer as ever in what has been accomplished in the past year, and told how our training *aviators are to-day averaging* 220,000 *miles of flying per day, which nearly equals nine trips around the world each day.*

In 3 *months we will be producing in a dozen plants nearly* 100 *Liberty engines per day, and yet in England they are only producing* 50 *per week of a well-known engine that we have been criticized for not manufacturing. Had we taken up the manufacture of that engine last year when we started developing the Liberty we would not have been in production as we are to-day.*

European nations gave us a year to get into aviation engine production, but we are into production in 8 *months.* The error we have made in our aviation program was that of too great optimism last summer, when we announced that we could do more than was humanly possible.

There have been seventeen different airplane investigations this year, and in every case excepting some in progress at present the investigators have given up in despair because of the magnitude of our aviation program.

Major Jesse G. Vincent told how fast the Liberty engine is by a comparison with an engine used in a motor truck, the same engine used in a light racing car and in a touring car, and Director Stratton of the Bureau of Standards gave his explanation of its speed by asking how fast is a locomotive and answered it by saying:

"That depends on the load it has to carry. If the Liberty engine is in a single-seated fighting plane it has very high speed. If in a two-man fighter it has a slower speed. If in a day bomber it is still slower and if in a night bombing plane that must cover long distances, carry heavy loads of bombs and remain in the air for many hours its speed may not be over 90 miles per hour."

F. G. Diffin, one of the delegates of the S. A. E. to the International Aircraft Conference in London last February, declared that as a nation we underestimate the fighting strength of Germany in the air, and that she is preparing to build in tens of thousands; that at present England and France have practically reached their limit of aircraft production and we must henceforth carry the burden.

President Kettering led the crusade and others joined him in a determination to push the propaganda of building those designs of planes, engines and other apparatus that we have ready rather than waiting until some super-type has been developed. Here he injected a quite familiar comparison with the annual model in the automobile industry.

No manufacturer refrained from building a 1917 model solely because he knew he could build a better model in 1918. Had that policy been followed we would not have 5,000,000 automobiles nor would we have the well-developed machines of to-day. So it must be with airplane engines, ordnance and other apparatus of war.

Coffin Tells of Airplane Accomplishments

Navy Flying Boats That Carry 13,000 lbs.

"IN all the talk of the airplane program," said Howard Coffin, former head of the Aircraft Production Board, "we have heard nothing of the navy, in spite of the fact that it has been doing remarkable work in the construction of flying boats and submarine hunters. The navy has built planes capable of carrying loads from 11,000 to 13,000 lb. and having engine power ranging from 400 to 1200 hp. The crews of these flying boats number five men and sometimes more.

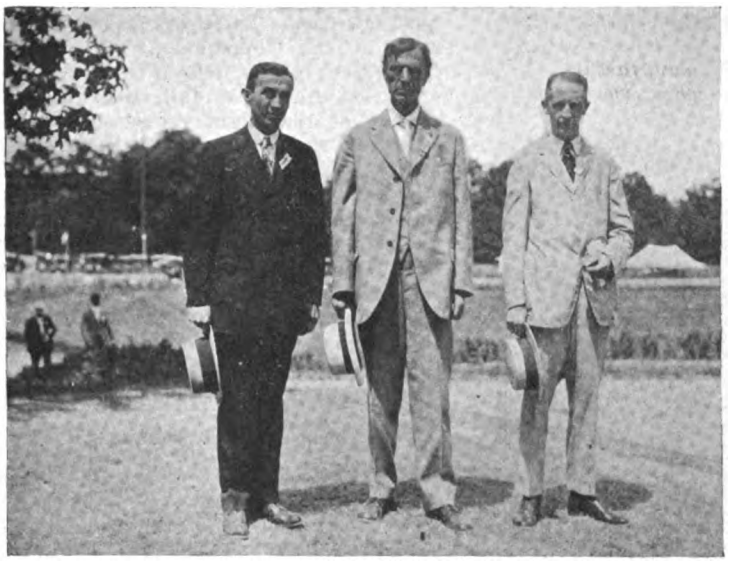
"Commander Koven told me the other day of a trip to Newport News from Philadelphia with a flying boat equipped with two Liberty engines taken from stock. These engines did not miss a shot on the entire trip, which is quite a record for engines which are not supposed to run.

"Daily trips are being made by the navy flying boats from Newport News to Washington, and yet nothing is ever heard about it. When we hear the size of these planes and the amount of their power equipment we are prone to wonder what the limit will be. The army also has large planes, but the navy has been forced into this heavy construction because of the work which it has to do.

Howard Coffin

150,000 Men Now Training at 30 Stations

"All of you have seen to-day enough exhibitions of flying to know that we are on the right way in this country. Only a few weeks ago some of our friends in Washington were talking about the one airplane which cost the country six hundred and forty million dollars, and we are familiar with the cartoons in the funny papers showing the scales having the little airplane on one side and the large bag of money on the other. As a matter of fact only between one-third and one-half of that appropriation has been spent.



"There have been built over 6000 training planes. Two thousand others were scheduled to be built in Europe, but these have been partly held up due to the drive in Italy and the offensive on the western front.

"There are 150,000 men in training at the various airplane plants and flying fields.

"There are between twenty-five and thirty of these training stations.

"*Perhaps the greatest good which has come out of all the recent investigations is that the theory that it is impossible to produce standardized airplanes in quantities had been exploded.* Standardized designs are being produced now.

G. M. Cameron, F. W. Gurney and G. T. R. Bell, of the Gurney Ball Bearing Co.

At the right and left are the Owen brothers, Ray M. and Ralph R.

Those who visit the Dayton Wright plant will see a fine example of this work.

"When the crates of planes are received on the other side it is not necessary to match up the different parts in the same way that they were put together in this country. The parts will go together because they are interchangeable, and it is recorded that in the space of two hours from the time of receipt a plane has been put together, the engine started and the plane flown.

This All Takes Time

"It has taken time to do all this and to get out the necessary tools, jigs and fixtures for the work. Those of you who have followed the work know what it means in the way of equipment and personnel to keep the planes in the air. You know what it means in the way of repair parts and fittings. You have also heard the foolish suggestion of bringing to this country an engine which has been tried out and found good in Europe, but you know that it is impossible to get into production on a foreign type of airplane engine in less than a year.

"Although the drawings, equipment, and even the engineers, are brought over from the other side, we have but to point to the example of the Gnome engine at the plant of the General Vehicle Co. and the Hispano-Suiza at the Wright-Martin plant or the Berliet at the plant of the American Locomotive Co.

"Those who have seen the exhibitions here and have been thoroughly conversant with the work know that American designs, American tools and American methods are far ahead of those over there when it comes to a production basis.

"The British, after three years and more of war, are only producing in the Rolls-Royce plant, where 10,000 men are employed, but fifty engines per week, and these have 50 hp. less and weigh 100 lb. more than the Liberty engines.

"So far as our purposes are concerned there are several plants in this country that will within the next 120 days be producing from fifty to 100 of these engines a day. Yet you cannot possibly convince a Senator of this.

"Navy boats have made flights frequently of ten hours continuously. Just figure out for yourself where ten hours will take them on the west front.

"The spruce production in this country has increased 750 per cent, and besides this there have been entire industries built up to take care of the requirements of accessories, such as wireless apparatus, delicate recording meters, bomb-dropping apparatus, flares, machine guns and many other things which were not produced here before.

Three Big Things Done

"These are more of a job than the plane and engine. Many of these things were not produced at all a year ago in this country.

Considering all things, there have been three big things done in the airplane industry in this country during the last year.

"1—*The production of the Liberty engine, including the Liberty cylinder, which should go through the war without a change in spite of other developments which may come up in engine practice.*

"2—*The discovery of a substitute for linen.*

"3—*The discovery that Douglas fir is a satisfactory wood for airplane construction.*

Read the Story on Page 12

"This had to be literally crammed down the throats of our Allies, but reports show that the wood is even superior to spruce and the supply is unlimited.

"It is unfortunate that the people cannot all know what is going on. From what we have seen in Dayton we know that we are going to show our friends on the other side that American industry is going to go a long way towards winning the war."

Trucks More Live Stock

KANSAS CITY, June 24—Live stock is the chief stimulant to truck use on country roads in Missouri. A recent tour of the northwestern part of the state, revealed the fact that live stock is being carried into nearly every town by truck, for shipment to stock yards. Stock raised within 25 miles of packing centers, is being taken direct to market by truck, in many cases.

The availability of trucks for carrying stock, especially hogs, to shipping points, is proving an important factor in the return of farmers to larger stock raising operations. The difficulty of making up a carload of stock at country stations, and the shrink and hazard of driving in hot weather, have been really serious drawbacks during the past two or three years of high values of farm products.

During the past few months many trucks have gone into service in northern Missouri for hauling live stock, and this development is in remarkable coincidence with the marktd tendency of northern Missouri farmers to raise more stock.

At Trenton, Missouri, for example, the local transfer company has recently installed truck service, and is building a good business with farmers hauling stock to town for shipment. Local transfer companies are doing this also at nearly all the larger towns. In the smaller communities, the truck that is doing live stock business is often owned by a farmer who makes good money from carrying the stock of his neighbors.

Miss Elsa Feist in garb she has adopted for Fordson tractor demonstrations in the Northwest. She had never driven a car, but piloted a tractor at work for the two-day demonstration at St. Paul

Two-Day Demonstration Sells 750 Fordsons

And They Were all Cash Sales, Too —Schmelzel Has an Intensive Method

MINNEAPOLIS, June 24—Of the allotment to Minnesota of 1000 Fordson tractors 750 were sold in a 2-day demonstration on a 30-acre tract of land belonging to Thomas Frankson, Lieutenant-Governor. These were cash sales. Hundreds were attracted to the farm in St. Paul to watch the work of the tractors under supervision of W. H. Schmelzel of the Schmelzel Tractor Co. So successful was the exhibition that it has been decided to have a second demonstration near the State Fair Grounds through fair week, Sept. 2-7.

Schmelzel will base the allotment to the farmers of the state on small grain acreage, which makes one Fordson to 8135 acres. The allotment is by counties and the Ford dealers make the distribution without profit. Statistics were compiled for the allotment by A. D. Wilson, federal food administrator for the state. Under this acreage arrangement Polk County, for instance, is to get an allotment of 41 tractors, and Ramsey County, in which St. Paul is situated, will get one, and Hennepin County, with the other twin city, five Fordsons.

Miss Elsa Feist of McCarron Lake, sister of one of the Ford employees in the Schmelzel plant at St. Paul, with no previous experience plowed for the 2 days with a Fordson and made such a hit that she was retained to demonstrate the tractor and Oliver plows at Grand Forks, N. D., and Moorhead, Minn. The Lieutenant-Governor essayed a few furrows at the Fordson throttle. He will plant the land to flax and sell the product for the Red Cross fund.

Iron Ore Costs More Now

WASHINGTON, June 22—An increase of 45 cents a gross ton in the price of iron ore effective July 1 was agreed upon yesterday by the War Industries Board, the American Steel and Iron Institute Committee and members of the steel industry. Further very important announcements resulting from the meeting and affecting shipments of steel to non-war industries are expected within the next few days. There will be no changes made in the Government's schedule of fixed steel prices, which has been in operation since last fall, with the exception of the slight reductions of pig iron and scrap iron prices authorized March 26 last. Steel prices, which will stand unless the President fails to put the agreement in operation by proclamation, are those made effective last fall, beginning with prices fixed for iron ore, coke, pig iron, etc., on Sept. 22, and extending over a period to Nov. 5, when the prices of pipe, cold-rolled steel, scrap, wire and tin plate were promulgated.

Business Tour in Kansas City

KANSAS CITY, June 20—The Young Men's Division of the Chamber of Commerce of Kansas City has adopted the method employed during past years by the Kansas City Motor Car Dealers' Association of staging tours through the territory for the purpose of stimulating business and interest in good roads. The tours last about three days and radiate in all directions from the city. One of the propagandas is that in favor of the return loads bureau.

Tires Coming From Texas

HOUSTON, TEXAS, June 24—The Universal Tire & Rubber Co. which recently acquired a site of 30 acres is having plans made for the buildings of its proposed manufacturing plant that it will soon begin constructing. It is stated that it will manufacture automobile tires and tubes and that it plans to make a specialty of export business. The initial unit of the plant will give employment to about 500 men and this will be increased to 1500 within a short time. The company is composed largely of Texas men. Several cities and towns of the State entered into strong competition to secure the new industry, but the selection of Houston was made because of its shipping, both water and rail, advantages.

Headquarters of Schmelzel Tractor Co., St. Paul, which will distribute Fordson tractors in Minnesota through Ford agents, distribution being based on acreage of small grains

Milwaukee Advertises War Service Program

Dealers Put It Up to Car Owners to Conserve Time and Labor at Service Stations

MILWAUKEE, June 24—Under the title "A Patriotic and Open Letter to Motor Car Owners of Milwaukee County," the Milwaukee Automobile Dealers' Association published a large display advertisement in the Milwaukee Sunday newspapers to announce the new rules and regulations for war conservation, at the same time making mention of the four emergency service stations already appointed for the purpose of rendering all-night, Sunday and holiday service to motorists in distress. The advertisement is signed, "War Service Committee, National Automobile Dealers' Association," and a further official touch is given by the statement that the conservation requirements are made effective by the Government, as set forth in recommendations of the War Economy Board of the Council of National Defense. The advertisement already published and the explanation to be mailed to all owners are only part of the work being done by the Milwaukee association at its own expense to show the Government every co-operation possible.

Rochester Drive-Aways Increase

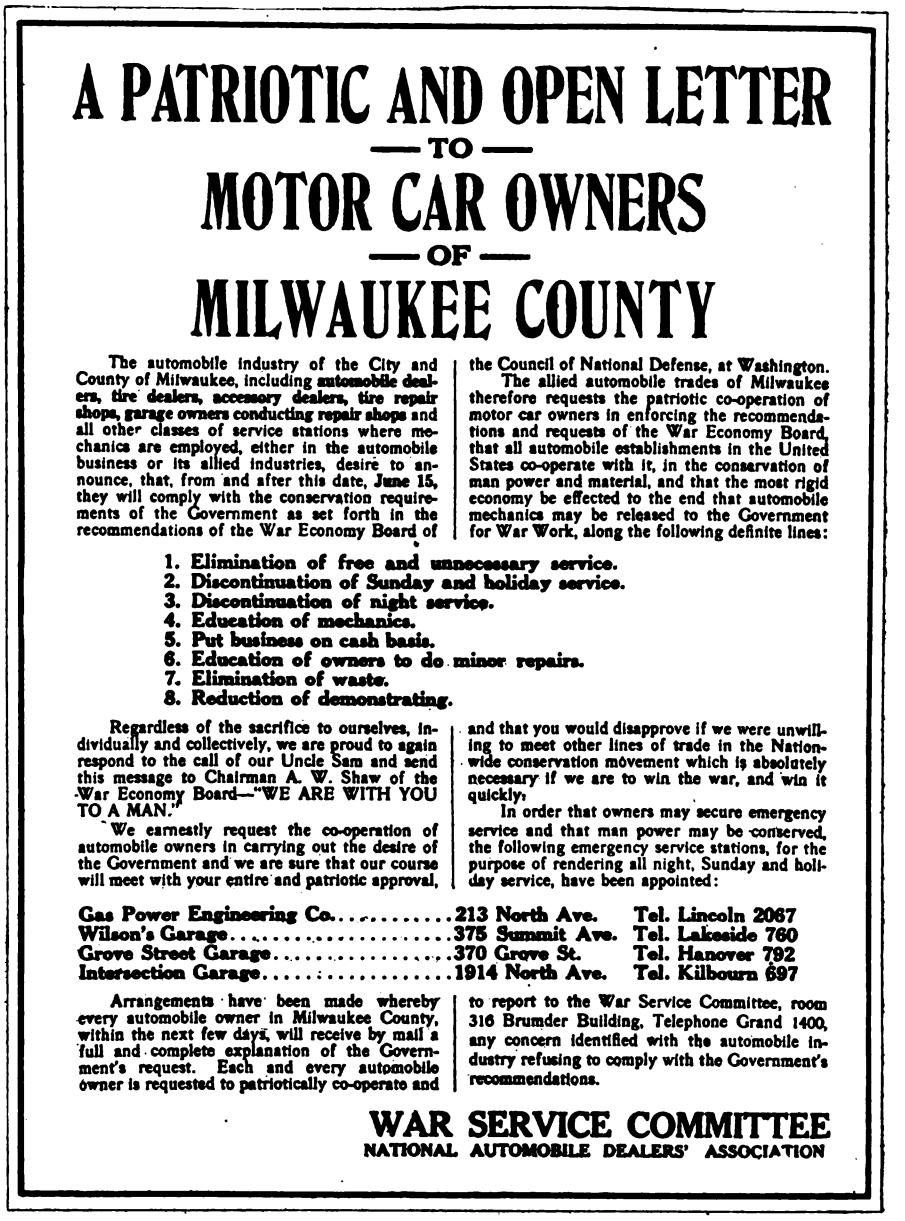
ROCHESTER, June 22—Harry P. Ruppert, manager of the automobile license bureau at Rochester, has for some time been taking advantage of the great number of drive-aways which are passing through the city to secure the transportation of his license plates from Buffalo to this city. Owing to traffic conditions it has been found impossible to get these boxes of plates accepted by either the railroads or express companies, so Ruppert has been doing the next best thing and bringing them in by motor cars.

The Automobile Club of Rochester has announced that the best route for distributors to follow from Buffalo to this city is as follows:

Rochester to Buffalo—From Buffalo to Snyder, turning to left at Williamsville onto Transit road, through Lockport, Wrights Corners, Ridgeway, Medina, Albion, Holley, turn to the left to Brockport, following the Ridge road through Clarkson and entering Rochester via Lake Avenue. This is known as the Ridge Road route and is longer than the other route but the roads are in better condition.

Filling Stations Demand Cash

MINNEAPOLIS, June 24—Conservation has reached into the filling station business and eight companies owning 84 stations in the Twin Cities have agreed to go on the cash basis July 1. Customers must pay cash or buy coupons at $10 a book. This action will release about 60 men for other work. It is estimated 14,000 customers are affected in the cities by this move as well as by the new conservation open hours of 8 a. m. to 8 p. m. every day except Sunday when 5 p. m. is the closing time.



Wilmington Embargoes Cars

WILMINGTON, DEL., June 24—Because of the tremendous demand on railroad facilities entering Wilmington, due to munition and shipbuilding establishments, and other incidental war enterprises, railroad authorities have established a hard and fast freight embargo against passenger cars. As a result, cars that are not on the truck class that are shipped to Wilmington by freight are halted at the nearest outside delivery point, where they are unloaded and run into the city under their own power. Most of these cars are delivered at West Chester, Pa., which is 20 miles distant and where the freight congestion is about as near the minimum as can be found in this part of the country.

This condition of affairs has further stimulated the drive-away idea, as far as Wilmington is concerned, and the ranks are gaining recruits. Those driving in cars last week included the Penn-Del Motor Co. (Mitchell), Guy R. Ford (Overland), Taylor Motor Sales Co. (Haynes), Sweeten-Wilmington (Hupmobile and Franklin), Delaware Motor Sales Co. (Cadillac), Gomery-Schwartz Co. (Hudson), Cahill & Co. (Dodge), French Street Garage (Reo), F. B. Norman & Co. (Ford).

Knutson Heads Duluth

DULUTH, MINN., June 24—At the annual meeting of the Duluth Automobile Dealers' Association the following officers were elected: H. B. Knutson, president; Russel W. Sherman, vice-president; Mr. Foster, treasurer; Phil Holgate, secretary; Geo. Wilson, director.

A PATRIOTIC AND OPEN LETTER
— TO —
MOTOR CAR OWNERS
— OF —
MILWAUKEE COUNTY

The automobile industry of the City and County of Milwaukee, including automobile dealers, tire dealers, accessory dealers, tire repair shops, garage owners conducting repair shops and all other classes of service stations where mechanics are employed, either in the automobile business or its allied industries, desire to announce, that, from and after this date, June 15, they will comply with the conservation requirements of the Government as set forth in the recommendations of the War Economy Board of the Council of National Defense, at Washington.

The allied automobile trades of Milwaukee therefore requests the patriotic co-operation of motor car owners in enforcing the recommendations and requests of the War Economy Board, that all automobile establishments in the United States co-operate with it, in the conservation of man power and material, and that the most rigid economy be effected to the end that automobile mechanics may be released to the Government for War Work, along the following definite lines:

1. Elimination of free and unnecessary service.
2. Discontinuation of Sunday and holiday service.
3. Discontinuation of night service.
4. Education of mechanics.
5. Put business on cash basis.
6. Education of owners to do minor repairs.
7. Elimination of waste.
8. Reduction of demonstrating.

Regardless of the sacrifice to ourselves, individually and collectively, we are proud to again respond to the call of our Uncle Sam and send this message to Chairman A. W. Shaw of the War Economy Board—"WE ARE WITH YOU TO A MAN."

We earnestly request the co-operation of automobile owners in carrying out the desire of the Government and we are sure that our course will meet with your entire and patriotic approval, and that you would disapprove if we were unwilling to meet other lines of trade in the Nation-wide conservation movement which is absolutely necessary if we are to win the war, and win it quickly.

In order that owners may secure emergency service and that man power may be conserved, the following emergency service stations, for the purpose of rendering all night, Sunday and holiday service, have been appointed:

Gas Power Engineering Co.	213 North Ave.	Tel. Lincoln 2067
Wilson's Garage	375 Summit Ave.	Tel. Lakeside 760
Grove Street Garage	370 Grove St.	Tel. Hanover 792
Intersection Garage	1914 North Ave.	Tel. Kilbourn 697

Arrangements have been made whereby every automobile owner in Milwaukee County, within the next few days, will receive by mail a full and complete explanation of the Government's request. Each and every automobile owner is requested to patriotically co-operate and to report to the War Service Committee, room 316 Brumder Building, Telephone Grand 1400, any concern identified with the automobile industry refusing to comply with the Government's recommendations.

WAR SERVICE COMMITTEE
NATIONAL AUTOMOBILE DEALERS' ASSOCIATION

This is the quarter-page display advertisement which the Milwaukee Automobile Dealers, Inc., inserted to tell of the war service plan and get owners to do their share in the work of conservation

Philadelphia Truck Dealers Hold Outing

Drop Business Cares for a Day and Play—High Speed at Mohican Club

PHILADELPHIA, PA., June 21—The fourth annual outing of the Motor Truck Association of Philadelphia held jointly with the Automobile Accessories Business Association and the Camden Automobile Trade Association at Kugler's on the Delaware River, was attended by about 300 members and their guests, and proved to be a real "get-together" event which brought the men from across the river into close touch and sympathy with the work and objects of the Philadelphians, aside from its social aspect.

While "shop talk" virtually was taboo, except in the set addresses, the gathering is regarded as having the effect of bringing the associations into closer contact in the matter of common interest. The fun started with the departure of the Philadelphians from their headquarters, at Broad and Callowhill Streets, in passenger cars—not trucks—for the Jersey side, at 1 p. m. At the Camden ferry the party was met by a delegation of the Jerseymen and given a warm welcome. The highest speed allowable for the Mohican Club was then maintained.

The guests of honor were Judge Eugene Bonniwell, of the Philadelphia Municipal Court, who is Democratic nominee for Governor of Pennsylvania; George M. Graham, chairman Motor Truck Highway Maintenance Committee of the National Defense Council, Washington; Emlen S. Hare, New York; Charles E. Grakelow and E. J. Cattell, City Statistician. All of these guests made speeches, patriotic in theme, and touching, from different angles, the rapid growth of the motor truck and allied trades in the last ten years, as well as the added impetus during the war.

As this meeting marked the last until the fall, the day was abandoned to enjoyment. Besides the "spellbinding" and the "well known and popular feed," there were field sports of various kinds. Owing to war conditions, the usual distribution of overalls for this part of the program was omitted, but the members had been warned not to wear anything that could be spoiled by rough usage. Old baseball uniforms and gymnasium costumes were the prevailing modes.

There was a potato race, a tug of war, a three-legged race, a fat man's race and the crowning feature—the baseball game between the Motor Truck Association and the Automobile Accessories Business Association, which was won by the former by the score of 17 to 10.

New Orders for Fordsons

DEARBORN, MICH., June 22—Henry Ford & Son has received more orders from states desiring tractors. A joint order has been placed for 1000 Fordsons to go to the States of Maryland and Delaware. Deliveries have not yet started on this order. New York has ordered 1000, of which 155 have been delivered. North and South Carolina have each placed orders for 100 tractors; these orders will be completed within 30 days. Only one distributer is provided for the entire New England sections; this is D. W. Flint, Providence, R. I., who has delivered 102 tractors and has orders for 200 more. One thousand will be delivered in this section. The Canadian delivery is now seventy-three tractors beyond its contract and Ford has orders for several more. It is believed the total will be 1129 before contract is closed. Of the 100 tractors ordered by Cuba thirteen have been delivered. Seven Fordsons have been shipped to South America. Deliveries to Ohio, Wisconsin, Iowa and Virginia are nearly completed. It is believed final shipments will be made about July 8.

Trucks Saving Wheat For Kansas Farmers

Requisitioned Machines Permit Its Removal from Badly Flooded Bottom Lands

KANSAS CITY, June 24—Trucks are saving wheat against possible destruction by floods, in bottom lands of Missouri and Kansas, this summer.

In many districts, floods in the past—often merely heavy rains that wash over the lowlands on which wheat is shocked or standing in sacks—have caused serious losses at this season. In many of these districts citizens are co-operating with farmers, to get the wheat moved as quickly after cutting as possible, to higher ground.

The hurry calls are sent into town, and all sorts of conveyances are offered for the purpose—and practically all the trucks of the communities.

Ossawatomie, Kansas, is one example of this practice. The wheat here had ripened on the lowlands quickly because of hot dry weather; it was an unusually large crop—and the local people were primed to give their utmost help in saving it.

W. H. Ellett, food administrator of Livingston County, Missouri, a banker, is making careful plans for moving wheat from lowlands of that district as soon as cut. He has already lined up several trucks which will follow the harvesters; and he is concentrating his cohorts of harvesters for tackling the bottom lands first. Every two or three years these bottoms are flooded, the damage frequently occurring just at harvest time.

Two Dealers Consolidate Service

WORCESTER, MASS., June 25—As a war conservation measure the establishments of the Henshaw Motor Co., Dodge distributer and the Packard Motor Car Co. of New England, will be consolidated in one building. The organizations will remain the same.

Philadelphia Truck Dealers Outing

This is the bunch of Philadelphia truck dealers who journeyed to Kugler's last week, the numbered ones being: 1—Lee J. Eastman. 2—W. H. Metcalf, secretary. 3—George M. Graham, chairman Motor Truck Committee, N. A. C. C. 4—J. D. Howley, President, Motor Truck Association of Philadelphia

Chevrolet Wins Chicago Derby at 108 Miles an Hour

Mulford Is Second on Windy City Board Track—Vail in a Hudson Takes Third

CHICAGO, June 26—Louis Chevrolet captured premier honors in the fourth annual Chicago Automobile Derby today, when in a hotly contested race he won the 100-mile event, the feature of the day's program, at a speed of over 108 m.p.h. His Frontenac traveled the century in 55 min. 29.6 sec., an average of 108.1 m.p.h., breaking the previous Chicago 2-mile speedway record for the distance of 55 min. 50 sec. made by De Palma in a Peugeot 2 years ago.

Mulford in another Frontenac took second, finishing 1 min. 38 sec. behind Chevrolet, with Vail's Hudson third nearly a minute later.

The other five to register on the timer at the finish followed in the order named: Hickey in a Hudson, Oldfield in his Oldfield Special, Alley in the Bender, Milton in a Duesenberg and De Palma in his Packard.

The 100-mile event was preceded by a 10-mile handicap run in three heats, which turned up Resta as the winner, his time being 5 min. 33.1 sec. Chevrolet got second and Oldfield third in the final. The two preliminary heats went to Resta and Chevrolet.

Between the two events De Palma put his Packard around the 2-mile board track in a successful trial for the track record for one lap at a speed of 116 m.p.h., bettering the best previous record for the track set by Resta two years ago at 113 m.p.h. This record does not equal that of the Sheepshead Bay 2-mile speedway in New York.

With two track records to his credit the meet can be considered a success. Chevrolet's time for the hundred miles is not so good as the record he established at Sheepshead Bay last fall, so no new American records were made. But Chevrolet now holds not only the American record for the distance but the Chicago track mark as well.

To-day's race proved the possibility of getting out a big crowd even in these war times. But it was only done by adopting baseball tactics of popular prices and late starting. Prices were very much reduced from those of early races on this speedway—$1 admission, free parking spaces and $1 grandstand seats. Instead of the 2 o'clock start the starting bomb was fired at 4 p. m.

That these arrangements were wise was shown by the fact that fully 40,000 attended, a crowd exceeded only once at the speedway, and that the day the track was inaugurated 3 years ago. Over half the track was lined with double rows of cars in the infield, the biggest turnout of cars ever seen at one time in Chicago.

It is doubtful if another such crowd could be gotten out for another handicap 100 mile race, for with fifteen contestants it is hard enough for the grandstands to follow the fortunes of the individual drivers without, as in this case, starting them out at different times. With the scoreboards two laps or more behind, as is inevitable on a 2-mile speedway, the difficulties of keeping track of the contestants are increased and the interest is lost. Before De Palma, the scratch man, started, the slower cars had made a lap, and so from the start cars were strung around the entire 2-mile circuit and the spectacle of a flying start was lost, as was the struggle for early leadership among the fast cars.

Times for 100-Mile Race

Handicap Seconds	Driver	Time	M.P.H.
15	Chevrolet	55:29.6	108.12
20	Mulford	57:07.2	105.04
75	Vail	58:14.0	103.03
70	Hickey	58:37.0	102.36
40	Oldfield	58:55.0	101.87
50	Milton	59:35.0	100.69
22	Alley	59:36.0	100.67
00	De Palma	.....	.....

Excellent Management

The timing and management of the race as a wholle seemed to be excellent. The scoreboards were behind and inaccurate as usual and the announcing was much too infrequent and sparse in information. Aside from this, the card was run off in fine shape.

De Palma played in hard luck. The favorite of the grandstands and scratch man in the handicapping started fifteenth; therefore the Italian had his Packard by the end of 14 miles up into sixth place and was making the best speed. Then his jinx got him and he spent nearly 4 min. at the pits changing spark plugs. When he got under way he reeled off the laps at 109 and 110 m.p.h. But the others had gained too much and toward the last his speed seemed to tell, for Chevrolet and Mulford during the last quarter maintained their distance.

Resta lost to-day his distinction of never having lost a race on the Chicago track. He was given 30 sec. start over De Palma and was climbing into the lead when after the first 30 miles he stopped to change plugs. Later he made a second stop with a broken accelerator spring, and a third and final when he withdrew with oiling trouble.

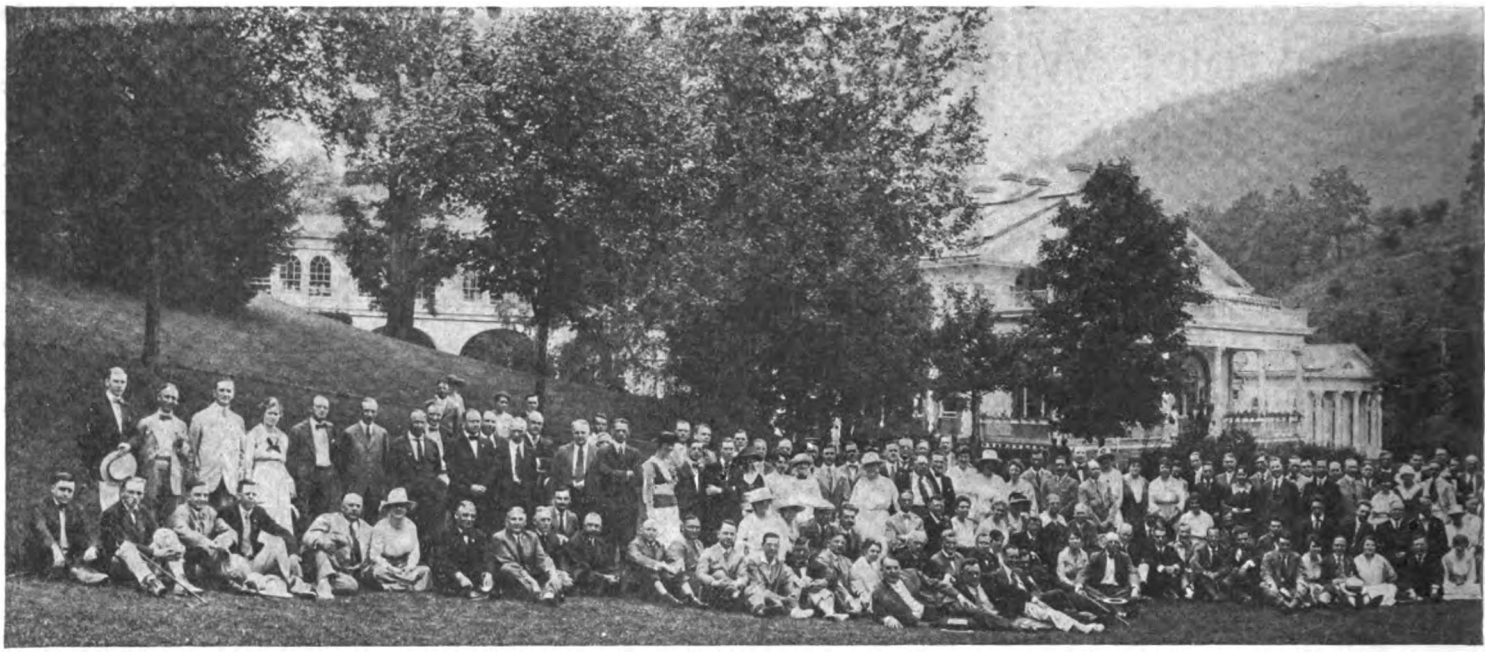
The specially imported Duray, holder of the world's straightaway record, also ran, but not well enough to show. He was never a factor.

Twelve pit stops were recorded, and of these six were due to fouled plugs. De Palma made his first stop early in the race and required 3 min. 10 sec. to replace fouled plugs. Before this, McCarthy, driving the Hoskins, was declared out, due to faulty plugs. Percy Ford, in the Duesenberg, drove up to his pit after a few laps, to make minor adjustments, and shortly after him came Milton to change a right rear shoe. His was the first case of tire trouble.

The next man to come to the pits was Duray, who evidently did not understand all the subtle qualities of the Frontenac. His trouble consisted chiefly of over-oiling and sooted plugs, although he did some experimenting with the carbureter while at the pits and from this time on seemed to be running better.

Three minutes after he got away, Resta came to his pit and changed plugs. He stopped 10 min., and this put him out of the running, although his car was going strong. On the next lap he again halted at the pits; this time to put in a new throttle spring, the other having broken and prevented the throttle from closing on the turns.

The eighth man to turn in was Ford, with a blown left tire. One minute after him came Milton, who changed a right rear shoe, the same as he did before. A noticeable factor in the 100-mile race was the slowness of the pit work; tires were not changed as rapidly as in some of the other Chicago races.



When the race was about half run Resta again brought his car to the pits, this time for good. He was troubled with fouled plugs, and his oil pump plunger, operated by the mechanic, was put out of commission.

About this time Alley, who had been going great guns, drew up for a tire, and this forced him to finish sixth, whereas he would have been among the leaders had he kept going. Omar Toft, in the Miller Special, had his trouble keeping oil from fouling plugs and was finally forced to the pits, to remain there while the leaders fought on.

All told there were but four tires replaced; quite remarkable when considering that the track was cut up and splintery. Only two of the four tires were actually cut to pieces, the others being changed by the drivers only as a matter of precaution. De Palma, after breaking the track record, changed all tires on his mount.

Resta's tires were specials, being intended for speedway and beach work. His car appears light and thus probably is very easy on tires. Practically all the drivers used Goodyear cord tires, excepting Oldfield, who had Firestones. The latter were also on Fetterman's Peerless. All cars had Rudge-Whitworth wire wheels and Hartford shock absorbers. Chevrolet used the new Benford spark plugs.

Even though Motor World printed a lot of pictures last week of the people at the Hot Springs meeting that didn't get in. It is the group picture taken on the lawn with the bath house in the background. If

M. A. M. A. Lifts Ban from Jobber Exhibit

Rules That Members May Enter Trade Exhibition Without Suffering Outlaw Penalty

NEW YORK, June 24—The accessory—or rather "automotive equipment"—atmosphere has been considerably clarified and there is joy in trade circles generally through the lifting of the ban of the Motor and Accessory Manufacturers' Association on the fall exhibit to be held by the National Association of Automobile Accessory Jobbers.

The M. A. M. A. recently declared that it would not sanction the jobbers' exhibit and ruled that any M. A. M. A. member exhibiting would be barred from showing at the New York and Chicago shows. But at Friday's meeting of the M. A. M. A. executive committee this action was rescinded.

There appeared before the committee a committee representing two or three dozen manufacturers who belong to both associations. These members stated that the jobbers' exhibit will not be a show, will not be open to the public, no admission will be charged, and the exhibit will not be operated for profit. The M. A. M. A. executive committee then ruled that the exhibit did not fall within its jurisdiction and took the action which makes it possible for those belonging to both associations to enter the jobbers' exhibit without incurring the displeasure of the M. A. M. A. This action has removed a serious sore spot.

The M. A. M. A. show committee was instructed to take up with Manager Samuel A. Miles the matter of participation in the 1919 New York and Chicago shows as usual.

The following members were admitted: Buffalo Pressed Steel Co., Buffalo, N. Y., automobile silencers and stampings; Staybestos Mfg. Co., Philadelphia, brake linings for cars and industrial machinery; Hartford Auto Parts Co., Hartford, Conn., universal joints and cone clutches; Automobile Screw Products Co., Cleveland, automobile screws; Crucible Steel Co. of America, Pittsburgh, crucible and open hearth steel; Armstrong Cork Co., Lancaster, Pa., linoleum and cork specialties.

A resolution was voted thanking Christian Girl for his patriotic and energetic work in the Government service at Washington.

Des Moines to Conserve

DES MOINES, June 24—Des Moines motor car dealers, garagemen and repairmen are preparing to meet to the fullest extent the Government's request for conservation of materials, time and labor. The entire program proposed here has not yet been completed, but the Motor Trades Bureau of the Chamber of Commerce, which is composed of all branches of the motor industries here, has held several conferences this week to work out the details. All houses will be closed daily at 6 o'clock and not opened Sundays except for storage. All minor repair work which can be done by owners will be refused. A cash basis for all repair work, parts and supplies, including tires, tubes, gasolene and oils, will be put into effect at once.

More Room for Waukesha

MILWAUKEE, June 24—The Waukesha Motor Co. is completing erection work on three shop additions, which will be ready for service early in July and provide about 30,000 sq. ft. of floorspace additional.

Car and Truck Saving Wheat Crop of Kansas

Motor Vehicles Are Transporting Workers and Crops and Getting Product Out with Small Delay

KANSAS CITY, June 24—The automobile and the truck are actually saving the wheat crops of Missouri and Kansas, for without the facilities for quick transportation of workers thousands of acres would be seriously delayed in gathering, and perhaps not be gathered at all.

Mention has already been made of the plans for sending city folk into the fields after working hours to help out the farmers. These plans are working out even better than had been expected.

At Lee's Summit, for instance, 28 miles from Kansas City, an unusually large increase in wheat acreage, and the sharp shortage of labor, had put farmers up against it. Wheat cutting began June 18.

Every evening from 50 to 300 men from Lee's Summit start out in automobiles and interurban buses, passage free, and swoop down on the farms, where wheat has been cut during the day, and shock it. A man can shock an acre an hour easily—if he knows how. Green hands work more slowly; but they can do the work.

The parties leave Lee's Summit at 7:30 p. m.; go there to ten miles, work two hours and get home shortly after 10 o'clock. They accept no money for this service—but it is work that the farmers have been dreading ever since planting. There is sufficient labor for cutting and threshing. The parties can frequently handle the shocking of wheat on half a dozen farms in an evening.

Similar free service is being performed throughout Kansas and Missouri.

Kansas City Active in Work of N.A.D.A.

Adopts Conservation Program and Expects to Get 2000 Members in City's Distributing Territory

KANSAS CITY, June 24—The Kansas City Motor Car Dealers' Association at a meeting June 19 again adopted in full the conservation program proposed by the National Auto Dealers' Association. The second endorsement was for the purpose of getting a larger number on record, and of making it very plain to the entire industry in Kansas City that this city is "going the limit" on the program. There was not a dissenting voice in the "discussion" of the subject—the only comments were rather jubilant exclamations that certain evils were at last to be eliminated—and that the motor car dealer was at last to have an occasional holiday. The association definitely designated the five important holidays, on which service shops and retail stores would be closed, in addition to Sundays: Jan. 1, May 30, July 4, Thanksgiving and Christmas.

"Kansas City is going to set an example to the entire Southwest in the observance of this program," said E. E. Peake, secretary of the association, addressing the members in a summing up of the comments, and expressing pleasure at the unanimity of sentiment.

Plans are being made for securing the co-operation and similar uniformity of action from all garagemen and every institution connected with the industry in Kansas City.

Kansas City is making a strong start on the membership campaign, which is a feature of the program of the national association. The local association has amended its by-laws to admit associate members, without vote, at a comparatively nominal fee. These associate members are retail dealers without territory for distribution. Practically every Ford dealer in Greater Kansas City is now in the association—and they are "strong for" every one of the projects that has yet been proposed. R. P. Rice, manager of the Kansas City Ford branch, is chairman of the committee appointed to build up the membership of the national association in Kansas City territory—and he announced that he expected to see 2000 of the possible 3000 dealers join. Letters are being sent to all dealers, by distributers, outlining the necessity for united action by dealers.

Change in Albee Personnell

DETROIT, June 24—R. C. Getsinger, formerly sales manager of the Saxon Motor Car Corp., Detroit, has been elected vice-president of the William N. Albee Co., Detroit. James Strasburg, formerly with the American Electrical Heater Co., The Saturday Night and the Strasburg-Miller Co., Detroit, has been appointed sales manager of the Albee company, which is engaged in sales promotion through advertising, especially in the automotive industries.

More Room For Packard

DETROIT, June 24—The Packard Motor Car Co. has leased the buildings formerly occupied by the National Body & Trimming Co., in the rear of the Packard factory, for a term of 3 years. The buildings have a frontage of 150 ft. on Mt. Elliott Avenue and depth of 400 ft., and contain a floor space aggregating 100,000 sq. ft. The Packard company will take possession in July, and plans to utilize the plant for general manufacturing and storage purposes. The National company has gone out of business.

Give Service Only for Cars They Sell

Labor So Short in Wilmington Some Dealers Are Restricting the Trade of Their Shops

WILMINGTON, DEL., June 24—The labor problem has become so acute in Wilmington that some of the motor establishments are confining their repairs and care of cars to the ones they especially represent. Labor and transportation are now the two big problems the local men have to deal with. While the latter has been largely overcome through the drive-away plan, the matter of help appears to be growing more serious.

The two principal reasons are the inroads made on the man power of the country by the war and the temptation in the matter of wages held out by other industries. In the local shipyards many unskilled men are receiving from $75 to $120 a week, while skilled help is paid in even larger proportion. Munition workers are also being well paid, and it is difficult for the motor establishments to compete. The patriotism of the men is holding many, however, with the belief that the inflated wages in the war work will not last forever and with the feeling that they are under some obligations to employers who have done well by them when there was not so much money in the other industries.

Spence Joins Sewell

INDIANAPOLIS, June 24—G. B. Spence, formerly retail sales manager for the Gibson Co., Indianapolis, Willys-Overland distributer, has been added to the staff of the Sewell Cushion Wheel Co., Detroit. He will have charge of all city sales east of Woodward Avenue.

Prominent Tradesmen Assume New Duties

Resignations and Promotions Place Workers in New Places

H. J. St. Aubin, for several years traffic manager of the Federal Motor Truck Co., Detroit, has resigned to enter the service at Camp Custer, Mich.

Louis W. Cossey has been appointed sales representative for the Lane Motor Truck Co., Kalamazoo, Mich., for western Massachusetts and New York state.

W. I. Brown, formerly sales manager of the Scripps-Booth Corp., Detroit, has become eastern district sales manager for the Cleveland Tractor Co. with headquarters at the home offices, Cleveland.

G. M. Evans, formerly treasurer of the Menominee Motor Truck Co., Menominee, Mich., is now a captain in the ordnance department of the United States Government.

P. L. Barter, sales manager for the McCord Mfg. Co., Detroit, has been promoted to the position of second-vice-president. He has been with the McCord company since its inception nearly 10 years ago.

Ansel W. Mingo, traffic manager of the Walker-Weiss Axle Co., Flint, Mich., is dead.

Lawrence Hayes has been appointed general superintendent and assistant plant manager of the Pontiac plant of the Hess Spring & Axle Co., succeeding Frank Gimmelsman, who has been transferred to Cleveland to become plant manager. He was formerly factory superintendent of the Perfection Spring division of the Standard Parts Co., Cleveland.

J. H. Quinlan succeeds C. H. Gresslee as division sales manager of the Selden Truck Sales Co., Rochester, N. Y. Quinlan will make his headquarters at Cincinnati and will be in charge of the Selden business in southern Ohio, Indiana, Kentucky and West Virginia.

H. B. Cunningham, for several years connected with the S. R. Blocksom Motor Co., 661 North Broad Street, Philadelphia, has been elected general manager of the Automobile Co. of Philadelphia, 674 North Broad Street.

J. W. DeCou has been appointed factory manager of the Ross Gear & Tool Co., Lafayette, Ind. He was for 8 years factory manager for the Thomas B. Jeffery Co., Kenosha, and 2 years factory manager for the Smith Form-A-Truck Co., Chicago.

C. W. Waughop, formerly eastern district manager of the Rainier Motor Corp., New York City, has joined the wholesale forces of the Hurlburt Motor Truck Co. of the same city, to cover Pennsylvania and Ohio territory.

Charles E. Wells has been appointed manager of the Philadelphia branch of the Oakland Motor Car Co., Pontiac. He has been assistant branch manager of the Oakland Omaha branch for the past year, previous to which time he was a branch manager for the John Deere Plow Co.

T. E. A. Barthel, formerly general manager of the King Motor Car Co., Detroit, has become associated with the Curtiss Aeroplane & Motor Corp., Buffalo, and his duties will have to do with the finances of the corporation.

C. E. Havens has been appointed service manager of the King Motor Car Co., Detroit, succeeding George C. Gurney, who recently resigned to accept a similar position with the Scripps-Booth Corp., Detroit.

Albert Boasberg, who has been a member of the sales force of the United States Tire & Rubber Co.'s Rochester branch, has been promoted to a position in the New York office of the company. He has been connected with the company in Buffalo and Chicago.

W. Grampp of the Grampp Motor Sales Co., Davenport, Iowa, Paige dealer for this territory, has been drafted for national army service and is closing out his agency and will leave with the next call for drafted men.

W. T. Woodrow has been appointed general manager of the Manitowoc (Wis.) plant of the Aluminum Castings Co., with main offices in Cleveland, O., to succeed Howard Emery, who some time ago was promoted to the position of general manager of the plant at Detroit. **Charles H. Seegitz,** assistant manager at Manitowoc, has been transferred to the purchasing department at Cleveland and is succeeded by L. H. Gleason.

Glover Watson, former Michigan distributer for the Minute wheel, has been appointed Southern sales manager for the Kol-Ben Wheel Co., Detroit. George H. Buck has been made Eastern sales manager.

Charles R. Porter, one of the pioneer truck salesmen in St. Louis, has joined the White staff in that city.

Thomas W. Lloyd, recently manager of the Kansas City branch of the K. P. Piston Ring Co., has been named manager of the St. Louis branch of the Stewart-Warner Speedometer Corp., succeeding **J. C. Stone,** who resigned to become president of the Liberty Accessories Corp. of St. Louis.

Samuel Niederberg, recently president of the United Automobile Sales Agency, a used car sales firm in St. Louis, has been appointed sales manager for the Milburn electric cars by Marshall Bros. of St. Louis.

J. M. Nichols of the Nichols-Cox-Woodall Sales Co., Brunswick tire distributer in St. Louis, has enlisted in the navy after disposing of his interest in the firm to his partners.

David B. White, recently of the Woods Electric Vehicle Co., St. Louis, and one of the "old timers," has quit the motor cars to become an official of the Ballard Snow Liniment Co. of St. Louis.

Charles E. Wells, for the last year assistant manager of the Omaha, Neb., branch of the Oakland Motor Car Co. of Pontiac, Mich., has been appointed manager of the Philadelphia branch.

C. K. Whidden, for several years connected with the Philadelphia sales force of the United States Tire Co., has been appointed assistant manager of the motor truck tire department sales organization of the company, with headquarters in New York City.

E. B. Moon, who was formerly director of sales of a large wholesale house, has been appointed sales manager and advertising manager for the Columbus Tractor Co., Columbus, Ohio.

Price Changes Made By 10 Manufacturers

Mexico Now Land of the Gasoline "Crock"

Cars of All Kinds and Descriptions Are Running in the Land of Revolutions and Cactus

MONTEREY, MEXICO, June 24—It may truly be said that Mexico is a land of used automobiles. While there have been importations of small lots of new cars from time to time during the last 8 years that unstable conditions have prevailed in this country, used cars have been brought in in large numbers, not only from the United States but from Central and South American countries. Besides these direct importations of used cars, there are still in every day use in the capital and the other principal cities of the country thousands of American, French and English models of many years ago.

In many instances these cars long since passed out of the hands of the original owners. Large numbers of them were left behind by wealthy citizens, when, for political reasons, they had to flee the country. They fell into the possession, by confiscatory methods, of army officers and public officials of the various successive revolutionary regimes through which the country has passed since the ousting of the late General Porfirio Diaz from the presidency. Most of the higher Government officials have succeeded in keeping themselves supplied with new automobiles from time to time, but for the most part old and badly wornout cars are still in use throughout the country.

The one exception to this condition is the thriving Gulf port of Tampico and the oil producing region adjacent thereto. The importation of new automobiles by American oil operators and other business men of Tampico has kept up right along. Some idea may be had of the practical uses to which automobiles are put in the Tampico region by the statement that one of the large American oil companies there is building a 65-mile automobile road to connect the field, where it is operating, with Tampico. It is expected that within the next few years a splendid system of highways will run all through the oil producing region. Tampico is well supplied with garages and automobile repair shops, and in these respects it is said to be ahead of any other city in Mexico.

St. Louis Has a Ladies' Night

ST. LOUIS, June 24—President John Shuford of the Motor Trade Accessory Association started his administration by getting everybody in a good humor. The first ladies' night was the occasion of the installation of officers for the year. Also a lady, Miss Alma Robb, salesmanager of the Woman's Department of the Missouri State Life Insurance Association, was a speaker. She spoke on the possibilities of a woman in business life, which, she predicted, the automobile industry soon would have to recognize.

Retiring President Marvin introduced the new officers, but they did not talk business but promised a platform at the next meeting.

A message from Chief of Police Young was read in which he promised that his department would stop the boys from jumping on runningboards of machines at ball parks and other places of amusement and recreation. The association has been asking for this rule because the boys had become a nuisance and because of the danger to them.

New Lauson Tractor Distributer in Northwest

MILWAUKEE, June 24—The John Lauson Mfg. Co. of New Holstein, Wisconsin, has closed the Northwest territory with the Northwestern Lauson Tractor Co., Minneapolis, which will distribute in Minnesota, South Dakota and the northwestern part of Wisconsin. The personnel of the company will be F. L. Sturr, Rockwood W. Bullard and D. E. Ryan, who have been associated with the Ford business in Minneapolis. The headquarters of the company will be at 1208 Harmon Place, Minneapolis. The initial order was for over 200 tractors. A complete stock of tractors and repairs will be maintained so that prompt delivery and service will be assured.

X-Ray Trucks for the Army

WASHINGTON, June 20—One and one-half ton General Motors Co. trucks equipped with special bodies made by the H. M. Babcock Co. will be used by the Medical Department of the United States Army for mobile X-ray equipment. Each truck will carry a complete X-ray outfit with a specially designed collapsible X-ray table. A stationary gas engine is included in the equipment and generates the electrical power for the X-rays. The sides of the truck body can be converted into tables on which patients can be treated.

Philadelphia Sociability Run Shaping Up

PHILADELPHIA, June 23—An encouraging list of entries has been received for the Philadelphia Garage Association's Sociability Run to Atlantic City on June 25. An entrance fee of $5 will be charged and merchandise prizes will go to the contestants guessing the nearest running time set by the committee. Applications are being made to the association's president, George G. Blind, who is also chairman for the run, and John R. Fox, the association's secretary. The starting point will be at North Broad and Diamond Streets at 8:30 a. m., but in case of rain the run will be postponed until the following day at the same hour and place. The White Horse Pike will be the route to the shore. The checking-in station at Atlantic City will be at 1715 Pacific Avenue. The committee consists of George G. Blind, John R. Fox, Richard Lussee, L. F. Pfeifer and Michael Waugh.

Gas Enough for All If We Don't Waste

Government Says Stories of Shortage Are Buncombe and Advises Users to Go Carefully

WASHINGTON, June 24.—There will be sufficient gasoline for war, passenger cars and all ordinary purposes if rational conservation is practiced by the public. This is the substance of a statement issued to-day by the Fuel Administration as follows:

"Up to the present time there has been sufficient supply of gasoline to meet all requirements, but in order to be prepared for any shortage, should it arise, plans are being considered by the Oil Division of the Fuel Administration, in co-operation with the automobile industry and the National Petroleum War Service Committee, for the purpose of determining the most satisfactory method of gasoline conservation.

"It is not expected in any event that it will be necessary to restrict normal consumption for freight vehicles and, provided there is a reasonable conservation by all concerned, it may not be necessary to seriously interfere with pleasure cars and motor boats.

"It must be borne in mind, however, that the paramount use for gasoline is for war purposes, all of which requirements will be supplied. The volume of this will largely govern the situation.

"It seems possible that rational conservation by the public will render Government action unnecessary."

Garfield After Fuel Information

WASHINGTON, June 21—All industries or concerns using 500 tons of coal or more annually are urged by the United States Fuel Administration to promptly fill in the questionnaire which has been sent to them by Dr. Garfield's organization. The purpose of the questionnaire is to establish without dispute the industries entitled to places on the "Preference List." These industries will be served with coal in sufficient amounts to care for their current requirements before distribution is made to other consumers.

The preference list already established by the War Industries Board is being re-classified to maintain degrees of preference. The first degree of preference has already been determined, and includes railroad fuel, steamship bunkers, exclusive of pleaure crafts, and by-product plants. The second, third and fourth degrees of preference are for the present being considered as one group, and no differentiation will be made between them until the complete re-classification has been made.

$500,000 Company for Inter-City Trucking

Beam-Fletcher in Philadelphia to Use 67 Trucks in Handling Short-Haul Freight

PHILADELPHIA, June 23—The Beam-Fletcher Corp. and the Union Transfer Co., the latter having strong railroad connections, have formed a $500,000 inter-city motor trucking company under the title of the Beam-Fletcher Transportation Co. and have just organized, electing the following officers and directors: President, Perry E. Beam, former president of the Beam-Fletcher Corporation; vice-president, E. C. B. Fletcher, and secretary and treasurer, Charles A. Bothell, former general manager of the Union Transfer Co. Directors: John Gribbel, president of the Griffin Mfg. Co.; John S. Jenks, Jr., banker; Gustavus B. Fletcher, vice-president Mitchell, Fletcher Co.; Charles A. Bothell, E. C. B. Fletcher and Perry E. Beam.

The fleet now owned and ordered consists of 67 trucks, twenty being used in long-haul traffic only, the vans being locked by a special process on leaving a terminal, there being no mode of unlocking them until they reach the delivery point. The rest of the trucks are used in local delivery to and from freight stations.

At present the company is handling an average of 200 tons of freight daily, or the capacity of 10 to 14 standard size railroad cars. Lines already are in operation between Philadelphia and New York, Baltimore, Reading, Easton, Allentown and Bethlehem and extensions to Harrisburg and Lancaster are about to be made, while it is expected to have a daily service to Trenton via Bristol and to Chester, Marcus Hook and Wilmington and an express service in conjunction with the Union Transfer Co. by July 15 to Atlantic City.

The Union Transfer Co., which has on its official personnel some of the most prominent business men in Philadelphia, including Agnew T. Dice and E. T. Stotesbury, has invested $150,000 of its surplus in the new enterprise. Shippers will be furnished with rate cards and the new schedule shows rates approximately the same as those of the express companies in nearly every instance.

Postpone Bloomington Show

BLOOMINGTON, ILL., June 24—The proposed outdoor show around the court house square here, arranged by the Bloomington Automobile Trade Association, was indefinitely postponed, due to labor troubles. All of the clerks in the stores of the uptown district went out on a strike and the mechanics and helpers in the various garages followed their example. This city is to entertain the Illinois State Federation of Labor in annual convention this fall, and organizers from outside points have been here for some time in the effort to unionize every branch of labor in order that the labor leaders, when they arrive, could be given a demonstration by the membership, and also as an illustration of what could be accomplished by active effort.

So far, the efforts of the organizers have not met with much success. Not a single line of industry would agree to the closed shop, the principal contention of the organizers, nor would the proprietors make any other concession which would take the control of the business out of their hands and place it in those of the employees. As soon as the various trades arrange a settlement with their respective employees, the outdoor show will be given as originally arranged. All preparations had been made and the dates fixed for June 20, 21 and 22 when the walkout took place. Pending the settlement, all of the garages were closed.

Start New England Truck Mail

WASHINGTON, D. C., June 24—Daily automobile parcel post service between New York and Worcester, Mass., will be started on July 1. When a bad stretch of road between Waterbury and Hartford, Conn., has been put in shape, the route will be extended to Portland, Me. Repairs to this road are scheduled to be completed by July 15. Stops will be made at Danbury, Conn., and Springfield, Mass., and other points along the line. With the New York-Portland service started, parcel post trucks will be in operation in connecting links over a continuous route between Portland and Warrenton, Va. Truck service between New York and Washington already is in operation. Further extension southward will be made as soon as cars can be secured.

Mason to Make Truck Tires

KENT, OHIO, June 24—The Mason Tire & Rubber Co. will manufacture solid truck tires. This is a new departure for the company. All sizes of solid tires will be made from Giant tires for use on the largest and heaviest trucks down to small sizes for light delivery trucks. The line will be complete in every detail. The Mason company expects to be turning out the small size truck tires within the next three months, and all sizes will be manufactured by the fall.

It is possible, according to the plan of the company, to take care of the contemplated production of 1200 to 1500 pneumatic tires a day which the Mason factory will soon reach and also to turn out a large number of solid tires. It is expected that the new department will be turning out 100 solid tires per day by Jan. 1, 1919. Forty to fifty people will be employed in the solid tire department.

Lee Clough, a pioneer in solid tire construction, has been secured by the Mason company to take charge of the new solid tire department. Clough has resigned from the Firestone Tire & Rubber Co., Akron, and will assume his new duties at once.

British Government Gets 6000 Fordsons

Retail Price of $1250 Has Been Fixed—Ford Completes Order for British Government

LONDON, July 18—By Cable—The 6000 Fordson tractors ordered by the British Government from Henry Ford & Son, Dearborn, Mich., have all been delivered, and Henry Ford has now completed all his obligations with the British Government so far as the Fordson tractors are concerned.

Now that the Government order of Fordson has been completed, this tractor has been placed on retail sale at a purchase price of $1,250. No information is available as to the quantities in which these tractors will be available for private sales.

In order to carry out still further its program of standardization on tractors the Government has started the sale of all of its tractors except Fordson, two International Harvester models, namely, Mogul and Titan. This has been done to secure standardized working conditions and simplify to the greatest extent the distribution of spare parts, as well as the education of operators for tractors.

In recognition of what Percival Perry, head of the Ford interests in England, has done for the Government, he has been knighted and is now Sir Percival Perry. In addition to his tractor activities he is now director of the mechanical warfare department of the Government.

Central Ohio at Height of Drive-Away Season

COLUMBUS, OHIO, June 24—This is the height of the drive-away season in Columbus and in fact all central Ohio points. Scores of cars are being driven to Columbus from the factories in Detroit, Flint and Toledo and in addition scores of other cars are coming through Columbus destined for points south and east of the Buckeye Capital. It is no unusual sight for a train of new cars numbering from 10 to 25 to be seen passing along the roads leading to the larger distributing centers. Practically all of the cars now sold in Columbus are received through the drive-away plan. This includes Overlands, Buicks, Hudsons, Chevrolets, Whites, Reos, Packards and in fact all of the makes.

Pratt Heads Higrade Motors

HARBOR SPRINGS, MICH., June 24—The following officers were elected at a recent meeting of the board of directors of the Higrade Motors Co.: President, J. Elmer Pratt; vice-president, Frank Voorheis; secretary and treasurer, Lette Shay. L. W. Coppock, M.E., Grand Rapids, was appointed consulting engineer of the company, and Lette Shay was made superintendent of purchases and production. The general sales and advertising offices will remain at Buffalo.

Salesmen Made to Your Order

(*Continued from page* 9)

thoroughly acquainted with his sales manager else he might have stayed, because Caswell caught a freight train from Marshalltown to Grinnell and was *at the appointed place on time.*

It was a very much surprised young man who received from Grinnell a telegram from the sales manager asking him to come to the factory on the following Monday morning and explain how it was that he had deserted his territory.

Pleasing the Wife

The wife is an important element in the life of a man. A large percentage of the plans of the Champion company are made for the benefit of the wives. Arrangements are made so that men can be home as much as possible. This sometimes necessitates heavy railroad expenses, but Caswell states it is a good investment because it makes better men. This leaving of territory is one of the big points that the sales management has to consider.

Hale Fellows

There is also the fellow who is too much a hale fellow well met. He doesn't realize the difference between real intensive sales work and the mere cultivation of acquaintances. In order to test this the salesmen were one time asked to do something that displeased them considerably. One man in particular was asked to turn in an itemized expense account, showing just which men in the sales organizations of his customers he was spending his money on. No limit was put on the amount of money he might spend and no criticism was made of his expenditure. He was simply asked to show on what men he spent the money.

Some Eye-Opener!

At the end of a certain period, when he was at the factory, he was shown a summary of this itemized report. It showed that certain salesmen in the organization of jobbers were disposing of large quantities of the Champion goods. It also showed that certain men in the jobbers' sales organizations were the recipients of considerable entertainment by this Champion salesman—*and the men who were selling the goods were not men on whom the salesmen had been spending money.* He had thought that he was promoting sales by being a good entertainer, and until the searchlight of scientific selling was put on his work he would not believe that he was *spending money in the wrong place.*

Sales Council

The sales organization is run on more or less socialistic lines. There is a council composed of the territorial managers, six in number. They work out plans under the supervision of the sales management, and have considerable to do with the operations of the sales department.

The salesmen are not required to turn in expense accounts. After a long investigation it was found that salesmen were spending on an average certain amounts. Therefore each man was allowed a certain amount of money each week, plus railroad fares. He is not required to turn in any accounting of it whatsoever.

Incidentally it is interesting to note that during the last three or four years the expense account has been raised three times, a total raise of about 10 per cent. The amount of the expense account was arrived at by setting down all the figures of all the different men, comparing them and arriving at what was considered a reasonable amount. This is standard for all men.

This method, states Caswell, makes the men better salesmen. They are not burdened with figuring out expense account.

It makes men better because it makes them better purchasing agents. They buy hotel rooms according to what they want and think they ought to have, instead of according to what the hotel clerk offers them. If a hotel clerk says he hasn't what they want, the salesman, who has become a buyer with what amounts to his own money, is quite likely to look somewhere else and get what he wants. The result is that the men acquire executive and purchasing ability, all of which adds to their sales fundamentals.

The Men Like It

From this it must not be imagined that the Champion sales organization is not a good place to work or is burdened with scientific and intensive methods to such an extent that a man has no joy in life. On the other hand, the men like the system. It is pretty much a 50-50 affair. There is fairness for the men and fairness for the house, and when a man is shown that the whole proposition is fair both ways, he generally has few kicks on the things that are done.

The system eliminates the irresponsibles and undesirables. The result is that the remaining sales force is one of which a man may be proud to be a member. Everywhere one goes in the trade he is almost sure to find a Champion salesman—at automobile shows, jobbers' conventions and at affairs of other kinds.

A study is made of the merchandising of the product; window display plans are accurately worked out. During the last year fourteen or fifteen window trimming cars have been traveling over the United States trimming thousands of windows. Lately the company changed its window trimming work, making it more efficient and more desirable for the dealer who sells the goods.

A photographic department is maintained for the purpose of showing by concrete illustration such efficiencies as good windows and other merchandising excellencies.

A man who remains a Champion man for any length of time is considered among salesmen a pretty good man. He may not like the system when he begins, but before he gets through he generally is proud to admit that he is one of the pupils under it.

From a sales management point of view the Caswell story is more than a story. It has solved a problem. One day another tradesman, impressed by the large number of fine Champion men he saw, asked: "Where do you get so many good men? I can't get any!"

"We don't get them," replied Caswell. "We make them!"

Farm Comfort and Dea'er Profit

(*Continued from page* 12)

The old kitchen stove is plenty good enough for boiling coffee and so an electric percolator isn't a very good article to sell, but an electric washing machine is another article that is readily sold to the farmers.

It doesn't require any particular overhead to handle this business, and the articles are not so displayed at headquarters that they clutter up the salesroom. Separate facilities are provided for them.

Whenever an order is secured for a farm-lighting system a local electrical contractor is called in to estimate on the work and do the wiring. Clark has nothing whatever to do with this beyond making the arrangement. Instead of resenting the intrusion of the automobile man into the electrical field the electrical contractor, who is not equipped to handle the farm-lighting system, who is not an outside salesman, and who hasn't seemed over-anxious to enter into the field, is only too glad to get the extra electrical contracting that arises from the sale that the automotive man makes.

Clark enthusiastically indorses the idea that the automotive dealer who handles farm-lighting systems can also handle electrical specialties. The profit in them is good and as an after-sale product they move readily. With a little intensive attention to their merchandising, problems that arise are so few that the business is highly desirable.

Automobile Accidents Decrease

ALBANY, N. Y., June 24—Notwithstanding an increase of 66,000 motor cars in New York state during the past year, automobile accidents have been decreased by two-thirds outside of New York city, according to a report of the National Highways association.

Roof 16-Valve Head Advanced

ANDERSON, IND., June 22—The Laurel Motors Corp., which manufactures the roof 16-valve head equipment for Fords, has increased its price to $100, effective July 1. The new equipment includes four racing plugs, a set of anti-leak wires and a coil box plate to attach the coil to the dash.

Books Received

For a long time there has been a crying need for a standard work of reference for the use of garage mechanics—a work which will tell them in one, two, three order the correct method of doing any given job on an automobile.

Few authors, however, have realized the fact that the garage mechanic often is unschooled—has not that patience with lengthy descriptions which comes from learning to read books intelligently. In consequence such books on repair methods as have been produced have failed of their object because mechanics could not be induced to read them and to put into practice the methods which have been described.

With these thoughts in mind the U. P. C. Book Co. has published "The Automobile Repairman's Helper," this being a collection of Better Mechanics articles which have appeared in Motor World during the past 2 years on methods of repairing motor vehicles from the repairer's point of view. The articles are intensely practical in nature.

For example: The reader is told in one article giving explicit instructions for the adjustment of a certain rear axle that a grinding noise may be caused by looseness between the gears or by worn teeth; that a peculiar clicking when letting in the clutch or when changing gears is due to slack in the driving system; that an intermittent catch or one that occurs with every revolution of the wheels may be caused by broken teeth, in which case tearing down the complete axle is necessary.

The article describing the method of making this particular adjustment is typical of every other one in the book. After delineating the symptoms of trouble, the method of curing each kind of trouble as indicated by a particular symptom is told in one, two, three order; all superfluous descriptions have been eliminated. The mechanic is told only exactly what he must do and is given the correct order in which to do it.

He is told, for example:

(1) To raise the car from the axle by an overhead block.
(2) To remove the front floor boards.
(3) To disconnect brake rods.
(4) To remove saddles holding the vertical bearings on the driving yoke ring at the rear of the transmission.
(5) To unscrew the brass packing collar on the sleeve of the universal joint at rear of transmission.

Straight through the instructions for completing this job the various steps are given in their proper sequence and, as pictures have from the earliest time been the most successful means of conveying an idea, each important step in the method is illustrated either with photographs, blueprints or pen-and-ink sketches, the latter being made while such a job was actually being done in a repairshop.

The need for the series has long been apparent and the decision to prepare this series of articles came as a result of a series of inspection and investigation tours in the course of which members of the editorial staff of Motor World visited upward of 1500 garages and repairshops in widely separated sections of the country.

It was the object of these visits to ascertain present methods of handling frequently recurring repair jobs, to compile data on these jobs, information concerning tools, equipment, etc., and to obtain very complete descriptions of how different mechanics tackled such jobs and finished them.

The method employed in preparing one of these articles will give some idea of the value of the work to practical mechanics. In the case of routine adjustments on a given car, for example, perhaps a dozen or more repairshops and service stations specializing on that particular car were visited. In each the method of handling a certain job was studied and the whole matter gone over in detail with the mechanic in the shop most competent on that particular job.

With all this information in hand it then became the duty of the author to extract from these dozen or more methods and to combine them so as to obtain the one best method and tools for the job. Obviously this has given the series an intensely practical slant.

Selden Thornton Williams, the author, was graduated from the Worcester Institute of Technology as mechanical engineer. Subsequently he spent considerable time in various large and small repairshops as a practical mechanic. At present he is naval aeronautical engineer at the Philadelphia Navy Yard.

The Automobile Repairman's Helper is a pocket size book, 4⅞ x 7 in., bound in serviceable red fabrikoid and containing 448 pages.

The volume is comprehensively indexed and cross indexed. It sells for $2.50 postpaid.

MEMBERS of the Cincinnati Automobile Dealers' Association developed a successful project in connection with the recent Red Cross drive by appealing to all citizens to dump their old tires, inner tubes and other rubber accessories on Fountain Square to build "Mt. Rubber." The response was generous, as will be seen by the accompanying photograph of "Mt. Rubber." The picture shows H. K. Shockley, general manager of the Cincinnati Automobile Dealers' Association on the pyramid. Equally generous was the bidding for the old rubber, more than $2,000 being realized, all of which was turned over to the Red Cross Fund by W. G. Welbon, treasurer of the association. One of the unusual contributions to the dealers' collection was a truck, which the owner presented in its entirety because he "could not get the tires off." It brought $50 in the sale.

National

A HIGH STANDARD OF THRIFT

THAT high standard of excellence by which National Cars are known is as much a standard of thrift as it is of fitness.

The extreme reliability which exists in every detail of their construction and operation is the basis of fundamental and thorough economy.

This, therefore, is far more than an economy expressed in moderate operating costs only.

A considerable part of it proceeds from the great stamina of National Cars by virtue of which, during long uninterrupted service, they remain largely free of even trivial troubles.

Consequently the possessor of a National Car equipped with either the six or twelve cylinder airplane-type motor enjoys an unusual automobile and, at the same time, finds that both his running and upkeep charges are reasonable.

And the National dealer enjoys the most substantial kind of patronage because he offers the most substantial kind of value.

NATIONAL MOTOR CAR & VEHICLE CORPORATION - INDIANAPOLIS

Leading The PROCESSION

SUPREME QUALITY has put the Rayfield Carburetor far in the lead—and maintenance of that quality keeps it there. The Rayfield is *the* "war carburetor." It conserves 30 to 50 per cent more gasolene than any other make. Ask one hundred interested people which they consider the greatest of all carburetors. A big majority will unhesitatingly answer—"the

RAYFIELD CARBURETOR

"The World's Best"

The New Rayfield Special for Ford Cars is the carburetor that gives satisfaction regardless of the going. Whether on hills, in sand or mud, the Rayfield produces the gas in just the right mixture to insure perfect motor performance. A Rayfield under the hood means that you'll "go over the top."

The New Rayfield Thermostat insures the proper temperature for best motor performance under all weather conditions. Quickly installed as a permanent part of the circulating system, it makes any automobile an all year around, efficient car. Write today for full description.

How to make the Motor Truck a more efficient factor in transportation

The Waltham Model O Truck Clock

Specified by U. S. Government to run War Trucks on Schedule Time

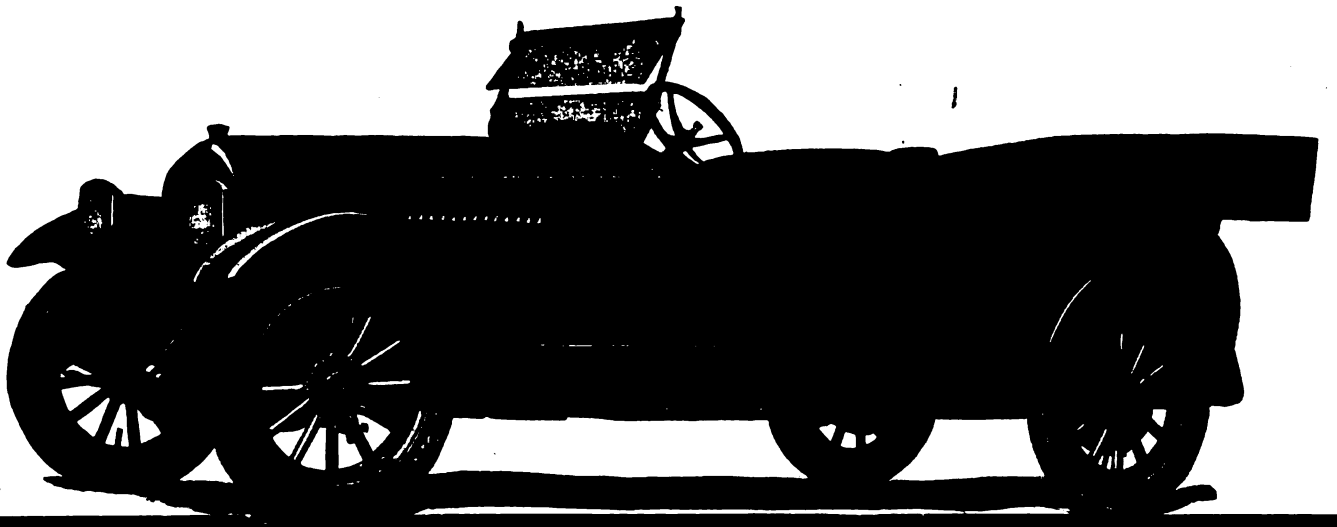
Not a day goes by but that the motor truck proves to be more and more of an absolute necessity in transportation. It has really come into its own.

Rails and freight yards may be congested but the highways of America are always open for motor truck traffic. When the railroads fail to deliver a shipment within reasonable distance—the motor truck comes to the rescue.

In normal times, trains that are run efficiently—run on strict schedule time. Now that motor trucks are in so many instances doing the work of railroads—isn't it just as important that they also should operate with railroad punctuality?

This necessitates equipping each truck with an accurate, reliable clock which will enable the driver to come and go as per schedule.

This idea has been proved sound by the U. S. Government which recently purchased 10,000 trucks for military purposes and specified that they must be equipped with the Waltham Model O Truck Clock.



Here is the only truck clock that will keep accurate time all of the time—because it is built to withstand climatic changes and the shocks of travel over rough roads.

Has two mainsprings and the radium dial and hands are plainly visible on the darkest night. You wind it only once in eight days at the flash of a red signal on the dial.

Ask us to tell you more about the Waltham Model O Truck Clock and how it will help to increase the efficiency of your motor trucks.

Says Fred Etchen

Head of Etchen Auto Company, Coffeyville, Kansas, Distributors of Studebaker Cars, Enthuses Over New BIG-SIX

"This New Series 19 Studebaker BIG-SIX is certainly a 'pippin' and making some hit in this part of Kansas. We will be able to sell, and have already sold, some of these beautiful BIG-SIXES to prospects who were in the market for cars in the $3,000 class."

This letter proves that Studebaker dealers have a line this year that appeals to the most exacting motorists and satisfies them completely at a much lower price than they have been accustomed to paying.

CASE SIX

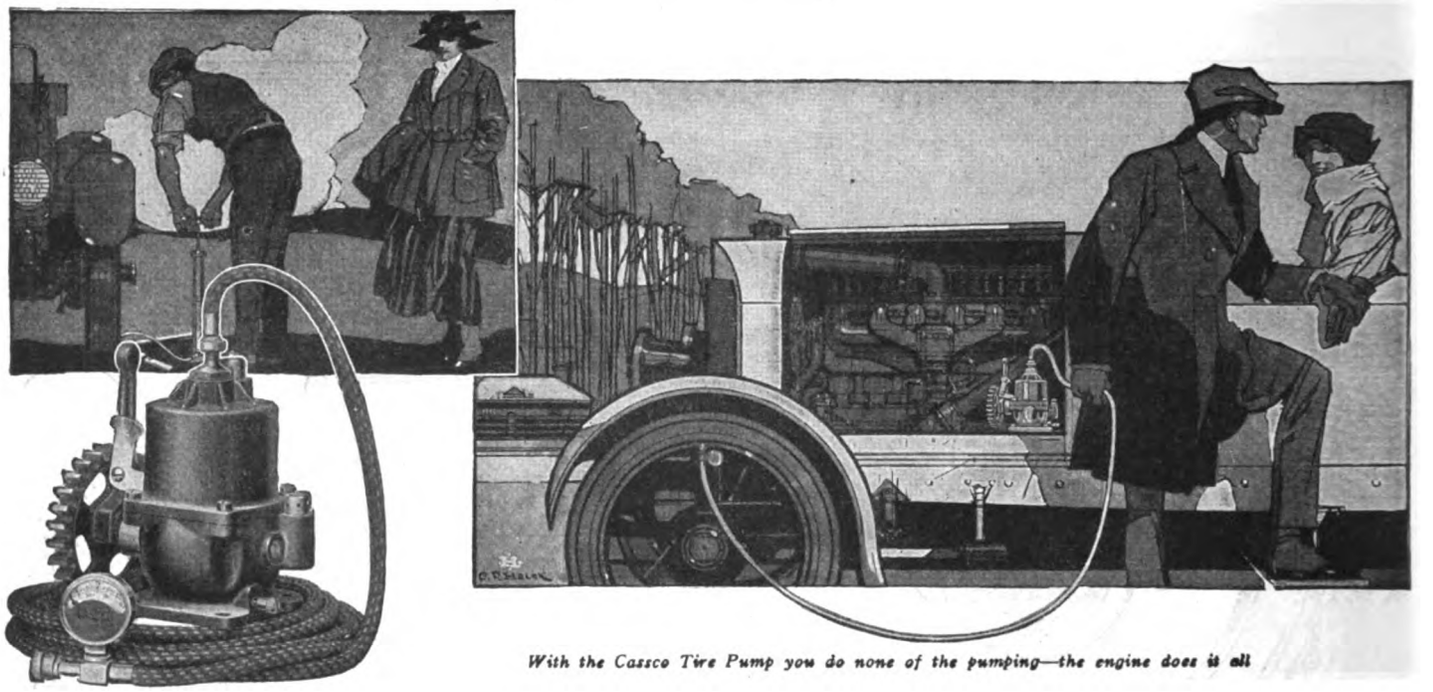
Seven-Passenger Family Model

Case Engineers Studied All Cars Before They Built This New CASE Six

BEFORE finally designing the New CASE Six, Case engineers searched all motordom, appraising the different advantages of all high-grade cars. They chose for this car the finest features, those most wanted regardless of cost. By a process of elimination this master car was designed.

No one feature predominates. The New CASE Six is an All-Feature Car. Knowing buyers find nothing lacking in this car. When it came to deciding on the price, even we were surprised at its lowness. Case factory efficiency and selling economies enabled us to offer this car at a much lower figure than even we deemed possible.

The Family Model, for seven or five people, dark blue, is offered for $1875. The Sport Model, for four people, color periscope green, is priced at $1875. The All-Seasons Model, Springfield type, color dark blue, sells for $2375.



See this car. Ride in it. Drive it yourself. Then compare it with cars costing much more. You will find no other car offers you as much—regardless of price.

(758)

DEALERS: A limited number of keen business men may obtain this Case Six for their patrons. Perhaps you may arrange to participate with us. If you will write we will gladly tell you.

With the Cassco Tire Pump you do none of the pumping—the engine does it all

Why break your back?

It costs money to do it

Pumping tires by hand is such weary, tiresome work, you are very apt to leave the tires improperly inflated.

Soft tires are the cause of 80% of tire troubles, according to tire authorities. Properly inflated tires mean high mileage.

The Cassco Engine-Driven Tire Pump insures well-inflated tires. You can get 40% to 100% more mileage out of properly inflated tires. That is $30 or $40 a year. Half a season's mileage will pay for the pump, and you avoid hard, dirty hand-pumping.

Get a good pump

When you get a pump get a real one. The Cassco Pump will inflate a 34 x 4 tire to 80 lbs. pressure in 90 seconds. That's a pump!

Good markets for the dealer

Nine out of ten motorists are prospects for a Cassco. Every car driven by a woman should have this engine-driven pump. A splendid market exists among new drivers because they generally buy a good hand-pump and the gauge. Get them to add a few dollars more and get a real pump. It includes one of the finest gauges made.

Cassco Pumps are on the good cars. The Cassco is one of the easiest accessories to sell because it gives so much real service. Less work and more mileage makes a strong appeal.

No oil spray

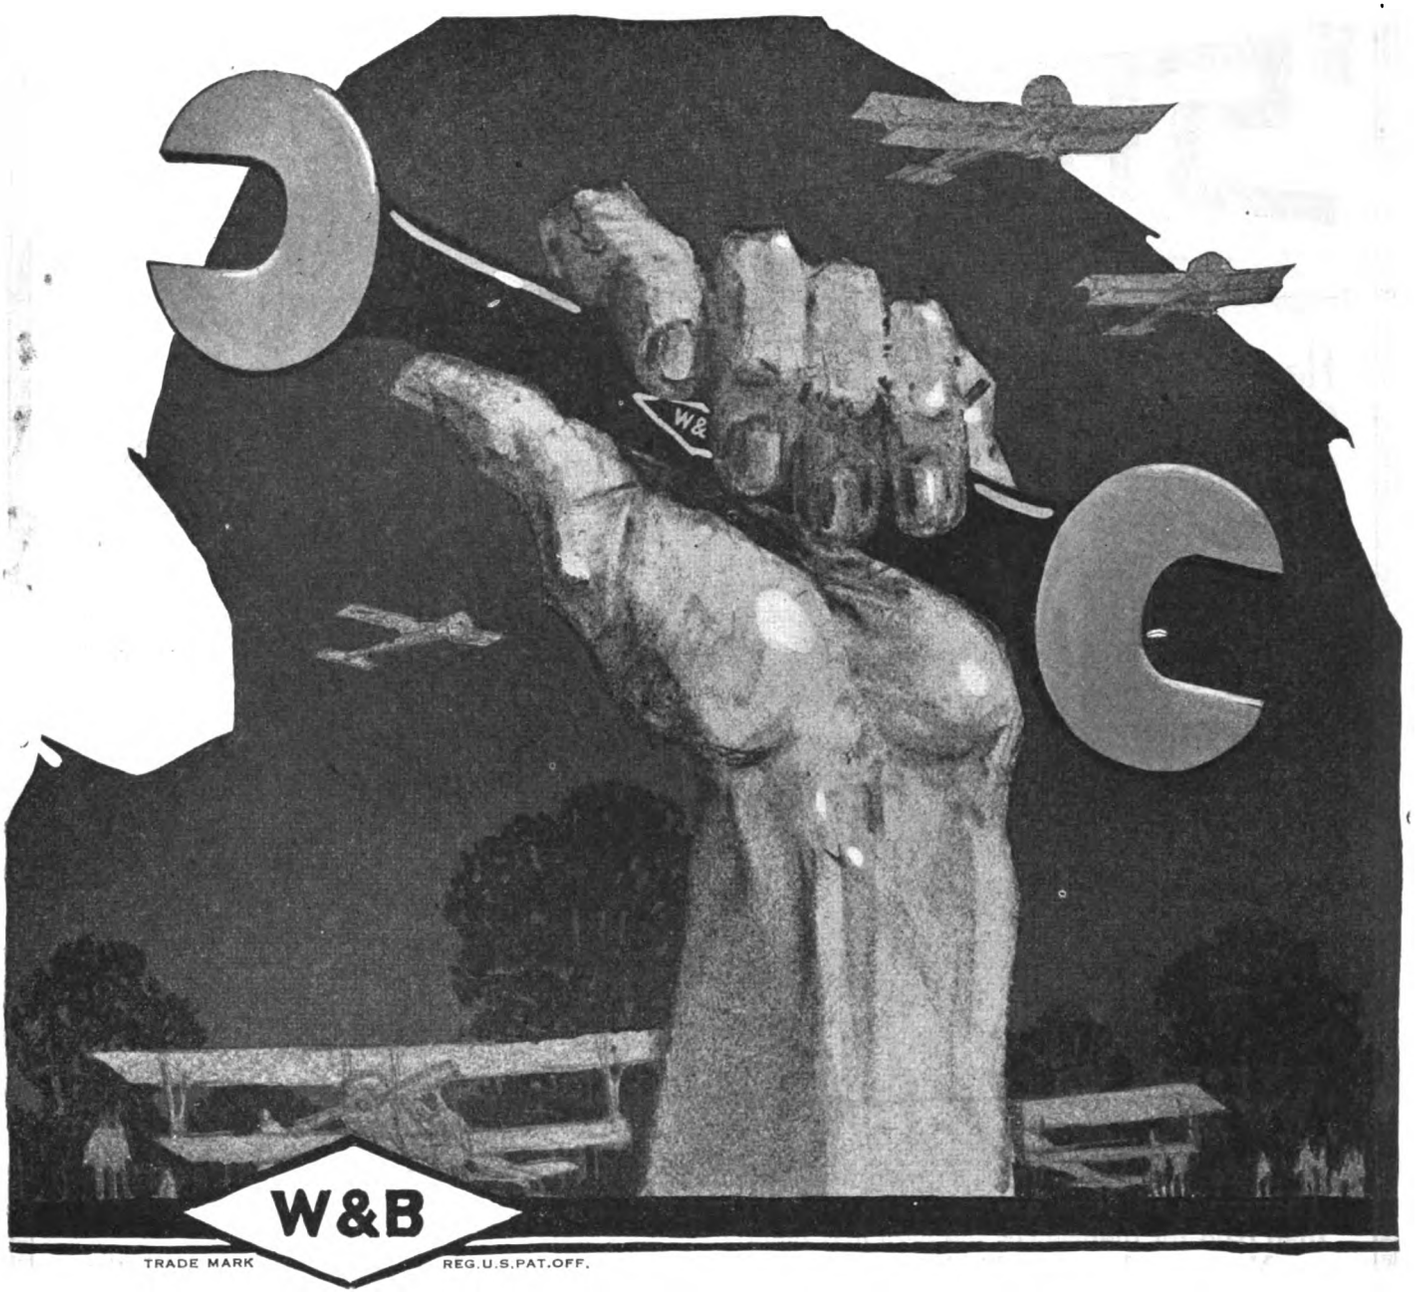
The Cassco is factory-built all through. That means better satisfaction than is possible from assembled pumps. A special design of piston and cylinder prevents oil spray, so fatal to tires. Easy to install.

Sell by demonstration

The way to sell a Cassco is to show it. Put one on your own car. Show your customers how it works. Saving the motorist's back is a strong argument. Saving their tires—a stronger one.

Write today for full information. It's profitable.

Complete with all fittings including fine gauge - - - - **$15.00**
Powerful pump—easy to install.



Ford Special - - $10.00

SHALER

BENCH TYPE STEAM TUBE VULCANIZER

Type "L-40"
Price $35.00
(Subject to Trade Discount)

Heated by Gas or Gasoline

Will Pay for Itself in a Week

This SHALER Tube Vulcanizer is the most popular vulcanizer ever put on the market. Thousands of them are in use in Garages and Repair Shops, and many of them have more than paid for themselves the *very first day* they were used!

You can do every kind of tube repairing with this vulcanizer, just as well as with the most expensive machines costing many times as much.

It repairs four tubes *at one time*—and vulcanizes perfectly any size or shape of puncture or cut up to two feet in length. There is no vulcanizer made that will turn out better work or do it more quickly—why think of paying a big price for a vulcanizer that will do no more than this practical SHALER Tube Vulcanizer!

Easy to Operate—Automatic Heat Control—SAFE!

Even a boy can make perfect repairs with this vulcanizer. You don't need experience. Your ordinary garage help can repair any size or kind of inner tube—and make a perfect job of it.

The SHALER Vulcanizer is the only one that has automatic heat control. Requires no watching or regulating, yet there is no danger of overheating tubes or undercuring the rubber. Takes up very little room in your garage or repair shop—it can be placed on any work bench and moved about at will. This vulcanizer uses little fuel—is furnished with either gas or gasoline burner—or both can be had if desired.

All Jobbers Sell This Popular Outfit

Ask your jobber now for complete information about SHALER Bench Tubo Vulcanizers—or send to us for the new SHALER Catalog of Shop Vulcanizers. Investigate—but do it NOW!

Do You Appreciate the Magnitude of the Maxwell Motor Car Company

More and more, automobile distributors are considering the future, its perils and its possibilities.

Which of the concerns now in business will be able to weather the storms—meet the severe demands of war and weather the gale of competition that will follow?

You, and every other successful merchandiser of motor cars and trucks, are trying to determine which will endure—which will pass.

For you have come to the conclusion that changes are wasteful and expensive.

You want to tie to one line for keeps.

And your experience teaches you that such a concern must be strongly fortified financially and splendidly equipped to manufacture a full line of passenger cars and trucks—and eventually also farm tractors.

Dealers are apprehensive just now—and not without reason—that we may be unable, because of the great amount of Government work we have taken on, to supply them enough motor cars and trucks to keep them in business.

The best answer to all such is to show, as we do on the following seven pages, reproductions of the various Maxwell factories.

We have a lot of Government work—every Maxwell plant is doing its full part.

We are doing all Uncle Sam has asked us to do—willing and eager to do as much more as he may desire.

But, while it is now certain that our motor car production will be seriously curtailed, still we hope to be able to take care of distributors and dealers as well as any other concern in the business.

Reduced to the size of a page, a 20-acre plant looks small.

Study the pictures however—you will have a better idea of the magnitude of this concern—a clearer conception of our tremendous manufacturing facilities.

Maxwell Motor Cars and Trucks are made in their entirety in the Maxwell plants.

We are genuine manufacturers—not assemblers.

We can guarantee the product, because, making every part ourselves, we know that every part is good.

We make a complete line—keep abreast of the times. And we like to do business year after year with the same folk.

For a permanent connection and a profitable business, you'll find this the most likely and desirable.

MAXWELL MOTOR COMPANY Inc.
DETROIT, MICH.

Digitized by Google

Maxwell Factory Facilities

Plant No. 1—Detroit

This plant, familiarly known as the Oakland plant, has an area of 650,592 square feet.

Here Maxwell cars are assembled.

There is also a large machine shop in which are manufactured many parts of the motor. Final assembly and chassis testing are also done here.

At this place also are the Maxwell Laboratories, the equipment of which is second to none in the world.

With us, a metallurgist laboratory is not merely a plaything or a place through which to show visitors, but it is one of the vital essentials in the manufacture of Maxwell motor cars and trucks.

We do not depend for the quality of our materials on tests made in the steel mills, but every batch of steel or other metal received is rigidly tested in our own laboratories.

No chance or guess work enters into the design or construction of the Maxwell product.

When a part is designed, the specifications by which that part is to be made and the various heat treating processes through which that material is to pass, are determined by the most exhaustive experiments.

Ordinary steels find no place in the Maxwell product.

Almost every major part is made of a different alloy or passes through a different form of treatment to produce in it those qualities requisite to perform its own particular function.

The long life and low operation cost of Maxwell motor cars is determined even more in the laboratory than in the factory.

MAXWELL MOTOR COMPANY Inc.
DETROIT, MICH.

Another Maxwell Factory

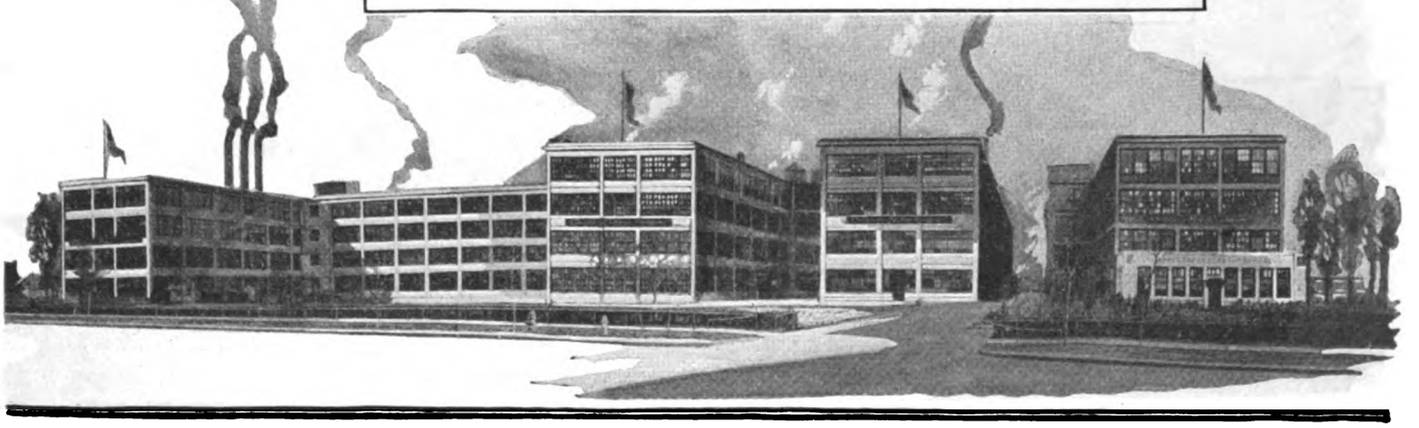
Chalmers Plant

Plant No. 2—Chalmers Plant

As everybody in the automobile business knows, the Chalmers factory and product, some months ago, came under the control of the Maxwell executives and organization.

The plant shown herein is familiar to all automobile dealers and manufacturers as the famous Chalmers plant of Detroit.

This factory has a floor space of 884,271 square feet, and here all parts of the Chalmers automobile are made, the car itself assembled and tested.



This is one of the most complete and one of the best equipped plants in the entire automobile industry, and the quality of the Chalmers product itself is the best evidence of the work done here.

In all fundamentals of design we found, when we took it over, that the Chalmers was a great automobile. It only needed a few refinements of details, a little closer attention to inspection, to become one of the really great motor cars.

The sales records are the best testimonial to its popularity and that, in turn, to its quality.

As in all the other Maxwell factories shown herein, a large amount of Government work is being done at this plant which necessarily called for reduction in our schedules for the coming year, but we hope to be able to continue manufacturing steadily although on a smaller scale.

Owing to the fact that this plant was nearer the center of the city and more accessible to distributors and dealers, the executive and sales offices of the Maxwell Motor Company are located here.

MAXWELL MOTOR COMPANY Inc.
DETROIT, MICH.

Another Maxwell Factory

Canadian Plant

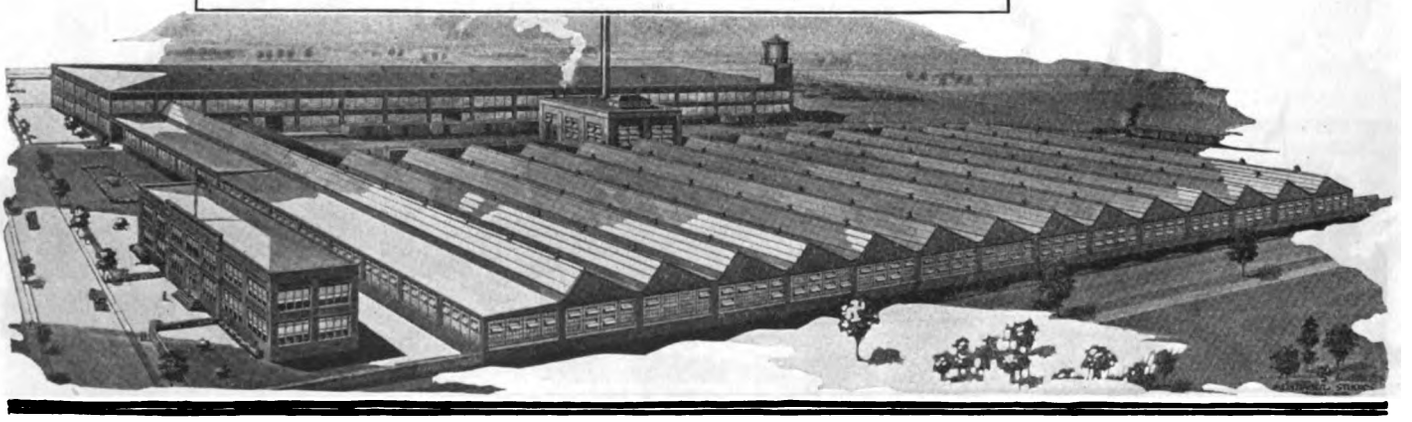
Located at Windsor, Ontario, directly across the Detroit River from Detroit, is the plant where Maxwell motor cars are made for Canada and other British possessions.

This plant, although not quite so large as the American factories, is just as complete in equipment as the others.

For example, a battery of dynamometers test the motors for power.

Your Canadian buyer is particular as is indicated by the fact that only a few of all American made cars enjoy any considerable business there.

Maxwell does the second largest business in Canada, as nearly as we can ascertain, the first being—well not exactly in the Maxwell class.



Maxwell popularity in Canada is due to the fact that it is designed along accepted standards and manufactured with the utmost precision and care.

And that brings us to a point we always like to emphasize in speaking of the Maxwell product.

We have never attempted to invent anything radically new, nor to try out experiments on our customers.

From the very first the policy of the Maxwell Motor Company has been to adhere to standardized units and, instead of trying to develop something radically new, concentrate all our thought to making those standard units better.

There is nothing new in a Maxwell motor car. From motor through the clutch, transmission, axles, steering gear and all other units, it is designed and built along accepted lines and in detail, as well as in the whole, represents the best there is of standard products.

MAXWELL MOTOR COMPANY Inc.
DETROIT, MICH.

Another Maxwell Factory

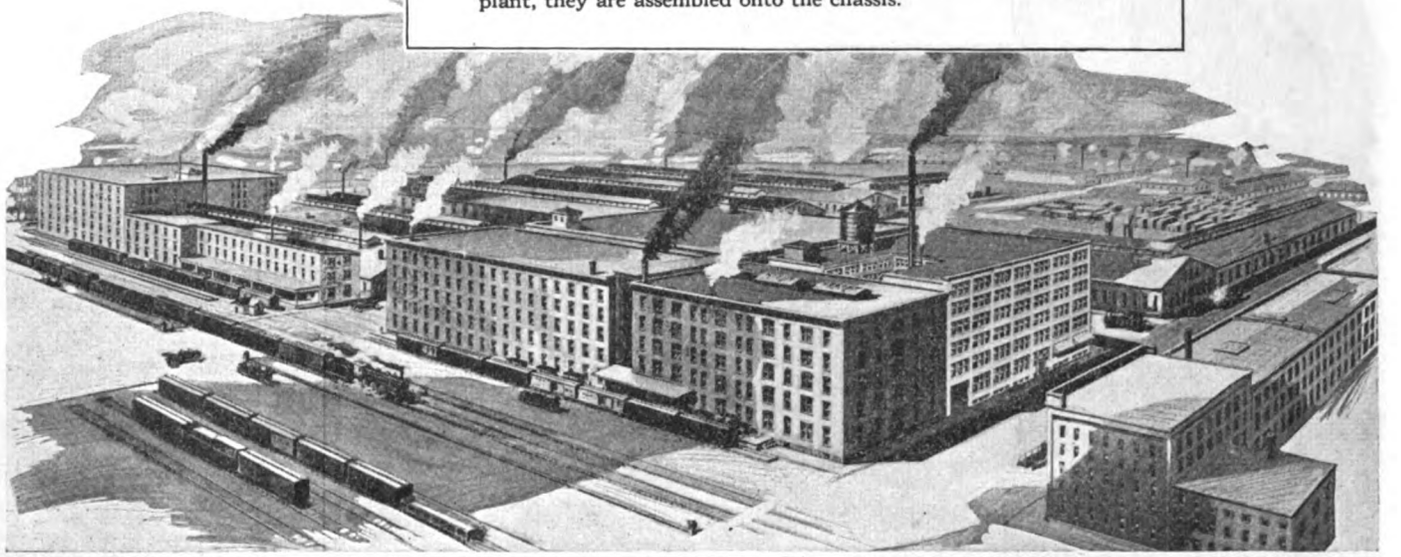
Dayton Plant No. 1

In this plant all Maxwell bodies are built.

To those who have been in the automobile industry a long time, that statement carries much of significance.

All old time dealers will recall the Stoddard Dayton cars with their wonderfully well built bodies, and when we say that those bodies were all built in this plant, you will readily understand that not only is the equipment here of the best, but the workmen the most skilled in bodycraft.

With a floor area of 282,425 square feet, we have ample room for the making of sheet metal stampings, turning out mill work and doing the finishing, upholstering and painting.



If we were permitted to tell the amount of work we are doing here on aircraft construction, you would have a more comprehensive idea of Uncle Sam's plans and of the present scale of operations in that direction.

It just happened that automobile body builders were splendidly equipped in experience, in machines and with workmen to turn out the wood and fabric parts of airplanes.

Always anxious to do its part, the Maxwell Motor Company was one of the first to offer as much of its facilities as Uncle Sam might require for this purpose.

The quality of Maxwell bodies—and they are noted for their staunchness and for the durability of finish—is due to the fact that we make them right here in our own plant and under our own supervision and inspection.

From here they are shipped to Detroit where, at the Oakland plant, they are assembled onto the chassis.

MAXWELL MOTOR COMPANY Inc.
DETROIT, MICH.

Digitized by Google

Another Maxwell Factory

Dayton Plant No. 2

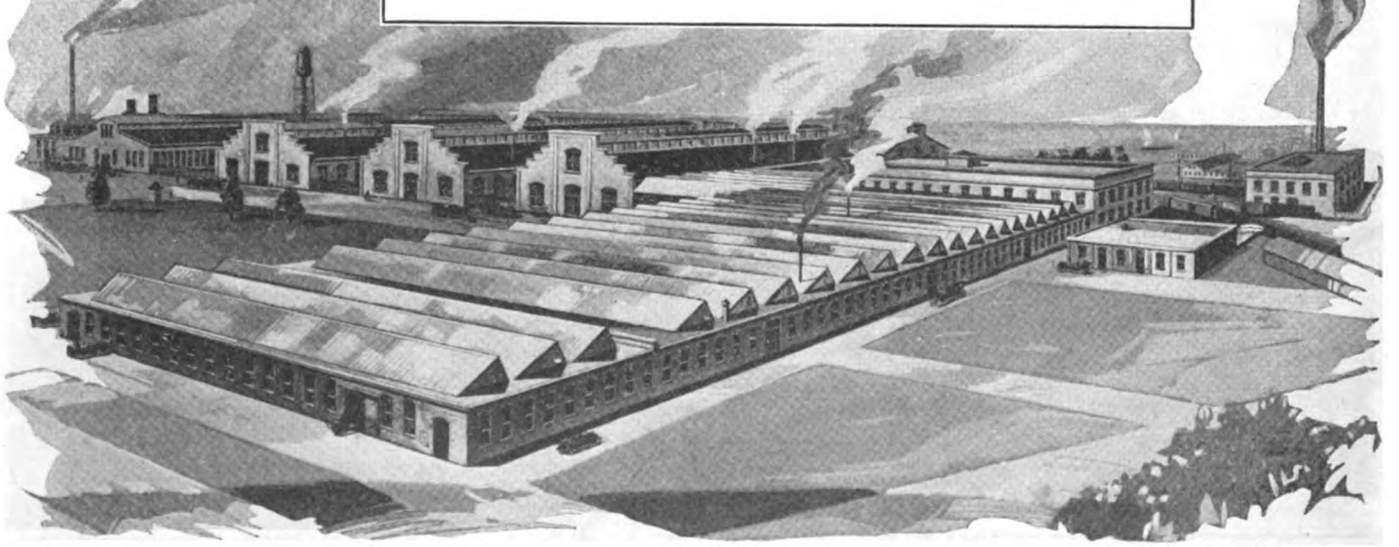
For convenience sake, we call this plant No. 2 but, as a matter of fact, there are crowded on this space two distinct plants which we call, within our own organization, "Dayton Plants Nos. 2 and 3."

There is a plant No. 4 also a short distance from this one of which, however, we have no photograph at this time.

The floor area of the latter is 45,000 square feet.

Here is one of the best foundries in the United States.

Cylinder and piston castings call for the best work of the foundryman, and until we made our own pistons we could not get the quality we desired.



So accurate is the work in this plant, our discards, due to imperfections in the casting, constitute a very small percentage of the total.

This in itself is a guarantee of quality to the buyer.

Here also are great batteries of heat treating furnaces.

All castings are annealed before machining to relieve them of stresses and to obviate the possibility of cylinder or piston casting distorting under heat in operation.

Every plan that science could devise; and every precaution that experience could dictate, is exercised here to the end that every Maxwell shall be as nearly perfect as is humanly possible.

MAXWELL MOTOR COMPANY Inc.
DETROIT, MICH.

Digitized by Google

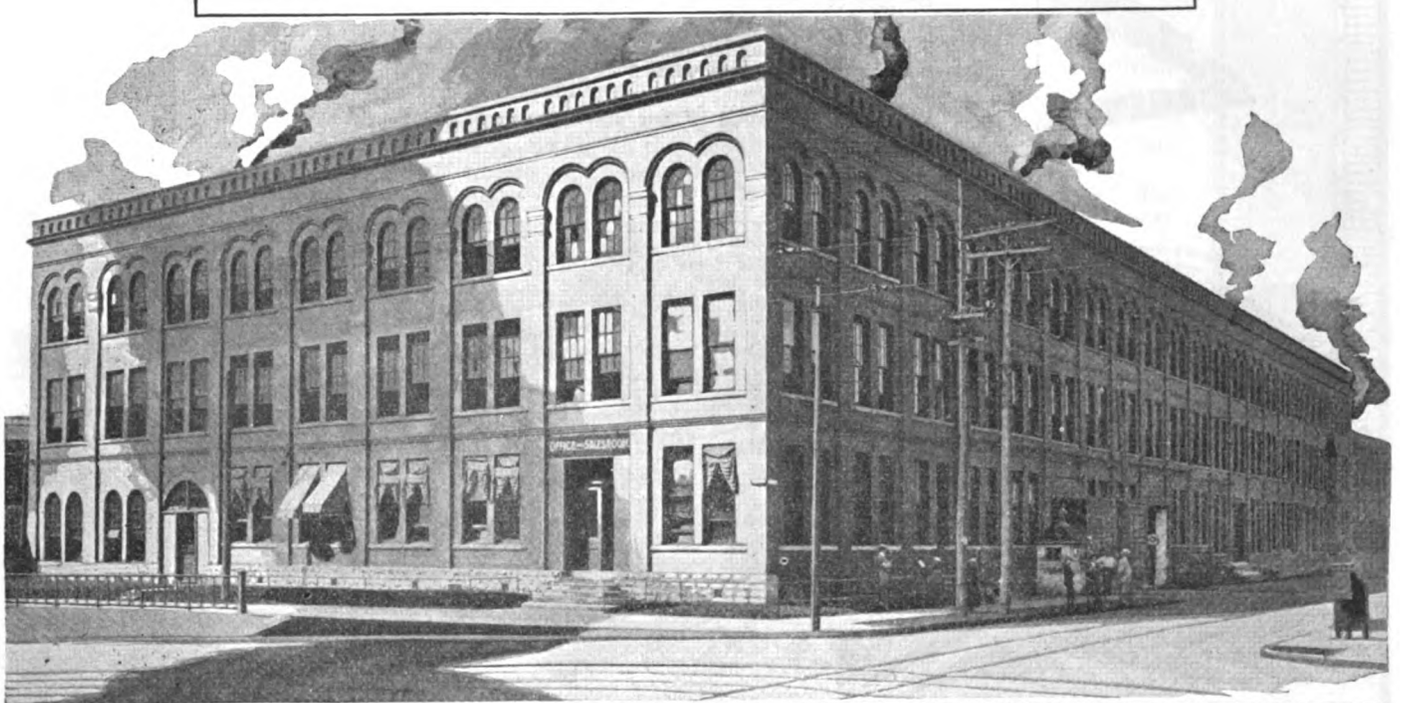
Another Maxwell Factory

Briscoe Plant

Several years now since the Briscoe Motor Company occupied this plant, but it is still familiarly known as such in the trade.

It is located on Woodward Avenue, Detroit, just two blocks off Grand Boulevard, and while not as large as some of the others, a tremendous amount of work is turned out here.

We have said that every part of the Maxwell car is manufactured in our own plants.



Many concerns who make that statement resort to a mental reservation when it comes to speaking of fenders, radiators, hoods, gas tanks, etc.

In our case this is not necessary because those important parts are all made in the "Briscoe Plant."

This was one of the first plants in the world to make stamped steel parts. From time to time the equipment has been improved as the science of steel stamping has developed until today there is no plant in the industry that turns out finer work or can attempt more difficult feats of stamping than are possible in this Maxwell factory.

Of course this plant does its quota of Government work too, although for obvious reasons we are unable to state here precisely what that work is.

Suffice it to say that the ingenuity of the Maxwell organization, the skill of Maxwell workmen and the precision of Maxwell machines have been brought into play to accomplish things that only a short time ago were considered impossible.

MAXWELL MOTOR COMPANY Inc.
DETROIT, MICH.

Digitized by Google

Another Maxwell Factory

Newcastle Plant

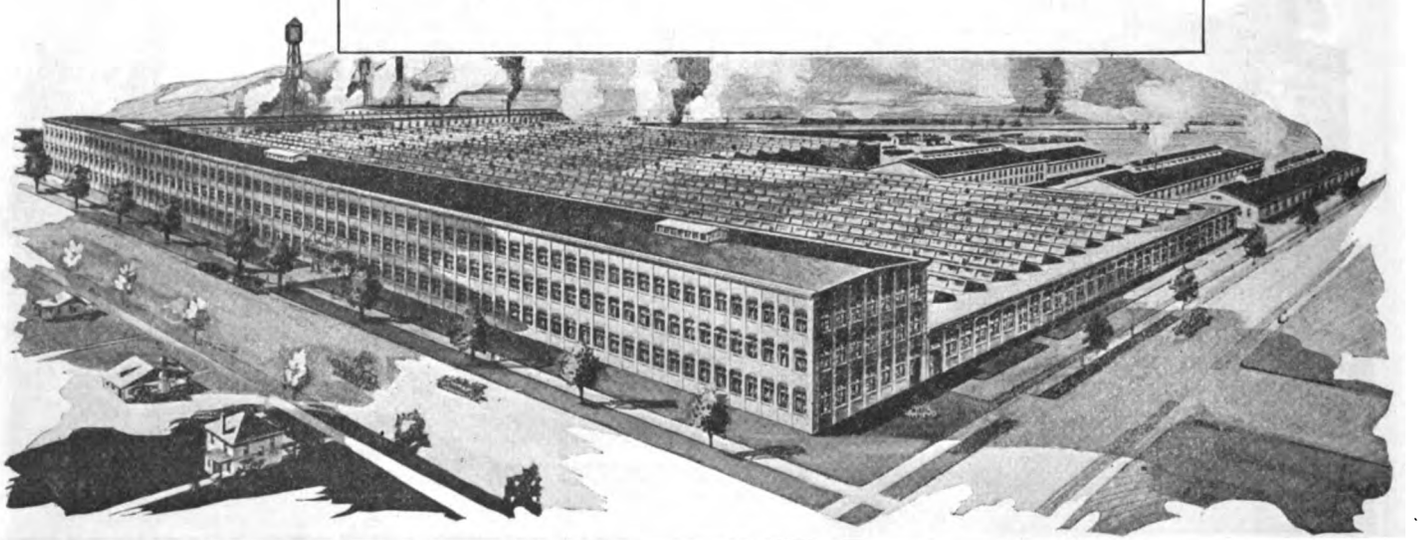
Situated in the little town of Newcastle, Indiana, where we are able to draw upon the great farm districts for young men and train them into expert machinists, our facilities for turning out good work are exceptional.

This is one of the largest of the Maxwell plants, having a floor area of nearly half a million square feet.

Because of its distance from Detroit, we maintain here, as well as at that point, a large laboratory for analytical work and the testing of metals.

Machines for determining the static and dynamic qualities of steel, torsional tests, etc., are here employed to determine the quality of every part in order that we may back it with the Maxwell guarantee.

The drop forging equipment at this plant is one of the finest in the world—and one of the biggest.

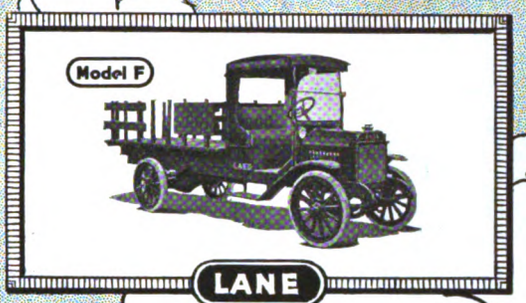


Here all drop forgings for the Maxwell car are made.

Also a very large percentage of automatically machined parts for transmission, axles, steering gear and other units are made in the Newcastle plant.

Because of its central location, we also handle all of the Maxwell service from this point.

Fully 50% of Maxwell owners can be furnished with replacement parts within 24 hours, while 50% of that, in turn, are within the 12 hour radius.



We are rather proud of our service system and consider it is second to none.

THESE TRUCKS

Will Put Ginger in Your Business

TODAY there is probably not a single automobile dealer in the United States able to obtain all the pleasure cars he can sell, and that condition is as certain to maintain until the end of the war, as that night follows the day.

But, on the other hand, owing to the emergencies of the titanic transportation problem, to which the modern truck has proven a veritable Godsend, it is equally certain that the government will interfere as little as possible with truck production.

And of all trucks there are none better than the LANE, for either dealer or customer.

In the first place LANE trucks are superior trucks—the best trucks in their capacity class ever made at any price: built on honor from the ground up and complete in every detail of construction and equipment, including standard electric lighting and starting systems, Continental motors, Timken axles, Goodrich DeLuxe tires, etc.

That's why LANE trucks sell easily in the face of any competition, and, once sold—stay sold, and sell others.

Then the LANE agency agreement carries an exceptionally liberal dealer's discount. ¶ Besides, it's plain, straightforward and easy to comply with.

You will find it greatly to your own advantage to tie up the LANE truck line for your territory. ¶ Act today before your competitor slides in ahead of you.

Send in the coupon now. ¶ It will be a pleasure to forward you full details of our sales proposition and, the super-merit of the LANE truck specifications will prove a genuine surprise to you.

ALL BACK PRESSURE IS ELIMINATED IN THE COOPER "SPECIAL" CUTOUT

The above designs show why there can be no back pressure in the Cooper "Special" Cut-out. Instead of coming in contact with a straight, perpendicular wall which will naturally cause a rebound, the gas comes in contact with a *slanted* wall which deflects the gas. This is the secret of the tremendous success of Cooper "Special" Cut-out.

"COOPER SPECIAL"

The construction and principle of the Cooper "Special" will appeal to the judgment of the man who ***knows*** what a good cut-out should be like.

—The slanted flapper and large exhaust opening prevent back pressure.

—The exhaust pipe is not cut in two to accommodate this cut-out.

—The flapper is opened three inches by pushing the foot pedal down one-half inch.

—The lock on the foot pedal works instantly and never fails.

The Cooper "Special" Cut-Out (for all makes of cars) does its work in a simple, efficient manner and never gives the least trouble.

The AC Line Is the Success Line; Grow With It. It Meets Best the Spark Plug Needs of Every Motorist. It Is Backed by National Advertising and the Judgment of Most Manufacturers.

With a complete line of AC Spark Plugs on your shelves you are prepared to meet best the requirements of every motorist that comes to your garage. Why tie up capital in slow-moving stock that has only extravagant claims to recommend it? Establish a reputation for handling only the best. That is the reputation that brings business to your doors.

With almost no exceptions, practically every fine car made is factory equipped with AC Spark Plugs. See for yourself in the list on opposite page. These plants chose AC's because in rigid laboratory and road tests, their superiority over all other makes was established beyond question.

And now that national advertising is carrying this truth broadcast, even the owners of those cars made by the few manufacturers who at present equip with other than AC Plugs are installing the plugs which we have specially designed for their cars.

By handling AC's exclusively, you are not limiting your market, for there are various types of AC Plugs specially designed for every make and style of motor. You are building a reputation for handling only highest quality merchandise. You are allying with success.

Write for complete information for dealers.

The telephone company has just printed a list of men who are going to buy Maxwell trucks

Open the directory and pick out the "butchers and bakers and candle-stick-makers"—get the Maxwell truck agency; bring 'em 'round for a "once-over"—have your order blank handy—say "sign here" and begin to figure your excess profits tax.

Here's a truck with the guts and go of $5000 kinds: worm drive—electric lights and generator—ten-foot loading space—a gas and tire miser and a mile glutton. Retails at $1085—several hundred dollars less than any other truck of similar capacity on the market.

Sherlock Holmes, the balance sheet, has discovered that over-sized, unnecessarily heavy, three- and five-ton trucks are bad buys; they carry too many half loads—eat their heads off and make the repair shops rich.

Land the Maxwell for your territory and learn what real money-making means—sight sales—net profits—repeat orders and no come-backs. The mails are uncertain nowadays—telegraph "Yes" before the "other man" beats you to it.

Motorists' Want HAVOLINE OIL

REG. U.S. PAT. OFF.

YES, they do—perhaps they don't ask for it—but you will see that they do want it, if you show them that you have it.

You are like that yourself. You don't always ask for advertised articles by name but you always take the kind that you know about or have heard of.

To help you sell Havoline Oil we have been telling motorists all over the country about Havoline Oil in the Saturday Evening Post, Literary Digest, and other magazines reaching millions. We have been doing this for years until the name Havoline is familiar to everybody.

We have taken those millions of interested readers under the hoods of their cars and shown them things as they are—the 2200 plunges of the piston per minute—the 3000 degrees of heat in the combustion chamber and the 400 degrees on the cylinder walls that cause any except the very best oil to break down.

We have shown these millions the need of the perfect protecting film of Havoline Oil in advertisements full of interest, conviction and selling force.

Why not identify yourself with an absolutely uniform and never-quitting oil while our arguments are fresh in motorists' minds?

Havoline banners, cards, window displays and all kinds of printed material are at your disposal to bring home to you cash returns for the money we have spent.

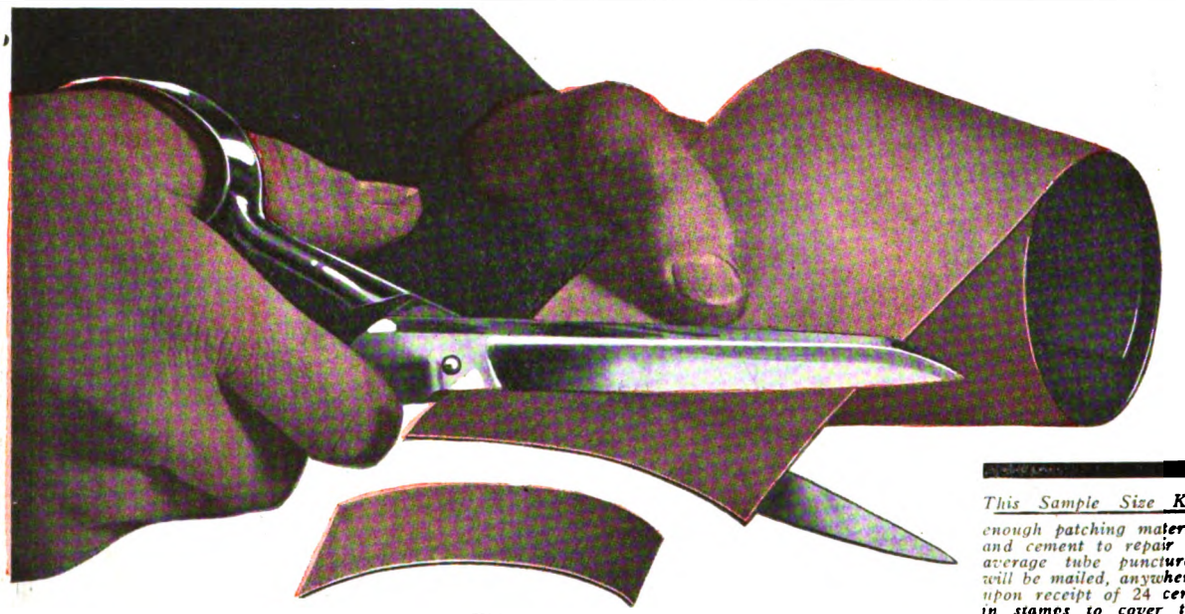
Five Times Tested -and Proved!

The smoothness in action and remarkable durability of the BUDA ENGINE are the results of the finest manufacture. They are safeguarded by tests of each engine which, we believe, are of unequaled severity.

1st, each engine is run by outside power until smooth. 2nd, it is run by its own power until smooth. 3rd, it is taken apart, examined and carefully adjusted. 4th, it is run under its own power. 5th, when it runs with perfection, its power output is measured by the electric dynamometer.

The engines which survive all these tests are real BUDA ENGINES for trucks, farm tractors, or high duty stationary work.



Made by The BUDA COMPANY, Harvey (Chicago Suburb), Ill.

Perma-Loc

The Original 3-Ply Patch

To Repair a Damaged Tube Economically and Permanently

DON'T use a "temporary" patch to repair a punctured or blown-out tube while you race to the nearest garage.

Use a PERMA-LOC self-vulcanizing patch and make a *permanent* repair. Just cut off a strip of PERMA-LOC of a size to fit the hole, apply a bit of PERMA-LOC Cement, press the patch firmly to the tube and you'll have a thoroughly sound repair that will *hold forever*. You can inflate the tube to full pressure, and use it, the minute you've applied the patch. The harder you drive, the more firmly you vulcanize PERMA-LOC to the tube. It will never creep or loosen!

To insure yourself against trouble and delay, stop at your dealer's today and secure a PERMA-LOC kit for your tool box. *There's enough in one strip to repair a 17-inch blowout.* Obtainable in 3 sizes, 50c., $1.00 and $1.50, complete with cement. If your dealer cannot supply you, write direct.

PERMA-LOC MFG. CO.

309 Board of Trade Building

Factory—Wilkes-Barre, Penna. **Scranton, Penna.**

This Sample Size Kit, enough patching material and cement to repair 12 average tube punctures, will be mailed, anywhere, upon receipt of 24 cents in stamps to cover the cost of postage, shipping and containers.

Dealers

The unusual sales features of PERMA-LOC make it an attractive and profitable seller. You can talk economy and simplicity to good purpose. PERMA-LOC will back up your claims. Write to your jobber or to us for discounts and full details.

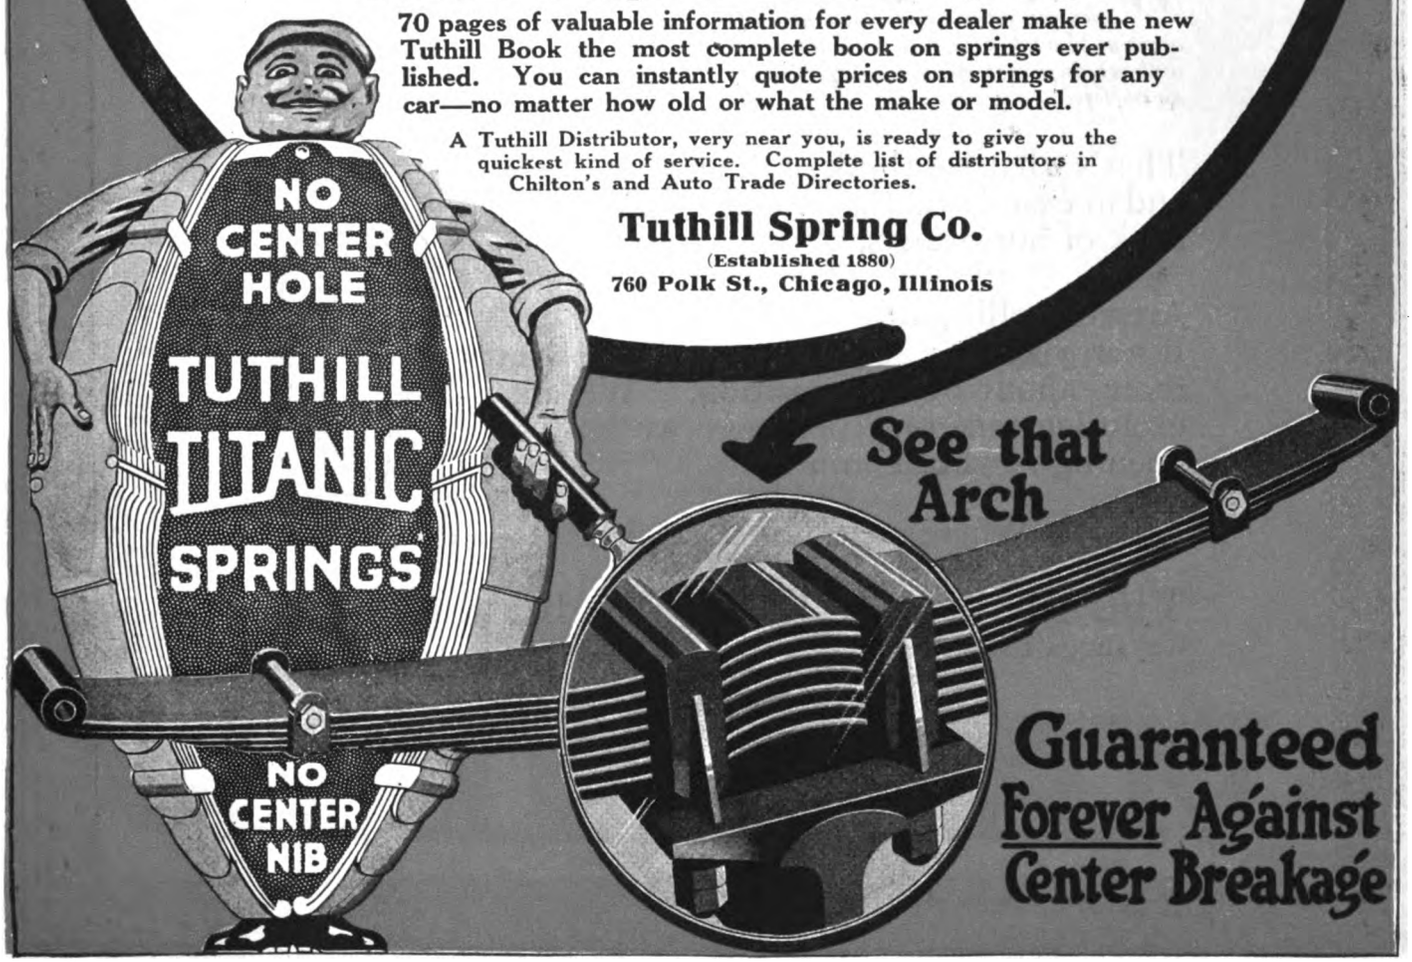
The Springs
With the Extra Guarantee

When your customers come to you with broken springs—replace them with springs that you can stand back of—springs that you can depend upon to deliver perfect satisfaction.

GUARANTEED
TUTHILL
TITANIC
SPRINGS
LUBRICATED

are so strong, so well built, so perfectly constructed, that they are not only guaranteed at all points and in every respect for one year, but they are also guaranteed *forever* against center breakage—where three out of four old-fashioned springs break.



That is why more spring replacements are made with Tuthill Titanics than with all other makes combined. And that is why Tuthill dealers are always successful dealers.

Send for Complete Book on Springs

70 pages of valuable information for every dealer make the new Tuthill Book the most complete book on springs ever published. You can instantly quote prices on springs for any car—no matter how old or what the make or model.

A Tuthill Distributor, very near you, is ready to give you the quickest kind of service. Complete list of distributors in Chilton's and Auto Trade Directories.

MARATHON

How We Sell Marathon Hand Made Tires

A TIRE isn't just a tire with us. It's a whole lot more than so much rubber and fabric. Here is what we say in our advertising to users and prospective users of Marathons —

WE look upon Marathon Tires as our business representatives; we are willing to build our reputation on the satisfaction you get in using them; and your complaint made to us about a Marathon Tire that doesn't properly represent that spirit, will get as prompt attention as if you complained about the act of an employee of our company.

That's what we think of the tires we make and in exactly that same spirit do we stand back of our dealers.

Are you selling tires on such a basis today? If not, you may be interested in knowing more about our proposition. We allot exclusive territory; perhaps we have an opening in your community.

Where are you? Let's hear from you.

TREMENDOUS POWER

The SPILLMAN "4" weighs more than other fours. Its *cam*shaft is nearly as heavy as the *crank*shaft of some fours. This added weight gives it solidity, steadiness, freedom from vibration, allowing the development of much greater power and speed while retaining in full its flexible, smooth-running efficiency.

It has developed as high as 48 Brake-Horsepower.

For light commercial trucks—¾-ton, 1-ton 1½-ton capacity—the SPILLMAN "4" is without a rival.

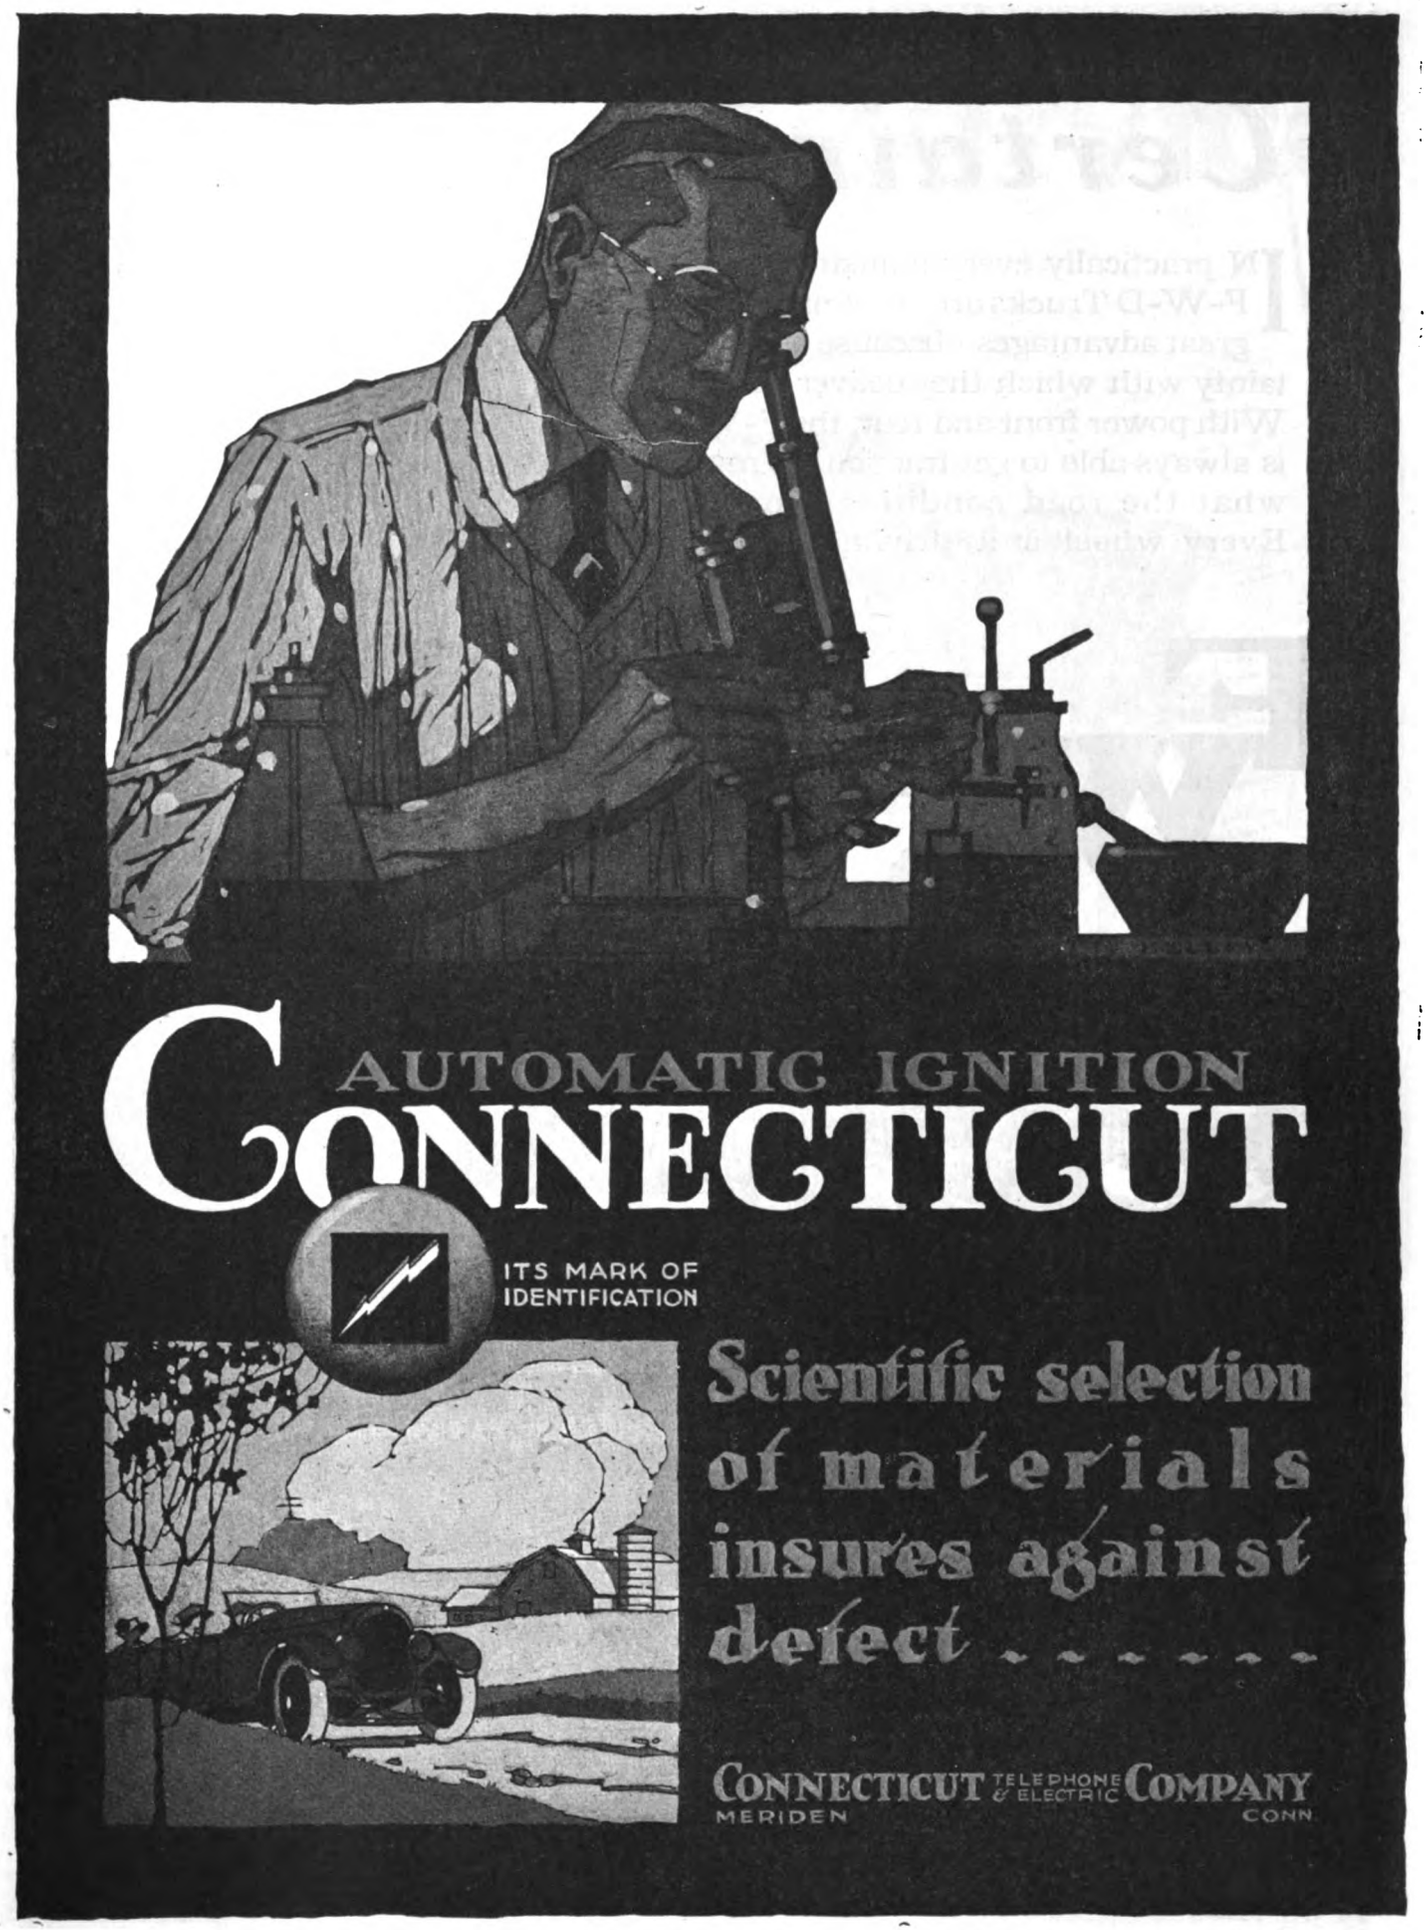
BOWER SAVES POWER

Truck Owners Know the Value of Simplicity



Bower Roller Bearings are of simple, yet scientific design. Consisting of a cylindrical roller with a flanged head at one end, this bearing reduces friction to the minimum. The constant heavy radial load is carried by the entire length of the roller. The side thrust is carried separately by the flange. Hence, the roller is self-aligning and always runs free.

Because of their simple trouble-proof construction and because Bower Bearings never need adjustment, they are prime favorites with truck owners.

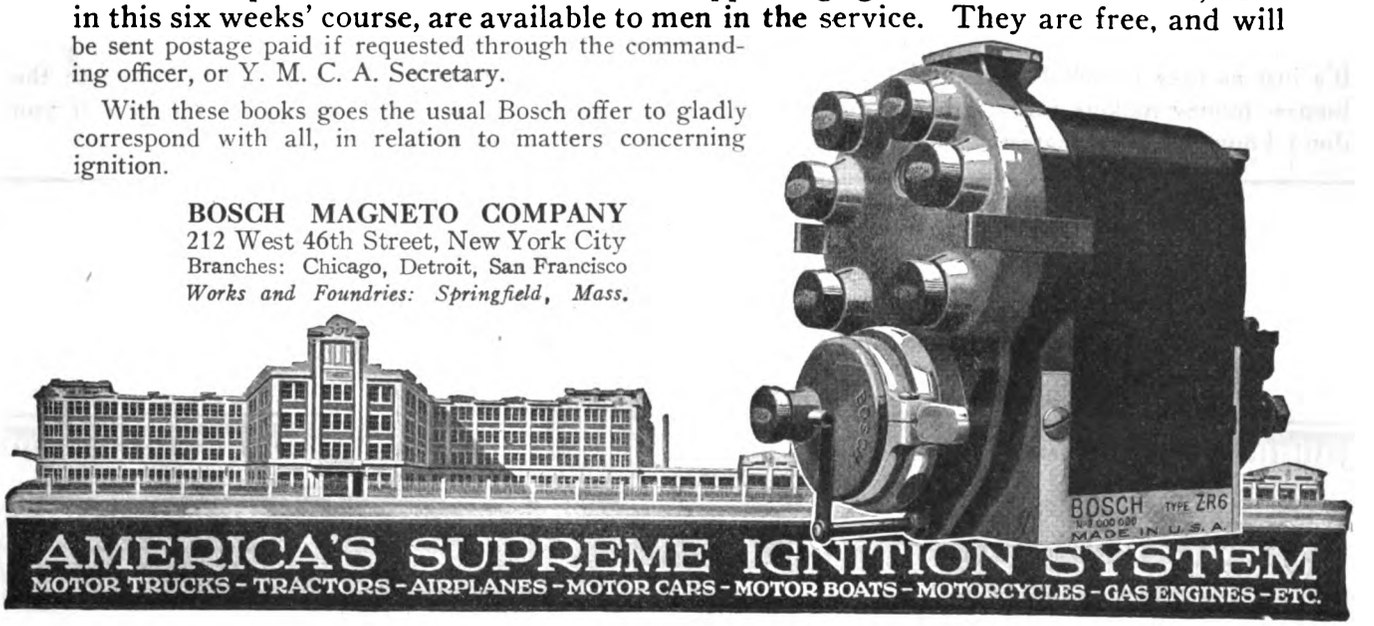
In the ★ Service



FOR months the Bosch schools have been co-operating with the Government, teaching to our soldiers the rudiments of gas engine operation, in addition to making plain the supposed mysteries of ignition.

The complete Bosch curriculum with supporting ignition reference books, used in this six weeks' course, are available to men in the service. They are free, and will be sent postage paid if requested through the commanding officer, or Y. M. C. A. Secretary.

With these books goes the usual Bosch offer to gladly correspond with all, in relation to matters concerning ignition.

Waterproof—

Water has no more effect on Duratex than on a duck's back.

This gives it a marked advantage over leather for automobile upholstery. Instead of an accidental or careless wetting causing it to check, stiffen or crack, no amount of drenching seems to impair the softness of its surface or mar the beauty of its finish.

DURATEX

is a super-product—the finest and most practical substitute for leather.

It is made by the only concern which, after fifty years' experience in the manufacture of the finest leathers, realized the coming world-demand for a leather substitute and changed to the production of a super-product—one which would serve all purposes for which genuine leather had previously been used.

MUNGER "Always Tight" Piston Rings

Ready to insert the Munger Re-grooving Tool to true-up a worn piston groove

The Munger Re-grooving Tool in position for cutting. Testing width of groove with an overwidth ring

Showing how easily Munger "Always Tight" Piston Rings can be placed in the piston grooves with the Munger Ring Insertion Tool

A simple one-piece ring that remains permanently gas-tight!

A ring so easy to install that anyone can slip it over the Munger Ring Insertion Tool without breakage or trouble of any kind.

A ring that will give you increased power, greater speed, smoother running, a lower gasoline consumption and an unusual freedom from excess carbon.

By a patent process of peening the Munger "Always Tight" Piston Ring is made to conform to the shape of the cylinder. The Munger "Always Tight" Expansion Joint keeps it compression-tight until completely worn out.

Each outfit of Munger "Always Tight" Piston Rings includes one *overwidth* ring for each piston, to be used in grooves that have become worn. Also a Re-grooving Tool, with which worn grooves can be str ightened and trued-up quickly and accurately without even disconnecting the piston from the connecting rod This avoids expensive lathe work and effects a saving that every car owner and repair man will appreciate.

NORWALK

Protected Territory on the Coming Tire

YOU can assume quality when you consider the sales record of a business as young as the Norwalk business. The growth of this business in four years is misleading only in one way—you might forget the years of experience behind its establishment. It reflects the experience of rubber tire and tube making from the beginning of the industry and the best standards of manufacture up to date. Nothing short of the best tubes and casings would satisfy the makers of NORWALK Casings and Tubes. In addition to the satisfaction that comes from leadership in quality, there is the practical business sense that realizes that to build business permanently re-sales to old customers is the one way.

Norwalks are offered dealers on a protected basis. Some few will take advantage of the Norwalk franchise now—others later. Through the trade the word is passing, "Get the Norwalk Agency." Correspondence invited.

BEST IN THE LONG RUN

FAIR TREATMENT

GOODRICH Sells FOR the Dealer

GOODRICH Tires on the shelves of a shop can be reckoned in terms of dealer's profit. They are tires sold.

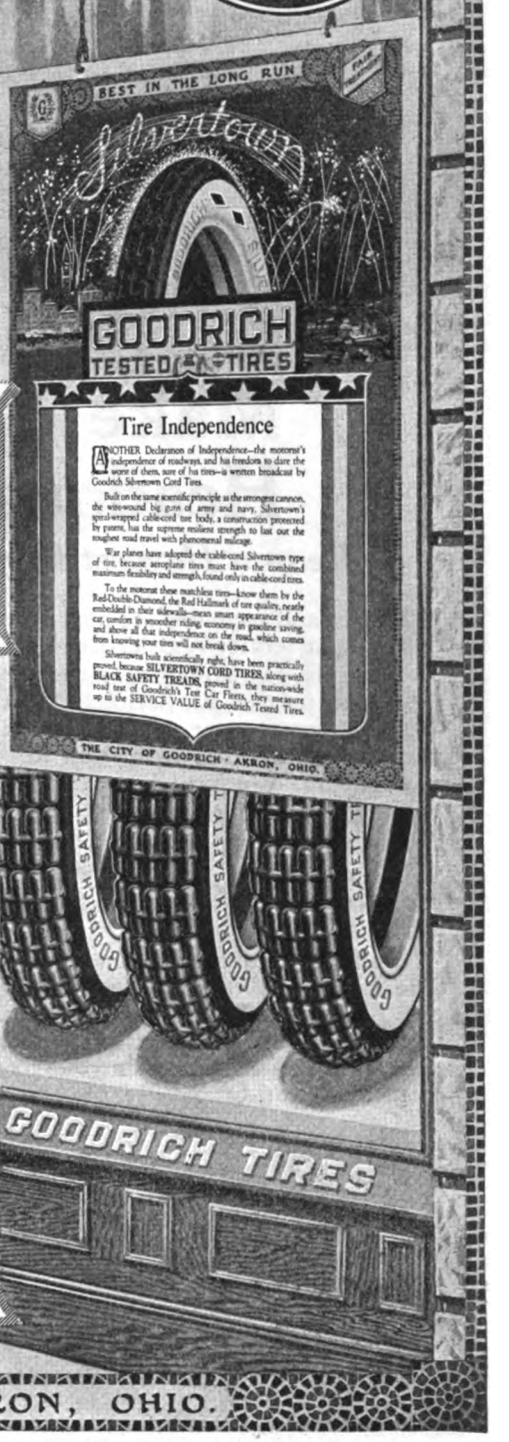
Count them sold, Mr. Dealer, because Goodrich sells tires FOR you rather than to you. Every honest and genuine selling force in business has been marshalled by Goodrich to sell them for you.

Goodrich workmen build SILVERTOWN CORDS, BLACK SAFETY TREADS and TUBES which are the flower of nearly half a century of skillful, conscientious rubber making. *That starts them best made.*

Goodrich Test Car Fleets under the keen eyes of tire experts put them to the road test the country over, and demonstrated their sure service on America's roads in every region. *That proves them.*

GOODRICH SERVICE VALUE TIRES

Goodrich Fair Treatment, the Goodrich creed which from the beginning of Goodrich has said a Goodrich patron must be satisfied with a Goodrich product, safeguards their future with the good will of the past. *That guarantees them.*



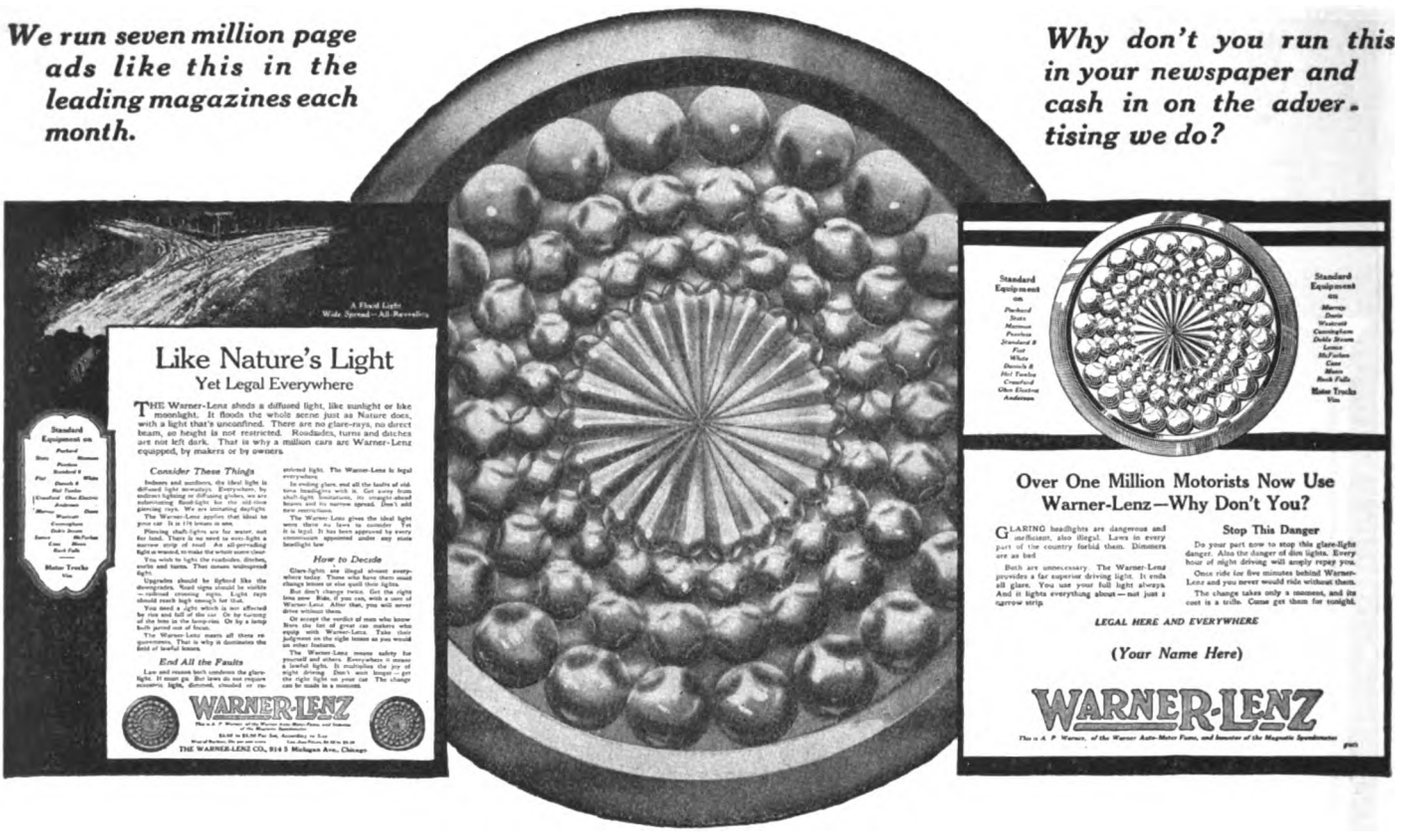
Goodrich salesmanship, ever energetic, ever watchful to new business conditions, keeps that *product, proof,* and *guarantee* ever big and fresh in the eye and mind of the tire user. *That sells them.*

Re-enforce your business with Goodrich Service Value Tires, and Goodrich methods of selling.

Put a "Goodrich Tested Tires" sign *outside* your store, and have all Goodrich selling forces *inside* working for you.

The year 1918 calls for the highest and best in tires and tire selling. Be a Goodrich dealer and you get it with profit and pride.

THE B. F. GOODRICH RUBBER COMPANY



THE CITY OF GOODRICH · AKRON, OHIO.

We run seven million page ads like this in the leading magazines each month.

Why don't you run this in your newspaper and cash in on the advertising we do?

Make Your Store Known as Headquarters for Warner-Lenz

Reap a Harvest from the Greatest Accessory Campaign Ever Run

IT pays, and pays well, to make your store known as headquarters for Warner-Lenz. It can easily be done.

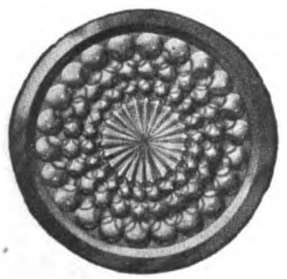
Note the two advertisements shown above. One, we run as part of our national advertising campaign — the greatest ever placed behind an automobile accessory; the other is for you to run in your local newspapers. We furnish it to you free upon request.

In this way you reap the benefit of the widespread advertising we are doing.

As our share, we run seven million full page advertisements each month. Think what influence such a campaign has.

Full pages appear at least once each month in The Saturday Evening Post, Literary Digest, Scientific American, Cosmopolitan, American and Metropolitan Magazines. Also in many motor and farm papers. Every car owner in your territory is reached monthly — and oftener.

Warner-Lenz is the pioneer and leader. Already, over one million cars are lighting night roads with its glareless light. It is legal under every law, state or local.



Nearly every car that has not already changed lenses will do so this summer. The great majority will change to Warner-Lenz.

Our advertising is winning hundreds of thousands of new users to Warner-Lenz.

Be sure you get your share. Warner-Lenz is the fastest selling and most profitable accessory ever marketed.

This newspaper advertisement is but one of the dealer helps we will furnish you. Send for it today and, at the same time, find out about the many other business winners we will send you, free.

This means business for you — big business. Write to us today.

KISSELKAR

The Kissel Motor Automatically Oils Itself—*No Waste!*

A MOTOR not oiled properly is a motor with bearings burning out—wrist pins sticking—pistons and cylinders scoring—cam shaft receiving excessive wear. Result—loss of power and "pep."

Nothing like that with the Kissel-built motor. A positive driven oil gear pump (see cut above) submerged in oil and fed by pressure—automatically ***envelopes all parts in a continuous mist or film of oil*** positive in action and clean sweeping in effect.

And note this—the amount of oil in cylinders is gauged so as to avoid excess of oil above pistons, thus eliminating fouling spark plugs and carbonization, which cause pre-ignition, "spark knock" and deadly gas fumes.

DEALERS—The above is one of the Hundred Quality Features of Kissel's Hundred Point Six. The other 99 are just as effective from a sales-creating standpoint. If there is no Kissel Agency in your territory, it will pay you to write or wire us to-day.

KISSEL MOTOR CAR COMPANY Hartford, Wis., U. S. A.

Trade Discounts

Manufactured under A. R. Mosler's Patent No. 1,218,298, March 6, 1917, Other Patents Pending

A New Schedule of Trade Prices on the

MOSLER VESUVIUS PLUG

No camouflage here; just straight stuff!

We have not made a price increase on the Vesuvius Plug for four years, and have not advanced it a penny since the war broke out, but now we have to come clean and say that there is not enough margin in the goods at the old price to make it worth while, and as of June 1st, "Price Increase" is with us.

In less than hundred lots the price is increased 5 cents per plug—

In hundred lots—2½ cents.

Surely a minimum increase.

Sold at the standard price,

$1.00

Send for a new dealer schedule—and full information on our whole Vesuvius sales plans.

Another Rapid Marvel Seller

Marvel dealers have demanded a reliable, cold patch outfit that would give the motorist the utmost in convenience and economy—AND HERE IT IS. The Marvel

Three Sizes Trusti-*patch* 25c 50c & $1.00

Comes in Sheets from which the motorist cuts any size or shape patch he wishes. There is no waste. Pin holes, tears and blowouts all look alike to the Trusti-*patch*.

The repair material is of a high grade, semi-cured gum on a Khaki or Rubber backing. To make a repair simply cut a patch the exact size required by the injury—no more—clean tube and prepare with Marvel Cement that comes with the outfit; then apply the Trusti-*patch* pressing down firmly with the fingers.

You can supply your trade with Trusti-*patch* to meet every requirement. Khaki back Trusti-*patch* comes in 25c, 50c and $1.00 cans—Rubber back Trusti-*patch* comes in 50c and $1.00 cans.

Selling the Marvel Trusti-*patch* is good business for the dealer because the motorist is quick to see the fallacy of carrying a big assortment of various shaped patches when he can cut any size required by the particular injury—with no waste. By selling him just what he needs you will make a satisfied customer—one who comes back for other Marvel Accessories—and the other products you stock.

Marvel dealers have a big advantage—every item in the Marvel Line is made right, is reliable, a good seller and profit maker.

Order from your jobber today a quantity of Marvel Trusti-*patch*. If you don't know the one nearest you, write us and we will see that your needs are promptly filled. Use the coupon.

Strongest Wire Wheel made 5 times as Strong as Wood Wheels

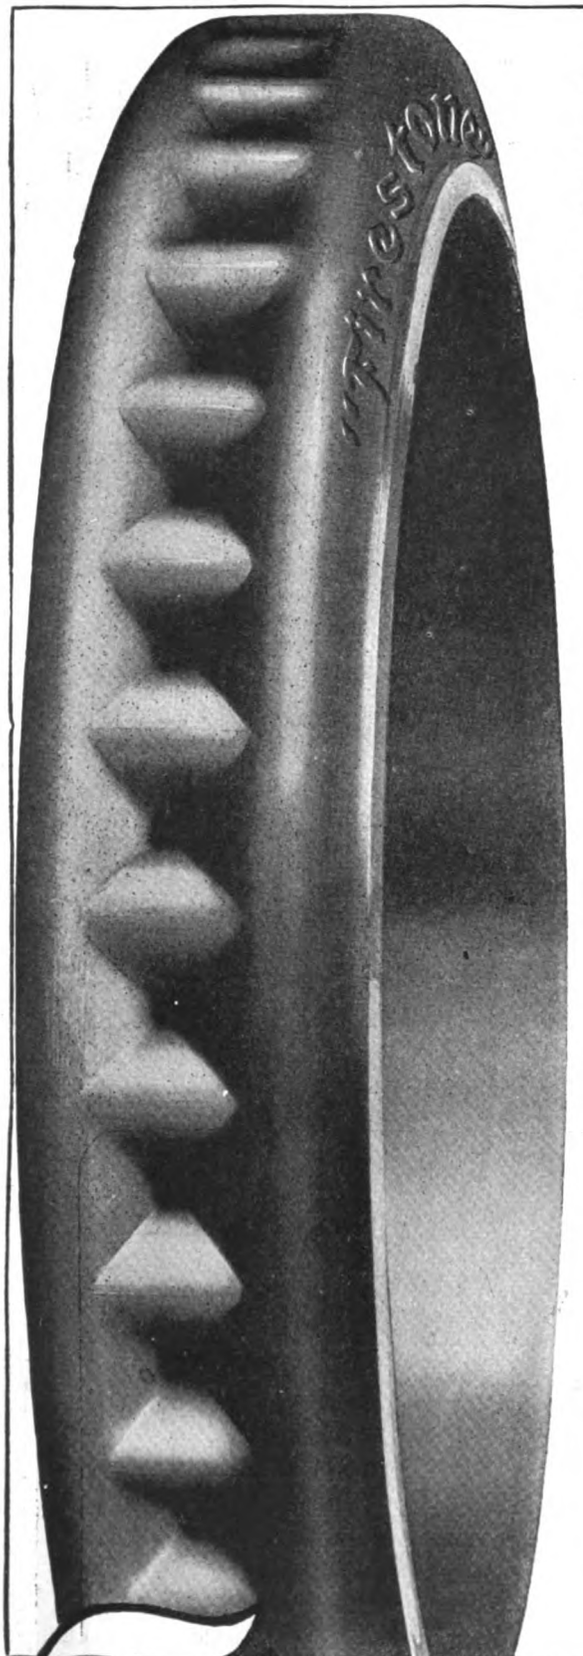
The unparalleled strength and rugged dependability of Pasco Wire Wheels have been proved by actual tests. The 4-spoke-crossing construction of tangent spoke-lacing, peculiar to the Pasco, constitutes a demonstrated protection against wear and breakage.

PASCO WHEELS

Besides having a superior web (each spoke crossing 4 others), Pasco Wire Wheels possess two other exclusive features, namely an indestructible hub-cap and a safety locking device that locks hub-cap and wheel to the hub, effectually preventing a loose or wobbling wheel.

These special features are not the results of happy chance, but of many years' study and practical experience in the manufacture of Wire Wheels. They are visible evidence of the thorough competence in Wire Wheel building distinguishing this organization, whose efforts have been exclusively devoted to this business for more than a generation.

You will find Pasco Wheels on practically every make of Airplane now in use. Considering the severe exactions of the Air Service, their pre-eminence in this field is significant.



DEALERS: A remarkable opportunity for immediate and continued profits. Write for liberal sales proposition.

War-Time Demands Emphasize the Extra Values in Firestone High-Speed Tires

TRUCKS must move faster. War conditions make it imperative. Truck speeds that were efficient twelve months ago fall below today's necessity.

The situation has brought Firestone Truck Tires into greater prominence than ever.

For both the Firestone Cushion Tire and the Firestone Giant Pneumatic Tire are essentially speed types.

The Firestone Cushion Tire is the fastest solid truck tire.

The Firestone Giant Pneumatic Tire brings pneumatic protection to trucks. For extreme truck speeds this tire is indispensable.

Both these types, like the entire line of Firestone Truck Tires, possess the great resilience and sure hold of the road that make speed *safe* for mechanism and men.

And Most Miles per Dollar is the measure of their economy.

Then there is the Firestone Giant Solid Tire with the grooved tread, which has revolutionized heavy trucking. For every type of vehicle there is a specially built Firestone tire. Our experts are at your disposal with advice as to the equipment best fitted to give you efficient, economical results. Call in the Firestone man.

EISEMANN

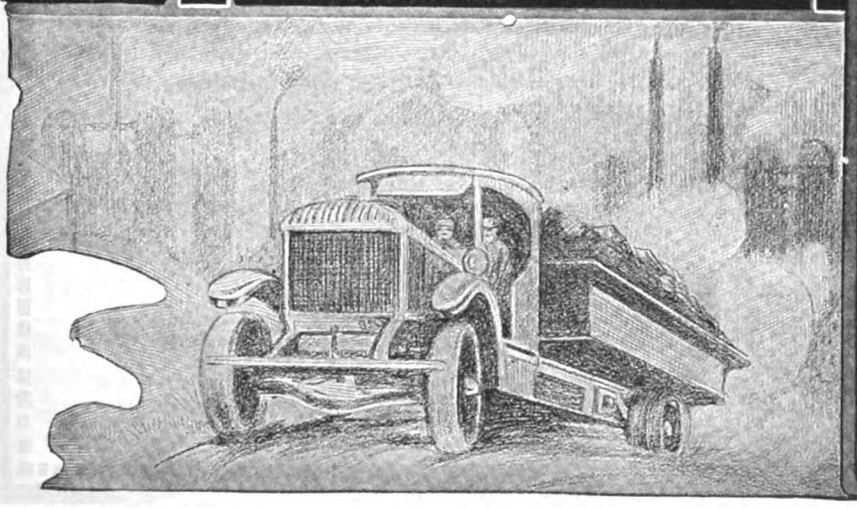
Away Goes Guesswork When Facts Step In

You need not depend upon impressions or opinions—your own or the other fellow's—to decide what source of ignition will give you the best service on truck or tractor or passenger car.

The superiority of the Eisemann Magneto is one of those demonstrated facts which are not open to argument.

Tests—competitive tests—tests under all conceivable conditions—tests conducted by ignition authorities of unquestionable standing—have proven conclusively the superior efficiency, dependability and durability of the Eisemann Magneto.

It is for this reason, and no other, that 126 manufacturers of motor vehicles—including practically all the recognized leaders who have established reputations to maintain—have adopted Eisemann Magnetos as standard equipment.



THE EISEMANN MAGNETO-COMPANY

Sales and General Offices:
32 Thirty-third Street, Brooklyn, N. Y.

Chicago:
910 So. Michigan Ave.

Detroit:
802 Woodward Ave.

EISEMANN SUPER-CONSTRUCTION

2—The Armature

The making of the Armature of an Eisemann Magneto is an excellent illustration of the exhaustive and scrupulous attention to detail through which this Company has realized its determination to produce the finest Magneto that can be built.

To complete the Armature Core and Winding from raw material to finished product, requires 49 distinct operations, inspections and tests. Though these processes cannot be described here, it should be pointed out that owing to the extreme care applied both to the selection of materials and to the processes of construction, Eisemann Armatures practically never short-circuit or burn out.

The shadowgraph above reveals the position of the Armature with relation to the Magneto as a whole.

Seventeen times around the earth equals the mileage of motor roads charted by Blue Book Scout Cars and described in detail in the

New 1918

Automobile Blue Book

Any place—anywhere in the United States—that can be reached by automobile—may now be easily reached by any motorist by following the simple Blue Book directions.

With the Blue Book he can plan his trips from start to finish before he starts, know how long it will take, what the roads are like, the stopping places, points to see, etc.

Then—on the road—in the car—the Blue Book will guide him every mile of the way, by landmarks and mileages; give him maps of towns and cities he'll pass through; point out the interesting places; direct him to hotels, garages and service stations when he comes to them; warn him of curves, grades and crossings ahead; give him speed laws and traffic regulations, steamship schedules and rates—it will enable him to make the trip there and back without having to ask a single question either before he starts or while he is on the way.

Known by motorists from Coast to Coast—the Blue Book is the one complete, up-to-date, practical automobile road guide on which they depend in vastly increasing numbers each year.

ELEVEN VOLUMES IN ALL

THE 1918 VOLUMES

Volume 1—New York State and Adjacent Canada.
Volume 2—New England and Maritime Provinces.
Volume 3—New Jersey, Pennsylvania, Delaware, Maryland, District of Columbia, Virginia and West Virginia.
Volume 4—Michigan, Indiana, Ohio and Kentucky, excepting Upper Peninsula of Michigan.
Volume 5—Illinois, Minnesota, Wisconsin, Iowa, Missouri and Upper Peninsula of Michigan.
Volume 6—The Southern States.
Volume 7—Montana, Wyoming, Colorado, New Mexico, Texas, North and South Dakota, Nebraska, Kansas, Oklahoma, Arkansas and Louisiana.
Volume 8—California, Nevada, Utah and Arizona.
Volume 9—Washington, Oregon, Idaho and British Columbia.
Volume A—New York City Metropolitan Blue Book. 200 round trips within a 100 mile radius of New York City.
Volume C—Chicago Metropolitan Blue Book. 200 round trips within a 100 mile radius of Chicago.

Bound in blue flexible binding.
Each volume $3.00 net or $3.15 postpaid.

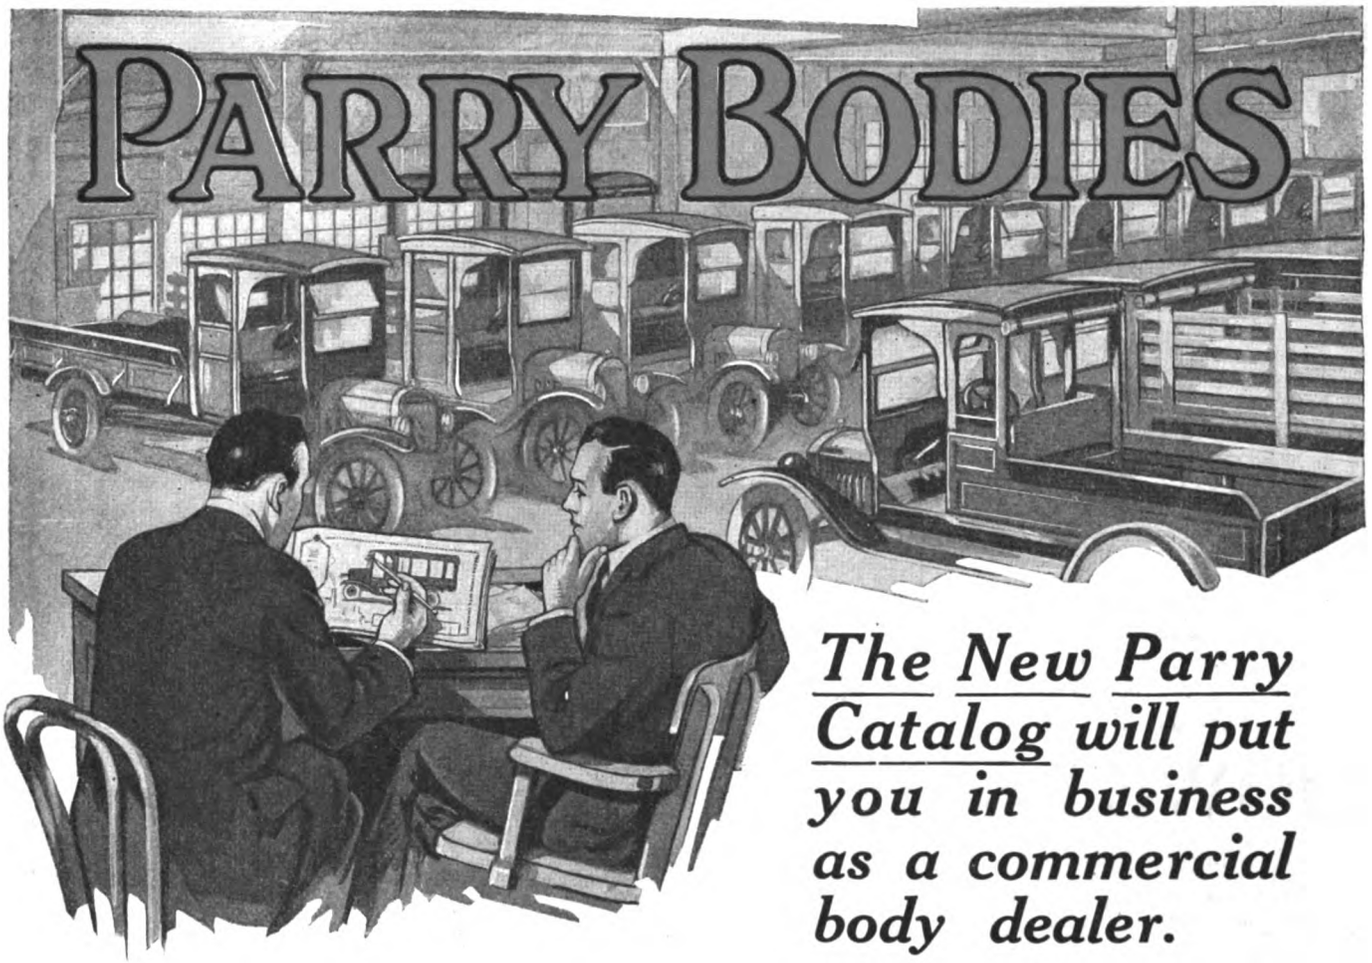
Thousands of Dealers and Garages

are today selling Blue Books—making good profits—and giving their customers better satisfaction—where in former years they simply wasted time.

When you are asked for road directions, do you **give** your valuable time telling how—or **give away a free** road map—neither of which is satisfactory to the tourist or fair to you?

Motorists will pay for this information—gladly—if you show them an Automobile Blue Book—and feel better satisfied.

Blue Books will serve them better—and you will be selling a commodity that you now largely give away.



If you are not today selling Blue Books you are depriving yourself of many $3.00 sales—and also of many more dollars in sales of other equipment that the Blue Books invariably bring to you.

Don't delay any longer. Send today to the nearest office for discounts and full information. Or, better still, let us send you a copy of the volume for your territory to look over. It will have to sell itself to you. If it doesn't, return it at our expense.

MANY dealers prefer having a large stock of commercial bodies on the floor at all times—believing that sales are thus made easier and deliveries quicker. That is unquestionably true if sufficient floor space is available. There are many hundreds of commercial body dealers, however who lack either the space or the capital to keep a number of bodies on the floor for display purposes, and for immediate delivery.

The new Parry commercial body catalog was designed principally for the purpose of eliminating—for the small dealers—the necessity of "stocking" heavily for their trade. This new catalog is complete from every standpoint. In simplicity it is a gem. By its use dealers will be enabled to practically display and sell bodies just as intelligently as though their display room was stocked with sample jobs.

Maybe the question of delivery now arises in your mind. Parry has always made 24-hour deliveries. This schedule has been somewhat slowed down because of labor and transportation conditions—because of a tremenduous demand—but we are now making deliveries within three to five days—which is considerably quicker than most other body makers can fill orders.

The Parry Catalog is so complete and so comprehensive that you can sell your prospect directly from it. You can wire your order by code word, and within two or three days it will be on its way to you. We have tried to put this catalog in the hands of every responsible dealer. If, by any chance, you have not received your copy advise us immediately, and we will forward same by next mail.

Make Good Business Better With HOWE Accessories

Scores of jobbers and hundreds of dealers are hitting the Big Profit target with our rapid-fire sellers—

Howe Kork Tred, the perfected cork-inlaid transmission lining for Fords—

And the Howe Spotlight, the searchlight with the wonderful spring-controlled bracket.

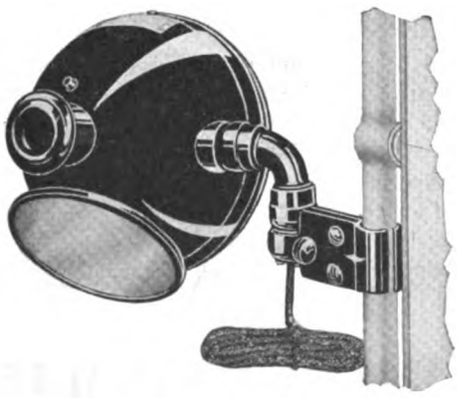
They are making enviable records in Better Business marksmanship, as shown by the large repeat orders for these two motoring essentials of proven quality.

If you are not carrying Howe accessories, you are letting profitable sales get away or depriving your customers of the best. Either is bad business.

Why not join the Better Business army? Our discounts to the trade are most liberal.

HOWE Kork Tred Makes Fords Behave

There is no other Ford transmission lining that is "just as good" as Kork Tred, no other that has the exclusive Kork Tred improvements or will wear as long and serve as efficiently.



The Kork Tred grip combines the smoothness of velvet with the sure hold of the bulldog. It eliminates the grabbing, jerking and slipping common to cars equipped with ordinary transmission lining which becomes glassy smooth in a few months of use.

The disks of cork cannot come out. They are securely held in pockets of brass, firmly riveted in high-grade fabric.

These brass pockets also serve as tiny oil reservoirs, holding the lubricant that the cork discs absorb and releasing it when pressure is applied, thus making brake and transmission action smoother and more quiet.

A set of Kork Tred for the Ford retails at $3.00.

The HOWE Spotlight Is Spring Controlled

The spring-controlled bracket of the Howe Spotlight is an exclusive feature of instant appeal. While two coil springs hold the turning joints in a firm grip and take up road shocks and wear, the Howe turns easily and direct to the spot where the light is wanted without sticking, binding and locking. Jars and vibration cannot shake it loose. No matter how long it is used, the Howe never flops around or rattles. This sure-grip bracket is hollow, thus protecting the wires and preventing short circuits.

The Howe, in fact, is a spotlight of many appreciated features. It can be detached for use as a trouble lamp by loosening a single set screw. The Tiffany-finished reflector gives perfect illumination at all distances. The design is streamline. Mazda bulbs are standard equipment.

The Howe now retails for $6.50, $5 and $4, the price varying according to size and design.

THE MARK OF HOWE IS THE STAMP OF QUALITY

THIS MEANS S[illegible]GE-PROFIT

BETTER than anyone else, Mr. Dealer, you know that the day of the makeshift cranking and lighting systems for Ford cars has passed, never to return.

You know it, because you have seen with your own eyes the unsatisfactory work-out of cheap John equipment.

You know it, because with your own ears you have heard Ford owners emphasizing in no uncertain words their unqualified disgust with the ordinary starting and lighting mechanism.

And there is, in truth, neither honor nor lasting profit in representing anything but the best in Ford starting and lighting systems.

Inevitably, that brings you square up to the Heinze-Springfield.

Beyond argument it is the leader of all Ford cranking and lighting plants. It's the system eventually selected by all dealers who, like yourself, appreciate the good will of customers, and are carefully building their business now with the definite object of maintaining leadership by outstripping all competition.

HEINZE-SPRINGFIELD
CRANKING AND LIGHTING SYSTEM
FOR FORD CARS

Let us present the complete details of our agency proposition. Send in the coupon to-day—it will have our immediate attention.

A Few Heinze-Springfield Superiority Points

1. A Two Unit, Six Volt, Single Wire Cranking and Lighting System, Bendix Drive. 2. Nothing visible with hood closed. 3. No interference with engine accessibility. 4. Installed complete in four hours. 5. No power drain on motor. 6. Patented mounting plate and chain adjustment insures quietness. Prevents broken chains. 7. Highest quality, most compact, most convenient combination Dash Switch, Ammeter, and Dash Lamp.

BENFORD'S

The Insulator Makes a Spark Plug

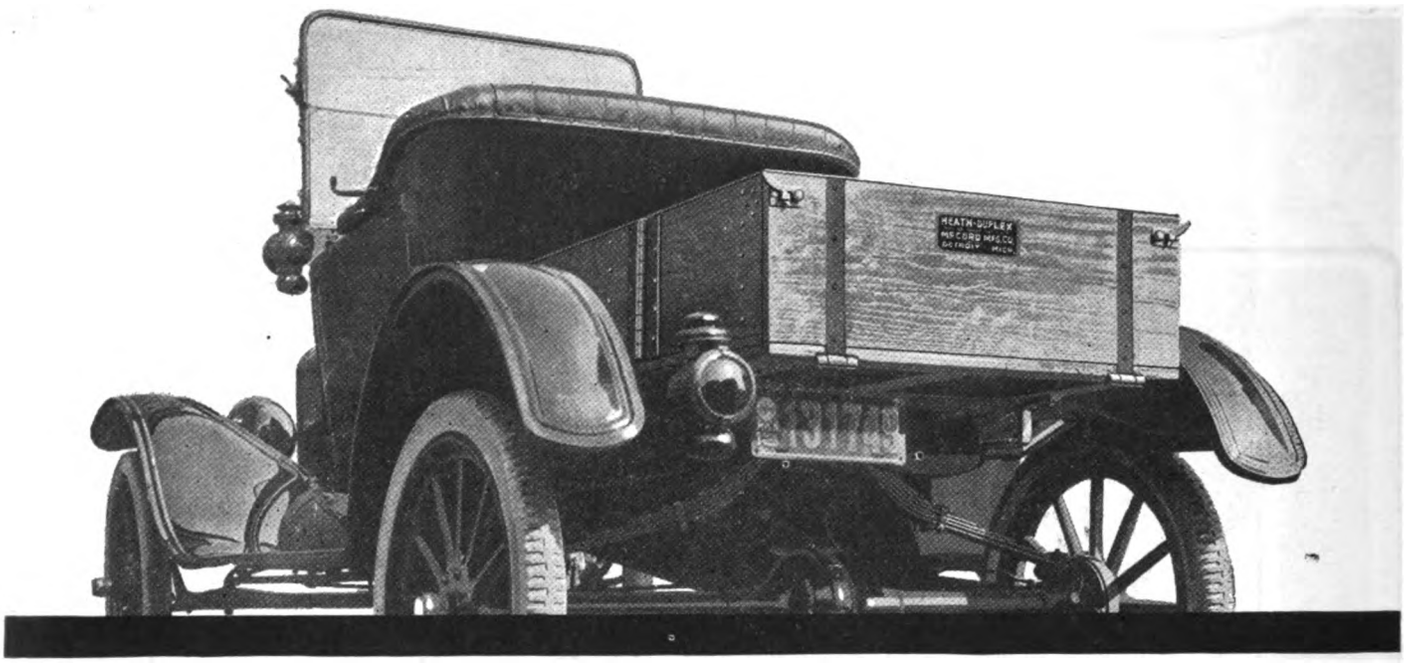
A SPARK plug is only as good as its insulator—and the blue adamant insulator is the great contributing feature to the success of the Golden Giant.

The manufacture of this insulator entails processes undreamed of by the ordinary maker of "ordinary" plugs. It includes refinements of electro-chemistry beside which the compounding of ordinary insulating materials is child's play. Our blue adamant is our own formula—and it must stand up under heat far beyond that which can be generated by any motor. And when it is ready for assembling into the Golden Giant it must be too tough to crack under even extraordinarily careless treatment.

Its use in the Golden Giant is certain insurance that all the electricity an ignition system can generate is delivered to the electrodes without loss.

The modern car deserves nothing less than the best in spark plugs—and the blue adamant insulator of the Golden Giant clinches its title to leadership of quality plugs—the others make no difference—

Buy at least one from your dealer now—



You'll want the whole set later.

Dealers: Get the 50-plug assortment from your jobber—and get the handsome Golden Giant display case, too.

Every Owner of a Ford Touring Car A Live Prospect

Heath Duplex

PATENTED MAY 12 1908, DEC 19 1916

Dealers throughout the country have been quick to realize the selling opportunity of the Heath DUPLEX.

With the campaign for national distribution scarcely a month under way, business has exceeded our most optimistic forecast.

These dealers know that over half of the Ford owners in their territory use their touring cars for carrying goods.

They have found out that every Ford owner who makes a regular or even a casual use of his car for business purposes wants this inexpensive, practical device as soon as he sees it.

They have already seen the natural demand for the Heath DUPLEX intensified by the complete campaign of national and local publicity behind it.

Every day sees considerable additional territory closed on the rights to sell the Heath DUPLEX.

If your territory is still open, we know you will be glad to learn the details of our attractive selling agreement.

From a Ford to a Truc in 60 Seconds

Lift off the Ford tonneau. Open up the Heath DUPLEX. You then have a staunch, strong delivery car.

Fold up the Heath DUPLEX, put back the tonneau, and you have the original Ford touring car.

Either change takes one minute. No tools are required. Fits old or new Ford touring cars.

In making the original installation the tonneau is made removable. Thereafter it can be slid on or off, while the front seat remains undisturbed.

The delivery body has a carrying space 4 feet 4½ inches long, 32 inches wide and 10 inches deep.

When passenger use is required the Heath DUPLEX is folded up without any visible sign of its truck utility. It does not alter the appearance of the passenger car.

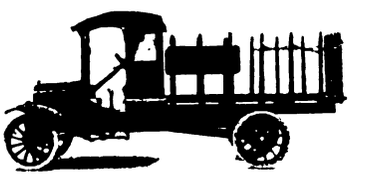
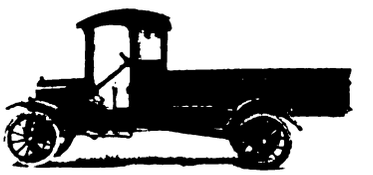
HENNEY
RURAL EXPRESS BODIES
FOR FORD MODEL T AND ONE-TON CHASSIS

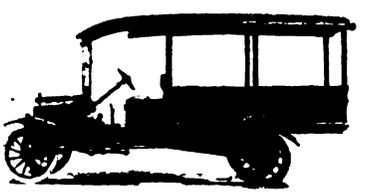
Unequalled Dealer Opportunity



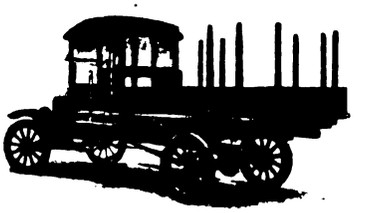
DEALERS! Read the handwriting on the wall. Local embargoes on foodstuffs caused by inadequate transportation facilities are causing the establishment of Rural Motor Express Services from farms to cities throughout the United States linking the farm and market.



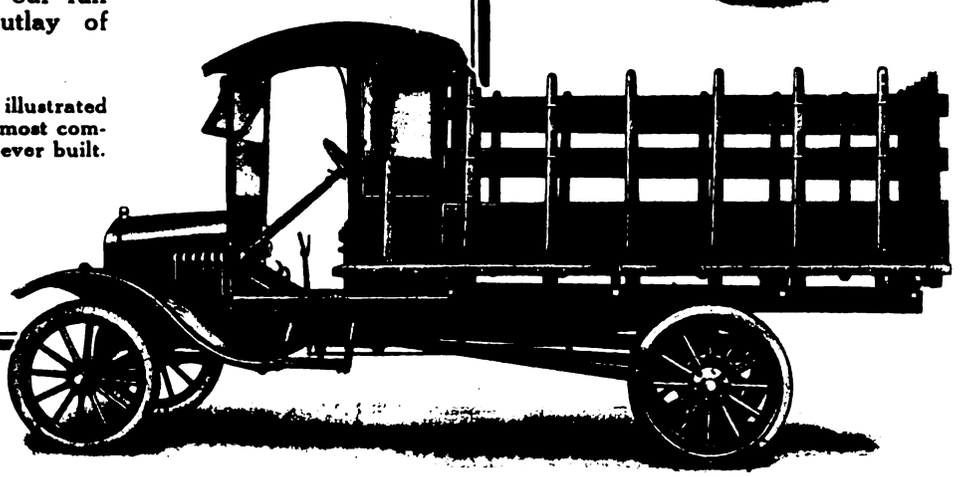
Henney Rural Express Bodies for Ford One Ton Truck and Model T Chassis, to carry milk, eggs, poultry, fruits, calves, garden truck and crops to the nearby market and return with coal, lumber, groceries, etc., for the farm, offers you unequaled opportunities. Both the Henney Express Body and the Ford Chassis under the severe test of day in and day out service, under all kinds of loads and in all kinds of weather, have clearly established themselves as useful and economical methods of transportation.



Henney Bodies are built of the best materials and workmanship—carefully selected, seasoned, kiln-dried hardwoods being used for the sills, floors, frames and parts, and the bodies are heavily ironed at every point of strain and wear.



Our 21 branch houses throughout the United States offer real service and large profits to you, allowing you to make immediate deliveries from our full stocks with very little outlay of capital.



Write today for our new illustrated catalog, showing the largest and most complete line of commercial bodies ever built.

The LAUSON 15-25

DUST PROOF-ALL GEARS ENCLOSED

DEALER—"Well, Mr. Smith, how's your LAUSON working—?"
FARMER—"Fine. Couldn't be better. You did me a real favor when you sold me a LAUSON 15-25. It works as easily as an automobile and has a reserve of power that makes me feel confident in my tractor and its ability to give continued service."

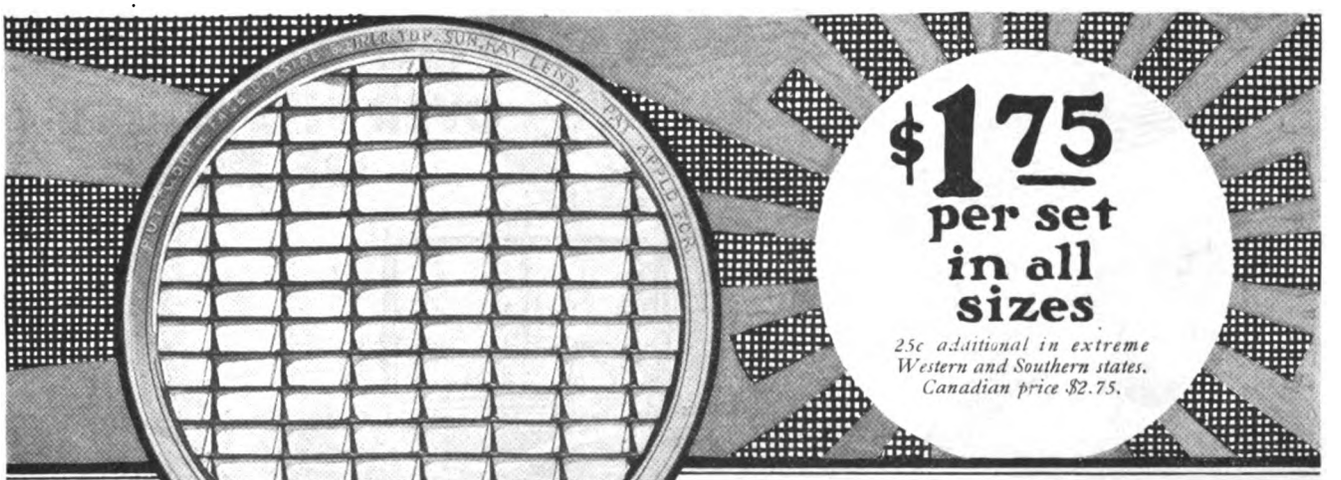
The above is the kind of conversation the dealer likes to have when he has sold a tractor.

The LAUSON 15-25 is the kind of tractor that brings forth this kind of recommendation from the user. It has built into it that perfection and power which means that no matter how hard the service it is put to, it will prove up with unqualified success all the claims we make for it.

There is little satisfaction for the dealer in selling his customers a tractor—or, for that matter, any other kind of machinery—which will continually break down and cause expense, delay, annoyance and a bad feeling which you cannot afford in your business.

The LAUSON is free from annoying break-downs and service troubles because it is built right by men with over twenty-three years of successful farm engine manufacturing experience. All it needs is reasonable care and attention.

It is standardized, unit assembly and accessibility throughout. It is dust-proof, all gears being enclosed, thus eliminating the friction which wears away the finest machine.



Check the specifications and see if the LAUSON is the tractor with which you would like to be associated. Then write for our interesting dealer proposition, as we still have some territory open and would like to get in touch with some dealers and distributors who can qualify for the LAUSON organization.

Specifications

Rating—Draw-bar H.P. 15; Belt H.P.25.
Engine—4½-inch bore by 6-inch stroke. Valve in head.

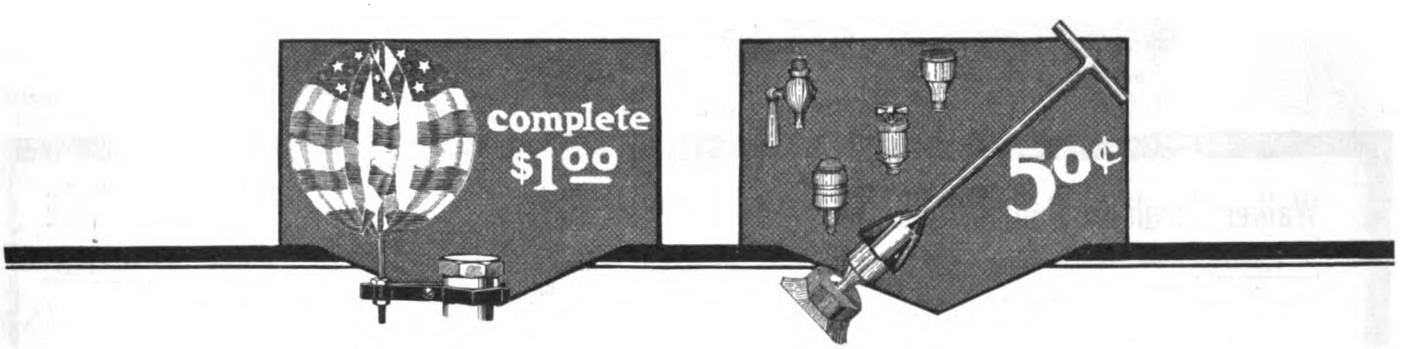
The Sun-Ray Lens

—"relative to the efficiency of Sun-Ray lenses;—we have tried them all from the cheapest to the most expensive, and have found Sun-Rays the *best* and *easiest* to sell."

That's what the Savage and Love Company of Rockford, Illinois, says.

And what's true in Rockford, Illinois, is true in any other part of the United States where automobiles are to be found.



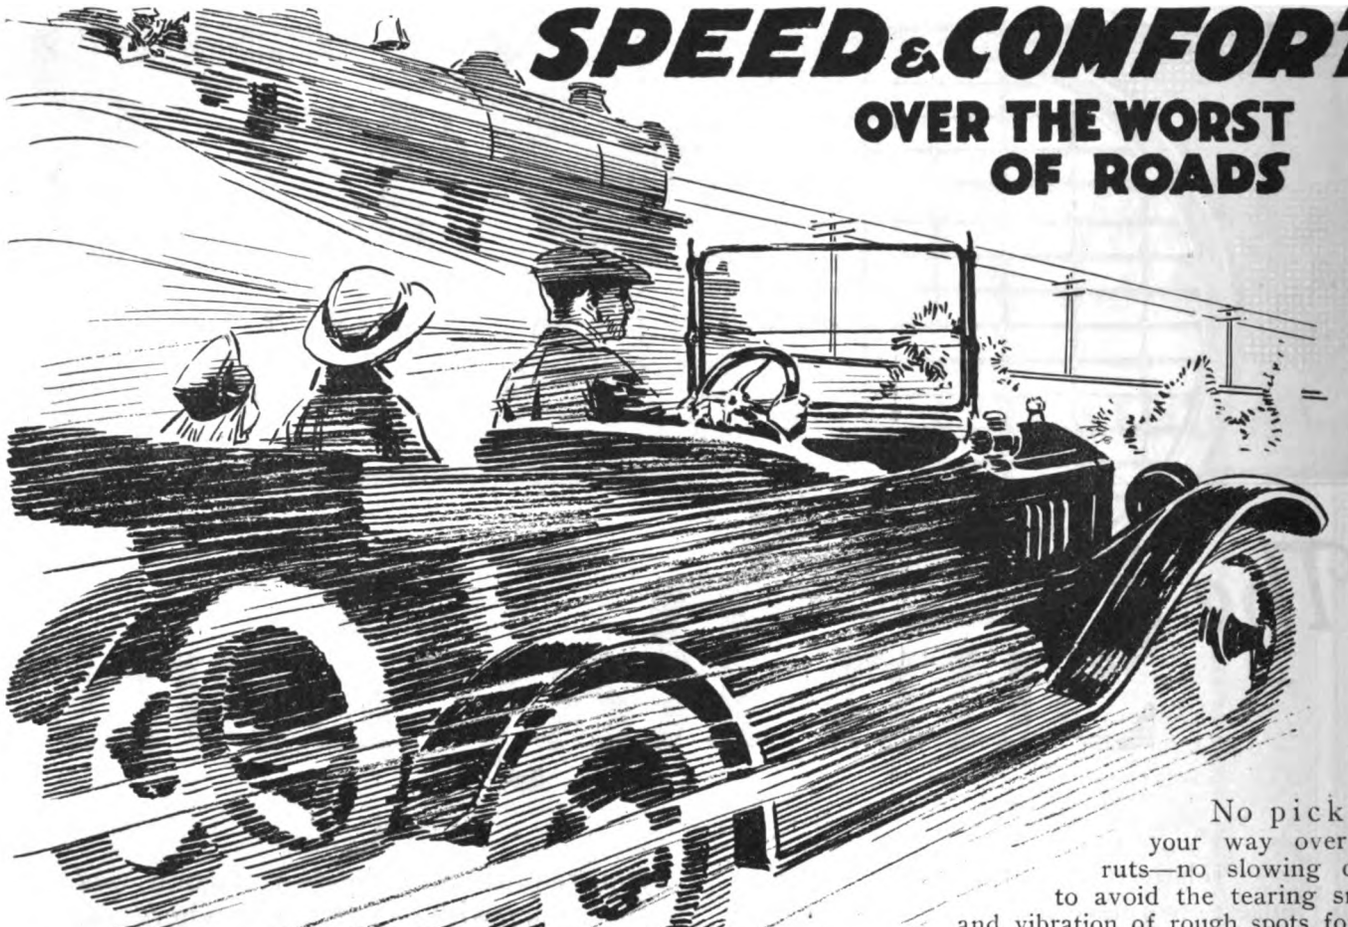
Sun-Rays are selling *everywhere* because they are *right*. They give you everything you require of a lens—refraction *and* diffusion,—with plenty of light where you want it. They meet every law.

Yet in spite of all their advantages Sun-Rays are priced at only $1.75 a pair *in all sizes*.

There's money in selling such a lens—good, cold, hard, money—and the sooner you dealers realize it, the sooner you will be getting your extra profit.

We'll be glad to talk business with you —*now*. Get in touch with us.

THE PRISMOLITE COMPANY, Columbus, Ohio



The Whirlyflag. *Here's a little novelty that has spread over the country like wildfire. It is made of enameled metal in either the Stars and Stripes or British Union Jack design. Fastens on radiator cap, bicycle or motorcycle. Attractive discount to dealers.*

The Universal Grease Cup Wrench. *Motorists everywhere have been quick to appreciate this handy tool. It takes care of grease cup, pet cock and water cock adjustments quickly and easily without soiling the hands—even in the most "out-of-the-way" parts of the car. Advertising material furnished with orders. Special terms for dealers.*

"The Motorist who is Brunnerwise knows Brunner Service Satisfies"

WE USE A BRUNNER AIR COMPRESSOR
FREE AIR
FOR YOUR CONVENIENCE

He knows because he has always found Brunner Service thoroughly dependable and for that reason he recognizes the Brunner sign as a sure sign of high-class, unfailing service—that is why thousands of Brunnerwise motorists patronize the garages displaying the Brunner sign—the service satisfies.

The Brunner Air Compressor was designed for the garageman's special use and has been consistently making good in the garage ever since the garage business has been a business. Built in the largest and best-equipped plant in the world devoted to the exclusive manufacture of garage air compressors. No special mechanical attachments necessary to help the motor carry the load—no restriction of the lubrication to invite disaster—no wild claims of impossible results, but simply the same good substantial business proposition it has always proven for the garageman who buys it. Write for No. 15 catalogue and name of Brunner Jobber who covers your town.

HERE ARE

The Present Conditions AND The Logical Conclusions

Business of this country demands and must have motor haulage as a war time necessity.

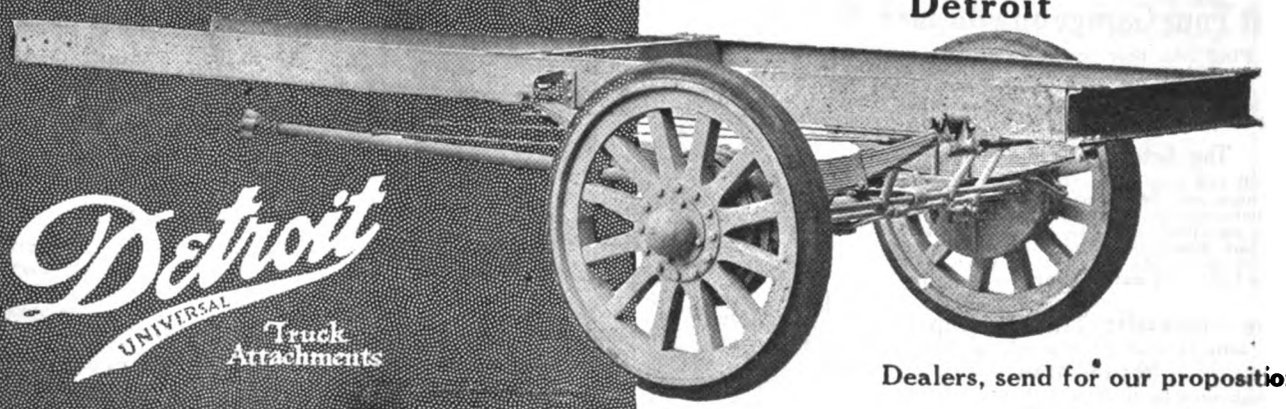
But the very lines of business—small manufacturers, merchants, farmers, etc., which need the speeding up effects of motor haulage the most are unable to pay the high prices which are now asked for motor trucks.

The truck attachment brought to its present high state of durability and efficiency solves the problem for both the business man and the dealer.

It gives the dealer an easy selling proposition on which immediate deliveries can be made in quantities. It provides the business man immediately with a fast durable adoptable truck at a cost he can easily afford to pay.

The wise dealer this year will push the product for which there is a wide spread demand—selling at a price low enough to make a big volume possible, and on which he can get immediate deliveries.

This describes the Detroit Universal Truck Attachment.



The famous Russell Internal Gear Axle, used in all models. Every part measures up to this same high standard of quality. Made by a company strong both personally and financially.

The most complete line on the market, running from a 1¼ ton model to a full three ton model.

Prices range from $400.00 to $675.00. Immediate Deliveries.

Dealers, write for our extremely liberal selling proposition.

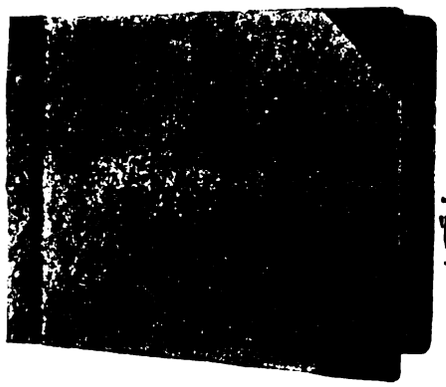
The Present Motor Car Situation Means a Demand for Warner Auto Upholstery Covers

WARNER AUTO UPHOLSTERY COVERS

FOR CLEANLINESS
COMFORT — ECONOMY — STYLE

Many automobilists are dressing up their present cars so they will look presentable for another year. They want Warner Auto Upholstery Covers.



Men who are investing in new cars are resolved to make these cars last longer than any they ever owned before. They, too, want Warner Auto Upholstery Covers.

Men who are buying used cars instead of paying the increased price which new cars are bringing want their purchases to look like new. They also want Warner Auto Upholstery Covers.

Because Warner Auto Upholstery Covers make motor cars look dressier and conserve motor car value, they are in greater demand now than ever before.

Let us show you how you can increase your business and profit and add to your list of satisfied customers by pushing the sale of Warner Auto Upholstery Covers.

The Warner Auto Top Company, 1640-1644 Central Ave., Cincinnati, Ohio

Business Records Must Now Conform to Law

THE revenue act gives the Treasury Department authority to enforce keeping of accurate records in every business that pays taxes under this act.

This System Is Complete

This System consists of three forms, all in one binder.
1—Cash Received and Sales Record.
2—Cash Paid and Expense Record.
3—Customers' Accounts.

MOTOR WORLD'S SIMPLIFIED SYSTEM OF ACCOUNTING

See Everything at a Glance

COMPLETE INSTRUCTION BOOK shows you exactly how to use it—you don't have to know anything about bookkeeping. Over 1500 Garage, Repair and Supply men using it now.

This in itself is a powerful argument for Motor World's Simplified System of Accounting. But, aside from this, every automobile and accessory dealer or garageman needs just such a system to give him vital facts concerning his business from day to day. His business of today is not what it was yesterday. The war has influenced business to such an extent that *accurate* records are absolutely necessary. This system was perfected by seven of the country's foremost merchandising experts.

Motor World's Simplified System of Accounting gives you all the information you want at a glance. Not a jumbled mass of facts and details, *but* a clear, concise history of your business. As this system requires a *minimum* amount of clerical work, it saves its cost in a short time. It will fit in with existing systems *as they are* in *your business.*

Price $15.00. Sent on 5 days' approval. If you would do without this system after looking it over send it back and your money will be refunded. You take no chances in ordering this system. Send in your order today.

Easily Attached to All Types of Engines. Patented June 11, 1918.

The GED

Gasoline Economizer and Decarbonizer

combines

Auxiliary Carburetion and Humidified Air

securing

Complete Combustion
Saving of 25 to 40% in Gasoline
Decided Increase in Power
Removal of Carbon

The G E D acts continuously and automatically—has no moving parts to adjust, wear or get out of order. It is an investment—not an expenditure. It repays its cost over and over each season.

The G E D automatically supplies humidified air by the most improved and efficient method.

MOISTURE properly introduced with the explosive mixture, by the process of humidifying the air, is highly beneficial to engine operation.

This scientific fact is proven in practice by the decidedly improved operation of your car after night fall or in damp weather.

It is also an established fact that the free carbon formed is changed to gas by uniting with the steam into which the water vapor is converted at the combustion temperature. This gas is expelled by the exhaust and the cylinders are consequently kept clean.

In addition, the G E D automatically provides auxiliary carburetion, which further improves combustion and releases the maximum percentage of the heat value of the fuel—while with the incomplete combustion generally obtained a large percentage of the heat units are undeveloped and pass out through the exhaust as waste gases.

Excellent agents' opportunity—the G E D demonstrates and sells itself. Write for particulars.

$10 Delivered Anywhere in the United States

Order the G E D through your dealer—or mail remittance direct to us, and we will send you the G E D at once by parcel post.

ATLAS AUTO SPECIALTIES CORP., 2120 Broadway, New York City

DEALERS! MAKE BIG MONEY SELLING "Meteor" RACING BODIES FOR FORDS

Here is a combination sport-speed body for Fords with all the class, snap and beauty demanded by car owners who want a car of distinction and beauty. The Meteor body is marvelously beautiful with long, swerving, graceful lines that blend together to form a car that is conceded to be the aristocrat of the road wherever it goes.

"Meteor" RACING BODIES FOR FORDS

Any Ford car can be converted into a sport roadster that reflects the appearance of the high-powered, commanding roadster that costs several thousand dollars.

Every part of Meteor bodies is built to withstand excessive strains and vibration. There is no need to buy extra fenders and radiator, as the original Ford fenders and radiator can be used.

DEALERS' PRICE $59.95—LIST PRICE $150.00

PRICE INCLUDES PAINTING *FREE*—IN EITHER RED OR BLUE

The price of $59.95 includes body complete—painted with five coats of either Stutz blue or Stutz red—beautiful, rich upholstering of "Carter" leatherette—22 gal. gas tank with brass filler cap—new dash and floor boards—large, roomy tool box. Everything complete. Nothing extra to buy.

Here is the most sensational offer ever made to dealers. The Meteor body is so beautiful, so unusual, so attractive that the full list price can easily be obtained. Every Ford owner wants one when he sees it.

Send check, money-order or cash with your order and we will make immediate shipment of one of these beautiful bodies.

Remember, you can sell these bodies for $150.00 retail.

HALLADAY BUMPERS

A BUMPER THAT FAILS WHEN YOU NEED IT IS WORSE THAN NONE AT ALL.

HALLADAY Bumpers
ARE MADE TO MAKE GOOD

They absorb and neutralize the shock with the least possible strain on the frame, springs and other parts of the car.

They are solidly built and accurately fitted, insuring stability, durability and freedom from noise and rattle.

Bear in mind—There is a HALLADAY BUMPER to fit the front and rear of every car on the road and wise dealers, who consider their own and their customers' interests, sell them.

L. P. HALLADAY COMPANY, Streator, Illinois

Well designed—built—finished

A well balanced car! Its stylish, modern body and ample roominess are linked with mechanical fidelity. A car you'll be proud of—a car with speed, quick action, flexibility. A car of low upkeep and economy—a car that will serve you long and serve you well.

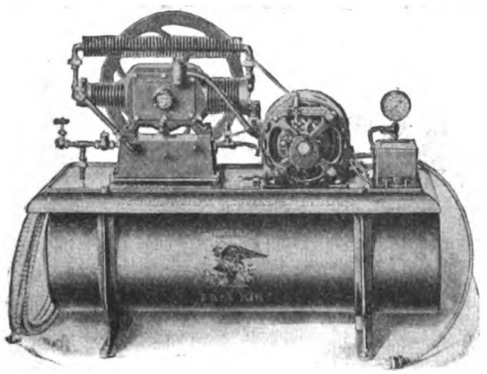
Join the Men Who Sell International Motor Trucks

This year men who sell **International Motor Trucks** will beat all previous records. On March 16th the sales of Internationals for 1918 had already passed the total 1917 dollars-and-cents mark. In this unusual year new and better methods cannot be kept down. Men who had been content with running in the old ruts before are being jolted out now, and every individual or firm now doing horse-and-wagon hauling is a prospect for an **International Motor Truck.** Many of these within reach of you are bound to buy trucks now. Who will do the selling?

Very soon the hot months will be here. Then, when horses fall down on hauling jobs, the thousands of **International Motor Trucks** in service will go on making and saving money for their owners, increasing a top-notch reputation, and making more sales for dealers.



International Motor Trucks meet the needs of any and every firm with hauling problems to solve. They are made in 1,500, 2,000, 3,000 and 4,000-pound capacity sizes. Prices range from $1,550 to $2,650 for the chassis (cash f.o.b. factory).

Do you want a contract? Consider this proposition carefully. You cannot afford to do otherwise. Write us at once, for territory is being snapped up eagerly by dealers who realize the present and future value of an **International Motor Truck** contract.

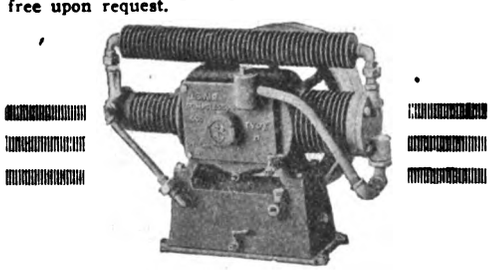
Any One of the 20 U. S. Air Compressors A "Good Buy"

HERE is a machine that is wholly worthy of carrying the name United States, representing as it does the greatest possible attainments and incorporating all the highest refinements that mechanical ingenuity has been able to contrive.

The U. S. DeLuxe Two Stage Automatic Air Compressor is the kind of machine that is almost invariably bought when a desire to own the best and most efficient machine is the governing factor.



The DeLuxe exactly meets the needs of a majority of garages. It maintains high pressure in great volume, is extremely quiet in operation, handsome in appearance, entirely automatic in operation and requires only a minimum of attention to keep in perfect running order.

All U. S. motor-driven units equipped with Patented Unloader which prevents burning out of motors, slipping of belts, etc.

THE UNITED STATES LINE comprises 20 different numbers in TWO STAGE and SINGLE STAGE TYPES, and various individual equipment adapted for forming combinations of almost unlimited kinds and capacities.

Each machine is designed to fill a particular need and it will perform that service in a manner that is never excelled and seldom equalled.

Our catalog giving complete information will be sent free upon request.

U. S. TWO STAGE COMPRESSORS without tank, motor or controlling equipment can be furnished if desired, having tight and loose pulleys, as illustrated, or large single wheel for direct motor drive. Capacities 4, 10 or 20 cubic feet per minute.

THE machine illustrated below occupies the same position in the *Single Stage* field that has been attained by our DeLuxe unit in the *Two Stage* field.

The U. S. Single Stage Automatic Air Unit D22 will be found highly satisfactory for garages and free air stations where the volume of business does not seem to justify the purchase of our DeLuxe Unit.

This outfit is shipped completely assembled, piped and tested and will be ready to run when attached to lighting or power circuit, thus avoiding any expense for installation.

Please send catalogs advertised in Motor World.

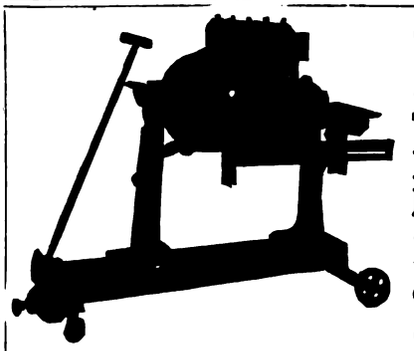
Ohio Karbon Killer

Will promptly and effectually put an end to 90 per cent of your engine troubles.

This sure, pure and efficient product

Eliminates Carbon Deposits;
Keeps Spark Plugs, Valves, Pistons and Cylinders Clean;
Makes Motor Run Smoother and Easier;
Produces More Uniform Combustion;
Increases Speed, Power and Mileage;
Decreases Gasoline Consumption;
Prevents Knocking, Missing, Backfiring, Loss of Compression, and
Reduces Repair Bills.



It is used in the gasoline—one teaspoonful to each 5 gallons. It's on the job every minute, and keeps your car in the pink of condition—ready to make a quick getaway at your slightest touch.

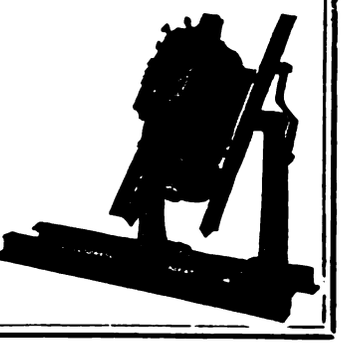
It sells at one dollar per pound, and a pound treats 480 gallons of gas. You need it badly every mile you travel—get some now. If your dealer can't supply you, send us his name and a one dollar bill—you'll get a can by return mail.

Mr. Dealer:—Better put in a stock of Ohio Karbon Killer, and get your share of this business. It has all other carbon remedies outclassed, and the demand is bound to grow. Write for dealer's prices, etc.

The Ohio Grease Co.

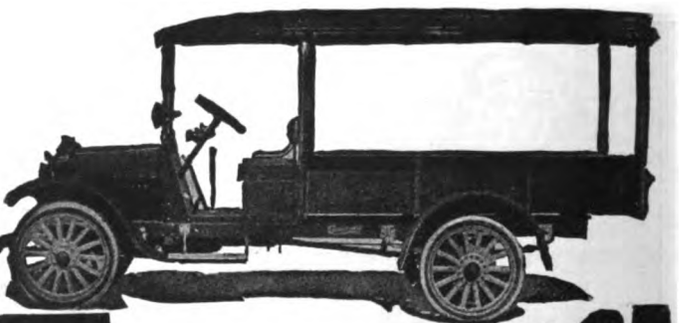
P. O. Box 122 **Loudonville, O.**

The Only Engine Stand THAT PROPERLY MOUNTS Every Type of Motor Suspension



And supports it in *any* position, so that the workman may reach all parts with ease and safety.

The MANLEY "EVERY WAY" ENGINE STAND



It can be anchored securely to the floor, or moved about the shop easily on roller-bearing casters, as occasion demands.

It can be adjusted to every position in a circle making it equally easy to work on valve mechanism, clean out carbon, grind valves, take up crankshaft, connecting rod, bearings, etc. In each position engine is rigidly locked by two side braces, leaving workman absolutely free and unobstructed. It supports the engine solidly, never gets shaky, and should last a lifetime without repairs. Prices (with complete equipment), Stationary, $48; Portable, $58.

For 4-point suspension, the brackets are bolted directly to cross arms, having 100 holes. For 3-point, adjustable cross bar shown in cut is provided.

100% Sales Increase

That's What the Famous Swinehart Emery-Wheel Test Did in 1917 for the Couch-Georger Tire Agency of Buffalo.

THE Emery-Wheel Test is the **strongest** selling argument **that any tire dealer can use.** It proves that the rubber in Swinehart Tires grinds down **slower than that of any other tire. See illustration.**

Think of the tires you can sell by being able to make such a statement to your trade, then

Write for Swinehart Dealer Proposition

SWINEHART TIRE & RUBBER CO., Akron, O.

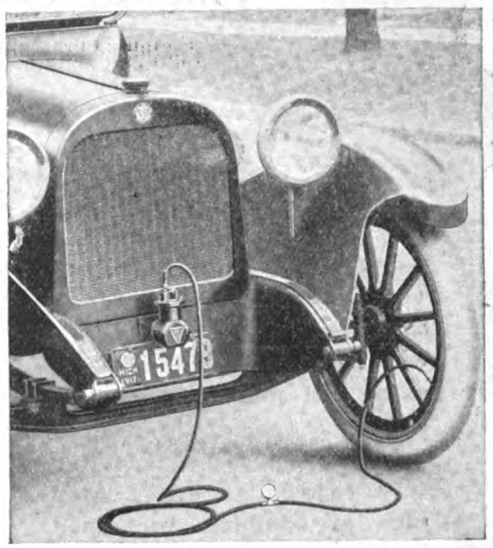
Swinehart Tires SELL

Have You Had Trouble With Your Tires?

The fault is not with the tires. You, or your chauffeur, or both, are to blame. The responsibility is yours because you should keep the tires pumped up to a specified pressure, and don't.

Tires that are kept up to the proper air pressure last twice as long—sometimes ten times longer—than tires that are run with not enough air in them. Measure your air daily with a

SCHRADER UNIVERSAL TIRE PRESSURE GAUGE



and get out of your tires all the miles they can give.

Price in U. S. A. **$1.25**

DUNN'S
COUNTERBALANCES
Make Ford Motors Run Smooth

Equally necessary on Racing Fords, passenger models, delivery cars and tractors. They add enough to life of the motor to pay for themselves quick. They positively give more speed, more power, greater economy. More than 1000 Fords are now equipped, and every user satisfied More than half of the orders received are repeat orders, coming from those who have tried them and know. Installed with a wrench.

Big Ready Sellers. Price $12.00 per Set.
Liberal Discount for Dealers and Jobbers.

You Don't Have To Dismantle The Engine

in order to mend a cracked water jacket or work of same type when you have a supply of Nicro Spelter and Flux. It melts at 300 deg., and adheres to cast iron, bronze or brass, making a perfect brazing and permanent repair.

PETERS NICRO SPELTER and FLUX

is the compound that mechanics have been dreaming of for years. It eliminates the danger of warpage, distortion and cracking, because no pre-heating is necessary when brazing with Nicro Spelter.

Car drives into your shop, you clean and prepare crack in water jacket, heat with small hand torch, apply Flux, then Spelter, clear off excess metal, and job is done. A perfect job, too!

Vulcanizing With a Vanderpool Vulcanizer Brings Big Profits

3 Cavity Combination Vanderpool Vulcanizer

Send in this ad with your name and we will mail catalogue and prices.

Here is an exceptional opportunity for Garages as well as Vulcanizing Companies to secure a vulcanizer that will turn out high-grade work at a small cost. The fuel saved alone will pay for the machine in a short time—then you will "cash in" on your investment. This plant, the Vanderpool Vulcanizer, is meeting with enthusiastic approval of hundreds of satisfied users all over the country. Unsolicited testimonials from the various companies now using the "Vanderpool" testify to the dependability, efficiency and economy of this "Vulcanizing Wonder." One man writes that the first month's profits paid for the plant. No experience needed—we teach you how. It occupies very little floor space, and "once bought, you will never have to buy again."

General Foreman

Machine Department Automobile Plant

Here is a chance for a man with a lot of fine, general shop experience, knowledge and ability to become General Foreman of the Machine Department of the Automobile Section of our plant.

The man must know how to meet emergencies, must have plenty of ability and be a go-getter in every sense of the word. This is big opportunity for the right man and the best man wins. Prove your record in your first letter.

Address Box A323 care Motor World

TOOL AND JIG DRAFTSMEN ON AIRPLANE ENGINE WORK

We have places for top-notch tool and jig draftsmen who are capable of doing Government work on airplane engines and we want these men at once to help us speed production of airplane motors for our fighting men in France and on the sea.

Here is a chance to fulfill a patriotic duty, to get in a good lick at the Hun and to do your share in our big, new airplane plant where the working conditions are ideal and wages the highest.

Come on, you red-blooded men. Join the fighting workers who are making good airplane engines for our fighters in France and on the sea.

The Hun is speeding his production—we must beat him. We need you, your country needs you, our men in France and on the sea need your help now.

Your Patented Automobile Accessory Manufactured

Many practical accessories are never placed on the market, due either to lack of manufacturing facilities, merchandising organization, or capital.

There are many automotive concerns prepared to consider and take hold of worth-while opportunities.

It is the work of this Department to bring these interests together.

There is no charge for this service.

Send blueprints, specifications and full information as to the kind of material and manufacturing equipment necessary to manufacture the article in question.

It is also important that you state whether you are in a position to finance the proposition, or if it is to be manufactured on a royalty basis.

For co-operation along the above lines, address

CHILD'S PLAY WITH A REAL WRENCH

TIRE AND RIM WRENCHES

No one likes to change a tire or rim at any time and with poor tools it is often a hardship, especially on the road.

Owners and repairers have found the ordinary and adjustable wrench most unsatisfactory and are demanding a tool that will permit the change to be easily and quickly made.

This demand is fully met by the trademarked, guaranteed **Walden-Worcester Brace Socket Wrench**—the only all steel brace wrench made. It has swivel handles of pressed steel and the wrench is nickel finish. There are no loose parts and the socket will not twist or shear off.

One wrench in any car will fit all nuts on the rim as they are uniform, but there is just the right size **Walden-Worcester Wrench** for any make of rim. List price 90 cents each.

This is an extremely fast selling line of great utility. **If you do not stock them write to-day for catalog No. 25 and discounts.**

Confidence—and What It Means to the Dealer

INDIANA
TIRES & TUBES

If every dealer would refuse to handle a certain line of goods until he had absolute confidence in that line most of his troubles would be over. For, when a dealer's confidence is gained, it means that the product has distinct merits. A dealer seldom, if ever, makes a mistake in giving his **entire** and **unqualified** confidence to a product.

With confidence backing him up the dealer will make a big success with the product. His sales will mount up because he can back each individual sale with a **personal** guarantee which is the deciding factor in the mind of the prospective purchaser.

Indiana Tires and Tubes are the kind of products that the dealer respects. Every Indiana sale is backed by the dealer's **personal** guarantee. By experience the dealer learns that Indiana Tires and Tubes give the kind of satisfaction that brings customers back with repeat orders.

Write for our dealer proposition and the details explaining why every Indiana dealer has the utmost confidence in Indiana Tires and Tubes.

1500 new dealers make rush for Globe Tire Selling Franchise

THE jump in Globe Tire sales is the biggest piece of news in automobile circles. We're not surprised. We knew that nothing could block the complete success of the longest-mileage hand-made wrapped tread automobile tire.

Take a good look at these figures. They're important.

Our production and sales of Globe Tires jumped 101.9 per cent in a year. A tremendous gain at this period of the tire industry.

In Trenton, New Jersey, where our factory is located, our distributors, the Para Company, sold $125,000 worth of Globe Tires in the past year. They did it right under the noses of nearly a dozen other Trenton tire factories.

New York City sales jumped over 200 per cent in a year.

Kentucky sales jumped more than 500 per cent.

Our distributor in Ogden, Utah, reports an enormous increase of 400 per cent in his sales since last March.

A year ago, we hadn't done five cents worth of business in the states of Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida, Mississippi, or Alabama. Today, we have most of this territory well covered with ambitious dealers doing a rushing Globe Tire business.

Globe Tire and Tube purchasers are sure repeaters. Globe Tires are the longest-mileage tires that can possibly be made.

Write or wire us today if you wish to build a permanently profitable business on Globe Tires. Exclusive, adequate dealer territory available for properly qualified merchants in many localities, especially in Iowa. Distributors' territories available in Denver, Michigan, Nebraska, Mississippi, and Alabama.

GLOBE RUBBER TIRE MANUFACTURING CO.

Executive Office, 1851 Broadway, New York City *Factory,* Trenton, New Jersey, U. S. A.

Branches in New York, Boston, Chicago, and Philadelphia

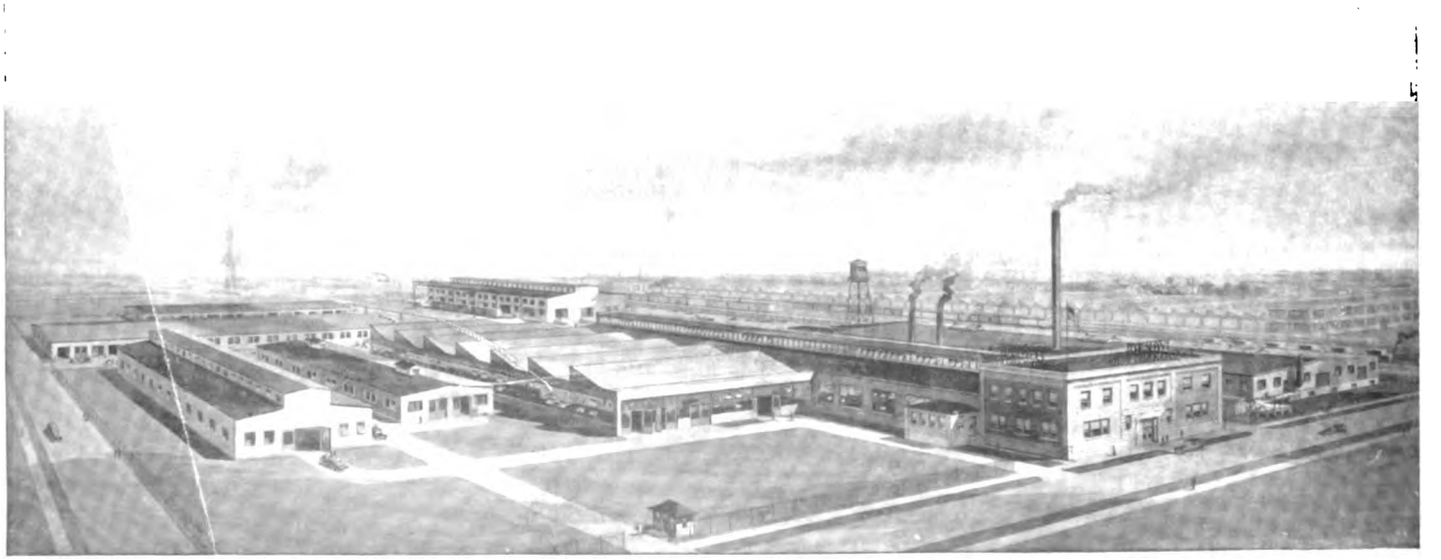
DENBY MOTOR TRUCKS

THE ideals of the builder are inevitably reflected in his product. For us there is but one ideal—the highest; there is no detail too small to be measured by it, and no effort too great to attain it.



Rigid adherence to this policy, laid down at the formation of the company, coupled with thorough co-operation with Denby dealers and Denby users, has built a world-wide demand for Denby trucks that has forced a consistent, constant enlargement of the Denby Plant.

Denby trucks are furnished in capacities of 1 ton to 5 tons.

Recent additions have more than doubled the capacity, and further new buildings are to be added as fast as possible, to keep pace with the demand and supply Denby dealers with the trucks to meet their needs.

Denby Motor Truck Company
